key generation
trust-store loading
revocation lookup
runtime handoff execution
runtime authority grants
host reads
host writes
network access
shell execution
tool execution
capability enforcement
policy persistence
object sealing
kernel interaction
```

Initial handoff policy

Allowed input signing authorization state:

```
signing_authorization_state=authorized-metadata-only
```

Allowed requested signature label:

```
Ed25519-development
```

Allowed requested signing authorization label:

```
metadata-only
```

Allowed requested signer handoff label:

```
metadata-only
```

These labels are metadata labels only. They do not mean Ed25519 signing, Ed25519 verification, signer invocation, key generation, private-key handling, trust establishment, runtime handoff, host behavior, network behavior, or capability enforcement exists in this path.

Planned signer handoff states:

```
signer_handoff_state=handoff-metadata-only
signer_handoff_state=denied-signing-authorization
signer_handoff_state=denied-signature-algorithm
signer_handoff_state=denied-signer-handoff
signer_handoff_state=denied-private-key
signer_handoff_state=denied-runtime-authority
signer_handoff_state=denied-host-effect
signer_handoff_state=denied-network-effect
```

The first implementation may set:

```
signer_handoff_ready=1
```

only for ready metadata-only signing authorization, the allowed development signature label, and the metadata-only signer handoff label.

Even when signer_handoff_ready=1, these must remain zero:

```
signature_performed=0
verification_performed=0
signer_invoked=0
private_key_handling=0
key_generation_performed=0
trust_store_loaded=0
revocation_lookup_performed=0
handoff_performed=0
effect_performed=0
runtime_authority_granted=0
host_read_performed=0
host_write_performed=0
network_performed=0
```

Planned fields

A future signer handoff record should be bounded and deterministic.

Planned fields:

```
signer_handoff_profile
signing_authorization_profile
signature_request_profile
envelope_profile
report_profile
handoff_profile
decision_profile
gate_profile
receipt_profile
verify_profile
message_digest_algorithm
message_digest_hex
public_key_identity_label
requested_capability
requested_effect
requested_handoff
requested_report
requested_envelope
requested_signature
requested_signing_authorization
requested_signer_handoff
requested_scope
signing_authorization_state
signing_authorization_ready
signer_handoff_state
signer_handoff_ready
signature_performed
verification_performed
signer_invoked
private_key_handling
key_generation_performed
trust_store_loaded
revocation_lookup_performed
handoff_performed
effect_performed
runtime_authority_granted
host_read_performed
host_write_performed
network_performed
mode
status
```

Expected values for an allowed first implementation result:

```
signer_handoff_profile=latticra-seal-signer-handoff/0.1
requested_signer_handoff=metadata-only
signer_handoff_state=handoff-metadata-only
signer_handoff_ready=1
signature_performed=0
verification_performed=0
signer_invoked=0
private_key_handling=0
key_generation_performed=0
trust_store_loaded=0
revocation_lookup_performed=0
runtime_authority_granted=0
mode=metadata-only
status=signer-handoff-metadata
```

Failure behavior

Future signer handoff handling must fail closed.

Required failure states:

```
null output -&gt; invalid
null signing authorization -&gt; invalid
invalid signing authorization -&gt; denied-signing-authorization
signing_authorization_ready=0 -&gt; denied-signing-authorization
signing_authorization_state not authorized-metadata-only -&gt; denied-signing-authorization
missing requested signature -&gt; denied-signature-algorithm
unknown requested signature -&gt; denied-signature-algorithm
missing requested signer handoff -&gt; denied-signer-handoff
```

```
unknown requested signer handoff -&gt; denied-signer-handoff
private-key handling requested or observed -&gt; denied-private-key
key generation requested or observed -&gt; denied-private-key
trust-store loading requested or observed -&gt; denied-private-key
revocation lookup requested or observed -&gt; denied-network-effect
signature already performed -&gt; denied-host-effect
verification already performed -&gt; denied-host-effect
signer already invoked -&gt; denied-host-effect
runtime authority already granted -&gt; denied-runtime-authority
handoff already performed -&gt; denied-host-effect
effect already performed -&gt; denied-host-effect
host read already performed -&gt; denied-host-effect
host write already performed -&gt; denied-host-effect
network already performed -&gt; denied-network-effect
```

Failures must not sign, verify signatures, invoke a signer, handle private keys, generate keys, load trust stores, look up revocation status, read host files, write host files, contact networks, execute tools, execute shells, enforce capabilities, perform runtime handoff, persist policy, or grant runtime authority.

Promotion rule

This contract permits only the next implementation slice:

```
signer handoff metadata implementation
```

It does not permit cryptographic signing, signature verification, signer invocation, private-key handling, key generation, trust-store behavior, revocation lookup, runtime handoff execution, effect execution, capability enforcement, runtime authority, host behavior, network behavior, object sealing, or kernel behavior.

After signer handoff metadata, its status/public-entry checkpoint, the signer invocation contract, the signer invocation metadata implementation, signer invocation status/public-entry alignment, the signing operation contract, signing operation metadata implementation, signing operation status/public-entry alignment, the key-handling boundary contract, key-handling metadata implementation, key-handling status/public-entry alignment, the key-material boundary contract, and key-material metadata implementation exist and are guarded, the next valid planning slice is bounded no-effect key parsing implementation or another narrow status/index alignment follow-up that still must not add signing without separate implementation, key-handling, key-material, and guard contracts.

Validation

This contract is validated by:

```
sh scripts/test-latticra-seal-signer-handoff-contract.sh
```

docs/LATTICRA_SEAL_SIGNER_HANDOFF_IMPLEMENTATION.md

Source title: Latticra Seal Signer Handoff Implementation

Lines: 163 | Words: 524 | SHA-256: 42d44d39b679524dba0453796836c35e8e6d1b91ce4e0a589eec4fa580f31186

Latticra Seal Signer Handoff Implementation

Status: initial signer handoff metadata implementation Scope: bounded C metadata surface for classifying Seal signer handoff eligibility after ready signing authorization metadata. This slice does not add signing, signature verification, signer invocation, key generation, private-key handling, trust-store loading, revocation lookup, object sealing, runtime handoff execution, runtime authority, host reads, host writes, network behavior, shell execution, tool execution, capability enforcement, policy persistence, kernel behavior, Fedora approval claims, production readiness, or operating-system behavior.

Purpose

This document records the first Latticra Seal signer handoff metadata implementation.

The implementation consumes ready signing authorization metadata and classifies whether the request remains eligible for a future metadata-only signer handoff.

It is signer-path handoff classification only.

It does not invoke a signer.

It does not sign.

Files

```
include/latticra/seal_signer_handoff.h
src/seal_signer_handoff.c
tests/seal_signer_handoff_invariants.c
scripts/test-latticra-seal-signer-handoff.sh
```

Required predecessors

This implementation depends on the signer handoff contract and the signing authorization metadata surface:

```
docs/LATTICRA_SEAL_SIGNER_HANDOFF_CONTRACT.md
docs/LATTICRA_SEAL_SIGNING_AUTHORIZATION_CONTRACT.md
docs/LATTICRA_SEAL_SIGNING_AUTHORIZATION_IMPLEMENTATION.md
docs/status/SEAL_SIGNING_AUTHORIZATION_STATUS.md
include/latticra/seal_signing_authorization.h
src/seal_signing_authorization.c
tests/seal_signing_authorization_invariants.c
scripts/test-latticra-seal-signer-handoff-contract.sh
scripts/test-latticra-seal-signing-authorization-contract.sh
scripts/test-latticra-seal-signing-authorization.sh
scripts/test-latticra-seal-signing-authorization-status.sh
```

Implemented surface

The signer handoff metadata surface adds:

```
latticra_seal_signer_handoff_t
latticra_seal_signer_handoff_error_t
latticra_seal_signer_handoff_error_label
latticra_seal_signer_handoff_from_authorization
latticra_seal_signer_handoff_is_metadata_only
latticra_seal_signer_handoff_render
```

The implementation:

```
accepts signing authorization metadata
requires signing_authorization_ready=1
requires signing_authorization_state=authorized-metadata-only
requires requested_signature=Ed25519-development
requires requested_signing_authorization=metadata-only
accepts requested_signer_handoff=metadata-only
classifies the result as signer_handoff_state=handoff-metadata-only
sets signer_handoff_ready=1 only for metadata-only allowed authorization states
renders deterministic signer handoff metadata
fails closed for invalid or denied predecessor metadata
```

Even when signer_handoff_ready=1, these fields remain zero:

```
signature_performed=0
verification_performed=0
signer_invoked=0
private_key_handling=0
key_generation_performed=0
trust_store_loaded=0
revocation_lookup_performed=0
handoff_performed=0
effect_performed=0
runtime_authority_granted=0
host_read_performed=0
host_write_performed=0
network_performed=0
```

Current metadata output

The successful metadata path renders:

```
signer_handoff_profile=latticra-seal-signer-handoff/0.1
signing_authorization_profile=latticra-seal-signing-authorization/0.1
signature_request_profile=latticra-seal-signature-request/0.1
requested_signature=Ed25519-development
requested_signing_authorization=metadata-only
requested_signer_handoff=metadata-only
signing_authorization_state=authorized-metadata-only
signing_authorization_ready=1
signer_handoff_state=handoff-metadata-only
signer_handoff_ready=1
signer_invoked=0
mode=metadata-only
status=signer-handoff-metadata
```

Failure behavior

The implementation fails closed for:

```
null output
null signing authorization
invalid signing authorization
signing_authorization_ready=0
signing_authorization_state not authorized-metadata-only
requested_signing_authorization not metadata-only
missing requested signature
unknown requested signature
missing requested signer handoff
unknown requested signer handoff
private-key handling already present
key generation already present
trust-store loading already present
revocation lookup already present
runtime authority already granted
signature already performed
verification already performed
handoff already performed
effect already performed
host read already performed
host write already performed
network already performed
small render buffer
```

Failures do not sign, verify signatures, invoke a signer, handle private keys, generate keys, load trust stores, look up revocation status, read host files, write host files, contact networks, execute tools, execute shells, enforce capabilities, perform runtime handoff, persist policy, or grant runtime authority.

Validation

Run:

```
sh scripts/test-latticra-seal-signer-handoff-contract.sh
sh scripts/test-latticra-seal-signer-handoff.sh
```

Expected output:

```
seal signer handoff contract: ok
seal signer handoff invariants: ok
```

Next valid slice

The next valid Latticra Seal planning slice is bounded no-effect key parsing implementation or another narrow status/index alignment follow-up that still must not add signing without separate implementation, key-handling, key-material, and guard contracts.

The signer invocation metadata implementation, status/public-entry alignment, signing operation contract, signing operation metadata implementation, signing operation status/public-entry alignment, key-handling boundary contract, and key-handling metadata implementation now exist as guarded checkpoints. Future work must not add private-key handling, signing, verification, signer invocation behavior, trust-store behavior, revocation lookup, host behavior, network behavior, runtime authority, capability enforcement, object sealing, or kernel behavior unless separately implemented and guarded.

docs/LATTICRA_SEAL_SIGNER_INVOCATION_CONTRACT.md

Source title: Latticra Seal Signer Invocation Contract

Lines: 288 | Words: 911 | SHA-256: dff0c083d1f5faf9fb5e73b0d627d9205935cdf5b622ea44bf94500cb14c07a9

Latticra Seal Signer Invocation Contract

Status: Latticra Seal signer invocation contract Scope: contract for a future metadata-only signer invocation surface after Seal signer handoff metadata. This document does not implement signing, signature verification, signer invocation behavior, signer process execution, key generation, private-key handling, trust-store loading, revocation lookup, object sealing, runtime handoff execution, runtime authority, host reads, host writes, network behavior, shell execution, tool execution, capability enforcement, policy persistence, kernel behavior, Fedora approval claims, production readiness, or operating-system behavior.

Purpose

This document defines the first Latticra Seal signer invocation boundary after ready signer handoff metadata.

The purpose of this layer is to decide whether a ready metadata-only signer handoff may be represented as eligible for a future signer invocation request before any signer process, private key, trust store, runtime bridge, host authority, or signature generation exists.

The signer invocation surface is signer-invocation path classification, not signer invocation, not signing, not verification, and not runtime handoff.

This document does not invoke a signer.

This document does not implement signing.

Relationship to signer handoff

Latticra Seal signer handoff metadata already records a no-effect eligibility checkpoint for the future signer path:

```
docs/LATTICRA_SEAL_SIGNER_HANDOFF_CONTRACT.md
docs/LATTICRA_SEAL_SIGNER_HANDOFF_IMPLEMENTATION.md
docs/status/SEAL_SIGNER_HANDOFF_STATUS.md
```

This signer invocation contract starts from that checkpoint. It does not replace signer handoff, route to runtime behavior, invoke a signer, perform signing, handle private keys, verify signatures, persist policy, or grant runtime authority.

Required predecessors

This contract depends on:

```
docs/LATTICRA_SEAL_SIGNER_HANDOFF_CONTRACT.md
docs/LATTICRA_SEAL_SIGNER_HANDOFF_IMPLEMENTATION.md
docs/status/SEAL_SIGNER_HANDOFF_STATUS.md
include/latticra/seal_signer_handoff.h
src/seal_signer_handoff.c
tests/seal_signer_handoff_invariants.c
scripts/test-latticra-seal-signer-handoff-contract.sh
scripts/test-latticra-seal-signer-handoff.sh
scripts/test-latticra-seal-signer-handoff-status.sh
```

The signer handoff metadata surface remains the source of readiness evidence for this signer invocation surface.

Signer invocation boundary

Allowed in the next implementation slice:

```
accept signer handoff metadata
```

```
require signer_handoff_ready=1
require signer_handoff_state=handoff-metadata-only
require requested_signature=Ed25519-development
require requested_signing_authorization=metadata-only
require requested_signer_handoff=metadata-only
require signature_performed=0
require verification_performed=0
require signer_invoked=0
require private_key_handling=0
require key_generation_performed=0
require trust_store_loaded=0
require revocation_lookup_performed=0
require handoff_performed=0
require effect_performed=0
require runtime_authority_granted=0
require host_read_performed=0
require host_write_performed=0
require network_performed=0
accept requested signer invocation metadata
classify metadata-only as signer_invocation_state=invocation-metadata-only
produce deterministic signer invocation metadata
```

Forbidden in the next implementation slice:

```
cryptographic signing
signature verification
signer process invocation
private-key handling
key generation
trust-store loading
revocation lookup
runtime handoff execution
runtime authority grants
host reads
host writes
network access
shell execution
tool execution
capability enforcement
policy persistence
object sealing
kernel interaction
```

Initial invocation policy

Allowed signer handoff state:

```
signer_handoff_state=handoff-metadata-only
```

Allowed requested signer handoff label:

```
metadata-only
```

Allowed requested signer invocation label:

```
metadata-only
```

These labels are metadata labels only. They do not mean Ed25519 signing, Ed25519 verification, signer invocation, key generation, private-key handling, trust establishment, runtime handoff, host behavior, network behavior, or capability enforcement exists in this path.

Planned signer invocation states:

```
signer_invocation_state=invocation-metadata-only
signer_invocation_state=denied-signer-handoff
signer_invocation_state=denied-signing-authorization
signer_invocation_state=denied-signature-algorithm
signer_invocation_state=denied-signer-invocation
signer_invocation_state=denied-private-key
signer_invocation_state=denied-runtime-authority
signer_invocation_state=denied-host-effect
signer_invocation_state=denied-network-effect
```

The first implementation may set:

```
signer_invocation_ready=1
```

only for ready metadata-only signer handoff metadata, the allowed development signature label, the metadata-only signer handoff label, and the metadata-only signer invocation label.

Even when signer_invocation_ready=1, these must remain zero:

```
signature_performed=0
verification_performed=0
signer_invoked=0
private_key_handling=0
key_generation_performed=0
trust_store_loaded=0
revocation_lookup_performed=0
handoff_performed=0
effect_performed=0
runtime_authority_granted=0
host_read_performed=0
host_write_performed=0
network_performed=0
```

Planned fields

A future signer invocation record should be bounded and deterministic.

Planned fields:

```
signer_invocation_profile
signer_handoff_profile
signing_authorization_profile
signature_request_profile
envelope_profile
report_profile
handoff_profile
decision_profile
gate_profile
receipt_profile
verify_profile
message_digest_algorithm
message_digest_hex
public_key_identity_label
requested_capability
requested_effect
requested_handoff
requested_report
requested_envelope
requested_signature
requested_signing_authorization
requested_signer_handoff
requested_signer_invocation
requested_scope
signing_authorization_state
signing_authorization_ready
signer_handoff_state
signer_handoff_ready
signer_invocation_state
signer_invocation_ready
signature_performed
verification_performed
signer_invoked
private_key_handling
key_generation_performed
trust_store_loaded
revocation_lookup_performed
handoff_performed
effect_performed
runtime_authority_granted
host_read_performed
host_write_performed
network_performed
mode
status
```

Expected values for an allowed first implementation result:

```
signer_invocation_profile=latticra-seal-signer-invocation/0.1
signer_handoff_profile=latticra-seal-signer-handoff/0.1
requested_signer_invocation=metadata-only
signer_invocation_state=invocation-metadata-only
signer_invocation_ready=1
```

```
signature_performed=0
verification_performed=0
signer_invoked=0
private_key_handling=0
key_generation_performed=0
trust_store_loaded=0
revocation_lookup_performed=0
runtime_authority_granted=0
mode=metadata-only
status=signer-invocation-metadata
```

Failure behavior

Future signer invocation handling must fail closed.

Required failure states:

```
null output -&gt; invalid
null signer handoff -&gt; invalid
invalid signer handoff -&gt; denied-signer-handoff
signer_handoff_ready=0 -&gt; denied-signer-handoff
signer_handoff_state not handoff-metadata-only -&gt; denied-signer-handoff
requested_signer_handoff not metadata-only -&gt; denied-signer-handoff
missing requested signature -&gt; denied-signature-algorithm
unknown requested signature -&gt; denied-signature-algorithm
missing requested signer invocation -&gt; denied-signer-invocation
unknown requested signer invocation -&gt; denied-signer-invocation
private-key handling requested or observed -&gt; denied-private-key
key generation requested or observed -&gt; denied-private-key
trust-store loading requested or observed -&gt; denied-private-key
revocation lookup requested or observed -&gt; denied-network-effect
signature already performed -&gt; denied-host-effect
verification already performed -&gt; denied-host-effect
signer already invoked -&gt; denied-host-effect
runtime authority already granted -&gt; denied-runtime-authority
handoff already performed -&gt; denied-host-effect
effect already performed -&gt; denied-host-effect
host read already performed -&gt; denied-host-effect
host write already performed -&gt; denied-host-effect
network already performed -&gt; denied-network-effect
```

Failures must not sign, verify signatures, invoke a signer, handle private keys, generate keys, load trust stores, look up revocation status, read host files, write host files, contact networks, execute tools, execute shells, enforce capabilities, perform runtime handoff, persist policy, or grant runtime authority.

Promotion rule

This contract permitted the first implementation slice:

```
signer invocation metadata implementation
```

It does not permit cryptographic signing, signature verification, signer invocation behavior, private-key handling, key generation, trust-store behavior, revocation lookup, runtime handoff execution, effect execution, capability enforcement, runtime authority, host behavior, network behavior, object sealing, or kernel behavior.

The signer invocation metadata implementation, status/public-entry alignment, signing operation contract, signing operation metadata implementation, signing operation status/public-entry alignment, key-handling boundary contract, key-handling metadata implementation, key-handling status/public-entry alignment, key-material boundary contract, and key-material metadata implementation now exist and are guarded. The next valid planning slice is bounded no-effect key parsing implementation or another narrow status/index alignment follow-up that still must not add signing without separate implementation, key-handling, key-material, and guard contracts.

Validation

This contract is validated by:

```
sh scripts/test-latticra-seal-signer-invocation-contract.sh
```

docs/LATTICRA_SEAL_SIGNER_INVOCATION_IMPLEMENTATION.md

Source title: Latticra Seal Signer Invocation Implementation

Lines: 174 | Words: 549 | SHA-256: 69185013bfac8ea6a09a0f3ddf29a22e557470435599dfc3e24ced6011c010ed

Latticra Seal Signer Invocation Implementation

Status: initial signer invocation metadata implementation Scope: bounded C metadata surface for classifying Seal signer invocation eligibility after ready signer handoff metadata. This slice does not add signing, signature verification, signer invocation behavior, signer process execution, key generation, private-key handling, trust-store loading, revocation lookup, object sealing, runtime handoff execution, runtime authority, host reads, host writes, network behavior, shell execution, tool execution, capability enforcement, policy persistence, kernel behavior, Fedora approval claims, production readiness, or operating-system behavior.

Purpose

This document records the first Latticra Seal signer invocation metadata implementation.

The implementation consumes ready signer handoff metadata and classifies whether the request remains eligible for a future metadata-only signer invocation path.

It is signer-invocation path classification only.

It does not invoke a signer.

It does not sign.

Files

```
include/latticra/seal_signer_invocation.h
src/seal_signer_invocation.c
tests/seal_signer_invocation_invariants.c
scripts/test-latticra-seal-signer-invocation.sh
```

Required predecessors

This implementation depends on the signer invocation contract and signer handoff metadata surface:

```
docs/LATTICRA_SEAL_SIGNER_INVOCATION_CONTRACT.md
docs/LATTICRA_SEAL_SIGNER_HANDOFF_CONTRACT.md
docs/LATTICRA_SEAL_SIGNER_HANDOFF_IMPLEMENTATION.md
docs/status/SEAL_SIGNER_HANDOFF_STATUS.md
include/latticra/seal_signer_handoff.h
src/seal_signer_handoff.c
tests/seal_signer_handoff_invariants.c
scripts/test-latticra-seal-signer-invocation-contract.sh
scripts/test-latticra-seal-signer-handoff-contract.sh
scripts/test-latticra-seal-signer-handoff.sh
scripts/test-latticra-seal-signer-handoff-status.sh
```

Implemented surface

The signer invocation metadata surface adds:

```
latticra_seal_signer_invocation_t
latticra_seal_signer_invocation_error_t
latticra_seal_signer_invocation_error_label
latticra_seal_signer_invocation_from_handoff
latticra_seal_signer_invocation_is_metadata_only
latticra_seal_signer_invocation_render
```

The implementation:

```
accepts signer handoff metadata
requires signer_handoff_ready=1
requires signer_handoff_state=handoff-metadata-only
requires requested_signature=Ed25519-development
```

```
requires requested_signing_authorization=metadata-only
requires requested_signer_handoff=metadata-only
accepts requested_signer_invocation=metadata-only
classifies the result as signer_invocation_state=invocation-metadata-only
sets signer_invocation_ready=1 only for metadata-only allowed handoff states
renders deterministic signer invocation metadata
fails closed for invalid or denied predecessor metadata
```

Even when signer_invocation_ready=1, these fields remain zero:

```
signature_performed=0
verification_performed=0
signer_invoked=0
private_key_handling=0
key_generation_performed=0
trust_store_loaded=0
revocation_lookup_performed=0
handoff_performed=0
effect_performed=0
runtime_authority_granted=0
host_read_performed=0
host_write_performed=0
network_performed=0
```

Current metadata output

The successful metadata path renders:

```
signer_invocation_profile=latticra-seal-signer-invocation/0.1
signer_handoff_profile=latticra-seal-signer-handoff/0.1
signing_authorization_profile=latticra-seal-signing-authorization/0.1
signature_request_profile=latticra-seal-signature-request/0.1
requested_signature=Ed25519-development
requested_signing_authorization=metadata-only
requested_signer_handoff=metadata-only
requested_signer_invocation=metadata-only
signing_authorization_state=authorized-metadata-only
signing_authorization_ready=1
signer_handoff_state=handoff-metadata-only
signer_handoff_ready=1
signer_invocation_state=invocation-metadata-only
signer_invocation_ready=1
signer_invoked=0
mode=metadata-only
status=signer-invocation-metadata
```

Failure behavior

The implementation fails closed for:

```
null output
null signer handoff
invalid signer handoff
signer_handoff_ready=0
signer_handoff_state not handoff-metadata-only
requested_signer_handoff not metadata-only
signing_authorization_ready=0
signing_authorization_state not authorized-metadata-only
requested_signing_authorization not metadata-only
missing requested signature
unknown requested signature
missing requested signer invocation
unknown requested signer invocation
private-key handling already present
key generation already present
trust-store loading already present
revocation lookup already present
runtime authority already granted
signature already performed
verification already performed
signer already invoked
handoff already performed
effect already performed
host read already performed
host write already performed
network already performed
small render buffer
```

Failures do not sign, verify signatures, invoke a signer, handle private keys, generate keys, load trust stores, look up revocation status, read host files, write host files, contact networks, execute tools, execute shells, enforce capabilities, perform runtime handoff, persist policy, or grant runtime authority.

Validation

Run:

```
sh scripts/test-latticra-seal-signer-invocation-contract.sh
sh scripts/test-latticra-seal-signer-invocation.sh
sh scripts/test-latticra-seal-signer-invocation-status.sh
```

Expected output:

```
seal signer invocation contract: ok
seal signer invocation invariants: ok
seal signer invocation status: ok
```

Next valid slice

The next valid Latticra Seal planning slice is bounded no-effect key parsing implementation or another narrow status/index alignment follow-up that still must not add signing without separate implementation, key-handling, key-material, and guard contracts.

The signer invocation status/public-entry alignment, signing operation contract, signing operation metadata implementation, signing operation status/public-entry alignment, key-handling boundary contract, and key-handling metadata implementation now exist as guarded checkpoints. Future work must not add private-key handling, signing, verification, signer invocation behavior, trust-store behavior, revocation lookup, host behavior, network behavior, runtime authority, capability enforcement, object sealing, or kernel behavior unless separately implemented and guarded.

docs/LATTICRA_SEAL_SIGNING_AUTHORIZATION_CONTRACT.md

Source title: Latticra Seal Signing Authorization Contract

Lines: 277 | Words: 832 | SHA-256: 223f7ebfcae4addd4d1fef97dbc280645f814f3cbd5e845c7f73783bf2a640cd

Latticra Seal Signing Authorization Contract

Status: Latticra Seal signing authorization contract Scope: contract for a future metadata-only signing authorization surface after Seal signature request metadata. This document does not implement signing, signature verification, key generation, private-key handling, trust-store loading, revocation lookup, object sealing, runtime handoff execution, runtime authority, host reads, host writes, network behavior, shell execution, tool execution, capability enforcement, policy persistence, kernel behavior, Fedora approval claims, production readiness, or operating-system behavior.

Purpose

This document defines the first Latticra Seal signing authorization boundary after ready signature request metadata.

The purpose of this layer is to decide whether a ready metadata-only signature request may be marked as eligible for a future signing path before any signer, private key, trust store, runtime bridge, or host authority exists.

The signing authorization surface is signing-path classification, not signing, not verification, and not runtime authorization.

This document does not implement signing.

Relationship to existing signature metadata

Latticra Seal already has a manifest-chain signature metadata envelope:

```
docs/LATTICRA_SEAL_SIGNATURE_IMPLEMENTATION_CONTRACT.md
docs/LATTICRA_SEAL_SIGNATURE_IMPLEMENTATION.md
include/latticra/seal_signature.h
src/seal_signature.c
tests/seal_signature_invariants.c
scripts/test-latticra-seal-signature.sh
```

That earlier surface records caller-supplied signature metadata for unsigned evidence manifests.

This contract is a separate envelope-chain authorization-planning layer. It starts from ready Seal signature request metadata and does not consume private keys, produce signatures, verify signatures, trust signatures, persist policy, or grant runtime authority.

Required predecessors

This contract depends on:

```
docs/LATTICRA_SEAL_SIGNATURE_REQUEST_CONTRACT.md
docs/LATTICRA_SEAL_SIGNATURE_REQUEST_IMPLEMENTATION.md
docs/status/SEAL_SIGNATURE_REQUEST_STATUS.md
include/latticra/seal_signature_request.h
src/seal_signature_request.c
tests/seal_signature_request_invariants.c
scripts/test-latticra-seal-signature-request-contract.sh
scripts/test-latticra-seal-signature-request.sh
scripts/test-latticra-seal-signature-request-status.sh
```

The signature request metadata surface remains the source of readiness evidence for this signing authorization surface.

Signing authorization boundary

Allowed in the next implementation slice:

```
accept signature request metadata
require signature_request_ready=1
require signature_request_state=requested-metadata-only
require requested_signature=Ed25519-development
require signature_performed=0
require verification_performed=0
require private_key_handling=0
require handoff_performed=0
require effect_performed=0
require runtime_authority_granted=0
require host_read_performed=0
require host_write_performed=0
require network_performed=0
accept requested signing authorization metadata
classify metadata-only as signing_authorization_state=authorized-metadata-only
produce deterministic signing authorization metadata
```

Forbidden in the next implementation slice:

```
cryptographic signing
signature verification
private-key handling
key generation
trust-store loading
revocation lookup
runtime handoff execution
runtime authority grants
host reads
host writes
network access
shell execution
tool execution
capability enforcement
policy persistence
object sealing
kernel interaction
```

Initial authorization policy

Allowed input signature request state:

```
signature_request_state=requested-metadata-only
```

Allowed requested signature label:

```
Ed25519-development
```

Allowed requested signing authorization label:

```
metadata-only
```

These labels are metadata labels only. They do not mean Ed25519 signing, Ed25519 verification, key generation, private-key handling, trust establishment, runtime handoff, host behavior, network behavior, or capability enforcement exists in this path.

Planned signing authorization states:

```
signing_authorization_state=authorized-metadata-only
signing_authorization_state=denied-signature-request
signing_authorization_state=denied-signature-algorithm
signing_authorization_state=denied-authorization-request
signing_authorization_state=denied-private-key
signing_authorization_state=denied-runtime-authority
signing_authorization_state=denied-host-effect
signing_authorization_state=denied-network-effect
```

The first implementation may set:

```
signing_authorization_ready=1
```

only for ready metadata-only signature requests, the allowed development signature label, and the metadata-only signing authorization label.

Even when signing_authorization_ready=1, these must remain zero:

```
signature_performed=0
verification_performed=0
private_key_handling=0
key_generation_performed=0
trust_store_loaded=0
revocation_lookup_performed=0
handoff_performed=0
effect_performed=0
runtime_authority_granted=0
host_read_performed=0
host_write_performed=0
network_performed=0
```

Planned fields

A future signing authorization record should be bounded and deterministic.

Planned fields:

```
signing_authorization_profile
signature_request_profile
envelope_profile
report_profile
handoff_profile
decision_profile
gate_profile
receipt_profile
verify_profile
message_digest_algorithm
message_digest_hex
public_key_identity_label
requested_capability
requested_effect
requested_handoff
requested_report
requested_envelope
requested_signature
requested_signing_authorization
requested_scope
signature_request_state
```

```
signature_request_ready
signing_authorization_state
signing_authorization_ready
signature_performed
verification_performed
private_key_handling
key_generation_performed
trust_store_loaded
revocation_lookup_performed
handoff_performed
effect_performed
runtime_authority_granted
host_read_performed
host_write_performed
network_performed
mode
status
```

Expected values for an allowed first implementation result:

```
signing_authorization_profile=latticra-seal-signing-authorization/0.1
requested_signing_authorization=metadata-only
signing_authorization_state=authorized-metadata-only
signing_authorization_ready=1
signature_performed=0
verification_performed=0
private_key_handling=0
key_generation_performed=0
trust_store_loaded=0
revocation_lookup_performed=0
runtime_authority_granted=0
mode=metadata-only
status=signing-authorization-metadata
```

Failure behavior

Future signing authorization handling must fail closed.

Required failure states:

```
null output -&gt; invalid
null signature request -&gt; invalid
invalid signature request -&gt; denied-signature-request
signature_request_ready=0 -&gt; denied-signature-request
signature_request_state not requested-metadata-only -&gt; denied-signature-request
missing requested signature -&gt; denied-signature-algorithm
unknown requested signature -&gt; denied-signature-algorithm
missing requested signing authorization -&gt; denied-authorization-request
unknown requested signing authorization -&gt; denied-authorization-request
private-key handling requested or observed -&gt; denied-private-key
key generation requested or observed -&gt; denied-private-key
trust-store loading requested or observed -&gt; denied-private-key
revocation lookup requested or observed -&gt; denied-network-effect
signature already performed -&gt; denied-host-effect
verification already performed -&gt; denied-host-effect
runtime authority already granted -&gt; denied-runtime-authority
handoff already performed -&gt; denied-host-effect
effect already performed -&gt; denied-host-effect
host read already performed -&gt; denied-host-effect
host write already performed -&gt; denied-host-effect
network already performed -&gt; denied-network-effect
```

Failures must not sign, verify signatures, handle private keys, generate keys, load trust stores, look up revocation status, read host files, write host files, contact networks, execute tools, execute shells, enforce capabilities, perform handoff, persist policy, or grant runtime authority.

Promotion rule

This contract permits only the next implementation slice:

```
signing authorization metadata implementation
```

It does not permit cryptographic signing, signature verification, private-key handling, key generation, trust-store behavior, revocation lookup, runtime handoff execution, effect execution, capability enforcement, runtime authority, host behavior, network behavior, object sealing, or kernel behavior.

After signing authorization metadata, its status/public-entry checkpoint, the signer handoff contract, and signer handoff metadata implementation exist, the next valid slice is signer handoff status/public-entry alignment. That future slice still must not add signing without a separate implementation contract, key-handling contract, and guards.

Validation

This contract is validated by:

```
sh scripts/test-latticra-seal-signing-authorization-contract.sh
```

The first metadata implementation is validated by:

```
sh scripts/test-latticra-seal-signing-authorization.sh
```

docs/LATTICRA_SEAL_SIGNING_AUTHORIZATION_IMPLEMENTATION.md

Source title: Latticra Seal Signing Authorization Implementation

Lines: 151 | Words: 457 | SHA-256: 663c332c1bd7dd58da2558c9a7bd87d87515bb34d95dc761349188cbf2457898

Latticra Seal Signing Authorization Implementation

Status: initial signing authorization metadata implementation Scope: bounded C metadata surface for classifying Seal signing authorization after ready signature request metadata. This slice does not add signing, signature verification, key generation, private-key handling, trust-store loading, revocation lookup, runtime handoff execution, runtime authority, host reads, host writes, network behavior, shell execution, tool execution, capability enforcement, policy persistence, object sealing, kernel behavior, Fedora approval claims, production readiness, or operating-system behavior.

Purpose

This document records the first Latticra Seal signing authorization metadata implementation.

The implementation consumes ready signature request metadata and classifies whether the request remains eligible for a future metadata-only signing path.

It is signing-path classification only.

It does not sign.

Files

```
include/latticra/seal_signing_authorization.h
src/seal_signing_authorization.c
tests/seal_signing_authorization_invariants.c
scripts/test-latticra-seal-signing-authorization.sh
```

Required predecessors

This implementation depends on the signing authorization contract and the signature request metadata surface:

```
docs/LATTICRA_SEAL_SIGNING_AUTHORIZATION_CONTRACT.md
docs/LATTICRA_SEAL_SIGNATURE_REQUEST_CONTRACT.md
docs/LATTICRA_SEAL_SIGNATURE_REQUEST_IMPLEMENTATION.md
docs/status/SEAL_SIGNATURE_REQUEST_STATUS.md
include/latticra/seal_signature_request.h
src/seal_signature_request.c
tests/seal_signature_request_invariants.c
scripts/test-latticra-seal-signature-request-contract.sh
scripts/test-latticra-seal-signature-request.sh
scripts/test-latticra-seal-signature-request-status.sh
```

Implemented surface

The signing authorization metadata surface adds:

```
latticra_seal_signing_authorization_t
latticra_seal_signing_authorization_error_t
latticra_seal_signing_authorization_error_label
latticra_seal_signing_authorization_from_request
latticra_seal_signing_authorization_is_metadata_only
latticra_seal_signing_authorization_render
```

The implementation:

```
accepts signature request metadata
requires signature_request_ready=1
requires signature_request_state=requested-metadata-only
requires requested_signature=Ed25519-development
accepts requested_signing_authorization=metadata-only
classifies the result as signing_authorization_state=authorized-metadata-only
sets signing_authorization_ready=1 only for metadata-only allowed request states
renders deterministic signing authorization metadata
fails closed for invalid or denied predecessor metadata
```

Even when signing_authorization_ready=1, these fields remain zero:

```
signature_performed=0
verification_performed=0
private_key_handling=0
key_generation_performed=0
trust_store_loaded=0
revocation_lookup_performed=0
handoff_performed=0
effect_performed=0
runtime_authority_granted=0
host_read_performed=0
host_write_performed=0
network_performed=0
```

Current metadata output

The successful metadata path renders:

```
signing_authorization_profile=latticra-seal-signing-authorization/0.1
signature_request_profile=latticra-seal-signature-request/0.1
requested_signature=Ed25519-development
requested_signing_authorization=metadata-only
signature_request_state=requested-metadata-only
signature_request_ready=1
signing_authorization_state=authorized-metadata-only
signing_authorization_ready=1
mode=metadata-only
status=signing-authorization-metadata
```

Failure behavior

The implementation fails closed for:

```
null output
null signature request
invalid signature request
signature_request_ready=0
signature_request_state not requested-metadata-only
missing requested signature
unknown requested signature
missing requested signing authorization
unknown requested signing authorization
private-key handling already present
runtime authority already granted
signature already performed
verification already performed
handoff already performed
effect already performed
host read already performed
host write already performed
network already performed
small render buffer
```

Failures do not sign, verify signatures, handle private keys, generate keys, load trust stores, look up revocation status, read host files, write host files, contact networks, execute tools, execute shells, enforce capabilities, perform handoff, persist policy, or grant runtime authority.

Validation

Run:

```
sh scripts/test-latticra-seal-signing-authorization-contract.sh
sh scripts/test-latticra-seal-signing-authorization.sh
```

Expected output:

```
seal signing authorization contract: ok
seal signing authorization invariants: ok
```

Next valid slice

The next valid Latticra Seal planning slice is bounded no-effect key parsing implementation or another narrow status/index alignment follow-up that still must not add signing without separate implementation, key-handling, key-material, and guard contracts.

That future slice must not add private-key handling, signing, verification, trust-store behavior, revocation lookup, host behavior, network behavior, runtime authority, capability enforcement, object sealing, or kernel behavior unless separately contracted, implemented, and guarded.

docs/LATTICRA_SEAL_SIGNING_OPERATION_CONTRACT.md

Source title: Latticra Seal Signing Operation Contract

Lines: 298 | Words: 933 | SHA-256: 5d6f62002604355eab845cd5f784d40ab12f0d372478aeadf374a2a030fef65b

Latticra Seal Signing Operation Contract

Status: Latticra Seal signing operation contract Scope: contract for a future metadata-only signing operation surface after Seal signer invocation metadata. This document does not implement cryptographic signing, signature verification, signer invocation behavior, signer process execution, key generation, private-key handling, trust-store loading, revocation lookup, object sealing, runtime handoff execution, runtime authority, host reads, host writes, network behavior, shell execution, tool execution, capability enforcement, policy persistence, kernel behavior, Fedora approval claims, production readiness, or operating-system behavior.

Purpose

This document defines the first Latticra Seal signing operation boundary after ready signer invocation metadata.

The purpose of this layer is to decide whether a ready metadata-only signer invocation record may be represented as eligible for a future metadata-only signing operation request before any private key, signer process, trust store, runtime bridge, host authority, or signature generation exists.

The signing operation surface is signing-operation path classification, not signing, not verification, not signer invocation, and not runtime handoff.

This document does not sign.

This document does not handle private keys.

Relationship to signer invocation

Latticra Seal signer invocation metadata already records a no-effect eligibility checkpoint for the future signer path:

```
docs/LATTICRA_SEAL_SIGNER_INVOCATION_CONTRACT.md
docs/LATTICRA_SEAL_SIGNER_INVOCATION_IMPLEMENTATION.md
docs/status/SEAL_SIGNER_INVOCATION_STATUS.md
```

This signing operation contract starts from that checkpoint. It does not replace signer invocation metadata, route to runtime behavior, invoke a signer, perform signing, handle private keys, verify signatures, persist policy, or grant runtime authority.

Required predecessors

This contract depends on:

```
docs/LATTICRA_SEAL_SIGNER_INVOCATION_CONTRACT.md
docs/LATTICRA_SEAL_SIGNER_INVOCATION_IMPLEMENTATION.md
docs/status/SEAL_SIGNER_INVOCATION_STATUS.md
include/latticra/seal_signer_invocation.h
src/seal_signer_invocation.c
tests/seal_signer_invocation_invariants.c
scripts/test-latticra-seal-signer-invocation-contract.sh
scripts/test-latticra-seal-signer-invocation.sh
scripts/test-latticra-seal-signer-invocation-status.sh
```

The signer invocation metadata surface remains the source of readiness evidence for this signing operation surface.

Signing operation boundary

Allowed in the next implementation slice:

```
accept signer invocation metadata
require signer_invocation_ready=1
require signer_invocation_state=invocation-metadata-only
require requested_signature=Ed25519-development
require requested_signing_authorization=metadata-only
require requested_signer_handoff=metadata-only
require requested_signer_invocation=metadata-only
require signature_performed=0
require verification_performed=0
require signer_invoked=0
require private_key_handling=0
require key_generation_performed=0
require trust_store_loaded=0
require revocation_lookup_performed=0
require handoff_performed=0
require effect_performed=0
require runtime_authority_granted=0
require host_read_performed=0
require host_write_performed=0
require network_performed=0
accept requested signing operation metadata
classify metadata-only as signing_operation_state=operation-metadata-only
produce deterministic signing operation metadata
```

Forbidden in the next implementation slice:

```
cryptographic signing
signature verification
signer process invocation
private-key handling
key generation
trust-store loading
revocation lookup
runtime handoff execution
runtime authority grants
host reads
host writes
network access
shell execution
tool execution
capability enforcement
policy persistence
object sealing
kernel interaction
```

Initial operation policy

Allowed signer invocation state:

```
signer_invocation_state=invocation-metadata-only
```

Allowed requested signer invocation label:

```
metadata-only
```

Allowed requested signing operation label:

```
metadata-only
```

These labels are metadata labels only. They do not mean Ed25519 signing, Ed25519 verification, signer invocation, key generation, private-key handling, trust establishment, runtime handoff, host behavior, network behavior, or capability enforcement exists in this path.

Planned signing operation states:

```
signing_operation_state=operation-metadata-only
signing_operation_state=denied-signer-invocation
signing_operation_state=denied-signer-handoff
signing_operation_state=denied-signing-authorization
signing_operation_state=denied-signature-algorithm
signing_operation_state=denied-signing-operation
signing_operation_state=denied-private-key
signing_operation_state=denied-runtime-authority
signing_operation_state=denied-host-effect
signing_operation_state=denied-network-effect
```

The first implementation may set:

```
signing_operation_ready=1
```

only for ready metadata-only signer invocation metadata, the allowed development signature label, the metadata-only signer invocation label, and the metadata-only signing operation label.

Even when signing_operation_ready=1, these must remain zero:

```
signature_performed=0
verification_performed=0
signer_invoked=0
private_key_handling=0
key_generation_performed=0
trust_store_loaded=0
revocation_lookup_performed=0
handoff_performed=0
effect_performed=0
runtime_authority_granted=0
host_read_performed=0
host_write_performed=0
network_performed=0
```

Planned fields

A future signing operation record should be bounded and deterministic.

Planned fields:

```
signing_operation_profile
signer_invocation_profile
signer_handoff_profile
signing_authorization_profile
signature_request_profile
envelope_profile
report_profile
handoff_profile
decision_profile
gate_profile
receipt_profile
verify_profile
message_digest_algorithm
message_digest_hex
public_key_identity_label
requested_capability
requested_effect
requested_handoff
requested_report
requested_envelope
```

```
requested_signature
requested_signing_authorization
requested_signer_handoff
requested_signer_invocation
requested_signing_operation
requested_scope
signing_authorization_state
signing_authorization_ready
signer_handoff_state
signer_handoff_ready
signer_invocation_state
signer_invocation_ready
signing_operation_state
signing_operation_ready
signature_performed
verification_performed
signer_invoked
private_key_handling
key_generation_performed
trust_store_loaded
revocation_lookup_performed
handoff_performed
effect_performed
runtime_authority_granted
host_read_performed
host_write_performed
network_performed
mode
status
```

Expected values for an allowed first implementation result:

```
signing_operation_profile=latticra-seal-signing-operation/0.1
signer_invocation_profile=latticra-seal-signer-invocation/0.1
requested_signing_operation=metadata-only
signing_operation_state=operation-metadata-only
signing_operation_ready=1
signature_performed=0
verification_performed=0
signer_invoked=0
private_key_handling=0
key_generation_performed=0
trust_store_loaded=0
revocation_lookup_performed=0
runtime_authority_granted=0
mode=metadata-only
status=signing-operation-metadata
```

Failure behavior

Future signing operation handling must fail closed.

Required failure states:

```
null output -&gt; invalid
null signer invocation -&gt; invalid
invalid signer invocation -&gt; denied-signer-invocation
signer_invocation_ready=0 -&gt; denied-signer-invocation
signer_invocation_state not invocation-metadata-only -&gt; denied-signer-invocation
requested_signer_invocation not metadata-only -&gt; denied-signer-invocation
signer_handoff_ready=0 -&gt; denied-signer-handoff
signer_handoff_state not handoff-metadata-only -&gt; denied-signer-handoff
requested_signer_handoff not metadata-only -&gt; denied-signer-handoff
requested_signing_authorization not metadata-only -&gt; denied-signing-authorization
missing requested signature -&gt; denied-signature-algorithm
unknown requested signature -&gt; denied-signature-algorithm
missing requested signing operation -&gt; denied-signing-operation
unknown requested signing operation -&gt; denied-signing-operation
private-key handling requested or observed -&gt; denied-private-key
key generation requested or observed -&gt; denied-private-key
trust-store loading requested or observed -&gt; denied-private-key
revocation lookup requested or observed -&gt; denied-network-effect
signature already performed -&gt; denied-host-effect
verification already performed -&gt; denied-host-effect
signer already invoked -&gt; denied-host-effect
runtime authority already granted -&gt; denied-runtime-authority
handoff already performed -&gt; denied-host-effect
effect already performed -&gt; denied-host-effect
host read already performed -&gt; denied-host-effect
host write already performed -&gt; denied-host-effect
```

```
network already performed -&gt; denied-network-effect
```

Failures must not sign, verify signatures, invoke a signer, handle private keys, generate keys, load trust stores, look up revocation status, read host files, write host files, contact networks, execute tools, execute shells, enforce capabilities, perform runtime handoff, persist policy, or grant runtime authority.

Promotion rule

This contract permits only the next implementation slice:

```
signing operation metadata implementation
```

It does not permit cryptographic signing, signature verification, signer invocation behavior, private-key handling, key generation, trust-store behavior, revocation lookup, runtime handoff execution, effect execution, capability enforcement, runtime authority, host behavior, network behavior, object sealing, or kernel behavior.

After signing operation metadata, its status/public-entry checkpoint, the key-handling boundary contract, key-handling metadata implementation, key-handling status/public-entry alignment, the key-material boundary contract, and key-material metadata implementation exist and are guarded, the next valid planning slice is bounded no-effect key parsing implementation or another narrow status/index alignment follow-up that still must not add signing without a separate implementation contract, key-handling contract, key-material contract, and guards.

Validation

This contract is validated by:

```
sh scripts/test-latticra-seal-signing-operation-contract.sh
```

docs/LATTICRA_SEAL_SIGNING_OPERATION_IMPLEMENTATION.md

Source title: Latticra Seal Signing Operation Implementation

Lines: 182 | Words: 551 | SHA-256: 9ddc9671c1c277f5546caa560a1f5d64ec79270f7943ccf7ffabff02552ae088

Latticra Seal Signing Operation Implementation

Status: initial signing operation metadata implementation Scope: bounded C metadata surface for classifying Seal signing operation eligibility after ready signer invocation metadata. This slice does not add cryptographic signing, signature verification, signer invocation behavior, signer process execution, key generation, private-key handling, trust-store loading, revocation lookup, object sealing, runtime handoff execution, runtime authority, host reads, host writes, network behavior, shell execution, tool execution, capability enforcement, policy persistence, kernel behavior, Fedora approval claims, production readiness, or operating-system behavior.

Purpose

This document records the first Latticra Seal signing operation metadata implementation.

The implementation consumes ready signer invocation metadata and classifies whether the request remains eligible for a future metadata-only signing operation path.

It is signing-operation path classification only.

It does not invoke a signer.

It does not sign.

It does not handle private keys.

Files

```
include/latticra/seal_signing_operation.h
src/seal_signing_operation.c
tests/seal_signing_operation_invariants.c
scripts/test-latticra-seal-signing-operation.sh
```

Required predecessors

This implementation depends on the signing operation contract and the signer invocation metadata surface:

```
docs/LATTICRA_SEAL_SIGNING_OPERATION_CONTRACT.md
docs/LATTICRA_SEAL_SIGNER_INVOCATION_CONTRACT.md
docs/LATTICRA_SEAL_SIGNER_INVOCATION_IMPLEMENTATION.md
docs/status/SEAL_SIGNER_INVOCATION_STATUS.md
include/latticra/seal_signer_invocation.h
src/seal_signer_invocation.c
tests/seal_signer_invocation_invariants.c
scripts/test-latticra-seal-signing-operation-contract.sh
scripts/test-latticra-seal-signer-invocation-contract.sh
scripts/test-latticra-seal-signer-invocation.sh
scripts/test-latticra-seal-signer-invocation-status.sh
```

Implemented surface

The signing operation metadata surface adds:

```
latticra_seal_signing_operation_t
latticra_seal_signing_operation_error_t
latticra_seal_signing_operation_error_label
latticra_seal_signing_operation_from_invocation
latticra_seal_signing_operation_is_metadata_only
latticra_seal_signing_operation_render
```

The implementation:

```
accepts signer invocation metadata
requires signer_invocation_ready=1
requires signer_invocation_state=invocation-metadata-only
requires requested_signature=Ed25519-development
requires requested_signing_authorization=metadata-only
requires requested_signer_handoff=metadata-only
requires requested_signer_invocation=metadata-only
accepts requested_signing_operation=metadata-only
classifies the result as signing_operation_state=operation-metadata-only
sets signing_operation_ready=1 only for metadata-only allowed signer invocation states
renders deterministic signing operation metadata
fails closed for invalid or denied predecessor metadata
```

Even when signing_operation_ready=1, these fields remain zero:

```
signature_performed=0
verification_performed=0
signer_invoked=0
private_key_handling=0
key_generation_performed=0
trust_store_loaded=0
revocation_lookup_performed=0
handoff_performed=0
effect_performed=0
runtime_authority_granted=0
host_read_performed=0
host_write_performed=0
network_performed=0
```

Current metadata output

The successful metadata path renders:

```
signing_operation_profile=latticra-seal-signing-operation/0.1
signer_invocation_profile=latticra-seal-signer-invocation/0.1
signer_handoff_profile=latticra-seal-signer-handoff/0.1
signing_authorization_profile=latticra-seal-signing-authorization/0.1
signature_request_profile=latticra-seal-signature-request/0.1
requested_signature=Ed25519-development
requested_signing_authorization=metadata-only
requested_signer_handoff=metadata-only
requested_signer_invocation=metadata-only
```

```
requested_signing_operation=metadata-only
signing_authorization_state=authorized-metadata-only
signing_authorization_ready=1
signer_handoff_state=handoff-metadata-only
signer_handoff_ready=1
signer_invocation_state=invocation-metadata-only
signer_invocation_ready=1
signing_operation_state=operation-metadata-only
signing_operation_ready=1
signer_invoked=0
mode=metadata-only
status=signing-operation-metadata
```

Failure behavior

The implementation fails closed for:

```
null output
null signer invocation
invalid signer invocation
signer_invocation_ready=0
signer_invocation_state not invocation-metadata-only
requested_signer_invocation not metadata-only
signer_handoff_ready=0
signer_handoff_state not handoff-metadata-only
requested_signer_handoff not metadata-only
signing_authorization_ready=0
signing_authorization_state not authorized-metadata-only
requested_signing_authorization not metadata-only
missing requested signature
unknown requested signature
missing requested signing operation
unknown requested signing operation
private-key handling already present
key generation already present
trust-store loading already present
revocation lookup already present
runtime authority already granted
signature already performed
verification already performed
signer already invoked
handoff already performed
effect already performed
host read already performed
host write already performed
network already performed
small render buffer
```

Failures do not sign, verify signatures, invoke a signer, handle private keys, generate keys, load trust stores, look up revocation status, read host files, write host files, contact networks, execute tools, execute shells, enforce capabilities, perform runtime handoff, persist policy, or grant runtime authority.

Validation

Run:

```
sh scripts/test-latticra-seal-signing-operation-contract.sh
sh scripts/test-latticra-seal-signing-operation.sh
```

Expected output:

```
seal signing operation contract: ok
seal signing operation invariants: ok
```

Next valid slice

The next valid Latticra Seal planning slice is bounded no-effect key parsing implementation or another narrow status/index alignment follow-up that still must not add signing without a separate implementation contract, key-handling contract, key-material contract, and guards.

The signing operation metadata implementation and its status/public-entry checkpoint are guarded checkpoints. Future work must not add private-key handling, signing, verification, signer invocation behavior, trust-store behavior, revocation lookup, host behavior, network behavior, runtime authority, capability enforcement, object sealing, or kernel behavior unless separately implemented and guarded.

docs/LATTICRA_SEAL_STALE_REQUEST_CASE_CONTRACT.md

Source title: Latticra Seal Stale Request Case Contract

Lines: 108 | Words: 304 | SHA-256: 63160ba82cd6218eebdf7a8e3af280b2dcfb213d73dec5fe8342cd22c4c985f7

Latticra Seal Stale Request Case Contract

Status: Latticra Seal stale request case contract Scope: case-specific contract after the unsigned request case fixture. This document does not implement runtime behavior, policy behavior, tool behavior, host behavior, network behavior, cryptographic behavior, freshness validation, replay detection, or authority grants.

Purpose

This document defines the third case-specific test contract for the Seal runtime gate path.

The case is a stale request. The expected posture is that the gate remains report-only, blocked by default, and grants no authority.

This document does not implement the case behavior.

Required predecessors

```
docs/LATTICRA_SEAL_RUNTIME_GATE_TEST_PLAN.md
docs/LATTICRA_SEAL_UNKNOWN_TOOL_CASE_CONTRACT.md
docs/LATTICRA_SEAL_UNKNOWN_TOOL_CASE_IMPLEMENTATION.md
docs/LATTICRA_SEAL_UNSIGNED_REQUEST_CASE_CONTRACT.md
docs/LATTICRA_SEAL_UNSIGNED_REQUEST_CASE_IMPLEMENTATION.md
docs/LATTICRA_SEAL_RUNTIME_GATE_IMPLEMENTATION.md
include/latticra/seal_runtime_gate.h
src/seal_runtime_gate.c
tests/seal_runtime_gate_invariants.c
tests/seal_unknown_tool_case.c
tests/seal_unsigned_request_case.c
scripts/test-latticra-seal-runtime-gate-test-plan.sh
scripts/test-latticra-seal-unknown-tool-case.sh
scripts/test-latticra-seal-unsigned-request-case.sh
```

Case definition

```
case_profile=latticra-seal-stale-request-case/0.1
case_name=stale-request
case_contract_present=1
stale_request_case_contract_present=1
input_request_timestamp_present=1
input_request_expiration_present=1
input_freshness_valid=0
expected_gate_state=report-only
expected_default_blocked=1
expected_stale_request_blocked=1
expected_runtime_authority_granted=0
expected_effect_performed=0
expected_host_read_performed=0
expected_host_write_performed=0
expected_network_performed=0
case_behavior_implemented=0
```

Future test requirements

A future implementation must add a deterministic test fixture showing that a stale request case remains blocked and does not perform effects.

Planned future file names:

```
tests/seal_stale_request_case.c
scripts/test-latticra-seal-stale-request-case.sh
```

Expected future output:

```
seal stale request case: ok
```

Boundary

This contract is documentation-only.

It does not add case execution, runtime behavior, host behavior, network behavior, MCP behavior, AI agent behavior, model behavior, tool behavior, shell behavior, policy behavior, freshness validation, replay detection, cryptographic behavior, or authority grants.

Claim gate

This contract alone does not justify the public claim that Latticra secures AI agents.

The accurate public claim remains:

```
Latticra Seal is building a report-only trust boundary for AI-era automation.
```

A stronger claim requires implemented and validated gate behavior plus case tests for unknown, unsigned, stale, and replayed requests.

Non-claims

```
stale_request_case_implemented=0
runtime_gate_case_tests_implemented=0
runtime_behavior_implemented=0
policy_behavior_implemented=0
tool_behavior_implemented=0
host_behavior_implemented=0
network_behavior_implemented=0
freshness_validation_implemented=0
replay_detection_implemented=0
authority_granted=0
production_readiness_claimed=0
external_endorsement_claimed=0
```

Next valid slice

The next valid Latticra Seal slice is the stale request case test fixture.

docs/LATTICRA_SEAL_STALE_REQUEST_CASE_IMPLEMENTATION.md

Source title: Latticra Seal Stale Request Case Implementation

Lines: 51 | Words: 157 | SHA-256: 996c318bc4889a3817467301d860998b55afd28f2ba6d96ea78134104ac66369

Latticra Seal Stale Request Case Implementation

Status: initial stale request case fixture Scope: local deterministic case fixture after the stale request case contract.

Purpose

This record documents the stale-request case fixture for the Seal runtime gate metadata path.

The fixture keeps the gate in report-only state and verifies that no authority, host operation, network operation, or effect is reported.

Added files

```
tests/seal_stale_request_case.c
scripts/test-latticra-seal-stale-request-case.sh
```

Validation

Run:

```
sh scripts/test-latticra-seal-stale-request-case.sh
```

Expected output:

```
seal stale request case: ok
```

Boundary

This slice is a local deterministic fixture only.

It does not add runtime behavior, tool behavior, host behavior, network behavior, effect behavior, or authority grants.

Claim boundary

This fixture does not by itself justify a stronger public claim.

The accurate public claim remains:

```
Latticra Seal is building a report-only trust boundary for AI-era automation.
```

Next valid slice

The next valid slice is the replayed request case contract.

docs/LATTICRA_SEAL_STATUS_ROLLUP_CONTRACT.md

Source title: Latticra Seal Status Rollup Contract

Lines: 238 | Words: 650 | SHA-256: 462631e0211a9bda71aeaf8c48ec261e0f27a39b78932d7f9a1f85add8177199

Latticra Seal Status Rollup Contract

Status: Latticra Seal status rollup contract Scope: contract for future status rollup metadata after runtime handoff metadata. This document does not implement runtime execution, runtime authority, effect execution, capability enforcement, cryptographic verification, verified receipts, public-key parsing, public-key trust stores, key generation, private-key storage, hardware key use, network trust lookup, revocation lookup, object sealing, host reads, host writes, kernel behavior, Fedora approval claims, production readiness, or operating-system behavior.

Purpose

This document defines the Latticra Seal status rollup layer.

The purpose of this layer is to provide one bounded summary of the current Seal chain:

```
report -&gt; measurement -&gt; manifest -&gt; signature policy -&gt; signature metadata -&gt;
verification
policy -&gt; verification receipt -&gt; capability gate -&gt; effect decision -&gt; runtime
handoff
```

This document does not implement status rollup behavior.

Required predecessors

This contract depends on:

```

scripts/test-latticra-seal-verification-receipt.sh
scripts/test-latticra-seal-capability-gate.sh
scripts/test-latticra-seal-effect-decision.sh
scripts/test-latticra-seal-runtime-handoff-contract.sh
scripts/test-latticra-seal-runtime-handoff.sh
```

The runtime handoff metadata surface remains inactive metadata until runtime-boundary behavior exists and is guarded.

Rollup boundary

The rollup may summarize Seal layer posture.

The rollup may not convert unsupported, unverified, denied, or inactive metadata into authority.

The rollup may not perform host reads, host writes, network access, kernel interaction, or runtime behavior.

Allowed in this contract slice:

```
rollup vocabulary
rollup-state labels
layer-present metadata planning
unsupported-state summary planning
denied-state summary planning
inactive-runtime summary planning
failure-state planning
promotion rules
non-claims
static guard validation
```

Forbidden in this contract slice:

```
runtime execution
runtime authority grants
effect execution
host reads
host writes
network access
capability enforcement
cryptographic verification
verified receipt generation
public-key parsing
public-key trust store loading
private-key handling
key generation
signature generation
```

```
revocation lookup
object sealing
kernel interaction
```

Initial rollup policy

The initial status rollup policy is conservative and metadata-only.

```
all implemented Seal layers may be summarized
cryptographic verification remains unsupported
verified receipt remains false
capability gate remains denied
effect decision remains denied
runtime handoff remains inactive
runtime boundary remains disabled
runtime authority remains zero
host read/write/network behavior remains zero
```

The first implementation after this contract may only add metadata fields and deterministic rendering. It must not perform runtime behavior.

Planned rollup states

Future records should use explicit labels:

```
rollup_state=metadata-only
rollup_state=incomplete
rollup_state=unsupported
rollup_state=denied
rollup_state=runtime-disabled
rollup_state=ready-for-review
```

For the next implementation, the expected state is:

```
rollup_state=metadata-only
```

Planned rollup fields

A future status rollup record should be bounded and deterministic.

Planned fields:

```
rollup_profile
report_present
measurement_present
manifest_present
signature_policy_present
signature_metadata_present
verification_policy_present
verification_receipt_present
capability_gate_present
effect_decision_present
runtime_handoff_present
cryptographic_verification_supported
verified
capability_gate_allowed
effect_allowed
handoff_active
runtime_boundary_state
runtime_authority_granted
host_read_performed
host_write_performed
network_performed
rollup_state
status
```

Initial values before real authority:

```
cryptographic_verification_supported=0
verified=0
capability_gate_allowed=0
effect_allowed=0
handoff_active=0
runtime_boundary_state=disabled
runtime_authority_granted=0
host_read_performed=0
host_write_performed=0
network_performed=0
```

```
rollup_state=metadata-only
status=status-rollup-contract-only
```

Failure behavior

Future status rollup handling must fail closed.

Required failure states:

```
null rollup output -&gt; invalid
missing required layer metadata -&gt; incomplete
unsupported verification -&gt; metadata-only
unverified receipt -&gt; metadata-only
denied capability gate -&gt; metadata-only
denied effect decision -&gt; metadata-only
inactive runtime handoff -&gt; metadata-only
runtime authority request -&gt; rejected
```

Failures must not parse keys, create keys, persist secrets, contact networks, query revocation status, verify records, sign records, read host files, write host files, enforce capabilities, execute effects, call runtime components, or grant runtime authority.

Promotion rule

This contract permits only the next implementation slice:

```
status rollup metadata implementation
```

It does not permit runtime execution, effect execution, capability enforcement, runtime authority, cryptographic verification, verified receipt generation, key handling, trust-store behavior, revocation lookup, object sealing, network behavior, host reads, host writes, or kernel behavior.

After status rollup metadata exists and is guarded, the next valid planning slice is Seal documentation/index alignment.

Validation

This contract is validated by:

```
sh scripts/test-latticra-seal-status-rollup-contract.sh
```

docs/LATTICRA_SEAL_STATUS_ROLLUP_IMPLEMENTATION.md

Source title: Latticra Seal Status Rollup Implementation

Lines: 131 | Words: 500 | SHA-256: 959baa0de31fccf5acb067d92585b214bb5706fe59fb5db3aeaed42f72ae5b31

Latticra Seal Status Rollup Implementation

Status: initial status rollup metadata implementation Scope: bounded C metadata surface for status rollup posture after runtime handoff metadata. This slice does not implement runtime execution, runtime authority, effect execution, capability enforcement, cryptographic verification, verified receipts, public-key parsing, public-key trust stores, key generation, private-key storage, hardware key use, network trust lookup, revocation lookup, object sealing, host reads, host writes, kernel behavior, Fedora approval claims, production readiness, or operating-system behavior.

Purpose

This document records the first Latticra Seal status rollup metadata implementation.

The implementation accepts an existing runtime handoff metadata record and produces deterministic status rollup metadata for the implemented Seal chain.

Added files

```
include/latticra/seal_status_rollup.h
src/seal_status_rollup.c
tests/seal_status_rollup_invariants.c
scripts/test-latticra-seal-status-rollup.sh
```

API summary

The status rollup metadata surface adds:

```
latticra_seal_status_rollup_t
latticra_seal_status_rollup_error_t
latticra_seal_status_rollup_error_label
latticra_seal_status_rollup_from_handoff
latticra_seal_status_rollup_is_metadata_only
latticra_seal_status_rollup_report
```

Rollup behavior

The implementation:

```
accepts a valid runtime handoff metadata record
sets report_present=1
sets measurement_present=1
sets manifest_present=1
sets signature_policy_present=1
sets signature_metadata_present=1
sets verification_policy_present=1
sets verification_receipt_present=1
sets capability_gate_present=1
sets effect_decision_present=1
sets runtime_handoff_present=1
sets cryptographic_verification_supported=0
sets verified=0
sets capability_gate_allowed=0
copies effect_allowed from handoff metadata
copies handoff_active from handoff metadata
copies runtime_boundary_state from handoff metadata
copies runtime_authority_granted from handoff metadata
copies host_read_performed from handoff metadata
copies host_write_performed from handoff metadata
copies network_performed from handoff metadata
sets rollup_state=metadata-only
renders deterministic status rollup metadata
```

Boundary

This implementation does not verify signatures, parse public keys, create keys, store keys, contact networks, query revocation status, persist status records, enforce capabilities, perform host reads, perform host writes, execute network behavior, call runtime components, or grant runtime authority.

It is metadata only.

Failure behavior

The implementation fails closed:

```
null status rollup output -&gt; LATTICRA_STATUS_NULL_ARGUMENT
null runtime handoff metadata input -&gt; invalid-input
invalid runtime handoff metadata -&gt; invalid-handoff
small report buffer -&gt; LATTICRA_STATUS_BUFFER_TOO_SMALL
```

Failures do not parse keys, create keys, persist secrets, contact networks, verify records, sign records, read host files, write host files, enforce capabilities, perform effects, call runtime components, or grant runtime authority.

Invariants

The invariant test verifies:

```
valid runtime handoff metadata produces deterministic status rollup metadata
report_present is one
measurement_present is one
```

```
manifest_present is one
signature_policy_present is one
signature_metadata_present is one
verification_policy_present is one
verification_receipt_present is one
capability_gate_present is one
effect_decision_present is one
runtime_handoff_present is one
cryptographic_verification_supported remains zero
verified remains zero
capability_gate_allowed remains zero
effect_allowed remains zero
handoff_active remains zero
runtime_boundary_state remains disabled
runtime_authority_granted remains zero
host_read_performed remains zero
host_write_performed remains zero
network_performed remains zero
rollup_state remains metadata-only
small report buffer fails closed
null inputs fail closed
invalid runtime handoff metadata fails closed
```

Validation

Run:

```
sh scripts/test-latticra-seal-status-rollup-contract.sh
sh scripts/test-latticra-seal-status-rollup.sh
sh scripts/test-latticra-seal-status-rollup-status.sh
sh scripts/test-latticra-seal-runtime-handoff-status.sh
sh scripts/test-latticra-seal-agentic-automation-security-status.sh
```

Next valid slice

The next valid Latticra Seal slice is policy decision status/public-entry alignment.

That future slice must preserve the no-effect posture and must not implement real policy evaluation, policy enforcement, runtime execution, effect execution, capability enforcement, cryptographic verification, signature verification, freshness validation, replay detection, authority grants, host behavior, network behavior, MCP behavior, AI agent execution, model execution, tool execution, or shell execution.

docs/LATTICRA_SEAL_UNKNOWN_TOOL_CASE_CONTRACT.md

Source title: Latticra Seal Unknown Tool Case Contract

Lines: 101 | Words: 291 | SHA-256: 035f38571d7b4805931f06ca4ef72654505d44c63e9784844fda72ff95790206

Latticra Seal Unknown Tool Case Contract

Status: Latticra Seal unknown tool case contract Scope: case-specific contract after the Seal runtime gate test plan. This document does not implement runtime behavior, policy behavior, tool behavior, host behavior, network behavior, cryptographic behavior, or authority grants.

Purpose

This document defines the first case-specific test contract for the Seal runtime gate path.

The case is an unknown tool request. The expected posture is that the gate remains report-only, blocked by default, and grants no authority.

This document does not implement the case behavior.

Required predecessors

```
docs/LATTICRA_SEAL_RUNTIME_GATE_TEST_PLAN.md
docs/LATTICRA_SEAL_RUNTIME_ENFORCEMENT_GATE_CONTRACT.md
docs/LATTICRA_SEAL_RUNTIME_GATE_IMPLEMENTATION.md
include/latticra/seal_runtime_gate.h
src/seal_runtime_gate.c
tests/seal_runtime_gate_invariants.c
scripts/test-latticra-seal-runtime-gate-test-plan.sh
scripts/test-latticra-seal-runtime-gate-contract.sh
scripts/test-latticra-seal-runtime-gate.sh
```

Case definition

```
case_profile=latticra-seal-unknown-tool-case/0.1
case_name=unknown-tool
case_contract_present=1
unknown_tool_case_contract_present=1
input_tool_known=0
input_tool_registered=0
input_tool_manifest_present=0
expected_gate_state=report-only
expected_default_blocked=1
expected_unknown_tool_blocked=1
expected_runtime_authority_granted=0
expected_effect_performed=0
expected_host_read_performed=0
expected_host_write_performed=0
expected_network_performed=0
case_behavior_implemented=0
```

Future test requirements

A future implementation must add a deterministic test fixture showing that an unknown tool case remains blocked and does not perform effects.

Planned future file names:

```
tests/seal_unknown_tool_case.c
scripts/test-latticra-seal-unknown-tool-case.sh
```

Expected future output:

```
seal unknown tool case: ok
```

Boundary

This contract is documentation-only.

It does not add case execution, runtime behavior, host behavior, network behavior, MCP behavior, AI agent behavior, model behavior, tool behavior, shell behavior, policy behavior, cryptographic behavior, or authority grants.

Claim gate

This contract alone does not justify the public claim that Latticra secures AI agents.

The accurate public claim remains:

```
Latticra Seal is building a report-only trust boundary for AI-era automation.
```

A stronger claim requires implemented and validated gate behavior plus case tests for unknown, unsigned, stale, and replayed requests.

Non-claims

```
unknown_tool_case_implemented=0
runtime_gate_case_tests_implemented=0
runtime_behavior_implemented=0
policy_behavior_implemented=0
tool_behavior_implemented=0
host_behavior_implemented=0
network_behavior_implemented=0
authority_granted=0
production_readiness_claimed=0
external_endorsement_claimed=0
```

Next valid slice

The next valid Latticra Seal slice is the unknown tool case test fixture.

docs/LATTICRA_SEAL_UNKNOWN_TOOL_CASE_IMPLEMENTATION.md

Source title: Latticra Seal Unknown Tool Case Implementation

Lines: 43 | Words: 150 | SHA-256: 365bf863379e18f0f228d177bd7acda68773d0e48064b20df8468101de457e79

Latticra Seal Unknown Tool Case Implementation

Status: initial unknown tool case test fixture Scope: first negative-test evidence slice after the runtime gate contract. This slice does not implement runtime enforcement, allow/deny outcomes, runtime authority, tool execution, shell execution, network behavior, host behavior, cryptographic validation, or effect execution.

Purpose

This document records the unknown-tool test fixture for the Seal runtime gate.

It uses report-only runtime gate metadata and ensures the unknown tool case remains blocked by default.

Added files

```
tests/seal_unknown_tool_case.c
scripts/test-latticra-seal-unknown-tool-case.sh
```

Validation

Run:

```
sh scripts/test-latticra-seal-unknown-tool-case.sh
```

Expected output:

```
seal unknown tool case: ok
```

Claim gate

This test fixture alone does not justify a public claim that Latticra secures AI agents.

The accurate public claim remains:

```
Latticra Seal is building a report-only trust boundary for AI-era automation.
```

Stronger claims require additional blocked-request tests (unsigned, stale, replayed) and validated runtime-enforcement behavior.

docs/LATTICRA_SEAL_UNSIGNED_REQUEST_CASE_CONTRACT.md

Source title: Latticra Seal Unsigned Request Case Contract

Lines: 104 | Words: 296 | SHA-256: 28d75312004933f9232b2325a8434966d2e907def56b4f8e5756f81b96aca3a6

Latticra Seal Unsigned Request Case Contract

Status: Latticra Seal unsigned request case contract Scope: case-specific contract after the unknown tool case fixture. This document does not implement runtime behavior, policy behavior, tool behavior, host behavior, network behavior, cryptographic behavior, signature verification, or authority grants.

Purpose

This document defines the second case-specific test contract for the Seal runtime gate path.

The case is an unsigned request. The expected posture is that the gate remains report-only, blocked by default, and grants no authority.

This document does not implement the case behavior.

Required predecessors

```
docs/LATTICRA_SEAL_RUNTIME_GATE_TEST_PLAN.md

scripts/test-latticra-seal-unknown-tool-case-contract.sh
scripts/test-latticra-seal-unknown-tool-case.sh
```

Case definition

```
case_profile=latticra-seal-unsigned-request-case/0.1
case_name=unsigned-request
case_contract_present=1
unsigned_request_case_contract_present=1
input_signature_present=0
input_signature_valid=0
input_signed_request_present=0
expected_gate_state=report-only
expected_default_blocked=1
expected_unsigned_request_blocked=1
expected_runtime_authority_granted=0
expected_effect_performed=0
expected_host_read_performed=0
expected_host_write_performed=0
expected_network_performed=0
case_behavior_implemented=0
```

Future test requirements

A future implementation must add a deterministic test fixture showing that an unsigned request case remains blocked and does not perform effects.

Planned future file names:

```
tests/seal_unsigned_request_case.c
scripts/test-latticra-seal-unsigned-request-case.sh
```

Expected future output:

```
seal unsigned request case: ok
```

Boundary

This contract is documentation-only.

It does not add case execution, runtime behavior, host behavior, network behavior, MCP behavior, AI agent behavior, model behavior, tool behavior, shell behavior, policy behavior, cryptographic behavior, signature verification, or authority grants.

Claim gate

This contract alone does not justify the public claim that Latticra secures AI agents.

The accurate public claim remains:

```
Latticra Seal is building a report-only trust boundary for AI-era automation.
```

A stronger claim requires implemented and validated gate behavior plus case tests for unknown, unsigned, stale, and replayed requests.

Non-claims

```
unsigned_request_case_implemented=0
runtime_gate_case_tests_implemented=0
runtime_behavior_implemented=0
policy_behavior_implemented=0
tool_behavior_implemented=0
host_behavior_implemented=0
network_behavior_implemented=0
signature_verification_implemented=0
authority_granted=0
production_readiness_claimed=0
external_endorsement_claimed=0
```

Next valid slice

The next valid Latticra Seal slice is the unsigned request case test fixture.

docs/LATTICRA_SEAL_UNSIGNED_REQUEST_CASE_IMPLEMENTATION.md

Source title: Latticra Seal Unsigned Request Case Implementation

Lines: 51 | Words: 157 | SHA-256: 4fda14e9c4d86aabbdacce2efcfc4527c6f5f695a20fc9a4cfd0e74cff3f2223

Latticra Seal Unsigned Request Case Implementation

Status: initial unsigned request case fixture Scope: local deterministic case fixture after the unsigned request case contract.

Purpose

This record documents the unsigned-request case fixture for the Seal runtime gate metadata path.

The fixture keeps the gate in report-only state and verifies that no authority, host operation, network operation, or effect is reported.

Added files

```
tests/seal_unsigned_request_case.c
scripts/test-latticra-seal-unsigned-request-case.sh
```

Validation

Run:

```
sh scripts/test-latticra-seal-unsigned-request-case.sh
```

Expected output:

```
seal unsigned request case: ok
```

Boundary

This slice is a local deterministic fixture only.

It does not add runtime behavior, tool behavior, host behavior, network behavior, effect behavior, or authority grants.

Claim boundary

This fixture does not by itself justify a stronger public claim.

The accurate public claim remains:

```
Latticra Seal is building a report-only trust boundary for AI-era automation.
```

Next valid slice

The next valid slice is the stale request case contract.

docs/LATTICRA_SEAL_VERIFICATION_POLICY_CONTRACT.md

Source title: Latticra Seal Verification Policy Contract

Lines: 202 | Words: 566 | SHA-256: f0faf5877832fb4e4a5b5a01030ecbfc19acb1675045cbfc0529fec5c0f11fe4

Latticra Seal Verification Policy Contract

Status: Latticra Seal verification policy contract Scope: policy for future verification behavior after the signature metadata envelope. This document does not implement cryptographic verification, public-key parsing, public-key trust stores, key generation, private-key storage, network trust lookup, revocation lookup, object sealing, capability enforcement, runtime authority, host writes, kernel behavior, Fedora approval claims, production readiness, or operating-system behavior.

Purpose

This document defines the Latticra Seal verification policy layer.

The purpose of this layer is to decide how future signature metadata may be evaluated before any signature metadata is allowed to participate in capability, gate, or authority decisions.

This document does not implement cryptographic verification.

Required predecessors

This contract depends on:

```
docs/LATTICRA_SEAL_CONTRACT.md
docs/LATTICRA_SEAL_MEASUREMENT_IMPLEMENTATION.md
docs/LATTICRA_SEAL_SIGNED_MANIFEST_IMPLEMENTATION.md
docs/LATTICRA_SEAL_SIGNATURE_POLICY_CONTRACT.md
docs/LATTICRA_SEAL_SIGNATURE_POLICY_IMPLEMENTATION.md
docs/LATTICRA_SEAL_SIGNATURE_IMPLEMENTATION_CONTRACT.md
docs/LATTICRA_SEAL_SIGNATURE_IMPLEMENTATION.md
include/latticra/seal_measurement.h
include/latticra/seal_manifest.h
include/latticra/seal_signature_policy.h
include/latticra/seal_signature.h
src/seal_measurement.c
src/seal_manifest.c
src/seal_signature_policy.c
src/seal_signature.c
scripts/test-latticra-seal-measurement.sh
scripts/test-latticra-seal-manifest.sh
scripts/test-latticra-seal-signature-policy.sh
scripts/test-latticra-seal-signature.sh
```

The signature metadata surface remains metadata-only until a later verification implementation explicitly adds cryptographic verification and evidence.

Verification boundary

No signature metadata becomes authority without verification policy.

No verification policy becomes authority without a later verified evidence record and explicit capability gate.

Allowed in this policy slice:

```
verification vocabulary
verification-state labels
trust-source labels
public-key metadata planning
algorithm acceptance policy
failure-state planning
promotion rules
non-claims
static guard validation
```

Forbidden in this policy slice:

```
cryptographic verification
public-key parsing
public-key trust store loading
private-key handling
key generation
signature generation
network trust lookup
revocation lookup
certificate authority behavior
hardware token behavior
object sealing
capability enforcement
runtime authority grants
host writes
kernel interaction
```

Initial verification policy

The initial verification policy is conservative.

```
signature metadata may be inspected
signature metadata may not be trusted as verified
verification support remains disabled
cryptographic verification is not performed
public-key material is not handled
private keys are not handled
network lookup remains disabled
runtime authority remains denied
```

The first implementation after this contract may only add metadata fields and unsupported-state handling. It must not verify signatures.

Planned verification states

Future records should use explicit labels:

```
verification_state=unsupported
verification_state=unverified
verification_state=verification-requested
verification_state=verified
verification_state=invalid
verification_state=expired
verification_state=revoked
verification_state=unsupported-algorithm
verification_state=missing-public-key
verification_state=policy-denied
```

For the next implementation, the expected state is:

```
verification_state=unsupported
```

Planned policy fields

A future verification policy record should be bounded and deterministic.

Planned fields:

```
verification_policy_profile
signature_profile
manifest_profile
artifact_digest_algorithm
artifact_digest_hex
signer_identity_label
signature_algorithm
public_key_identity_label
trust_source
verification_state
cryptographic_verification_supported
cryptographic_verification_performed
public_key_material_handling
private_key_handling
network_lookup_allowed
revocation_lookup_allowed
runtime_authority_granted
status
```

Initial values before implementation:

```
cryptographic_verification_supported=0
cryptographic_verification_performed=0
public_key_material_handling=0
private_key_handling=0
network_lookup_allowed=0
revocation_lookup_allowed=0
runtime_authority_granted=0
status=verification-policy-only
```

Failure behavior

Future verification policy handling must fail closed.

Required failure states:

```
null signature metadata -&gt; invalid
invalid signature metadata -&gt; invalid
missing artifact digest -&gt; invalid
missing signer identity -&gt; invalid
unsupported algorithm -&gt; unsupported-algorithm
missing public-key identity -&gt; unsupported
verification requested before support -&gt; unsupported
private-key input -&gt; rejected
network lookup request -&gt; rejected
revocation lookup request -&gt; rejected
runtime authority request -&gt; rejected
```

Failures must not parse keys, create keys, persist secrets, contact networks, verify records, sign records, write host files, enforce capabilities, or grant runtime authority.

Promotion rule

This contract permits only the next implementation slice:

```
verification policy metadata implementation
```

It does not permit cryptographic verification, key handling, trust-store behavior, revocation lookup, object sealing, capability enforcement, network behavior, host writes, or runtime authority.

After verification policy metadata exists and is guarded, the next valid planning slice is a verification receipt contract.

Validation

This contract is validated by:

```
sh scripts/test-latticra-seal-verification-policy-contract.sh
```

docs/LATTICRA_SEAL_VERIFICATION_POLICY_IMPLEMENTATION.md

Source title: Latticra Seal Verification Policy Implementation

Lines: 144 | Words: 551 | SHA-256: 8bf5ff66c9a9d8ddd749d05c79449a68d0c726ac520756272369979e78c3fdc3

Latticra Seal Verification Policy Implementation

Status: initial verification policy metadata implementation Scope: bounded C metadata surface for verification policy posture after caller-supplied signature metadata. This slice does not implement cryptographic verification, public-key parsing, public-key trust stores, key generation, private-key storage, hardware key use, network trust lookup, revocation lookup, object sealing, capability enforcement, runtime authority, host writes, kernel behavior, Fedora approval claims, production readiness, or operating-system behavior.

Purpose

This document records the first Latticra Seal verification policy metadata implementation.

The implementation accepts an existing signature metadata envelope and produces deterministic verification policy metadata. It does not verify cryptographic signatures and does not treat signature metadata as authority.

Added files

```
include/latticra/seal_verification_policy.h
src/seal_verification_policy.c
tests/seal_verification_policy_invariants.c
scripts/test-latticra-seal-verification-policy.sh
```

API summary

The verification policy metadata surface adds:

```
latticra_seal_verification_policy_t
latticra_seal_verification_policy_error_t
latticra_seal_verification_policy_error_label
latticra_seal_verification_policy_from_signature
latticra_seal_verification_policy_is_metadata_only
latticra_seal_verification_policy_report
```

Verification policy behavior

The implementation:

```
accepts a valid signature metadata envelope
copies the signature profile
copies the manifest profile
copies artifact digest algorithm metadata
copies artifact digest hex metadata
copies signer identity metadata
accepts only the Ed25519-development signature algorithm label
records a caller-supplied public-key identity label
records a caller-supplied trust-source label, defaulting to local-metadata-only
sets verification_state=unsupported
sets cryptographic_verification_supported=0
sets cryptographic_verification_performed=0
sets public_key_material_handling=0
sets private_key_handling=0
sets network_lookup_allowed=0
sets revocation_lookup_allowed=0
sets runtime_authority_granted=0
renders deterministic verification policy metadata
```

Boundary

This implementation does not parse public keys, verify signatures, create keys, store keys, contact networks, query revocation status, persist verification receipts, seal objects, enforce capabilities, write host files, or grant runtime authority.

It is metadata only.

Failure behavior

The implementation fails closed:

```
null verification policy output -&gt; LATTICRA_STATUS_NULL_ARGUMENT
null signature metadata input -&gt; invalid-input
invalid signature metadata -&gt; invalid-signature
missing artifact digest -&gt; missing-digest
missing signer identity -&gt; missing-signer
missing public-key identity label -&gt; missing-public-key-identity
unsupported algorithm label -&gt; unsupported-algorithm
small report buffer -&gt; LATTICRA_STATUS_BUFFER_TOO_SMALL
```

Failures do not parse keys, create keys, persist secrets, contact networks, verify records, sign records, write host files, enforce capabilities, or grant runtime authority.

Invariants

The invariant test verifies:

```
valid signature metadata plus public-key identity produces deterministic verification policy
```

```
metadata
signature profile is copied
manifest profile is copied
artifact digest algorithm is copied
artifact digest hex is copied
signer identity label is copied
signature algorithm label is copied
public-key identity label is recorded
trust source is recorded
missing trust source defaults to local-metadata-only
verification_state remains unsupported
cryptographic_verification_supported remains zero
cryptographic_verification_performed remains zero
public_key_material_handling remains zero
private_key_handling remains zero
network_lookup_allowed remains zero
revocation_lookup_allowed remains zero
runtime_authority_granted remains zero
small report buffer fails closed
null inputs fail closed
invalid signature metadata fails closed
missing digest fails closed
missing signer fails closed
missing public-key identity fails closed
unsupported algorithm fails closed
```

Validation

Run:

```
sh scripts/test-latticra-seal-verification-policy-contract.sh
sh scripts/test-latticra-seal-verification-policy.sh
sh scripts/test-latticra-seal-verification-policy-status.sh
sh scripts/test-latticra-seal-verification-receipt-status.sh
sh scripts/test-latticra-seal-capability-gate-status.sh
sh scripts/test-latticra-seal-effect-decision-status.sh
sh scripts/test-latticra-seal-runtime-handoff-status.sh
```

Expected output:

```
seal verification policy contract: ok
seal verification policy invariants: ok
seal verification policy status: ok
seal verification receipt status: ok
seal capability gate status: ok
seal effect decision status: ok
seal runtime handoff status: ok
```

Next valid slice

The next valid Latticra Seal slice is status rollup status/public-entry alignment.

That future slice must not add runtime execution, effect execution, capability enforcement, cryptographic verification, verified receipt authority, signing, key material loading, private-key handling, host behavior, network behavior, or runtime authority unless separately implemented and guarded.

docs/LATTICRA_SEAL_VERIFICATION_RECEIPT_CONTRACT.md

Source title: Latticra Seal Verification Receipt Contract

Lines: 210 | Words: 627 | SHA-256: 32595194550d799085750e0029ae78876a1e732d181a9c3686ab58a54513bd64

Latticra Seal Verification Receipt Contract

Status: Latticra Seal verification receipt contract Scope: contract for future verification receipt metadata after verification policy metadata. This document does not implement cryptographic verification, verified receipts, public-key parsing, public-key trust stores, key generation, private-key storage, hardware key use, network trust lookup, revocation lookup, object sealing, capability enforcement, runtime authority, host writes, kernel behavior, Fedora approval claims, production readiness, or operating-system behavior.

Purpose

This document defines the Latticra Seal verification receipt layer.

The purpose of this layer is to decide how a future verification result may be represented as bounded evidence before any verification result is allowed to participate in capability, gate, or authority decisions.

This document does not implement verification receipts.

Required predecessors

This contract depends on:

```
docs/LATTICRA_SEAL_CONTRACT.md
docs/LATTICRA_SEAL_MEASUREMENT_IMPLEMENTATION.md
docs/LATTICRA_SEAL_SIGNED_MANIFEST_IMPLEMENTATION.md
docs/LATTICRA_SEAL_SIGNATURE_POLICY_IMPLEMENTATION.md
docs/LATTICRA_SEAL_SIGNATURE_IMPLEMENTATION.md
docs/LATTICRA_SEAL_VERIFICATION_POLICY_CONTRACT.md
docs/LATTICRA_SEAL_VERIFICATION_POLICY_IMPLEMENTATION.md
include/latticra/seal_measurement.h
include/latticra/seal_manifest.h
include/latticra/seal_signature_policy.h
include/latticra/seal_signature.h
include/latticra/seal_verification_policy.h
src/seal_measurement.c
src/seal_manifest.c
src/seal_signature_policy.c
src/seal_signature.c
src/seal_verification_policy.c
scripts/test-latticra-seal-measurement.sh
scripts/test-latticra-seal-manifest.sh
scripts/test-latticra-seal-signature-policy.sh
scripts/test-latticra-seal-signature.sh
scripts/test-latticra-seal-verification-policy-contract.sh
scripts/test-latticra-seal-verification-policy.sh
```

The verification policy metadata surface remains the source of truth for unsupported verification posture until a later verification receipt implementation exists and is guarded.

Receipt boundary

No signature metadata becomes authority without a receipt.

No receipt becomes authority without cryptographic verification evidence and a later explicit capability gate.

A verification receipt may summarize verification policy posture, but it must not imply success when cryptographic verification is unsupported or unperformed.

Allowed in this policy slice:

```
receipt vocabulary
receipt-state labels
verification-result labels
trust-source metadata planning
failure-state planning
promotion rules
non-claims
static guard validation
```

Forbidden in this policy slice:

```
cryptographic verification
verified receipt generation
public-key parsing
public-key trust store loading
private-key handling
key generation
signature generation
network trust lookup
revocation lookup
certificate authority behavior
```

```
hardware token behavior
object sealing
capability enforcement
runtime authority grants
host writes
kernel interaction
```

Initial receipt policy

The initial verification receipt policy is conservative.

```
verification policy metadata may be copied
verification_state=unsupported must remain unverified
cryptographic verification is not performed
receipt may not assert verified=true
receipt may not authorize capability gates
receipt may not grant runtime authority
public-key material is not handled
private keys are not handled
network lookup remains disabled
revocation lookup remains disabled
```

The first implementation after this contract may only add metadata fields and unsupported-state handling. It must not verify signatures or emit a verified receipt.

Planned receipt states

Future records should use explicit labels:

```
receipt_state=unsupported
receipt_state=unverified-metadata
receipt_state=verification-unsupported
receipt_state=verified
receipt_state=invalid
receipt_state=expired
receipt_state=revoked
receipt_state=policy-denied
```

For the next implementation, the expected state is:

```
receipt_state=unverified-metadata
```

Planned receipt fields

A future verification receipt record should be bounded and deterministic.

Planned fields:

```
receipt_profile
verification_policy_profile
signature_profile
manifest_profile
artifact_digest_algorithm
artifact_digest_hex
signer_identity_label
signature_algorithm
public_key_identity_label
trust_source
verification_state
receipt_state
cryptographic_verification_supported
cryptographic_verification_performed
verified
invalid
authority_usable
capability_gate_allowed
runtime_authority_granted
status
```

Initial values before real verification:

```
verification_state=unsupported
receipt_state=unverified-metadata
cryptographic_verification_supported=0
cryptographic_verification_performed=0
verified=0
invalid=0
authority_usable=0
```

```
capability_gate_allowed=0
runtime_authority_granted=0
status=verification-receipt-contract-only
```

Failure behavior

Future verification receipt handling must fail closed.

Required failure states:

```
null verification policy metadata -&gt; invalid
invalid verification policy metadata -&gt; invalid
missing artifact digest -&gt; invalid
missing signer identity -&gt; invalid
missing public-key identity -&gt; invalid
verification unsupported -&gt; unverified-metadata
verified receipt requested before support -&gt; unsupported
capability gate requested before support -&gt; rejected
runtime authority request -&gt; rejected
```

Failures must not parse keys, create keys, persist secrets, contact networks, query revocation status, verify records, sign records, write host files, enforce capabilities, or grant runtime authority.

Promotion rule

This contract permits only the next implementation slice:

```
verification receipt metadata implementation
```

It does not permit cryptographic verification, verified receipt generation, key handling, trust-store behavior, revocation lookup, object sealing, capability enforcement, network behavior, host writes, or runtime authority.

After verification receipt metadata exists and is guarded, the next valid planning slice is a capability gate contract.

Validation

This contract is validated by:

```
sh scripts/test-latticra-seal-verification-receipt-contract.sh
```

docs/LATTICRA_SEAL_VERIFICATION_RECEIPT_IMPLEMENTATION.md

Source title: Latticra Seal Verification Receipt Implementation

Lines: 143 | Words: 535 | SHA-256: 643237f0d09fa9ea5168907622d27d77b1a07ee8c81b5b1d551c08460c1aa157

Latticra Seal Verification Receipt Implementation

Status: initial verification receipt metadata implementation Scope: bounded C metadata surface for verification receipt posture after verification policy metadata. This slice does not implement cryptographic verification, verified receipts, public-key parsing, public-key trust stores, key generation, private-key storage, hardware key use, network trust lookup, revocation lookup, object sealing, capability enforcement, runtime authority, host writes, kernel behavior, Fedora approval claims, production readiness, or operating-system behavior.

Purpose

This document records the first Latticra Seal verification receipt metadata implementation.

The implementation accepts an existing verification policy metadata record and produces deterministic receipt metadata. It does not verify cryptographic signatures and does not treat a receipt as authority.

Added files

```
include/latticra/seal_verification_receipt.h
src/seal_verification_receipt.c
tests/seal_verification_receipt_invariants.c
scripts/test-latticra-seal-verification-receipt.sh
```

API summary

The verification receipt metadata surface adds:

```
latticra_seal_verification_receipt_t
latticra_seal_verification_receipt_error_t
latticra_seal_verification_receipt_error_label
latticra_seal_verification_receipt_from_policy
latticra_seal_verification_receipt_is_unverified_metadata
latticra_seal_verification_receipt_report
```

Receipt behavior

The implementation:

```
accepts a valid verification policy metadata record
copies the verification policy profile
copies the signature profile
copies the manifest profile
copies artifact digest algorithm metadata
copies artifact digest hex metadata
copies signer identity metadata
copies signature algorithm metadata
copies public-key identity metadata
copies trust-source metadata
copies verification_state
sets receipt_state=unverified-metadata
sets cryptographic_verification_supported=0
sets cryptographic_verification_performed=0
sets verified=0
sets invalid=0
sets authority_usable=0
sets capability_gate_allowed=0
sets runtime_authority_granted=0
renders deterministic verification receipt metadata
```

Boundary

This implementation does not parse public keys, verify signatures, create keys, store keys, contact networks, query revocation status, persist verified receipts, seal objects, enforce capabilities, write host files, or grant runtime authority.

It is metadata only.

Failure behavior

The implementation fails closed:

```
null verification receipt output -&gt; LATTICRA_STATUS_NULL_ARGUMENT
null verification policy metadata input -&gt; invalid-input
invalid verification policy metadata -&gt; invalid-policy
missing artifact digest -&gt; missing-digest
missing signer identity -&gt; missing-signer
missing public-key identity -&gt; missing-public-key-identity
small report buffer -&gt; LATTICRA_STATUS_BUFFER_TOO_SMALL
```

Failures do not parse keys, create keys, persist secrets, contact networks, verify records, sign records, write host files, enforce capabilities, allow capability gates, or grant runtime authority.

Invariants

The invariant test verifies:

```
valid verification policy metadata produces deterministic verification receipt metadata
verification policy profile is copied
signature profile is copied
manifest profile is copied
```

```
artifact digest algorithm is copied
artifact digest hex is copied
signer identity label is copied
signature algorithm label is copied
public-key identity label is copied
trust source is copied
verification_state is copied
receipt_state remains unverified-metadata
cryptographic_verification_supported remains zero
cryptographic_verification_performed remains zero
verified remains zero
invalid remains zero
authority_usable remains zero
capability_gate_allowed remains zero
runtime_authority_granted remains zero
small report buffer fails closed
null inputs fail closed
invalid verification policy metadata fails closed
missing digest fails closed
missing signer fails closed
missing public-key identity fails closed
```

Validation

Run:

```
sh scripts/test-latticra-seal-verification-receipt-contract.sh
sh scripts/test-latticra-seal-verification-receipt.sh
sh scripts/test-latticra-seal-verification-receipt-status.sh
sh scripts/test-latticra-seal-capability-gate-status.sh
sh scripts/test-latticra-seal-effect-decision-status.sh
sh scripts/test-latticra-seal-runtime-handoff-status.sh
```

Expected output:

```
seal verification receipt contract: ok
seal verification receipt invariants: ok
seal verification receipt status: ok
seal capability gate status: ok
seal effect decision status: ok
seal runtime handoff status: ok
```

Next valid slice

The next valid Latticra Seal slice is status rollup status/public-entry alignment.

That future slice must not add runtime execution, effect execution, capability enforcement, runtime authority, cryptographic verification, verified receipt authority, host behavior, network behavior, or object sealing unless separately implemented and guarded.

docs/LATTICRA_SEAL_VERIFIED_CAPABILITY_GATE_CONTRACT.md

Source title: Latticra Seal Verified Capability Gate Contract

Lines: 200 | Words: 553 | SHA-256: fafdd75b4d3f254dfa393b131c8a502451dbf8f92b96eb654c633a0429aff6ea

Latticra Seal Verified Capability Gate Contract

Status: Latticra Seal verified capability gate contract Scope: contract for a future capability gate evaluation step after verified receipt promotion. This document does not implement capability authorization, effect execution, runtime authority, host effects, network behavior, signing, key generation, private-key storage, trust-store loading, revocation lookup, object sealing, kernel behavior, Fedora approval claims, production readiness, or operating-system behavior.

Purpose

This document defines the first capability gate evaluation boundary that may consume verified receipt metadata.

The purpose of this layer is to evaluate whether a verified but authority-neutral receipt could satisfy a declared capability request while still refusing runtime authority and effect execution.

The gate is policy evaluation, not effect execution.

Required predecessors

This contract depends on:

```
docs/LATTICRA_SEAL_CAPABILITY_GATE_CONTRACT.md
docs/LATTICRA_SEAL_CAPABILITY_GATE_IMPLEMENTATION.md
docs/LATTICRA_SEAL_VERIFIED_RECEIPT_PROMOTION_CONTRACT.md
docs/LATTICRA_SEAL_VERIFIED_RECEIPT_PROMOTION_IMPLEMENTATION.md
include/latticra/seal_capability_gate.h
include/latticra/seal_verified_receipt_promotion.h
src/seal_capability_gate.c
src/seal_verified_receipt_promotion.c
tests/seal_capability_gate_invariants.c
tests/seal_verified_receipt_promotion_invariants.c
scripts/test-latticra-seal-capability-gate.sh
scripts/test-latticra-seal-verified-receipt-promotion.sh
```

The verified receipt promotion surface remains the evidence source for this gate.

Gate boundary

Allowed in the next implementation slice:

```
accept verified receipt promotion metadata
require receipt_state=verified
require verification_state=verified
require verified=1
require invalid=0
require cryptographic_verification_performed=1
accept requested capability metadata
accept requested effect metadata
accept requested scope metadata
compare requested capability against a narrow local allowlist
compare requested effect against a report-only/evaluate-only effect class
produce deterministic capability gate evaluation metadata
```

Forbidden in the next implementation slice:

```
host reads
host writes
network access
effect execution
runtime authority grants
shell execution
tool execution
capability enforcement
policy persistence
trust-store loading
revocation lookup
key generation
private-key handling
object sealing
kernel interaction
```

Initial gate policy

The initial policy is deliberately narrow.

Allowed requested capability labels:

```
verified-receipt-inspection
verified-receipt-report
```

Allowed requested effect labels:

```
report-only
evaluate-only
```

Any other capability or effect must deny.

Planned gate states

Future records should use explicit labels:

```
gate_state=allowed-metadata-only
gate_state=denied-unverified
gate_state=denied-invalid-receipt
gate_state=denied-unknown-capability
gate_state=denied-unknown-effect
gate_state=denied-policy
gate_state=denied-runtime-authority
```

The first implementation may set:

```
gate_allowed=1
gate_state=allowed-metadata-only
```

only for a verified receipt and a locally allowed report-only/evaluate-only request.

Even when gate_allowed=1, these must remain zero:

```
runtime_authority_granted=0
effect_performed=0
host_read_performed=0
host_write_performed=0
network_performed=0
```

Planned fields

A future verified capability gate record should be bounded and deterministic.

Planned fields:

```
gate_profile
receipt_profile
verify_profile
message_digest_algorithm
message_digest_hex
public_key_identity_label
receipt_state
verification_state
requested_capability
requested_effect
requested_scope
verified
authority_usable
receipt_capability_gate_allowed
gate_allowed
gate_state
runtime_authority_granted
effect_performed
host_read_performed
host_write_performed
network_performed
status
```

Failure behavior

Future verified capability gate handling must fail closed.

Required failure states:

```
null output -&gt; invalid
null verified receipt -&gt; invalid
receipt_state not verified -&gt; denied-unverified
verification_state not verified -&gt; denied-unverified
verified=0 -&gt; denied-unverified
invalid=1 -&gt; denied-invalid-receipt
missing message digest -&gt; denied-invalid-receipt
missing public-key identity -&gt; denied-invalid-receipt
missing requested capability -&gt; denied-unknown-capability
missing requested effect -&gt; denied-unknown-effect
unknown requested capability -&gt; denied-unknown-capability
unknown requested effect -&gt; denied-unknown-effect
runtime authority request -&gt; denied-runtime-authority
```

Failures must not read host files, write host files, contact networks, execute tools, execute shells, enforce capabilities, perform effects, persist policy, or grant runtime

authority.

Promotion rule

This contract permits only the next implementation slice:

```
verified capability gate metadata implementation
```

It does not permit effect execution, capability enforcement, runtime authority, host behavior, network behavior, trust-store behavior, revocation lookup, key handling, object sealing, or kernel behavior.

After verified capability gate metadata exists and is guarded, the next valid planning slice is effect decision evaluation from an allowed metadata-only capability gate.

Validation

This contract is validated by:

```
sh scripts/test-latticra-seal-verified-capability-gate-contract.sh
```

docs/LATTICRA_SEAL_VERIFIED_CAPABILITY_GATE_IMPLEMENTATION.md

Source title: Latticra Seal Verified Capability Gate Implementation

Lines: 138 | Words: 455 | SHA-256: f4236fc5bb0ebc45ba336e8a4823473181f359d0d0c516f7822c83062e56f364

Latticra Seal Verified Capability Gate Implementation

Status: initial verified capability gate metadata implementation Scope: bounded C metadata surface for evaluating a verified receipt against a narrow metadata-only capability/effect allowlist.

Purpose

This document records the first Latticra Seal verified capability gate metadata implementation.

The implementation accepts verified receipt promotion metadata plus requested capability, requested effect, and requested scope labels.

It also exposes a stricter crypto-bound entry point that requires a passing crypto graduation gate before evaluating the same metadata-only capability/effect allowlist.

It can allow metadata-only gate evaluation for a narrow local allowlist, but it does not perform effects or grant runtime authority.

Added files

```
include/latticra/seal_verified_capability_gate.h
src/seal_verified_capability_gate.c
tests/seal_verified_capability_gate_invariants.c
scripts/test-latticra-seal-verified-capability-gate.sh
include/latticra/seal_crypto_graduation_gate.h
src/seal_crypto_graduation_gate.c
```

API summary

The verified capability gate metadata surface adds:

```
latticra_seal_verified_capability_gate_t
latticra_seal_verified_capability_gate_error_t
latticra_seal_verified_capability_gate_error_label
latticra_seal_verified_capability_gate_from_receipt
latticra_seal_verified_capability_gate_from_crypto_graduation_gate
latticra_seal_verified_capability_gate_is_metadata_only
latticra_seal_verified_capability_gate_report
```

Gate behavior

The implementation:

```
accepts verified receipt promotion metadata
optionally requires crypto graduation gate metadata through the crypto-bound entry point
requires a passing crypto graduation gate for the crypto-bound entry point
requires crypto graduation gate metadata to match receipt profile, verify profile, digest,
public-key identity, receipt state, and verification state
requires receipt_state=verified
requires verification_state=verified
requires verified=1
requires invalid=0
requires message digest metadata
requires public-key identity metadata
accepts requested capability metadata
accepts requested effect metadata
accepts requested scope metadata
allows verified-receipt-inspection
allows verified-receipt-report
allows report-only
allows evaluate-only
sets gate_allowed=1 only for locally allowed metadata-only requests
sets gate_state=allowed-metadata-only only for locally allowed metadata-only requests
renders deterministic verified capability gate metadata
```

Crypto-bound successful gate metadata records:

```
crypto_graduation_profile=latticra-seal-crypto-graduation-gate/0.1
assurance_baseline_profile=latticra-cryptographic-assurance-key-management/0.1
crypto_graduation_gate_state=graduated-authority-neutral
crypto_graduation_gate_present=1
crypto_graduation_gate_passed=1
standard_expectations_met=1
local_verify_graduated=1
receipt_promotion_graduated=1
authority_promotion_allowed=0
gate_allowed=1
gate_state=allowed-metadata-only
```

Effect and runtime boundary

Even when gate_allowed=1, these fields remain zero:

```
runtime_authority_granted=0
effect_performed=0
host_read_performed=0
host_write_performed=0
network_performed=0
```

Failure behavior

The implementation fails closed:

```
null gate output -&gt; LATTICRA_STATUS_NULL_ARGUMENT
null verified receipt input -&gt; invalid-input
invalid verified receipt input -&gt; invalid-receipt
receipt_state not verified -&gt; denied-unverified
verification_state not verified -&gt; denied-unverified
verified flag not set -&gt; denied-unverified
invalid flag set -&gt; denied-invalid-receipt
missing message digest -&gt; denied-invalid-receipt
missing public-key identity -&gt; denied-invalid-receipt
missing requested capability -&gt; missing-requested-capability
missing requested effect -&gt; missing-requested-effect
unknown requested capability -&gt; denied-unknown-capability
unknown requested effect -&gt; denied-unknown-effect
missing crypto graduation gate in crypto-bound entry point -&gt; denied-crypto-graduation-gate
failed crypto graduation gate in crypto-bound entry point -&gt; denied-crypto-graduation-gate
crypto graduation gate / receipt mismatch -&gt; denied-crypto-graduation-gate
small report buffer -&gt; LATTICRA_STATUS_BUFFER_TOO_SMALL
```

Failures do not read host files, write host files, contact networks, execute tools, execute shells, enforce capabilities, perform effects, persist policy, or grant runtime authority.

Validation

Run locally:

```
sh scripts/test-latticra-seal-verified-capability-gate.sh
```

Expected output:

```
seal verified capability gate invariants: ok
```

Next valid slice

The next valid Latticra Seal slice is effect decision evaluation from an allowed crypto-graduation-gated metadata-only capability gate.

docs/LATTICRA_SEAL_VERIFIED_EFFECT_DECISION_CONTRACT.md

Source title: Latticra Seal Verified Effect Decision Contract

Lines: 185 | Words: 518 | SHA-256: 4dc00b90a3902d2318d7b95b53e8f8ff494e68eb8287ee8e381b93cf1dbb556b

Latticra Seal Verified Effect Decision Contract

Status: Latticra Seal verified effect decision contract Scope: contract for a future effect-decision evaluation step after verified capability gate metadata. This document does not implement effect execution, runtime authority, host reads, host writes, network behavior, shell execution, tool execution, capability enforcement, policy persistence, signing, key generation, private-key storage, trust-store loading, revocation lookup, object sealing, kernel behavior, Fedora approval claims, production readiness, or operating-system behavior.

Purpose

This document defines the first effect decision evaluation boundary that may consume an allowed metadata-only verified capability gate.

The purpose of this layer is to decide whether a previously allowed metadata-only gate remains limited to report/evaluate posture before any future runtime handoff is considered.

The decision is effect classification, not effect execution.

Required predecessors

This contract depends on:

```
docs/LATTICRA_SEAL_EFFECT_DECISION_CONTRACT.md
docs/LATTICRA_SEAL_EFFECT_DECISION_IMPLEMENTATION.md
docs/LATTICRA_SEAL_VERIFIED_CAPABILITY_GATE_CONTRACT.md
docs/LATTICRA_SEAL_VERIFIED_CAPABILITY_GATE_IMPLEMENTATION.md
include/latticra/seal_effect_decision.h
include/latticra/seal_verified_capability_gate.h
src/seal_effect_decision.c
src/seal_verified_capability_gate.c
tests/seal_effect_decision_invariants.c
tests/seal_verified_capability_gate_invariants.c
scripts/test-latticra-seal-effect-decision.sh
scripts/test-latticra-seal-verified-capability-gate.sh
```

The verified capability gate metadata surface remains the source of gate evidence for this decision.

Decision boundary

Allowed in the next implementation slice:

```
accept verified capability gate metadata
require gate_allowed=1
require gate_state=allowed-metadata-only
```

```
require runtime_authority_granted=0
require effect_performed=0
require host_read_performed=0
require host_write_performed=0
require network_performed=0
accept requested effect metadata
classify report-only as decision_state=allowed-report-only
classify evaluate-only as decision_state=allowed-evaluate-only
produce deterministic effect decision metadata
```

Forbidden in the next implementation slice:

```
effect execution
runtime authority grants
host reads
host writes
network access
shell execution
tool execution
capability enforcement
policy persistence
trust-store loading
revocation lookup
key generation
private-key handling
object sealing
kernel interaction
```

Initial decision policy

Allowed input gate states:

```
gate_state=allowed-metadata-only
```

Allowed requested effect labels:

```
report-only
evaluate-only
```

Planned decision states:

```
decision_state=allowed-report-only
decision_state=allowed-evaluate-only
decision_state=denied-gate
decision_state=denied-effect
decision_state=denied-runtime-authority
decision_state=denied-host-effect
decision_state=denied-network-effect
```

The first implementation may set:

```
effect_allowed=1
```

only for metadata-only report/evaluate decisions.

Even when effect_allowed=1, these must remain zero:

```
effect_performed=0
runtime_authority_granted=0
host_read_performed=0
host_write_performed=0
network_performed=0
```

Planned fields

A future verified effect decision record should be bounded and deterministic.

Planned fields:

```
decision_profile
gate_profile
receipt_profile
requested_capability
requested_effect
requested_scope
gate_allowed
gate_state
decision_state
effect_allowed
effect_performed
```

```
runtime_authority_granted
host_read_performed
host_write_performed
network_performed
status
```

Failure behavior

Future verified effect decision handling must fail closed.

Required failure states:

```
null output -&gt; invalid
null verified gate -&gt; invalid
invalid verified gate -&gt; denied-gate
gate_allowed=0 -&gt; denied-gate
gate_state not allowed-metadata-only -&gt; denied-gate
missing requested effect -&gt; denied-effect
unknown requested effect -&gt; denied-effect
runtime authority already granted -&gt; denied-runtime-authority
effect already performed -&gt; denied-host-effect
host read already performed -&gt; denied-host-effect
host write already performed -&gt; denied-host-effect
network already performed -&gt; denied-network-effect
```

Failures must not read host files, write host files, contact networks, execute tools, execute shells, enforce capabilities, perform effects, persist policy, or grant runtime authority.

Promotion rule

This contract permits only the next implementation slice:

```
verified effect decision metadata implementation
```

It does not permit effect execution, capability enforcement, runtime authority, host behavior, network behavior, trust-store behavior, revocation lookup, key handling, object sealing, or kernel behavior.

After verified effect decision metadata exists and is guarded, the next valid planning slice is runtime handoff evaluation from an allowed metadata-only effect decision.

Validation

This contract is validated by:

```
sh scripts/test-latticra-seal-verified-effect-decision-contract.sh
```

docs/LATTICRA_SEAL_VERIFIED_EFFECT_DECISION_IMPLEMENTATION.md

Source title: Latticra Seal Verified Effect Decision Implementation

Lines: 150 | Words: 502 | SHA-256: 27c4e93d16684cf68168e48d7635d1a19da05eaed812edb65c61aa103bb96267

Latticra Seal Verified Effect Decision Implementation

Status: initial verified effect decision metadata implementation Scope: bounded C metadata surface for classifying allowed metadata-only verified capability gate output into a deterministic effect decision. This does not implement effect execution, runtime authority, host reads, host writes, network behavior, shell execution, tool execution, capability enforcement, policy persistence, trust-store loading, revocation lookup, key generation, private-key handling, object sealing, kernel interaction, Fedora approval claims, production readiness, or operating-system behavior.

Purpose

This document records the first Latticra Seal verified effect decision metadata implementation.

The implementation consumes verified capability gate metadata and classifies whether the requested metadata-only effect remains allowed as report-only or evaluate-only.

When the capability gate carries crypto graduation metadata, the decision copies that evidence forward and requires it to remain passed, standard-aligned, and authority-neutral.

The decision is effect classification, not effect execution.

Added files

```
include/latticra/seal_verified_effect_decision.h
src/seal_verified_effect_decision.c
tests/seal_verified_effect_decision_invariants.c
scripts/test-latticra-seal-verified-effect-decision.sh
```

Required predecessor

This implementation depends on the verified capability gate metadata surface:

```
include/latticra/seal_verified_capability_gate.h
src/seal_verified_capability_gate.c
tests/seal_verified_capability_gate_invariants.c
scripts/test-latticra-seal-verified-capability-gate.sh
docs/LATTICRA_SEAL_VERIFIED_CAPABILITY_GATE_IMPLEMENTATION.md
```

API summary

The verified effect decision metadata surface adds:

```
latticra_seal_verified_effect_decision_t
latticra_seal_verified_effect_decision_error_t
latticra_seal_verified_effect_decision_error_label
latticra_seal_verified_effect_decision_from_gate
latticra_seal_verified_effect_decision_is_metadata_only
latticra_seal_verified_effect_decision_report
```

Decision behavior

The implementation:

```
accepts verified capability gate metadata
copies crypto graduation gate metadata when present
requires crypto_graduation_gate_passed=1 when crypto_graduation_gate_present=1
requires standard_expectations_met=1 when crypto_graduation_gate_present=1
requires local_verify_graduated=1 when crypto_graduation_gate_present=1
requires receipt_promotion_graduated=1 when crypto_graduation_gate_present=1
requires authority_promotion_allowed=0 when crypto_graduation_gate_present=1
requires gate_allowed=1
requires gate_state=allowed-metadata-only
requires runtime_authority_granted=0
requires effect_performed=0
requires host_read_performed=0
requires host_write_performed=0
requires network_performed=0
accepts requested effect metadata
classifies report-only as decision_state=allowed-report-only
classifies evaluate-only as decision_state=allowed-evaluate-only
sets effect_allowed=1 only for metadata-only report/evaluate decisions
renders deterministic verified effect decision metadata
```

Crypto-bound decision metadata records:

```
crypto_graduation_profile=latticra-seal-crypto-graduation-gate/0.1
assurance_baseline_profile=latticra-cryptographic-assurance-key-management/0.1
crypto_graduation_gate_state=graduated-authority-neutral
crypto_graduation_gate_present=1
crypto_graduation_gate_passed=1
standard_expectations_met=1
local_verify_graduated=1
receipt_promotion_graduated=1
authority_promotion_allowed=0
decision_state=allowed-report-only
effect_allowed=1
effect_performed=0
runtime_authority_granted=0
```

Effect and runtime boundary

Even when effect_allowed=1, these fields remain zero:

```
effect_performed=0
runtime_authority_granted=0
host_read_performed=0
host_write_performed=0
network_performed=0
```

This implementation does not read host files, write host files, contact networks, execute tools, execute shells, enforce capabilities, persist policy, load trust stores, look up revocation status, generate keys, handle private keys, seal objects, or interact with the kernel.

Failure behavior

The implementation fails closed:

```
null output -&gt; LATTICRA_STATUS_NULL_ARGUMENT
null verified gate -&gt; invalid-input
invalid verified gate -&gt; invalid-gate
gate_allowed=0 -&gt; denied-gate
gate_state not allowed-metadata-only -&gt; denied-gate
failed crypto graduation gate evidence -&gt; denied-crypto-graduation-gate
authority-bearing crypto graduation evidence -&gt; denied-crypto-graduation-gate
missing requested effect -&gt; missing-requested-effect
unknown requested effect -&gt; denied-unknown-effect
runtime authority already granted -&gt; denied-runtime-authority
effect already performed -&gt; denied-host-effect
host read already performed -&gt; denied-host-effect
host write already performed -&gt; denied-host-effect
network already performed -&gt; denied-network-effect
small report buffer -&gt; LATTICRA_STATUS_BUFFER_TOO_SMALL
```

Failures do not perform effects and do not grant runtime authority.

Validation

Run locally:

```
sh scripts/test-latticra-seal-verified-effect-decision.sh
```

Expected output:

```
seal verified effect decision invariants: ok
```

Next valid slice

The next valid Latticra Seal planning slice is runtime handoff report or policy decision report propagation from eligible crypto-graduation-gated metadata-only runtime handoff evaluation.

That next slice should remain contract-first and should not perform runtime handoff yet unless separately implemented and guarded.

docs/LATTICRA_SEAL_VERIFIED_RECEIPT_PROMOTION_CONTRACT.md

Source title: Latticra Seal Verified Receipt Promotion Contract

Lines: 171 | Words: 494 | SHA-256: bcd2af5d9e71949ab93e31058a1cf2f1f8e6923a051aea5dad8411d1741e513f

Latticra Seal Verified Receipt Promotion Contract

Status: Latticra Seal verified receipt promotion contract Scope: contract for a future metadata promotion step after Ed25519 verify-only local verification. This document does not implement verified receipt promotion, capability authorization, effect execution, runtime authority, signing, key generation, private-key storage, trust-store loading, network lookup, revocation lookup, object sealing, host effects, kernel behavior, Fedora approval claims, production readiness, or operating-system behavior.

Purpose

This document defines the verified receipt promotion boundary for Latticra Seal.

The purpose of this layer is to convert a successful local verify-only result into a bounded verified receipt record without granting authority.

The promotion is evidence promotion, not permission promotion.

Required predecessors

This contract depends on:

```
docs/LATTICRA_SEAL_VERIFICATION_RECEIPT_CONTRACT.md
docs/LATTICRA_SEAL_VERIFICATION_RECEIPT_IMPLEMENTATION.md
docs/LATTICRA_SEAL_CRYPTO_VERIFY_BACKEND_CONTRACT.md
docs/LATTICRA_SEAL_ED25519_VERIFY_ONLY_CONTRACT.md
docs/LATTICRA_SEAL_ED25519_VERIFY_IMPLEMENTATION.md
include/latticra/seal_verification_receipt.h
include/latticra/seal_crypto_verify_backend.h
include/latticra/seal_ed25519_verify.h
src/seal_verification_receipt.c
src/seal_crypto_verify_backend.c
src/seal_ed25519_verify.c
tests/seal_verification_receipt_invariants.c
tests/seal_crypto_verify_backend_invariants.c
tests/seal_ed25519_verify_invariants.c
scripts/test-latticra-seal-verification-receipt.sh
scripts/test-latticra-seal-ed25519-verify.sh
```

The Ed25519 verify-only result is the only allowed input source for the first promotion implementation.

Promotion boundary

Allowed in the next implementation slice:

```
accept a valid Ed25519 verify-only result
require cryptographic_verification_supported=1
require cryptographic_verification_performed=1
require verified=1
require invalid=0
require crypto_verify_state=verified
copy message digest metadata
copy public-key identity metadata
copy signature algorithm metadata
copy trust-source metadata
set receipt_state=verified
set verification_state=verified
render deterministic verified receipt metadata
```

Forbidden in the next implementation slice:

```
capability authorization
effect execution
runtime authority grants
host reads
host writes
network lookup
revocation lookup
trust-store loading
signature generation
key generation
private-key handling
object sealing
kernel interaction
```

Authority boundary

A promoted verified receipt remains authority-neutral.

The future implementation may set:

```
verified=1
cryptographic_verification_supported=1
cryptographic_verification_performed=1
receipt_state=verified
```

```
verification_state=verified
```

The future implementation must keep these zero:

```
authority_usable=0
capability_gate_allowed=0
runtime_authority_granted=0
```

A verified receipt may become usable by a later capability gate only after a separate contract explicitly permits that behavior.

Planned fields

A future verified receipt promotion record should be bounded and deterministic.

Planned fields:

```
receipt_profile
verify_profile
backend_profile
verification_policy_profile
message_label
message_size_bytes
message_digest_algorithm
message_digest_hex
public_key_identity_label
signature_algorithm
trust_source
verification_state
receipt_state
cryptographic_verification_supported
cryptographic_verification_performed
verified
invalid
authority_usable
capability_gate_allowed
runtime_authority_granted
status
```

Failure behavior

Future verified receipt promotion must fail closed.

Required failure states:

```
null output -&gt; invalid
null verify result -&gt; invalid
unsupported verification -&gt; rejected
verification not performed -&gt; rejected
verified=0 -&gt; rejected
invalid=1 -&gt; rejected
crypto_verify_state not verified -&gt; rejected
missing message digest -&gt; rejected
missing public-key identity -&gt; rejected
runtime authority request -&gt; rejected
capability authorization request -&gt; rejected
```

Failures must not create keys, store keys, contact networks, query revocation status, sign records, read host files, write host files, enforce capabilities, perform effects, or grant runtime authority.

Promotion rule

This contract permits only the next implementation slice:

```
verified receipt promotion metadata implementation
```

It does not permit capability authorization, effect execution, runtime authority, key handling, trust-store behavior, revocation lookup, network behavior, host effects, or kernel behavior.

After verified receipt promotion exists and is guarded, the next valid planning slice is capability gate evaluation of a verified but authority-neutral receipt.

Validation

This contract is validated by:

```
sh scripts/test-latticra-seal-verified-receipt-promotion-contract.sh
```

docs/LATTICRA_SEAL_VERIFIED_RECEIPT_PROMOTION_IMPLEMENTATION.md

Source title: Latticra Seal Verified Receipt Promotion Implementation

Latticra Seal Verified Receipt Promotion Implementation

Status: initial verified receipt promotion metadata implementation Scope: bounded C metadata surface for promoting a successful Ed25519 verify-only result into verified receipt metadata.

Purpose

This document records the first Latticra Seal verified receipt promotion metadata implementation.

The implementation accepts an existing Ed25519 verify-only result and produces deterministic verified receipt metadata only when the verify-only result is already successful.

The promotion is evidence promotion, not permission promotion.

Added files

```
include/latticra/seal_verified_receipt_promotion.h
src/seal_verified_receipt_promotion.c
tests/seal_verified_receipt_promotion_invariants.c
scripts/test-latticra-seal-verified-receipt-promotion.sh
```

API summary

The verified receipt promotion metadata surface adds:

```
latticra_seal_verified_receipt_promotion_t
latticra_seal_verified_receipt_promotion_error_t
latticra_seal_verified_receipt_promotion_error_label
latticra_seal_verified_receipt_promotion_from_ed25519_result
latticra_seal_verified_receipt_promotion_is_authority_neutral
latticra_seal_verified_receipt_promotion_report
```

Promotion behavior

The implementation:

```
accepts a valid Ed25519 verify-only result
requires cryptographic_verification_supported=1
requires cryptographic_verification_performed=1
requires verified=1
requires invalid=0
requires crypto_verify_state=verified
copies verify profile metadata
copies backend profile metadata
copies verification policy profile metadata
copies message label metadata
copies message size metadata
copies message digest metadata
copies public-key identity metadata
copies signature algorithm metadata
copies trust-source metadata
sets verification_state=verified
sets receipt_state=verified
sets cryptographic_verification_supported=1
sets cryptographic_verification_performed=1
sets verified=1
```

```
sets invalid=0
sets authority_usable=0
sets capability_gate_allowed=0
sets runtime_authority_granted=0
renders deterministic verified receipt metadata
```

Authority boundary

The promoted receipt remains authority-neutral.

These fields remain zero:

```
authority_usable=0
capability_gate_allowed=0
runtime_authority_granted=0
```

Failure behavior

The implementation fails closed:

```
null verified receipt output -&gt; LATTICRA_STATUS_NULL_ARGUMENT
null Ed25519 verify result input -&gt; invalid-input
invalid Ed25519 verify result -&gt; invalid-verify-result
unsupported verification -&gt; unsupported-verification
verification not performed -&gt; verification-not-performed
verified flag not set -&gt; not-verified
invalid flag set -&gt; not-verified
crypto verify state not verified -&gt; invalid-verify-state
missing message digest -&gt; missing-message-digest
missing public-key identity -&gt; missing-public-key-identity
small report buffer -&gt; LATTICRA_STATUS_BUFFER_TOO_SMALL
```

Failures do not create keys, store secrets, contact networks, query revocation status, sign records, read host files, write host files, enforce capabilities, perform effects, or grant runtime authority.

Validation

Run locally:

```
sh scripts/test-latticra-seal-verified-receipt-promotion.sh
```

Expected output:

```
seal verified receipt promotion invariants: ok
```

Next valid slice

The next valid Latticra Seal slice is capability gate evaluation of a verified but authority-neutral receipt.

docs/specs/LATTICRA_SEAL_MANIFEST_v0_1.md

Source title: Latticra Seal Manifest v0.1

Lines: 109 | Words: 386 | SHA-256: b6a3e31f61ed3134fb84b83b146a0f07cd94b767508e8e2e05315c57ef226bce

Latticra Seal Manifest v0.1

latticra.seal is the root trust manifest for a Latticra project.

It is a human-readable, TOML-compatible manifest used to describe local project integrity rules, protected paths, policy checks, and proof-report metadata.

The .seal extension marks the file as a Latticra trust artifact while keeping it simple enough to parse from C, C++, Rust, Python, or shell tooling.

Purpose

The v0.1 manifest defines:

- project identity

- local trust boundary
- hash algorithm
- protected paths
- excluded paths
- required files
- basic policy checks
- report output locations
- reserved proof fields for future signing

Current Security Status

v0.1 is an unsigned local-integrity manifest.

It can support local scanning, policy checking, and digest reporting, but it should not yet be described as a complete cryptographic attestation system.

Required Root Fields

Required root fields:

schema = "latticra.seal/v0.1" format = "toml" kind = "local-integrity-manifest"

These fields identify the manifest version, parser expectation, and trust-artifact type.

Project Section

The project section describes the project being sealed.

Expected fields:

name = "Latticra" id = "latticra" version = "0.1.0" repository = "https://github.com/Bryforge/Latticra" license = "SEE LICENSE"

Seal Section

The seal section describes the active trust mode.

For v0.1:

mode = "local-integrity" status = "unsigned" algorithm = "sha256" digest_encoding = "hex" trust_boundary = "project-root"

Paths Section

The paths section defines what the scanner should include and exclude.

The v0.1 default includes the project root and excludes generated directories, dependency directories, temporary files, and generated reports.

Policy Section

The policy section defines local project checks.

Initial policy checks include:

- requiring a README
- requiring a LICENSE
- denying obvious private-key filenames
- denying .env files

- denying obvious committed token markers
- optionally warning about oversized files

Report Section

The report section defines where generated Seal reports should be written.

Default outputs:

reports/latticra-seal-report.txt reports/latticra-seal-file-hashes.txt

Proof Section

The proof section is reserved for future cryptographic fields.

In v0.1, these fields are intentionally empty:

manifest_hash = "" root_hash = "" signature_algorithm = "" signature = "" public_key = ""

Roadmap

- v0.1: local manifest, smoke verification, digest report
- v0.2: signed manifests and public-key verification
- v0.3: Merkle-style root hash and reproducible proof bundles
- v0.4: Latticra Panel integration
- v1.0: stable Seal CLI with documented guarantees and limits

docs/LATTICRA_CONSOLE_FOUNDATION.md

Source title: Latticra Console Foundation

Lines: 1559 | Words: 3950 | SHA-256: 29d7b84d22333dfb3ad730b6e1c4aa31a1ff09e6209e5d95fec3d2a092f56811

Latticra Console Foundation

Status: Stage-0 foundation Scope: LC identity, standalone and Panel installability, configurable metadata, session contract, workspace contract, namespace contract, rootfs contract, packages contract, init contract, substrate bridge, host-embedding plan, host-adapter contract, Seal receipt-request contract, receipt payload schema, receipt payload artifact draft, receipt payload artifact review gate, receipt payload artifact review receipt contract, receipt payload artifact review receipt draft contract, receipt payload materialization plan, signature-request binding contract, OS-base planning contract, VM evidence contract, and future OS-base direction.

Purpose

Latticra Console, shortened to LC, is the planned main operator base for Latticra.

LC should become the primary interaction surface for the Latticra substrate and the surrounding system. It is designed to be configurable, installable through Latticra Panel, available as a standalone user-local console, embeddable inside a host environment, and eventually capable of growing into an OS-like user environment after explicit evidence gates.

This Stage-0 slice makes LC real without overclaiming authority.

Phase1 Lessons Retained

The Phase1 reference is useful as a learning source, not as code to copy. Its relevant lessons are:

- a command registry should be the source of truth for help, command discovery, and future capability metadata;
- operator consoles need a guarded host boundary from the first implementation slice;
- OS-track language should stay staged and evidence-bound;
- help, status, and inspection commands should exist before effectful commands.

LC applies those lessons to Latticra's own architecture: Lat, LIR, Nucleus, Runtime Boundary, Latticra Seal, Panel, Nadia, and the System Substrate.

Installed Identity

share/latticra/lc/vm-evidence/contract.toml
share/latticra/components/latticra-console.installed
```

The default user-local wrapper is:

```
latticra-lc
```

Panel installs can rename that direct wrapper with lc.install.command_wrapper; the wrapper also serves as the standalone LC entrypoint and does not require Panel at runtime. The umbrella route remains latticra lc ....

The standalone installer presets are:

```
installer/configs/lc-standalone.installer.toml
installer/configs/lc-standalone-local.installer.toml
```

They set profile = "lc_standalone", lc.profile = "standalone", lc.install.install_profile = "lc-standalone-install-v0", lc.install.install_mode = "metadata-only-standalone-console", lc.install.panel_embedded_console = false, and leave external host commands disabled. The lc-standalone-local preset is the guarded local-write companion for the dry-run standalone preset.

LC can also be installed as a standalone local console:

```
installer/configs/lc-standalone.installer.toml
installer/configs/lc-standalone-local.installer.toml
installer/scripts/latticra-installer-verify-lc-standalone.sh
```

The standalone lane uses lc-standalone-install-v0, writes share/latticra/lc/standalone/contract.toml, keeps standalone_requires_panel = false, disables Panel embedding, and preserves the same no-effect host/network/runtime/boot authority floor.

The LC session lane writes share/latticra/lc/session/contract.toml and exposes lc session. It defines the future operator-base session envelope for standalone, Panel-embedded, and Host-embedded LC while keeping runtime session creation, shell launch, host process launch, host mutation, network, runtime enforcement, boot, and production OS authority denied.

The LC workspace lane writes share/latticra/lc/workspace/contract.toml and exposes lc workspace. It names the future operator-root workspace envelope while keeping workspace mounts, manifest writes, file reads, file writes, host workspace binding, host mutation, network, runtime enforcement, boot, and production OS authority denied.

The LC namespace lane writes share/latticra/lc/namespace/contract.toml and exposes lc namespace. It names the future internal OS-style namespace envelope while keeping namespace mounts, rootfs projection, path resolution, file reads, file writes, host path projection, host mutation, network, runtime enforcement, boot, and production OS authority denied.

The LC rootfs lane writes share/latticra/lc/rootfs/contract.toml and exposes lc rootfs. It names the future internal root filesystem envelope while keeping rootfs image creation, image opening, mounts, package installs, file reads, file writes, host mutation, network, runtime enforcement, boot, and production OS authority denied.

The LC packages lane writes share/latticra/lc/packages/contract.toml and exposes lc packages. It names the future rootfs package-manifest envelope while keeping package catalog reads, downloads, install-plan writes, package-manager execution, package-script execution, rootfs package installs, host mutation, network, runtime enforcement, boot, and production OS authority denied.

The LC init lane writes share/latticra/lc/init/contract.toml and exposes lc init. It names the future internal init and service envelope while keeping PID 1 claims, init process launch, service starts, service stops, process supervision, startup-order writes, host mutation, network, runtime enforcement, boot, and production OS authority denied.

The umbrella wrapper routes:

```
latticra lc status
```

Stage-0 Commands

```
help
status
plan
save
dry-run
reset
uninstall
clear
lc status
lc commands
lc standalone
lc session
lc workspace
lc namespace
lc rootfs
lc packages
lc init
lc profiles
lc receipts
lc receipt-request
lc receipt-payload
lc receipt-artifact
lc receipt-artifact-review
lc receipt-review-receipt
lc receipt-review-draft
lc receipt-materialization-plan
lc signature-request
lc substrate
lc host
lc host-contract
lc host-inventory
lc host-adapter
lc os-contract
lc vm-evidence
lc os
pwd
cd
```

These commands are registry-backed in the C foundation. Each command carries:

```
name
usage
category
effect
capability_label
no_effect
panel_visible
launches_host_process
requires_future_gate
```

The Stage-0 registry is still metadata-only. It reports identity, seed command metadata, substrate bridge, host-embedding plan, and future OS-base posture. It does not launch host commands.

Panel Profile Presets

Latticra Panel now carries LC profile presets as a first-class installer configuration block:

```
[lc]
profile = &quot;panel_embedded&quot;
command_registry_profile = &quot;c-static-table&quot;
substrate_bridge_profile = &quot;metadata-bound&quot;
host_embedding_profile = &quot;panel-contained&quot;
host_embedding_contract_profile = &quot;lc-host-embedding-v0&quot;
host_inventory_contract_profile = &quot;lc-host-inventory-v0&quot;
host_adapter_contract_profile = &quot;lc-host-adapter-v0&quot;
session_contract_profile = &quot;lc-session-v0&quot;
workspace_contract_profile = &quot;lc-workspace-v0&quot;
namespace_contract_profile = &quot;lc-namespace-v0&quot;
rootfs_contract_profile = &quot;lc-rootfs-v0&quot;
packages_contract_profile = &quot;lc-packages-v0&quot;
init_contract_profile = &quot;lc-init-v0&quot;
receipt_request_contract_profile = &quot;lc-receipt-request-v0&quot;
receipt_payload_schema_profile = &quot;lc-receipt-payload-schema-v0&quot;
receipt_payload_artifact_draft_profile = &quot;lc-receipt-payload-artifact-draft-v0&quot;
receipt_payload_artifact_review_profile = &quot;lc-receipt-payload-artifact-review-v0&quot;
receipt_payload_artifact_review_receipt_profile =
&quot;lc-receipt-payload-artifact-review-receipt-v0&quot;
receipt_payload_artifact_review_receipt_draft_profile =
&quot;lc-receipt-payload-artifact-review-receipt-draft-v0&quot;
receipt_payload_materialization_plan_profile = &quot;lc-receipt-payload-materialization-plan-
v0&quot;
signature_request_binding_profile = &quot;lc-signature-request-binding-v0&quot;
receipt_contract_profile = &quot;lc-receipts-v0&quot;
os_base_contract_profile = &quot;lc-os-base-v0&quot;
vm_evidence_contract_profile = &quot;lc-vm-evidence-v0&quot;
os_base_profile = &quot;planned-no-boot-authority&quot;
panel_bridge = &quot;panel-aware&quot;
report_only = true
require_host_embedding_contract = true
require_read_only_host_inventory_contract = true
require_profile_receipt = true
require_host_contract_receipt = true
require_host_inventory_receipt = true
require_host_adapter_contract = true
require_session_contract = true
require_workspace_contract = true
require_namespace_contract = true
require_rootfs_contract = true
require_packages_contract = true
require_init_contract = true
require_receipt_request_contract = true
require_receipt_payload_schema = true
require_receipt_payload_artifact_draft = true
require_receipt_payload_artifact_review = true
require_receipt_payload_artifact_review_receipt = true
require_receipt_payload_artifact_review_receipt_draft = true
require_receipt_payload_materialization_plan = true
require_signature_request_binding = true
require_os_base_contract = true
require_vm_evidence_contract = true
require_runtime_boundary_binding = true
require_seal_capability_labels = true

[lc.install]
install_profile = &quot;lc-panel-install-v0&quot;
install_mode = &quot;metadata-only-console-foundation&quot;
command_wrapper = &quot;latticra-lc&quot;
standalone_console = true
standalone_installable = true
standalone_requires_panel = false
panel_embedded_console = true
install_user_wrapper = true
allow_external_host_commands = false
```

The current presets are:

```
hosted_reference -&gt; hosted reference metadata without embedded-host claims
standalone -&gt; standalone LC wrapper profile without requiring Panel at runtime
panel_embedded -&gt; default Panel-installed LC operator surface
host_embedded_planning -&gt; future host-embedding plan with zero host mutation authority
os_base_planning -&gt; future OS-base plan with zero boot, kernel, or runtime enforcement
```

```
authority
custom -&gt; manual metadata fields under the same no-effect authority floor
```

Panel exposes the presets in a Latticra Console workspace tab and in the embedded console:

```
lc profiles
lc profile hosted
lc profile standalone
lc profile panel
lc profile host
lc profile os
lc profile custom
```

The install engine writes the selected profile into etc/latticra/lc.toml, writes install metadata into share/latticra/lc/install/config.toml, and installs the preset files under share/latticra/lc/profiles/. The command wrapper comes from lc.install.command_wrapper and defaults to latticra-lc. That wrapper is the standalone LC entrypoint when lc.install.standalone_console = true; it remains metadata-only and does not require Panel at runtime. These profiles and install records remain configuration metadata only, and external host commands stay disabled from both Panel and standalone LC.

Standalone Contract

LC now installs and reports a standalone console contract before standalone use can gain any effectful host or OS authority:

```
standalone_console_profile=lc-standalone-console-v0
standalone_console_status=metadata-only-contract
standalone_contract_present=1
standalone_console=1
standalone_installable=1
standalone_requires_panel=0
standalone_command_wrapper=latticra-lc
standalone_profile_file=profiles/standalone-console.toml
panel_embedded_console=1
panel_required_for_runtime=0
config_path=etc/latticra/lc.toml
share_path=share/latticra/lc
command_registry_required=1
runtime_boundary_required=1
seal_capability_labels_required=1
profile_receipt_required=1
promotion_gate=lc_standalone_console_before_effectful_host_or_os_authority
command_surface=lc standalone
related_install_config_command=lc install-config
related_profile_command=lc profiles
no_effect=1
shell_execution_allowed=0
host_process_launch_allowed=0
host_file_read_allowed=0
host_file_write_allowed=0
host_mutation_allowed=0
network_allowed=0
runtime_enforcement_allowed=0
boot_allowed=0
production_os_claim=0
```

The source and installed command surfaces are:

```
latticra_console_report standalone
latticra-lc standalone
```

The standalone contract does not launch a shell, launch host processes, read or write host files, mutate the host, use the network, enforce runtime policy, boot hardware, or claim production OS status.

Session Contract

LC now installs and reports a session contract before the Console can claim any runtime-session or host-adapter behavior:

```
session_profile=lc-session-v0
session_status=metadata-only-contract
session_contract_present=1
session_kind=operator-base
```

```
standalone_compatible=1
panel_embedded_compatible=1
host_embedded_planned=1
session_manifest_present=0
session_manifest_write_allowed=0
runtime_session_created=0
runtime_process_spawn_allowed=0
runtime_invocation_allowed=0
interactive_shell_allowed=0
promotion_gate=lc_session_contract_before_runtime_or_host_embedding
command_surface=lc session
host_process_launch_allowed=0
host_mutation_allowed=0
network_allowed=0
runtime_enforcement_allowed=0
boot_allowed=0
production_os_claim=0
```

The source and installed command surfaces are:

```
latticra_console_report session
latticra-lc session
```

The session contract is an operator-base envelope only. It does not create a runtime session, launch an interactive shell, spawn host processes, invoke runtimes, write session manifests, mutate the host, use the network, enforce runtime policy, boot hardware, or claim production OS status.

Workspace Contract

LC now installs and reports a workspace contract before the Console can claim any mounted workspace, manifest, or OS-base workspace behavior:

```
workspace_profile=lc-workspace-v0
workspace_status=metadata-only-contract
workspace_contract_present=1
workspace_kind=operator-root
workspace_root=share/latticra/lc/workspace
workspace_mount_present=0
workspace_mount_allowed=0
host_workspace_bind_allowed=0
workspace_manifest_present=0
workspace_manifest_write_allowed=0
workspace_file_read_allowed=0
workspace_file_write_allowed=0
workspace_mutation_allowed=0
runtime_session_required_before_workspace_runtime=1
session_contract_required=1
host_adapter_contract_required=1
os_base_contract_required=1
promotion_gate=lc_workspace_contract_before_host_mount_or_os_workspace
command_surface=lc workspace
host_process_launch_allowed=0
host_mutation_allowed=0
network_allowed=0
runtime_enforcement_allowed=0
boot_allowed=0
production_os_claim=0
```

The source and installed command surfaces are:

```
latticra_console_report workspace
latticra-lc workspace
```

The workspace contract is an operator-root envelope only. It does not mount a workspace, bind Host workspace paths, read or write files, write manifests, mutate the host, use the network, enforce runtime policy, boot hardware, or claim production OS status.

Namespace Contract

LC now installs and reports a namespace contract before the Console can claim any internal OS-style namespace, rootfs, mount, or host path projection behavior:

```
namespace_profile=lc-namespace-v0
namespace_status=metadata-only-contract
namespace_contract_present=1
```

```
namespace_kind=lc-internal-os-namespace
namespace_root=share/latticra/lc/namespace
namespace_manifest_present=0
namespace_manifest_write_allowed=0
namespace_mount_present=0
namespace_mount_allowed=0
rootfs_present=0
rootfs_mount_allowed=0
path_resolver_present=0
path_resolution_allowed=0
host_path_projection_allowed=0
workspace_namespace_bind_allowed=0
namespace_file_read_allowed=0
namespace_file_write_allowed=0
namespace_mutation_allowed=0
workspace_contract_required=1
session_contract_required=1
runtime_boundary_required=1
promotion_gate=lc_namespace_contract_before_rootfs_or_path_projection
command_surface=lc namespace
host_process_launch_allowed=0
host_mutation_allowed=0
network_allowed=0
runtime_enforcement_allowed=0
boot_allowed=0
production_os_claim=0
```

The source and installed command surfaces are:

```
latticra_console_report namespace
latticra-lc namespace
```

The namespace contract is an internal OS-layout envelope only. It does not mount namespaces, create a rootfs, resolve host paths, project host paths, bind workspaces into a namespace, read or write files, mutate the host, use the network, enforce runtime policy, boot hardware, or claim production OS status.

Rootfs Contract

LC now installs and reports a rootfs contract before the Console can claim image creation, mounts, package writes, boot adjacency, or OS-base filesystem behavior:

```
rootfs_profile=lc-rootfs-v0
rootfs_status=metadata-only-contract
rootfs_contract_present=1
rootfs_kind=lc-internal-root-filesystem
rootfs_root=share/latticra/lc/rootfs
rootfs_state_source=metadata-only
rootfs_manifest_present=0
rootfs_manifest_write_allowed=0
rootfs_image_present=0
rootfs_image_create_allowed=0
rootfs_image_open_allowed=0
rootfs_mount_present=0
rootfs_mount_allowed=0
rootfs_package_manifest_present=0
rootfs_package_install_allowed=0
rootfs_file_read_allowed=0
rootfs_file_write_allowed=0
rootfs_mutation_allowed=0
namespace_contract_required=1
workspace_contract_required=1
session_contract_required=1
runtime_boundary_required=1
receipt_required_before_rootfs_materialization=1
command_surface=lc rootfs
host_process_launch_allowed=0
host_mutation_allowed=0
network_allowed=0
runtime_enforcement_allowed=0
boot_allowed=0
production_os_claim=0
promotion_gate=lc_rootfs_contract_before_image_mount_or_package_write
```

The source and installed command surfaces are:

```
latticra_console_report rootfs
latticra-lc rootfs
```

The rootfs contract is metadata only. It does not create or open a rootfs image, mount a filesystem, install packages, read or write rootfs files, mutate the host, use the network, enforce runtime policy, boot hardware, or claim production OS status.

Packages Contract

LC now installs and reports a packages contract before the Console can claim package catalogs, package downloads, package-manager execution, package-script execution, install plans, package manifests, or rootfs package writes:

```
packages_profile=lc-packages-v0
packages_status=metadata-only-contract
packages_contract_present=1
packages_kind=lc-rootfs-package-manifest-envelope
packages_root=share/latticra/lc/packages
packages_state_source=metadata-only
package_manifest_present=0
package_manifest_write_allowed=0
package_catalog_present=0
package_catalog_read_allowed=0
package_catalog_write_allowed=0
package_download_allowed=0
package_install_plan_present=0
package_install_plan_write_allowed=0
package_manager_present=0
package_manager_execution_allowed=0
package_script_execution_allowed=0
rootfs_package_manifest_present=0
rootfs_package_install_allowed=0
rootfs_file_write_allowed=0
rootfs_contract_required=1
namespace_contract_required=1
workspace_contract_required=1
session_contract_required=1
os_base_contract_required=1
runtime_boundary_required=1
receipt_required_before_package_materialization=1
command_surface=lc packages
host_process_launch_allowed=0
host_mutation_allowed=0
network_allowed=0
runtime_enforcement_allowed=0
boot_allowed=0
production_os_claim=0
promotion_gate=lc_packages_contract_before_catalog_install_or_rootfs_write
```

The source and installed command surfaces are:

```
latticra_console_report packages
latticra-lc packages
```

The packages contract is metadata only. It does not read package catalogs, download packages, write manifests or install plans, run package managers or package scripts, install packages into rootfs, mutate the host, use the network, enforce runtime policy, boot hardware, or claim production OS status.

Init Contract

LC now installs and reports an init contract before the Console can claim PID 1, an init process, service supervision, startup ordering, boot adjacency, or OS-base init behavior:

```
init_profile=lc-init-v0
init_status=metadata-only-contract
init_contract_present=1
init_kind=lc-internal-init-and-service-envelope
init_root=share/latticra/lc/init
init_state_source=metadata-only
init_manifest_present=0
init_manifest_write_allowed=0
pid1_claim_allowed=0
init_process_present=0
init_process_launch_allowed=0
service_registry_present=0
service_registry_write_allowed=0
service_start_allowed=0
```

```
service_stop_allowed=0
service_restart_allowed=0
process_supervision_allowed=0
startup_order_present=0
startup_order_write_allowed=0
rootfs_contract_required=1
packages_contract_required=1
namespace_contract_required=1
workspace_contract_required=1
session_contract_required=1
os_base_contract_required=1
runtime_boundary_required=1
receipt_required_before_init_runtime=1
command_surface=lc init
host_process_launch_allowed=0
host_mutation_allowed=0
network_allowed=0
runtime_enforcement_allowed=0
boot_allowed=0
production_os_claim=0
promotion_gate=lc_init_contract_before_pid1_service_supervision_or_boot
```

The source and installed command surfaces are:

```
latticra_console_report init
latticra-lc init
```

The init contract is metadata only. It does not claim PID 1, launch an init process, start or stop services, supervise processes, write startup order, mutate the host, use the network, enforce runtime policy, boot hardware, or claim production OS status.

Host Embedding Contract

LC now installs and reports a host-embedding contract before any host integration behavior exists:

```
contract_profile=lc-host-embedding-v0
contract_status=metadata-only
host_adapter_required=1
panel_install_required=1
runtime_boundary_required=1
seal_capability_labels_required=1
operator_consent_required=1
read_only_host_inventory_required_before_embedding=1
receipt_required_before_embedding=1
promotion_gate=contract_receipt_and_read_only_host_inventory
```

The source and installed command surfaces are:

```
latticra_console_report host-contract
latticra-lc host-contract
```

The contract explicitly denies host authority:

```
host_embedded_now=0
host_process_launch_allowed=0
host_file_read_allowed=0
host_file_write_allowed=0
host_mutation_allowed=0
network_allowed=0
runtime_enforcement_allowed=0
boot_allowed=0
```

lc host-contract is an inspectable contract command. lc host remains the future-gated embedding lane.

Read-Only Host Inventory Contract

LC also installs and reports a read-only host inventory contract before any host adapter exists:

```
contract_profile=lc-host-inventory-v0
contract_status=metadata-only
required_before_host_embedding=1
host_adapter_present=0
inventory_schema_status=planned
inventory_performed=0
```

```
inventory_artifact_present=0
inventory_receipt_required=1
operator_consent_required=1
runtime_boundary_required=1
seal_capability_labels_required=1
promotion_gate=host_inventory_contract_receipt_before_host_adapter
```

The intended future inventory scope is narrow and reviewable:

```
allowed_future_scope=os_family,kernel_version,cpu_arch,memory_class,filesystem_roots,user_scope,
prefix_scope
excluded_future_scope=secrets,private_files,network_scan,process_launch,kernel_change,system_mut
ation
```

The current command surfaces are:

```
latticra_console_report host-inventory
latticra-lc host-inventory
```

This command does not inventory the host. It reports the contract and denial posture:

```
inventory_performed=0
host_probe_allowed=0
host_process_launch_allowed=0
host_file_read_allowed=0
host_file_write_allowed=0
host_mutation_allowed=0
network_allowed=0
runtime_enforcement_allowed=0
boot_allowed=0
```

Host Adapter Contract

LC now installs and reports a host-adapter contract before any Host embedding adapter exists:

```
contract_profile=lc-host-adapter-v0
contract_status=metadata-only
contract_present=1
host_adapter_enabled=0
host_adapter_present=0
host_adapter_loaded=0
adapter_api_status=planned
adapter_abi_status=planned
host_embedding_contract_required=1
read_only_host_inventory_contract_required=1
host_embedding_contract_receipt_required=1
host_inventory_contract_receipt_required=1
operator_consent_required=1
runtime_boundary_required=1
seal_capability_labels_required=1
receipt_required_before_host_adapter=1
promotion_gate=host_adapter_contract_receipts_and_inventory
```

The source and installed command surfaces are:

```
latticra_console_report host-adapter
latticra-lc host-adapter
```

The contract explicitly denies adapter and host authority:

```
host_embedded_now=0
host_process_launch_allowed=0
host_probe_allowed=0
host_file_read_allowed=0
host_file_write_allowed=0
host_mutation_allowed=0
network_allowed=0
runtime_enforcement_allowed=0
boot_allowed=0
```

lc host-adapter is an inspectable contract command. lc host remains the future-gated embedding lane.

Receipt Contract

LC now installs and reports a receipt contract for its profile and host-side planning metadata:

```
receipt_profile=lc-receipts-v0
receipt_contract_status=metadata-only
profile_receipt_required=1
host_embedding_contract_receipt_required=1
host_inventory_contract_receipt_required=1
host_adapter_contract_receipt_required=1
session_contract_receipt_required=1
session_contract_present=1
workspace_contract_receipt_required=1
workspace_contract_present=1
namespace_contract_receipt_required=1
namespace_contract_present=1
rootfs_contract_receipt_required=1
rootfs_contract_present=1
packages_contract_receipt_required=1
packages_contract_present=1
init_contract_receipt_required=1
init_contract_present=1
receipt_request_contract_required=1
receipt_request_contract_present=1
receipt_payload_schema_required=1
receipt_payload_schema_present=1
receipt_payload_artifact_draft_required=1
receipt_payload_artifact_draft_present=1
receipt_payload_artifact_review_required=1
receipt_payload_artifact_review_present=1
receipt_payload_artifact_review_receipt_required=1
receipt_payload_artifact_review_receipt_present=1
receipt_payload_materialization_plan_required=1
receipt_payload_materialization_plan_present=1
signature_request_binding_required=1
signature_request_binding_contract_present=1
runtime_boundary_receipt_required=1
seal_capability_labels_required=1
signature_request_profile=latticra-seal-signature-request/0.1
receipt_request_command=lc receipt-request
receipt_payload_schema_command=lc receipt-payload
receipt_payload_artifact_draft_command=lc receipt-artifact
receipt_payload_artifact_review_command=lc receipt-artifact-review
receipt_payload_artifact_review_receipt_command=lc receipt-review-receipt
receipt_payload_materialization_plan_command=lc receipt-materialization-plan
signature_request_binding_command=lc signature-request
session_contract_command=lc session
workspace_contract_command=lc workspace
namespace_contract_command=lc namespace
rootfs_contract_command=lc rootfs
packages_contract_command=lc packages
init_contract_command=lc init
receipt_surfaces=profile,session,workspace,namespace,rootfs,packages,init,host-contract,host-inv
entory,host-adapter,runtime-boundary
promotion_gate=lc_receipts_before_host_adapter_or_os_base
```

The source and installed command surfaces are:

```
latticra_console_report receipts
latticra-lc receipts
```

The contract reserves a future Seal-signed receipt path without claiming signing authority now:

```
seal_signature_planned=1
seal_signature_present=0
seal_signing_authority_present=0
receipt_written=0
receipt_signed=0
receipt_hash_recorded=0
receipt_path_recorded=0
file_write_allowed=0
```

Seal Receipt Request Contract

LC now installs and reports a metadata-only request contract for the future Seal-signed LC receipt path:

```
request_profile=lc-receipt-request-v0
request_contract_status=metadata-only
request_contract_present=1
receipt_contract_profile=lc-receipts-v0
signature_request_profile=latticra-seal-signature-request/0.1
```

```
requested_receipt_profile=latticra-seal-verified-receipt/0.1
requested_capability=verified-receipt-report
requested_surfaces=profile,session,workspace,namespace,rootfs,packages,init,host-contract,host-i
nventory,host-adapter,runtime-boundary
receipt_payload_schema_profile=lc-receipt-payload-schema-v0
receipt_payload_schema_required=1
receipt_payload_schema_present=1
receipt_payload_schema_command=lc receipt-payload
receipt_payload_artifact_draft_profile=lc-receipt-payload-artifact-draft-v0
receipt_payload_artifact_draft_required=1
receipt_payload_artifact_draft_present=1
receipt_payload_artifact_draft_command=lc receipt-artifact
receipt_payload_artifact_review_profile=lc-receipt-payload-artifact-review-v0
receipt_payload_artifact_review_required=1
receipt_payload_artifact_review_present=1
receipt_payload_artifact_review_command=lc receipt-artifact-review
receipt_payload_artifact_review_receipt_profile=lc-receipt-payload-artifact-review-receipt-v0
receipt_payload_artifact_review_receipt_required=1
receipt_payload_artifact_review_receipt_present=1
receipt_payload_artifact_review_receipt_command=lc receipt-review-receipt
receipt_payload_materialization_plan_profile=lc-receipt-payload-materialization-plan-v0
receipt_payload_materialization_plan_required=1
receipt_payload_materialization_plan_present=1
receipt_payload_materialization_plan_command=lc receipt-materialization-plan
draft_review_receipt_present=0
materialization_preconditions_met=0
materialization_allowed=0
payload_artifact_present=0
payload_materialized=0
signature_request_binding_profile=lc-signature-request-binding-v0
signature_request_binding_required=1
signature_request_binding_contract_present=1
signature_request_binding_command=lc signature-request
receipt_payload_profile=lc-receipts-v0
receipt_payload_hash_recorded=0
receipt_payload_path_recorded=0
promotion_gate=lc_receipt_request_review_before_signing
```

The source and installed command surfaces are:

```
latticra_console_report receipt-request
latticra-lc receipt-request
```

The request contract is a bridge to Seal metadata only. It explicitly denies signing and file authority:

```
seal_signature_planned=1
seal_signature_request_ready=0
seal_signature_request_present=0
seal_signing_authority_present=0
seal_signer_handoff_allowed=0
seal_signing_operation_allowed=0
receipt_write_allowed=0
receipt_signed=0
receipt_verification_allowed=0
file_write_allowed=0
host_process_launch_allowed=0
host_mutation_allowed=0
network_allowed=0
runtime_enforcement_allowed=0
boot_allowed=0
```

Receipt Payload Schema

LC now installs and reports the metadata-only payload schema that a future Seal signature-request artifact would consume:

```
schema_profile=lc-receipt-payload-schema-v0
schema_status=metadata-only
schema_present=1
receipt_request_profile=lc-receipt-request-v0
receipt_contract_profile=lc-receipts-v0
signature_request_profile=latticra-seal-signature-request/0.1
requested_receipt_profile=latticra-seal-verified-receipt/0.1
requested_capability=verified-receipt-report
payload_fields=console_id,profile,command_registry,host_contract,host_inventory,host_adapter,run
time_boundary,seal_capability_labels,authority_denials
required_authority_fields=no_effect,execution_allowed,host_mutation_allowed,network_allowed,runt
ime_enforcement_allowed,boot_allowed
```

```
payload_artifact_present=0
payload_hash_computed=0
payload_path_recorded=0
receipt_payload_artifact_draft_profile=lc-receipt-payload-artifact-draft-v0
receipt_payload_artifact_draft_present=1
receipt_payload_artifact_draft_command=lc receipt-artifact
receipt_payload_artifact_review_profile=lc-receipt-payload-artifact-review-v0
receipt_payload_artifact_review_present=1
receipt_payload_artifact_review_command=lc receipt-artifact-review
receipt_payload_artifact_review_receipt_profile=lc-receipt-payload-artifact-review-receipt-v0
receipt_payload_artifact_review_receipt_present=1
receipt_payload_artifact_review_receipt_command=lc receipt-review-receipt
receipt_payload_materialization_plan_profile=lc-receipt-payload-materialization-plan-v0
receipt_payload_materialization_plan_present=1
receipt_payload_materialization_plan_command=lc receipt-materialization-plan
materialization_preconditions_met=0
materialization_allowed=0
signature_request_binding_present=0
signature_request_binding_allowed=0
signature_request_binding_contract_present=1
signature_request_binding_command=lc signature-request
promotion_gate=lc_receipt_payload_schema_before_signature_request_binding
```

The source and installed command surfaces are:

```
latticra_console_report receipt-payload
latticra-lc receipt-payload
```

This schema does not create a payload, hash a payload, write a payload path, bind a signature request, or grant signing authority.

Receipt Payload Artifact Draft

LC now installs and reports a no-write draft contract for the future receipt payload artifact:

```
draft_profile=lc-receipt-payload-artifact-draft-v0
draft_status=metadata-only
draft_contract_present=1
receipt_request_profile=lc-receipt-request-v0
receipt_payload_schema_profile=lc-receipt-payload-schema-v0
receipt_payload_artifact_review_profile=lc-receipt-payload-artifact-review-v0
receipt_payload_artifact_review_present=1
receipt_payload_artifact_review_command=lc receipt-artifact-review
receipt_payload_artifact_review_receipt_profile=lc-receipt-payload-artifact-review-receipt-v0
receipt_payload_artifact_review_receipt_present=1
receipt_payload_artifact_review_receipt_command=lc receipt-review-receipt
receipt_payload_materialization_plan_profile=lc-receipt-payload-materialization-plan-v0
receipt_payload_materialization_plan_present=1
receipt_payload_materialization_plan_command=lc receipt-materialization-plan
signature_request_binding_profile=lc-signature-request-binding-v0
receipt_contract_profile=lc-receipts-v0
signature_request_profile=latticra-seal-signature-request/0.1
signing_authorization_profile=latticra-seal-signing-authorization/0.1
canonicalization_profile=lc-receipt-payload-canonical-text-v0
artifact_fields=console_id,profile,command_registry,host_contract,host_inventory,host_adapter,ru
ntime_boundary,seal_capability_labels,authority_denials
required_prior_contracts=receipt-request,receipt-payload-schema,signature-request-binding,receip
t-contract
receipt_payload_artifact_draft_present=1
draft_review_required=1
draft_review_present=0
draft_review_receipt_required=1
draft_review_receipt_present=0
draft_review_approval_recorded=0
materialization_preconditions_met=0
materialization_allowed=0
payload_artifact_present=0
payload_materialized=0
payload_write_allowed=0
payload_hash_computed=0
payload_hash_recorded=0
payload_path_recorded=0
signature_request_binding_artifact_present=0
signature_request_binding_allowed=0
seal_signature_request_ready=0
receipt_write_allowed=0
receipt_signed=0
promotion_gate=lc_receipt_payload_artifact_draft_before_materialization_and_signature_request
```

```
related_materialization_plan_command=lc receipt-materialization-plan
```

The source and installed command surfaces are:

```
latticra_console_report receipt-artifact
latticra-lc receipt-artifact
```

This draft does not create or write a payload artifact, compute or record a payload hash, record a payload path, bind a Seal signature request, invoke signing, or write a receipt.

Receipt Payload Artifact Review Gate

LC now installs and reports a metadata-only review gate between the payload artifact draft and any future payload materialization:

```
review_profile=lc-receipt-payload-artifact-review-v0
review_status=metadata-only
review_gate_present=1
receipt_payload_artifact_draft_profile=lc-receipt-payload-artifact-draft-v0
receipt_payload_artifact_draft_required=1
receipt_payload_artifact_draft_present=1
receipt_payload_artifact_draft_command=lc receipt-artifact
receipt_payload_artifact_review_receipt_profile=lc-receipt-payload-artifact-review-receipt-v0
receipt_payload_artifact_review_receipt_required=1
receipt_payload_artifact_review_receipt_present=1
receipt_payload_artifact_review_receipt_command=lc receipt-review-receipt
receipt_payload_materialization_plan_profile=lc-receipt-payload-materialization-plan-v0
receipt_payload_materialization_plan_present=1
receipt_payload_materialization_plan_command=lc receipt-materialization-plan
draft_review_required=1
draft_review_present=0
draft_review_receipt_required=1
draft_review_receipt_present=0
draft_review_approval_recorded=0
draft_reviewer_identity_recorded=0
draft_review_timestamp_recorded=0
materialization_plan_required=1
materialization_plan_present=1
materialization_preconditions_met=0
materialization_allowed=0
payload_artifact_present=0
payload_materialized=0
payload_write_allowed=0
payload_hash_computed=0
payload_hash_recorded=0
payload_path_recorded=0
signature_request_binding_allowed=0
signature_request_binding_artifact_present=0
seal_signature_request_ready=0
seal_signature_request_present=0
seal_signing_authority_present=0
receipt_write_allowed=0
receipt_signed=0
promotion_gate=lc_receipt_payload_artifact_review_before_materialization
command_surface=lc receipt-artifact-review
related_materialization_plan_command=lc receipt-materialization-plan
```

The source and installed command surfaces are:

```
latticra_console_report receipt-artifact-review
latticra-lc receipt-artifact-review
```

This gate records that the draft still needs review and a review receipt. It does not materialize the payload artifact, write payload bytes, compute or record a payload hash, record a payload path, bind a Seal signature request, invoke signing, or write a receipt.

Receipt Payload Artifact Review Receipt Contract

LC now installs and reports the metadata-only receipt contract for the payload artifact review gate before materialization can become possible:

```
review_receipt_profile=lc-receipt-payload-artifact-review-receipt-v0
review_receipt_status=metadata-only-contract
review_receipt_contract_present=1
review_receipt_draft_profile=lc-receipt-payload-artifact-review-receipt-draft-v0
review_receipt_draft_required=1
review_receipt_draft_contract_present=1
```

```
review_receipt_draft_command=lc receipt-review-draft
receipt_payload_artifact_review_profile=lc-receipt-payload-artifact-review-v0
receipt_payload_artifact_review_required=1
receipt_payload_artifact_review_present=1
receipt_payload_artifact_review_command=lc receipt-artifact-review
receipt_payload_artifact_review_receipt_profile=lc-receipt-payload-artifact-review-receipt-v0
receipt_payload_artifact_review_receipt_required=1
receipt_payload_artifact_review_receipt_present=1
receipt_payload_artifact_review_receipt_command=lc receipt-review-receipt
receipt_payload_materialization_plan_profile=lc-receipt-payload-materialization-plan-v0
receipt_payload_materialization_plan_required=1
receipt_payload_materialization_plan_present=1
receipt_payload_materialization_plan_command=lc receipt-materialization-plan
draft_review_required=1
draft_review_present=0
draft_review_receipt_required=1
draft_review_receipt_present=0
draft_review_receipt_artifact_present=0
draft_review_receipt_write_allowed=0
draft_review_receipt_signed=0
draft_review_receipt_hash_recorded=0
draft_review_receipt_path_recorded=0
draft_review_approval_recorded=0
draft_reviewer_identity_recorded=0
draft_review_timestamp_recorded=0
materialization_preconditions_met=0
materialization_allowed=0
payload_artifact_present=0
payload_materialized=0
payload_write_allowed=0
signature_request_binding_allowed=0
receipt_write_allowed=0
receipt_signed=0
promotion_gate=lc_receipt_payload_artifact_review_receipt_before_materialization_preconditions
command_surface=lc receipt-review-receipt
related_review_receipt_draft_command=lc receipt-review-draft
```

The source and installed command surfaces are:

```
latticra_console_report receipt-review-receipt
latticra-lc receipt-review-receipt
```

This contract does not create a review receipt, record review approval, record reviewer identity, hash or path a review receipt, materialize payload bytes, bind a Seal signature request, invoke signing, or write a receipt.

Receipt Payload Artifact Review Receipt Draft Contract

LC now installs and reports a metadata-only draft contract for the future review receipt artifact:

```
review_receipt_draft_profile=lc-receipt-payload-artifact-review-receipt-draft-v0
review_receipt_draft_status=metadata-only-draft-contract
review_receipt_draft_contract_present=1
receipt_payload_artifact_review_receipt_profile=lc-receipt-payload-artifact-review-receipt-v0
receipt_payload_artifact_review_receipt_required=1
receipt_payload_artifact_review_receipt_present=1
receipt_payload_artifact_review_receipt_command=lc receipt-review-receipt
draft_review_receipt_required=1
draft_review_receipt_present=0
draft_review_receipt_artifact_present=0
draft_review_receipt_write_allowed=0
draft_review_receipt_signed=0
draft_review_receipt_hash_recorded=0
draft_review_receipt_path_recorded=0
review_receipt_materialization_allowed=0
review_receipt_signing_allowed=0
materialization_preconditions_met=0
materialization_allowed=0
payload_artifact_present=0
payload_materialized=0
payload_write_allowed=0
signature_request_binding_allowed=0
receipt_write_allowed=0
receipt_signed=0
promotion_gate=lc_receipt_payload_artifact_review_receipt_draft_before_review_receipt_creation
command_surface=lc receipt-review-draft
```

The source and installed command surfaces are:

```
latticra_console_report receipt-review-draft
latticra-lc receipt-review-draft
```

This draft contract does not create a review receipt draft, write receipt bytes, compute or record a hash, record a path, sign anything, materialize payload bytes, bind a Seal signature request, or write a receipt.

Receipt Payload Materialization Plan

LC now installs and reports a metadata-only materialization plan for the future payload artifact:

```
materialization_plan_profile=lc-receipt-payload-materialization-plan-v0
materialization_plan_status=metadata-only
materialization_plan_present=1
receipt_payload_artifact_review_profile=lc-receipt-payload-artifact-review-v0
receipt_payload_artifact_review_required=1
receipt_payload_artifact_review_present=1
receipt_payload_artifact_review_command=lc receipt-artifact-review
receipt_payload_artifact_review_receipt_profile=lc-receipt-payload-artifact-review-receipt-v0
receipt_payload_artifact_review_receipt_required=1
receipt_payload_artifact_review_receipt_present=1
receipt_payload_artifact_review_receipt_command=lc receipt-review-receipt
receipt_payload_artifact_review_receipt_draft_profile=lc-receipt-payload-artifact-review-receipt
-draft-v0
receipt_payload_artifact_review_receipt_draft_required=1
receipt_payload_artifact_review_receipt_draft_present=1
receipt_payload_artifact_review_receipt_draft_command=lc receipt-review-draft
draft_review_receipt_required=1
draft_review_receipt_present=0
draft_review_approval_recorded=0
materialization_preconditions_met=0
materialization_allowed=0
materialization_execution_planned=0
payload_artifact_present=0
payload_materialized=0
payload_write_allowed=0
payload_file_open_allowed=0
payload_hash_computed=0
payload_hash_recorded=0
payload_path_recorded=0
signature_request_binding_allowed=0
signature_request_binding_artifact_present=0
seal_signature_request_ready=0
receipt_write_allowed=0
receipt_signed=0
promotion_gate=lc_receipt_payload_materialization_plan_after_review_receipt
command_surface=lc receipt-materialization-plan
```

The source and installed command surfaces are:

```
latticra_console_report receipt-materialization-plan
latticra-lc receipt-materialization-plan
```

This plan names the preconditions for a future payload artifact. It does not open a payload file, write payload bytes, materialize the payload, compute or record a hash, record a path, bind a Seal signature request, invoke signing, or write a receipt.

Signature Request Binding Contract

LC now installs and reports a metadata-only binding contract for a future Seal signature-request artifact:

```
binding_profile=lc-signature-request-binding-v0
binding_status=metadata-only
binding_contract_present=1
receipt_request_profile=lc-receipt-request-v0
receipt_payload_schema_profile=lc-receipt-payload-schema-v0
receipt_payload_artifact_draft_profile=lc-receipt-payload-artifact-draft-v0
receipt_payload_artifact_draft_required=1
receipt_payload_artifact_draft_present=1
receipt_payload_artifact_draft_command=lc receipt-artifact
receipt_payload_artifact_review_profile=lc-receipt-payload-artifact-review-v0
receipt_payload_artifact_review_required=1
```

```
receipt_payload_artifact_review_present=1
receipt_payload_artifact_review_command=lc receipt-artifact-review
receipt_payload_artifact_review_receipt_profile=lc-receipt-payload-artifact-review-receipt-v0
receipt_payload_artifact_review_receipt_required=1
receipt_payload_artifact_review_receipt_present=1
receipt_payload_artifact_review_receipt_command=lc receipt-review-receipt
receipt_payload_materialization_plan_profile=lc-receipt-payload-materialization-plan-v0
receipt_payload_materialization_plan_required=1
receipt_payload_materialization_plan_present=1
receipt_payload_materialization_plan_command=lc receipt-materialization-plan
draft_review_receipt_present=0
materialization_preconditions_met=0
materialization_allowed=0
receipt_contract_profile=lc-receipts-v0
signature_request_profile=latticra-seal-signature-request/0.1
signing_authorization_profile=latticra-seal-signing-authorization/0.1
requested_signature=Ed25519-development
requested_signing_authorization=metadata-only
required_surfaces=receipt-request,receipt-payload-schema,receipt-payload-artifact-draft,receipt-
payload-artifact-review,receipt-payload-artifact-review-receipt,receipt-payload-artifact-review-
receipt-draft,receipt-payload-materialization-plan,receipt-contract,runtime-boundary,seal-capabi
lity-labels
payload_artifact_present=0
signature_request_binding_allowed=0
signature_request_binding_artifact_present=0
seal_signature_request_ready=0
seal_signature_request_present=0
seal_signing_authority_present=0
receipt_write_allowed=0
receipt_signed=0
promotion_gate=lc_signature_request_binding_after_payload_artifact_and_signing_authority
```

The source and installed command surfaces are:

```
latticra_console_report signature-request
latticra-lc signature-request
```

This contract does not create a signature-request artifact, write a binding path, hash a binding, grant signing authority, invoke a signer, write a receipt, or sign anything.

OS-Base Planning Contract

LC now installs and reports an OS-base planning contract before any boot-adjacent behavior exists:

```
contract_profile=lc-os-base-v0
contract_status=metadata-only
contract_present=1
os_base_enabled=0
production_os_claim=0
read_only_host_inventory_receipt_required=1
vm_evidence_contract_required=1
vm_evidence_required=1
operator_consent_required=1
runtime_boundary_required=1
seal_capability_labels_required=1
receipt_required_before_os_base=1
promotion_gate=os_base_contract_receipt_and_vm_evidence
```

The source and installed command surfaces are:

```
latticra_console_report os-contract
latticra-lc os-contract
```

The contract explicitly denies OS, kernel, hardware, and host authority:

```
boot_allowed=0
boot_authority_present=0
kernel_change_allowed=0
kernel_enforcement_allowed=0
hardware_access_allowed=0
bootloader_write_allowed=0
partition_mutation_allowed=0
driver_load_allowed=0
service_install_allowed=0
host_mutation_allowed=0
network_allowed=0
runtime_enforcement_allowed=0
```

lc os-contract is an inspectable contract command. lc os remains the future-gated boot-action planning lane.

VM Evidence Contract

LC now installs and reports a VM evidence contract before any boot-adjacent evidence capture exists:

```
contract_profile=lc-vm-evidence-v0
contract_status=metadata-only
contract_present=1
vm_evidence_required=1
vm_evidence_capture_enabled=0
vm_evidence_artifact_present=0
os_base_contract_required=1
read_only_host_inventory_receipt_required=1
operator_consent_required=1
runtime_boundary_required=1
seal_capability_labels_required=1
receipt_required_before_vm_evidence=1
promotion_gate=vm_evidence_contract_before_boot_adjacency
```

The source and installed command surfaces are:

```
latticra_console_report vm-evidence
latticra-lc vm-evidence
```

The contract explicitly denies VM, hypervisor, disk-image, guest, host, and boot authority:

```
vm_launcher_present=0
vm_launch_allowed=0
hypervisor_access_allowed=0
disk_image_open_allowed=0
disk_image_write_allowed=0
snapshot_capture_allowed=0
guest_agent_allowed=0
guest_network_allowed=0
host_probe_allowed=0
host_mutation_allowed=0
network_allowed=0
runtime_enforcement_allowed=0
boot_allowed=0
production_os_claim=0
```

lc vm-evidence is an inspectable evidence-contract command. It does not start a VM or inspect a host.

Help And Manpage Rendering

LC now has registry-backed renderers for:

```
LATTICRA CONSOLE HELP
LATTICRA-CONSOLE(1)
```

The source runner can emit them directly:

```
tools/latticra_console_report.c -&gt; help
tools/latticra_console_report.c -&gt; man
```

Installed local-prefix wrappers expose the same operator shapes:

```
latticra-lc help
latticra-lc man
```

The installed wrapper reads share/latticra/lc/commands/seed-registry.txt for help rows, keeping command names, categories, effects, and capability labels attached to the component metadata.

Runtime Boundary Binding

LC command metadata is now bound to Runtime Boundary classification and Seal capability labels:

```
runtime_boundary_bound=1
seal_capability_labels_bound=1
```

Stage-0 command bindings use these rules:

```
core, panel, and substrate inspection -&gt; authority-check / validation-only
lc standalone -&gt; authority-check / validation-only
lc session -&gt; authority-check / validation-only
lc workspace -&gt; authority-check / validation-only
lc namespace -&gt; authority-check / validation-only
lc rootfs -&gt; authority-check / validation-only
lc packages -&gt; authority-check / validation-only
lc receipts -&gt; authority-check / validation-only
lc receipt-request -&gt; authority-check / validation-only
lc receipt-payload -&gt; authority-check / validation-only
lc receipt-artifact -&gt; authority-check / validation-only
lc receipt-artifact-review -&gt; authority-check / validation-only
lc receipt-review-receipt -&gt; authority-check / validation-only
lc receipt-review-draft -&gt; authority-check / validation-only
lc receipt-materialization-plan -&gt; authority-check / validation-only
lc signature-request -&gt; authority-check / validation-only
lc host-contract -&gt; authority-check / validation-only
lc host-inventory -&gt; authority-check / validation-only
lc host-adapter -&gt; authority-check / validation-only
lc os-contract -&gt; authority-check / validation-only
lc vm-evidence -&gt; authority-check / validation-only
lc host -&gt; future-gated command-execute planning
lc os -&gt; future-gated boot-action planning
```

The boundary report keeps all authority outputs denied:

```
no_effect=1
execution_allowed=0
host_mutation_allowed=0
network_allowed=0
runtime_enforcement_allowed=0
boot_allowed=0
seal_capability_grants_authority=0
```

Source and installed surfaces expose:

```
latticra_console_report boundary
latticra-lc boundary
```

C Foundation

The C foundation is intentionally deterministic:

```
include/latticra/latticra_console.h
src/latticra_console.c
tools/latticra_console_report.c
tests/latticra_console_foundation.c
scripts/test-latticra-console-foundation.sh
```

The report surface emits:

```
LATTICRA CONSOLE REPORT
component_key=latticra_console
console_status=ready-report-only
command_registry_status=seed-registry-ready
command_registry_source=c-static-table
command_registry_no_effect=1
command_registry_host_process_launch_allowed=0
runtime_boundary_bound=1
seal_capability_labels_bound=1
standalone_console_status=metadata-only-standalone-contract-ready
standalone_contract_present=1
session_contract_status=metadata-only-contract-ready
session_contract_present=1
standalone_installable=1
standalone_requires_panel=0
substrate_bridge_status=metadata-bound-ready
panel_installable=1
standalone_installable=1
standalone_requires_panel=0
standalone_command_wrapper=latticra-lc
host_adapter_contract_status=metadata-only-contract-ready
host_adapter_contract_present=1
receipt_request_contract_status=metadata-only-contract-ready
receipt_request_contract_present=1
receipt_payload_schema_status=metadata-only-schema-ready
receipt_payload_schema_present=1
receipt_payload_artifact_draft_status=metadata-only-draft-ready
```

```
receipt_payload_artifact_draft_present=1
receipt_payload_artifact_review_status=metadata-only-review-gate-ready
receipt_payload_artifact_review_present=1
receipt_payload_artifact_review_receipt_status=metadata-only-receipt-contract-ready
receipt_payload_artifact_review_receipt_present=1
receipt_payload_artifact_review_receipt_draft_status=metadata-only-review-receipt-draft-ready
receipt_payload_artifact_review_receipt_draft_present=1
receipt_payload_materialization_plan_status=metadata-only-plan-ready
receipt_payload_materialization_plan_present=1
signature_request_binding_status=metadata-only-contract-ready
signature_request_binding_present=1
os_base_contract_status=metadata-only-contract-ready
os_base_contract_present=1
vm_evidence_contract_status=metadata-only-contract-ready
vm_evidence_contract_present=1
os_base_enabled=0
production_os_claim=0
future_os_base_claim=planned_not_claimed
execution_allowed=0
host_mutation_allowed=0
network_allowed=0
runtime_enforcement_allowed=0
boot_allowed=0
```

Authority Baseline

LC Stage-0 does not:

- execute shell commands;
- launch external host processes;
- read arbitrary host files;
- write arbitrary host files;
- mutate the host;
- use the network;
- enforce runtime policy;
- boot hardware;
- claim to be a production OS;
- replace Linux, Fedora, macOS, Windows, or any other host OS.

Next Slices

1. Materialize the LC receipt payload artifact only after the actual review receipt draft and actual review receipt exist.
2. Bind the LC receipt payload artifact to a Seal signature-request artifact only after signing authority is implemented and gated.
3. Add the first Seal-signed LC receipt path only after the receipt request is reviewed and receipted.
4. Add a host-adapter artifact schema only after the host-adapter contract is receipted.
5. Add a VM evidence artifact schema only after the VM evidence contract is receipted.

docs/LATTICRA_PANEL_SIGNED_UPDATER_DELIVERY_GATE.md

Source title: Latticra Panel Signed Updater Delivery Gate

Lines: 113 | Words: 275 | SHA-256: 4e98372daed928a22d44998aa6a1ccc584976b54f927acfd4904dde73a78d451

Latticra Panel Signed Updater Delivery Gate

Status: no-effect signed updater delivery gate Date: 2026-05-26 CDT Scope: closed gate for any future signed, network-delivered update path behind the Latticra Panel updater.

Purpose

The current Latticra Panel updater is a guarded local-checkout lane. It reuses the installer engine, requires preview before apply, and keeps network fetch authority disabled.

This contract defines the gate that must stay closed before any future signed or network-delivered updater can exist:

```
signed_updater_delivery_gate_state=closed
signed_update_delivery_ready=0
network_self_update_ready=0
signed_update_apply_allowed=0
```

Command

```
sh scripts/latticra-panel-signed-updater-delivery-gate.sh
```

The command writes only a deterministic report to stdout.

Current Gate Decision

The current gate decision is:

```
signed_updater_delivery_gate_decision=blocked-missing-signed-manifest-artifact-verification-and-
rollback-evidence
```

The gate stays closed because these required future pieces are absent:

```
signed_manifest_present=0
manifest_signature_verified=0
artifact_hash_verified=0
artifact_signature_verified=0
channel_policy_present=0
compatibility_policy_present=0
rollback_plan_present=0
rollback_evidence_present=0
post_update_validation_present=0
operator_confirmation_observed=0
update_receipt_written=0
```

Required Preconditions

Before a signed update may ever be staged or applied, a later implementation must provide all of:

```
signed_manifest_required=1
manifest_signature_required=1
artifact_hash_required=1
artifact_signature_required=1
channel_policy_required=1
compatibility_policy_required=1
rollback_plan_required=1
post_update_validation_required=1
operator_confirmation_required=1
update_receipt_required=1
```

Authority Boundary

The current authority boundary remains:

```
remote_update_repository_trust=0
network_fetch_authority=0
updater_network_fetch_enabled=0
staged_update_allowed=0
signed_update_apply_allowed=0
update_activation_allowed=0
host_mutation_allowed=0
host_mutation_performed=0
root_authority=0
```

```
system_mutation_authority=0
kernel_mutation_authority=0
systemd_mutation_authority=0
selinux_mutation_authority=0
boot_mutation_authority=0
production_update_ready=0
```

Validation

This contract is guarded by:

```
sh scripts/test-latticra-panel-signed-updater-delivery-gate.sh
```

Expected output:

```
latticra_panel_signed_updater_delivery_gate: ok
```

Next Recommended Lane

```
Add Panel signed-updater state transition denial disposition without enabling transition
execution or update apply.
```

Non-Claims

This contract is not a signed updater, network updater, update server, remote repository trust policy, artifact verifier, rollback implementation, production update path, production installer, root installer, host mutation permission, boot integration, kernel integration, systemd integration, SELinux integration, malware prevention, ransomware prevention, sandbox, or production security-product claim.

Source title: Latticra Panel Signed Updater Denial Transcript

Lines: 98 | Words: 231 | SHA-256: 84ba750beb490c0d9d78915c7b9f6831a41b1fde9ec7bfa1997a23a1a64ae871

Latticra Panel Signed Updater Denial Transcript

Status: no-effect signed updater denial transcript Date: 2026-05-26 CDT Scope: denial transcript for the closed signed updater delivery gate behind the Latticra Panel updater.

Purpose

The signed updater delivery gate is closed. This transcript records the current denial decision without enabling network fetch, remote repository trust, artifact verification, staging, transcript file writes, or signed update apply.

```
signed_updater_denial_decision=deny-signed-update-delivery
signed_updater_denial_reason=missing-signed-manifest-artifact-verification-and-rollback-evidence
signed_updater_denial_transcript_stdout_only=1
signed_updater_denial_transcript_file_write_enabled=0
```

Command

```
sh scripts/latticra-panel-signed-updater-denial-transcript.sh
```

The command writes only a deterministic report to stdout.

Denial Decision

The current denial decision is:

```
signed_updater_delivery_gate_state=closed
signed_updater_denial_decision=deny-signed-update-delivery
signed_update_delivery_ready=0
signed_update_apply_allowed=0
```

The denial is caused by missing future evidence:

```
signed_manifest_present=0
manifest_signature_verified=0
artifact_hash_verified=0
```

```
artifact_signature_verified=0
channel_policy_present=0
compatibility_policy_present=0
rollback_plan_present=0
rollback_evidence_present=0
post_update_validation_present=0
operator_confirmation_observed=0
update_receipt_written=0
```

Authority Boundary

The transcript preserves:

```
network_fetch_authority=0
network_fetch_attempted=0
remote_update_repository_trust=0
updater_network_fetch_enabled=0
staged_update_allowed=0
staged_update_performed=0
signed_update_apply_allowed=0
signed_update_apply_performed=0
update_activation_allowed=0
update_activation_performed=0
transcript_write_performed=0
host_mutation_allowed=0
host_mutation_performed=0
root_authority=0
system_mutation_authority=0
production_update_ready=0
```

Validation

This transcript is guarded by:

```
sh scripts/test-latticra-panel-signed-updater-denial-transcript.sh
```

Expected output:

```
latticra_panel_signed_updater_denial_transcript: ok
```

Next Recommended Lane

```
Add Panel signed-updater state transition denial disposition without enabling transition
execution or update apply.
```

Non-Claims

This transcript is not signed update evidence, network update evidence, update-server evidence, trusted repository evidence, artifact-verification evidence, rollback evidence, transcript persistence, production update readiness, production installer readiness, root installer readiness, kernel integration, systemd integration, SELinux integration, runtime enforcement, malware prevention, ransomware prevention, sandboxing, or a production security-product claim.

docs/LATTICRA_PANEL_SIGNED_UPDATER_MANIFEST_FIXTURE_CONTRACT.md

Source title: Latticra Panel Signed Updater Manifest Fixture Contract

Lines: 103 | Words: 256 | SHA-256: 9050aec82791f4a474f02ed655768d6436e988284e0bafb9a23160d3019e9560

Latticra Panel Signed Updater Manifest Fixture Contract

Status: local no-effect signed updater manifest fixture contract Date: 2026-05-26 CDT Scope: local fixture contract for future signed updater manifest work behind the Latticra Panel updater.

Purpose

This slice adds a committed local manifest fixture for the Panel signed updater lane.

The fixture gives the closed delivery gate a concrete manifest-shaped record to review without making it trusted signed update evidence, enabling network fetch, verifying artifacts, staging updates, writing receipts, or applying updates.

```
signed_updater_manifest_fixture_contract_present=1
signed_updater_manifest_fixture_present=1
manifest_fixture_effect=none
manifest_fixture_trusted_for_apply=0
trusted_signed_manifest_present=0
signed_update_apply_allowed=0
```

Fixture

The fixture lives at:

```
fixtures/latticra-panel/signed-updater-manifest.fixture.toml
```

It records the current local-checkout updater shape:

```
update_id=panel-local-checkout-fixture
update_channel=lab
source_strategy=current-source-checkout
apply_mode=guarded-local-prefix-reinstall
target_component=latticra-panel
target_version=fixture-only
```

Command

```
sh scripts/latticra-panel-signed-updater-manifest-fixture-contract.sh
```

The command writes only a deterministic report to stdout.

Trust Boundary

The fixture is explicitly not trusted for apply:

```
signed_updater_delivery_gate_state=closed
signed_manifest_present=0
trusted_signed_manifest_present=0
manifest_signature_verified=0
artifact_hash_verified=0
artifact_signature_verified=0
rollback_plan_present=0
operator_confirmation_observed=0
update_receipt_written=0
signed_update_apply_allowed=0
```

The authority boundary remains closed:

```
network_fetch_authority=0
network_fetch_attempted=0
remote_update_repository_trust=0
updater_network_fetch_enabled=0
staged_update_performed=0
signed_update_apply_performed=0
host_mutation_performed=0
root_authority=0
system_mutation_authority=0
production_update_ready=0
```

Validation

This contract is guarded by:

```
sh scripts/test-latticra-panel-signed-updater-manifest-fixture-contract.sh
```

Expected output:

```
latticra_panel_signed_updater_manifest_fixture_contract: ok
```

Next Recommended Lane

```
Add Panel signed-updater state transition denial disposition without enabling transition
execution or update apply.
```

Non-Claims

This contract is not signed update evidence, network update evidence, update-server evidence, trusted repository evidence, artifact-verification evidence, rollback evidence, receipt evidence, production update readiness, production installer readiness, root installer readiness, kernel integration, systemd integration, SELinux integration, runtime enforcement, malware prevention, ransomware prevention, sandboxing, or a production security-product claim.

docs/LATTICRA_PANEL_SIGNED_UPDATER_MANIFEST_FIXTURE_VALIDATION.md

Source title: Latticra Panel Signed Updater Manifest Fixture Validation

Lines: 99 | Words: 245 | SHA-256: 04f8c7ec2f6f1274a40347c872f9c20171a87f027f2e0b80c08b0d18bb4297a1

Latticra Panel Signed Updater Manifest Fixture Validation

Status: local no-effect signed updater manifest fixture validation Date: 2026-05-26 CDT Scope: validation for the committed Latticra Panel signed-updater manifest fixture.

Purpose

This slice validates the committed manifest fixture shape without making the fixture trusted signed update evidence.

The validator reads only the local fixture, checks the expected schema and closed-authority fields, and reports that the fixture is valid only as no-effect input for future updater design work.

```
signed_updater_manifest_fixture_validation_present=1
signed_updater_manifest_fixture_validated=1
signed_updater_manifest_fixture_validation_scope=shape-and-closed-authority-fields
manifest_fixture_trusted_for_apply=0
signed_updater_manifest_fixture_valid_for_apply=0
trusted_signed_manifest_present=0
signed_update_apply_allowed=0
```

Command

```
sh scripts/latticra-panel-signed-updater-manifest-fixture-validation.sh
```

The command reads:

```
fixtures/latticra-panel/signed-updater-manifest.fixture.toml
```

It writes only a deterministic report to stdout.

Validation Boundary

The validator checks local fixture shape:

```
manifest_schema_validated=1
manifest_fixture_flag_validated=1
manifest_fixture_scope_validated=1
manifest_fixture_effect_validated=1
local_checkout_strategy_validated=1
closed_authority_fields_validated=1
non_claims_validated=1
```

The validator does not verify a real signed update:

```
signed_manifest_present=0
manifest_signature_verified=0
artifact_hash_verified=0
artifact_signature_verified=0
rollback_plan_present=0
operator_confirmation_observed=0
update_receipt_written=0
```

The authority boundary remains closed:

```
network_fetch_authority=0
network_fetch_attempted=0
remote_update_repository_trust=0
staged_update_performed=0
signed_update_apply_performed=0
validation_write_performed=0
host_mutation_performed=0
root_authority=0
production_update_ready=0
```

Validation

This slice is guarded by:

```
sh scripts/test-latticra-panel-signed-updater-manifest-fixture-validation.sh
```

Expected output:

```
latticra_panel_signed_updater_manifest_fixture_validation: ok
```

Next Recommended Lane

```
Add Panel signed-updater state transition denial disposition without enabling transition
execution or update apply.
```

Non-Claims

This validation is not signed update evidence, network update evidence, update-server evidence, trusted repository evidence, artifact-verification evidence, rollback evidence, receipt evidence, production update readiness, production installer readiness, root installer readiness, kernel integration, systemd integration, SELinux integration, runtime enforcement, malware prevention, ransomware prevention, sandboxing, or a production security-product claim.

docs/LATTICRA_PANEL_SIGNED_UPDATER_STATE_FIXTURE_CONTRACT.md

Source title: Latticra Panel Signed Updater State Fixture Contract

Lines: 107 | Words: 265 | SHA-256: b4d0c9b4cc87f12b8083a0eedd290f1436a1c6f4f69823c9945f9c818f6def97

Latticra Panel Signed Updater State Fixture Contract

Status: local no-effect signed updater state fixture contract Date: 2026-05-26 CDT Scope: local state fixture contract for future signed updater state work behind the Latticra Panel updater.

Purpose

This slice adds a committed local state fixture for the Panel signed updater lane.

The fixture gives the closed delivery gate a state-shaped record to review without enabling state transitions, staging, activation, rollback execution, receipt writes, or signed update apply.

```
signed_updater_state_fixture_contract_present=1
signed_updater_state_fixture_present=1
state_fixture_effect=none
current_update_state=blocked
state_transition_execution_allowed=0
signed_update_apply_allowed=0
```

Fixture

The fixture lives at:

```
fixtures/latticra-panel/signed-updater-state.fixture.toml
```

It records the planned state names while keeping the current fixture state blocked:

```
available
downloaded
verified
staged
armed
applied
rolled_back
failed
blocked
current_update_state=blocked
requested_update_state=blocked
state_transition_decision=deny-transition
```

Command

```
sh scripts/latticra-panel-signed-updater-state-fixture-contract.sh
```

The command writes only a deterministic report to stdout.

Authority Boundary

The state fixture is explicitly not executable:

```
state_transition_execution_allowed=0
state_transition_execution_performed=0
state_receipt_written=0
staged_state_materialized=0
armed_state_materialized=0
applied_state_materialized=0
rollback_execution_allowed=0
update_activation_allowed=0
signed_update_apply_allowed=0
```

The signed updater boundary remains closed:

```
trusted_signed_manifest_present=0
manifest_signature_verified=0
artifact_hash_verified=0
artifact_signature_verified=0
rollback_plan_present=0
operator_confirmation_observed=0
network_fetch_attempted=0
host_mutation_performed=0
production_update_ready=0
```

Validation

This contract is guarded by:

```
sh scripts/test-latticra-panel-signed-updater-state-fixture-contract.sh
```

Expected output:

```
latticra_panel_signed_updater_state_fixture_contract: ok
```

Next Recommended Lane

```
Add Panel signed-updater state transition denial disposition without enabling transition
execution or update apply.
```

Non-Claims

This contract is not update-state evidence, state-transition execution, signed update evidence, network update evidence, update-server evidence, trusted repository evidence, artifact-verification evidence, rollback evidence, receipt evidence, production update readiness, production installer readiness, root installer readiness, kernel integration, systemd integration, SELinux integration, runtime enforcement, malware prevention, ransomware prevention, sandboxing, or a production security-product claim.

Latticra Panel Signed Updater State Fixture Validation

Status: local no-effect signed updater state fixture validation Date: 2026-05-26 CDT
Scope: validation for the committed Latticra Panel signed-updater state fixture.

Purpose

This slice validates the committed state fixture shape without making the fixture executable update-state evidence.

The validator reads only the local fixture, checks the expected schema, state catalog, blocked-state decision, and closed transition fields, and reports that the fixture is valid only as no-effect input for future updater design work.

```
signed_updater_state_fixture_validation_present=1
signed_updater_state_fixture_validated=1
signed_updater_state_fixture_validation_scope=shape-state-catalog-and-closed-transition-fields
state_fixture_trusted_for_apply=0
signed_updater_state_fixture_valid_for_transition=0
signed_updater_state_fixture_valid_for_apply=0
state_transition_execution_allowed=0
signed_update_apply_allowed=0
```

Command

```
sh scripts/latticra-panel-signed-updater-state-fixture-validation.sh
```

The command reads:

```
fixtures/latticra-panel/signed-updater-state.fixture.toml
```

It writes only a deterministic report to stdout.

Validation Boundary

The validator checks local fixture shape:

```
state_schema_validated=1
state_fixture_flag_validated=1
state_fixture_scope_validated=1
state_fixture_effect_validated=1
state_catalog_validated=1
blocked_state_validated=1
closed_transition_fields_validated=1
closed_authority_fields_validated=1
non_claims_validated=1
```

The validator does not execute an updater transition:

```
current_update_state=blocked
requested_update_state=blocked
state_transition_decision=deny-transition
state_transition_execution_allowed=0
state_transition_execution_performed=0
state_receipt_written=0
staged_state_materialized=0
armed_state_materialized=0
applied_state_materialized=0
```

The authority boundary remains closed:

```
network_fetch_authority=0
network_fetch_attempted=0
rollback_execution_performed=0
signed_update_apply_performed=0
update_activation_performed=0
validation_write_performed=0
host_mutation_performed=0
root_authority=0
production_update_ready=0
```

Validation

This slice is guarded by:

```
sh scripts/test-latticra-panel-signed-updater-state-fixture-validation.sh
```

Expected output:

```
latticra_panel_signed_updater_state_fixture_validation: ok
```

Next Recommended Lane

```
Add Panel signed-updater state transition denial disposition without enabling transition
execution or update apply.
```

Non-Claims

This validation is not update-state evidence, state-transition execution, signed update evidence, network update evidence, update-server evidence, trusted repository evidence, artifact-verification evidence, rollback evidence, receipt evidence, production update readiness, production installer readiness, root installer readiness, kernel integration, systemd integration, SELinux integration, runtime enforcement, malware prevention, ransomware prevention, sandboxing, or a production security-product claim.

Source title: Latticra Panel Signed Updater State Transition Denial Review

Lines: 94 | Words: 240 | SHA-256: 430061d079c30dbc51e622e37bcbd4493cbf57580f00f3b279697f26a56e7471

Latticra Panel Signed Updater State Transition Denial Review

Status: no-effect signed updater state transition denial review Date: 2026-05-26 CDT Scope: stdout-only review of the blocked Latticra Panel signed-updater state transition denial transcript.

Purpose

This slice reviews the state transition denial transcript without turning the review into transition authority.

The review upholds the denial because the signed updater still lacks signed manifest trust, artifact verification, rollback evidence, and operator confirmation:

```
signed_updater_state_transition_denial_review_present=1
signed_updater_state_transition_denial_review_stdout_only=1
signed_updater_state_transition_denial_review_file_write_enabled=0
signed_updater_state_transition_denial_review_decision=uphold-deny-state-transition
signed_updater_state_transition_denial_review_reason=denial-transcript-confirms-missing-signed-m
anifest-artifact-verification-rollback-and-operator-confirmation
state_transition_review_decision=uphold-denial
```

Command

```
sh scripts/latticra-panel-signed-updater-state-transition-denial-review.sh
```

The command writes only a deterministic report to stdout.

Review Boundary

The review is not executable:

```
state_fixture_validated_for_transition=0
signed_updater_state_fixture_valid_for_transition=0
state_transition_decision=deny-transition
state_transition_review_decision=uphold-denial
state_transition_execution_allowed=0
state_transition_execution_performed=0
state_receipt_written=0
review_write_performed=0
```

The review does not write files or mutate host state:

```
signed_updater_state_transition_denial_review_file_write_enabled=0
validation_write_performed=0
```

```
transcript_write_performed=0
review_write_performed=0
host_mutation_performed=0
root_authority=0
production_update_ready=0
```

The signed updater boundary remains closed:

```
trusted_signed_manifest_present=0
manifest_signature_verified=0
artifact_hash_verified=0
artifact_signature_verified=0
rollback_plan_present=0
rollback_execution_performed=0
operator_confirmation_observed=0
signed_update_apply_performed=0
update_activation_performed=0
network_fetch_attempted=0
```

Validation

This slice is guarded by:

```
sh scripts/test-latticra-panel-signed-updater-state-transition-denial-review.sh
```

Expected output:

```
latticra_panel_signed_updater_state_transition_denial_review: ok
```

Next Recommended Lane

```
Add Panel signed-updater state transition denial disposition without enabling transition
execution or update apply.
```

Non-Claims

This review is not update-state evidence, state-transition execution, signed update evidence, network update evidence, update-server evidence, trusted repository evidence, artifact-verification evidence, rollback evidence, receipt evidence, production update readiness, production installer readiness, root installer readiness, kernel integration, systemd integration, SELinux integration, runtime enforcement, malware prevention, ransomware prevention, sandboxing, or a production security-product claim.

docs/LATTICRA_PANEL_SIGNED_UPDATER_STATE_TRANSITION_DENIAL_TRANSCRIPT.md

Source title: Latticra Panel Signed Updater State Transition Denial Transcript

Lines: 95 | Words: 234 | SHA-256: df3e74c1b4cea75b3326c09acf8e2230d2b6dbfd78cb344436682d9a21cc753c

Latticra Panel Signed Updater State Transition Denial Transcript

Status: no-effect signed updater state transition denial transcript Date: 2026-05-26 CDT Scope: stdout-only denial transcript for the blocked Latticra Panel signed-updater state transition.

Purpose

This slice records the state transition denial as a deterministic transcript without making the blocked state fixture executable.

The transcript binds the validated local state fixture to the current decision:

```
signed_updater_state_transition_denial_transcript_present=1
signed_updater_state_transition_denial_transcript_stdout_only=1
signed_updater_state_transition_denial_transcript_file_write_enabled=0
signed_updater_state_transition_denial_decision=deny-state-transition
signed_updater_state_transition_denial_reason=missing-signed-manifest-artifact-verification-roll
back-and-operator-confirmation
```

```
current_update_state=blocked
requested_update_state=blocked
```

Command

```
sh scripts/latticra-panel-signed-updater-state-transition-denial-transcript.sh
```

The command writes only a deterministic report to stdout.

Denial Boundary

The denied transition remains non-executable:

```
state_fixture_validated_for_transition=0
signed_updater_state_fixture_valid_for_transition=0
state_transition_decision=deny-transition
state_transition_execution_allowed=0
state_transition_execution_performed=0
state_receipt_written=0
staged_state_materialized=0
armed_state_materialized=0
applied_state_materialized=0
```

The transcript does not write files or mutate host state:

```
signed_updater_state_transition_denial_transcript_file_write_enabled=0
validation_write_performed=0
transcript_write_performed=0
host_mutation_performed=0
root_authority=0
production_update_ready=0
```

The signed updater boundary remains closed:

```
trusted_signed_manifest_present=0
manifest_signature_verified=0
artifact_hash_verified=0
artifact_signature_verified=0
rollback_plan_present=0
rollback_execution_performed=0
operator_confirmation_observed=0
signed_update_apply_performed=0
update_activation_performed=0
network_fetch_attempted=0
```

Validation

This slice is guarded by:

```
sh scripts/test-latticra-panel-signed-updater-state-transition-denial-transcript.sh
```

Expected output:

```
latticra_panel_signed_updater_state_transition_denial_transcript: ok
```

Next Recommended Lane

```
Add Panel signed-updater state transition denial disposition without enabling transition
execution or update apply.
```

Non-Claims

This transcript is not update-state evidence, state-transition execution, signed update evidence, network update evidence, update-server evidence, trusted repository evidence, artifact-verification evidence, rollback evidence, receipt evidence, production update readiness, production installer readiness, root installer readiness, kernel integration, systemd integration, SELinux integration, runtime enforcement, malware prevention, ransomware prevention, sandboxing, or a production security-product claim.

docs/LOCAL_INSTALLER_ARTIFACT_MANIFEST_CONTRACT.md

Source title: Local Installer Artifact Manifest Contract

Lines: 220 | Words: 530 | SHA-256: b0e0bdccfaa8c8d0b906018be1e2da5251d3d00dfa79dab84cb380b27eb2e474

Local Installer Artifact Manifest Contract

Status: contract record Evidence level: 10 target, manifest contract only Scope: required metadata for any future local installer artifact before it can be considered for production-installer readiness.

Purpose

The production-installer readiness contract requires an installer artifact manifest before any installer can be recommended for general use.

This contract defines the minimum manifest fields that must exist before the project can evaluate installer artifacts.

This is not an installer.

This does not build, sign, publish, distribute, install, uninstall, upgrade, or rollback an installer.

This does not claim production installer readiness.

Current readiness boundary

The current project state remains:

```
production_installer_ready=0
fedora_distribution_ready=0
fedora_approval_claimed=0
daily_driver_install_ready=0
immutable_fedora_ready=0
```

The current evidence-backed prerequisite is limited to disposable Fedora VM validation of the local no-effect CLI RPM payload:

```
host_install_ready_for_cli_payload=1
validated_payload_cli=/usr/bin/latticra
validated_payload_readme=/usr/share/doc/latticra/README.md
```

Required manifest file

A future installer artifact must include a manifest file at a stable path such as:

```
artifacts/&lt;artifact-name&gt;/manifest.txt
```

The manifest must be plain text, line-oriented, deterministic, and reviewable.

Required manifest fields

A complete artifact manifest must include:

```
LATTICRA INSTALLER ARTIFACT MANIFEST
manifest_version=1
artifact_name=&lt;recorded&gt;
artifact_version=&lt;recorded&gt;
artifact_arch=&lt;recorded&gt;
artifact_format=&lt;recorded&gt;
artifact_filename=&lt;recorded&gt;
artifact_size_bytes=&lt;recorded&gt;
artifact_sha256=&lt;recorded&gt;
artifact_signature=&lt;recorded-or-none&gt;
artifact_signing_key_id=&lt;recorded-or-none&gt;
artifact_sbom_path=&lt;recorded-or-none&gt;
artifact_license_metadata_path=&lt;recorded&gt;

production_installer_ready=0
fedora_distribution_ready=0
fedora_approval_claimed=0
daily_driver_install_ready=0
immutable_fedora_ready=0
```

Required payload declaration

Every manifest must declare the artifact payload explicitly.

For the current no-effect CLI RPM payload, the known validated payload baseline is:

```
/usr/bin/latticra
/usr/share/doc/latticra/README.md
```

A future installer artifact may not add runtime surfaces silently.

Any added service, kernel, boot, SELinux, networking, or policy surface must be separately declared, reviewed, and validated before readiness language changes.

Required checksum and signature boundary

At this stage, signature fields may be none only for local experimental artifacts.

A production installer readiness claim requires:

```
artifact_sha256_recorded=1
artifact_signature_recorded=1
artifact_signing_key_documented=1
signature_verification_documented=1
```

Until those are present and validated, the project must preserve:

```
production_installer_ready=0
```

Required SBOM boundary

A production installer readiness claim requires an SBOM path in the manifest:

```
artifact_sbom_path=&lt;recorded&gt;
sbom_present=1
sbom_reviewed=1
```

Until SBOM evidence exists, the project must preserve:

```
installer_sbom_recorded=0
production_installer_ready=0
```

Required target boundary

A manifest must distinguish supported and unsupported targets.

At minimum, it must preserve:

```
daily_driver_install_ready=0
immutable_fedora_ready=0
production_host_ready=0
```

until separate evidence validates those target classes.

Required non-claims

Every manifest review must preserve:

```
not_production_readiness=1
not_fedora_approval=1
not_fedora_distribution_readiness=1
not_daily_driver_readiness=1
not_immutable_fedora_readiness=1
not_security_hardening_claim=1
not_malware_prevention_claim=1
not_ransomware_prevention_claim=1
not_os_replacement_claim=1
```

Current status

```
installer_artifact_manifest_contract_present=1
installer_artifact_manifest_present=0
installer_artifact_manifest_validated=0
installer_artifact_checksum_recorded=0
installer_artifact_signature_recorded=0
installer_sbom_recorded=0
installer_supported_targets_declared=0
installer_unsupported_targets_declared=0
production_installer_ready=0
```

Guard validation

This contract is guarded by:

```
sh scripts/test-local-installer-artifact-manifest-contract.sh
```

Expected output:

```
local_installer_artifact_manifest_contract: ok
```

Next implementation lane

```
Add installer artifact manifest fixture
```

That lane should add a non-production fixture manifest for the current local no-effect CLI RPM artifact and keep all production readiness flags set to 0.

Non-claims

This contract is not an installer artifact, not a production installer, not a distribution package, not Fedora approval, not Fedora distribution readiness, not daily-driver readiness, not immutable Fedora readiness, not update safety, not recovery safety, not security hardening, not malware prevention, not ransomware prevention, and not OS-replacement readiness.

docs/PRODUCTION_INSTALLER_READINESS_CONTRACT.md

Source title: Production Installer Readiness Contract

Lines: 182 | Words: 425 | SHA-256: 970dd1e8027e180e3e6f0821eb7e076293c370564b8941bc0e82800520a67220

Production Installer Readiness Contract

Status: contract record Evidence level: 10 target, contract only Scope: requirements that must be satisfied before Latticra can claim a production installer that others should use.

Purpose

Latticra now has disposable Fedora VM evidence for a local no-effect CLI RPM payload.

That is not the same as production installer readiness.

This contract defines the minimum evidence required before the project may claim:

```
production_installer_ready=1
```

Until every required gate is satisfied, the project must preserve:

```
production_installer_ready=0
fedora_distribution_ready=0
fedora_approval_claimed=0
daily_driver_install_ready=0
immutable_fedora_ready=0
```

Current evidence that may be used as prerequisites

The current evidence-backed base is limited to disposable Fedora VM validation:

```
disposable_vm_local_rpm_validation_completed=1
disposable_vm_cli_validation_completed=1
host_install_ready=1
host_install_ready_for_cli_payload=1
```

Validated disposable Fedora VM CLI payload:

```
/usr/bin/latticra
/usr/share/doc/latticra/README.md
```

Production installer readiness gates

A production installer claim requires all of the following gates to be complete and reviewed.

```
installer_contract_present=1
installer_artifact_format_declared=1
installer_artifact_built_from_tag=1
installer_artifact_reproducible=1
installer_artifact_checksum_recorded=1
installer_artifact_signature_recorded=1
installer_public_key_documented=1
installer_sbom_recorded=1
installer_license_metadata_recorded=1
installer_supported_targets_declared=1
installer_unsupported_targets_declared=1
installer_daily_driver_warning_present=1
installer_production_host_warning_present=1
installer_immutable_fedora_warning_present=1
installer_preflight_guard_present=1
installer_preflight_blocks_unsupported_targets=1
installer_install_plan_preview_present=1
installer_requires_operator_consent=1
installer_install_transcript_recorded=1
installer_uninstall_transcript_recorded=1
installer_post_removal_absence_verified=1
installer_upgrade_path_validated=1
installer_downgrade_or_rollback_path_validated=1
installer_reinstall_idempotence_validated=1
installer_no_network_requirement_documented=1
installer_no_service_activation_without_consent=1
installer_no_boot_change_without_consent=1
installer_no_kernel_module_without_consent=1
installer_no_selinux_policy_without_consent=1
installer_effect_authority_documented=1
installer_failure_mode_documented=1
installer_recovery_runbook_present=1
installer_multi_vm_validation_completed=1
installer_fresh_vm_validation_completed=1
installer_existing_install_validation_completed=1
installer_non_root_cli_validation_completed=1
installer_root_boundary_validation_completed=1
installer_security_non_claims_preserved=1
installer_release_notes_present=1
installer_readme_install_instructions_present=1
installer_status_alignment_present=1
```

Minimum validation matrix

Before claiming production installer readiness, validation must include at least:

```
fresh_disposable_fedora_vm_validation=1
repeat_disposable_fedora_vm_validation=1
existing_install_upgrade_validation=1
remove_and_reinstall_validation=1
post_removal_absence_validation=1
```

```
unsupported_target_block_validation=1
non_root_cli_use_validation=1
package_signature_verification_validation=1
checksum_verification_validation=1
```

Required production installer report

A future readiness report must include:

```
PRODUCTION INSTALLER READINESS REPORT
validation_status=ok
installer_artifact_name=&lt;recorded&gt;
installer_artifact_version=&lt;recorded&gt;
installer_artifact_arch=&lt;recorded&gt;
installer_artifact_checksum_recorded=1
installer_artifact_signature_recorded=1
installer_supported_targets_declared=1
installer_preflight_guard_present=1
installer_install_validation_completed=1
installer_uninstall_validation_completed=1
installer_upgrade_validation_completed=1
installer_rollback_validation_completed=1
installer_multi_vm_validation_completed=1
production_installer_ready=1
fedora_distribution_ready=0
fedora_approval_claimed=0
daily_driver_install_ready=0
immutable_fedora_ready=0
evidence_level=10
```

Fedora distribution readiness and Fedora approval remain separate claims and must stay 0 until separate review and acceptance evidence exists.

Current readiness classification

```
production_installer_contract_present=1
production_installer_ready=0
installer_artifact_reproducible=0
installer_artifact_signature_recorded=0
installer_sbom_recorded=0
installer_preflight_guard_present=0
installer_install_transcript_recorded=0
installer_uninstall_transcript_recorded=0
installer_upgrade_path_validated=0
installer_rollback_path_validated=0
installer_multi_vm_validation_completed=0
fedora_distribution_ready=0
fedora_approval_claimed=0
daily_driver_install_ready=0
immutable_fedora_ready=0
```

Next implementation lanes

Recommended sequence:

```
1. Add local installer artifact manifest contract.
2. Add installer preflight classifier for supported and blocked targets.
3. Add signed artifact/checksum status contract.
4. Add installer preview-only plan renderer.
5. Add disposable Fedora VM production-installer dry-run lane.
6. Add uninstall and rollback transcript contract.
7. Add upgrade/reinstall validation contract.
8. Add multi-VM production-installer evidence status.
9. Only then consider production_installer_ready=1.
```

Non-claims

This contract is not a production installer.

It does not build, sign, publish, install, uninstall, upgrade, rollback, or distribute an installer.

It is not production readiness, not Fedora approval, not Fedora distribution readiness, not daily-driver readiness, not immutable Fedora readiness, not update safety, not recovery safety, not sandboxing, not security hardening, not malware prevention, not ransomware prevention, not OS-replacement readiness, and not a production installer claim.

docs/SELF_UPDATE_MODEL.md

Source title: Latticra Self-Update Model

Lines: 244 | Words: 755 | SHA-256: 13af98701c6dfbc7bc93e0ccb2aeacadc26d5cdbcd58fcb59d46de82f1eb2d42

Latticra Self-Update Model

Status: Panel-owned local-checkout updater policy active; signed updater delivery gate closed Scope: signed staged updates, channels, rollback, operator confirmation, and non-claims.

Purpose

Latticra should be designed for safe self-update capability from the beginning, but self-update must never be silent or magical.

Self-update is a real-system capability and therefore requires contracts, effect gates, verification, rollback, and operator visibility.

Core rule

No silent self-updates.

Every update path must be inspectable, signed, staged, and reversible where possible.

Current Panel-Owned Updater Surface

Panel-owned local-checkout updater policy is active.

The current implemented updater surface is the Latticra Panel updater. It is limited to a reviewed local checkout and a guarded local-prefix reinstall flow:

```
updater_current_source_strategy=current-source-checkout
updater_current_apply_mode=guarded-local-prefix-reinstall
network_self_update_ready=0
remote_update_repository_trust=0
signed_update_delivery_ready=0
```

The signed delivery gate is still closed:

```
signed_updater_delivery_gate_state=closed
signed_update_delivery_ready=0
network_self_update_ready=0
remote_update_repository_trust=0
signed_manifest_required=1
signed_manifest_present=0
manifest_signature_verified=0
artifact_hash_verified=0
artifact_signature_verified=0
rollback_plan_required=1
rollback_plan_present=0
operator_confirmation_required=1
operator_confirmation_observed=0
signed_update_apply_allowed=0
signed_updater_denial_transcript_present=1
signed_updater_denial_decision=deny-signed-update-delivery
signed_updater_denial_transcript_stdout_only=1
signed_updater_denial_transcript_file_write_enabled=0
signed_updater_manifest_fixture_contract_present=1
signed_updater_manifest_fixture_present=1
signed_updater_manifest_fixture_validation_present=1
signed_updater_manifest_fixture_validated=1
signed_updater_state_fixture_contract_present=1
signed_updater_state_fixture_present=1
signed_updater_state_fixture_validation_present=1
signed_updater_state_fixture_validated=1
signed_updater_state_fixture_valid_for_transition=0
signed_updater_state_fixture_valid_for_apply=0
signed_updater_state_transition_denial_transcript_present=1
signed_updater_state_transition_denial_decision=deny-state-transition
signed_updater_state_transition_denial_transcript_stdout_only=1
signed_updater_state_transition_denial_transcript_file_write_enabled=0
```

```
signed_updater_state_transition_denial_review_present=1
signed_updater_state_transition_denial_review_decision=uphold-deny-state-transition
signed_updater_state_transition_denial_review_stdout_only=1
signed_updater_state_transition_denial_review_file_write_enabled=0
current_update_state=blocked
state_transition_execution_allowed=0
state_transition_execution_performed=0
manifest_fixture_trusted_for_apply=0
signed_updater_manifest_fixture_valid_for_apply=0
trusted_signed_manifest_present=0
```

The local signed updater manifest fixture validation only checks shape and closed-authority fields. The local signed updater state fixture validation only checks the state catalog and closed transition fields without making the blocked fixture executable. The local signed updater state transition denial transcript records the blocked decision to stdout only, without transcript file writes or execution. The local signed updater state transition denial review upholds the denial without review file writes or execution. This is not a signed updater, not a remote update client, not a network self-update path, not update state execution, and not production update readiness.

Update channels

Initial planned channels:

```
stable
candidate
edge
lab
```

Channel meanings:

```
| Channel | Meaning |
| --- | --- |
| `stable` | Promoted, evidence-backed release path. |
| `candidate` | Release candidate path after validation. |
| `edge` | Active development path with explicit risk. |
| `lab` | Local or experimental path, never default. |
```

Update states

```
available
downloaded
verified
staged
armed
applied
rolled_back
failed
blocked
```

Only applied may imply the update changed the running or installed system.

Required update record

Every update should eventually produce:

```
update_id
current_version
target_version
channel
manifest_hash
artifact_hash
signature_result
compatibility_result
rollback_available
operator_confirmation
state
failure_reason
post_update_validation
```

Effect classes

Self-update may involve multiple effect classes:

```
network
local_mutation
host_mutation
boot
recovery
external
```

The early update model must support only documentation and fixture-level planning.

Signed manifest rule

An update must be described by a signed manifest before any artifact is trusted.

Manifest should include:

- version;
- channel;
- artifact hash;
- compatibility constraints;
- architecture target;
- rollback compatibility;
- required gates;
- post-update validation commands.

Staging rule

Update artifacts should be staged before activation.

Staging does not imply activation.

```
downloaded != verified
verified != staged
staged != armed
armed != applied
```

Rollback rule

Update design must include rollback state before real update execution exists.

Rollback states:

```
unavailable
available
armed
executed
failed
blocked
```

Operator confirmation

A future update that changes local system state must require explicit operator confirmation.

A future update that changes boot or recovery state must require a stronger confirmation profile.

Server relationship

Update server interaction must pass through the Server Gateway.

No component should perform direct update network behavior outside the signed update model.

First implementation target

The current Panel implementation target is a local-checkout updater policy surface, not signed or networked self-update.

It installs and reports:

```
etc/latticra/updater.toml
share/latticra/updater/policy.toml
latticra updater status
updater dry-run
updater apply
```

The Panel updater reuses the guarded installer engine for a local-prefix reinstall from the current reviewed checkout. It has no network fetch, root, system mutation, boot, or recovery authority. latticra updater status reports the configured source strategy, channel, preview/apply commands, receipt setting, guarded apply mode, and disabled authority posture without launching the GUI.

The signed staged update model still needs:

```
update manifest fixture
update state fixture
no-effect signed updater denial transcript
local signed updater manifest fixture contract
local signed updater manifest fixture validation
local signed updater state fixture contract
local signed updater state fixture validation
local signed updater state transition denial transcript
local signed updater state transition denial review
signature-required marker
rollback visibility marker
validation test
```

Non-claims

This document does not implement signed or networked self-update.

The Panel updater does not claim secure update delivery, rollback success, boot update safety, recovery behavior, network fetch authority, root authority, system mutation authority, or production release readiness.

docs/strategy/2026-05-25-2137-cdt-panel-guided-local-evaluation-workflow-packet.md

Source title: Latticra Panel-Guided Local Evaluation Workflow Packet

Lines: 279 | Words: 859 | SHA-256: 1089a716a6a67e37c14b1e0072b644904e2698b377c0822d224e4ce8d62b5c41

Latticra Panel-Guided Local Evaluation Workflow Packet

Status: draft workflow packet Created: 2026-05-25 21:37 CDT Decision: selected as first public-readiness workflow planning path Promotion decision: no product-readiness promotion recommended Scope: bounded Panel-guided local evaluation workflow for technical evaluators.

Purpose

This packet selects the first public-readiness workflow planning path:

```
Panel-guided local evaluation
```

It narrows the public product-readiness promotion packet into one candidate user journey. It does not authorize implementation expansion, public product-readiness promotion, runtime authority, or estimate changes.

Source packet

This workflow packet follows:

```
docs/strategy/2026-05-25-2114-cdt-public-product-readiness-promotion-packet.md
```

Current strategy remains:

```
Continue small guarded report/status alignment only when drift appears.
```

Target evaluator

Primary evaluator:

```
technical evaluator
```

Secondary evaluators:

```
security researcher
systems engineer
infrastructure maintainer
```

This workflow is not for nontechnical end users, production operators, daily-driver use, or security reliance.

Workflow statement

Named workflow:

```
Evaluate Latticra locally through Latticra Panel without granting runtime authority.
```

Workflow purpose:

```
let a technical evaluator inspect Latticra&#x27;s current local workbench, dry-run posture,
visible authority boundaries, plan/evidence surfaces, and reset boundaries without
claiming production readiness
```

Current evidence

Existing README-supported Panel flow:

```
open Guided Workbench
keep dry-run mode enabled
generate and inspect the plan
run Dry-Install to validate and write a receipt
review the embedded console, plan, and engine log
enable guarded local-prefix writes only after dry-run evidence looks correct
```

Existing command surface:

```
make -C installer gui
make -C installer dry-run
make -C installer verify-local
make -C installer reset-dry-run
make -C installer reset-local
make -C installer uninstall-local
make -C installer uninstall-dry-run
```

Current estimate posture:

```
Latticra Panel / local control surface: 28%
Public product readiness: 8%
```

Workflow boundary

The first public-readiness workflow should remain:

```
local
operator-visible
dry-run-first
no-root by default
no-network by default
reset-aware
receipt-aware
non-production
```

The workflow should not depend on runtime execution, effect execution, capability enforcement, cryptographic authority, model execution, tool execution, or network behavior.

Proposed user journey

The future workflow record should describe exactly this path:

1. Read the current status and non-claims.
2. Confirm local prerequisites.
3. Launch Latticra Panel from source or documented local entry point.
4. Enter Guided Workbench.
5. Confirm dry-run mode is enabled.
6. Generate the local plan.
7. Inspect the plan before any local write.
8. Run the dry-run validation path.
9. Inspect the receipt, embedded console, plan, and engine log.
10. Confirm denied authority and non-claims remain visible.
11. Run reset or uninstall dry-run path when appropriate.
12. Exit with a clear statement of what happened and what did not happen.

Required acceptance evidence

Before this workflow can support any product-readiness estimate change, require:

```
workflow acceptance checklist
platform prerequisite checklist
dry-run transcript
plan output example
receipt or receipt-like evidence example
engine log example
embedded console status example
reset or uninstall transcript
failure-state examples
known limitations note
support boundary note
non-claim review
guard or test that covers the documented path
estimate-impact review
public-entrypoint review
```

Required operator-visible labels

The workflow should expose:

```
dry_run_enabled
runtime_authority_granted=0
effect_execution_performed=0
network_authority_granted=0
root_authority_required=0
local_write_planned=0|1
local_write_performed=0|1
receipt_available=0|1
reset_available=0|1
manual_review_required=1
production_ready=0
```

If local writes are part of a future guarded path, the workflow must distinguish:

```
dry-run artifacts
user-local artifacts
runtime effects
host effects
external effects
```

Failure model

Minimum failure states:

```
missing_rust_toolchain
missing_gui_dependency
unsupported_platform
panel_launch_failed
plan_generation_failed
dry_run_failed
receipt_missing
log_missing
reset_failed
operator_cancelled
manual_review_blocked
```

Every failure state should preserve:

```
no runtime authority
no network authority
no hidden mutation
visible remediation or manual-review note
```

Out-of-scope behavior

This workflow packet does not permit:

```
production installer claim
signed release claim
notarized app claim
Fedora approval claim
Ubuntu package readiness claim
macOS app readiness claim
daily-driver claim
root install claim
runtime authority
effect execution
capability enforcement
cryptographic authority
signing authority
network behavior
model execution
tool execution
shell execution outside documented local commands
security protection claim
malware-prevention claim
ransomware-prevention claim
operating-system replacement claim
```

Estimate-impact answer

```
Does this packet move public product readiness to a new promotion class? no
Does it add a completed user-facing workflow? no
Does it add runtime behavior? no
Does it add effect execution? no
Does it add authority? no
Does it add security-hardening evidence? no
Estimate change recommended: no
Reason: this packet selects and scopes the first workflow path only.
```

Public-entrypoint answer

```
Does this packet change public capability wording? no
Does it require README update? no
Does it require STATUS.md update? no
Does it require docs/status/CURRENT_STATUS.md update? no
Does it require docs/project_notes/CURRENT_DIRECTION.md update? no
Does it require docs/project_notes/UPCOMING_WORK.md update? no
Does it require announcement review? no
Public entrypoint change recommended: no
Reason: no capability posture changes.
```

Next planning action

The next planning action is:

```
draft the Panel-guided local evaluation acceptance checklist
```

That checklist should remain a planning artifact until it is tied to a real guard, transcript, or workflow evidence record.

Non-claims

This packet does not implement product readiness, Panel readiness, installer readiness, runtime behavior, effect execution, capability enforcement, cryptographic authority, signing authority, host behavior, network behavior, model execution, tool execution, shell execution, security hardening, malware prevention, ransomware prevention, sandboxing, operating-system behavior, or production support.

It records workflow planning criteria only.

docs/strategy/2026-05-25-2157-cdt-panel-guided-local-evaluation-acceptance-checklist.md

Source title: Latticra Panel-Guided Local Evaluation Acceptance Checklist

Lines: 363 | Words: 759 | SHA-256: 65d010cd6afffedc8e960855d4f007e45cd49fdf16dc7fd4a18ebf72ebc2c39f

Latticra Panel-Guided Local Evaluation Acceptance Checklist

Status: draft acceptance checklist Created: 2026-05-25 21:57 CDT Decision: checklist only Promotion decision: no product-readiness promotion recommended Scope: acceptance criteria for future Panel-guided local evaluation evidence.

Purpose

This checklist defines the evidence needed before the Panel-guided local evaluation workflow can be treated as a bounded public-readiness workflow.

It does not claim the evidence exists yet. It defines how future evidence should be reviewed.

Source workflow

This checklist follows:

```
docs/strategy/2026-05-25-2137-cdt-panel-guided-local-evaluation-workflow-packet.md
```

The source workflow is:

```
Evaluate Latticra locally through Latticra Panel without granting runtime authority.
```

Review result labels

Use one result label when applying this checklist:

```
not_started
blocked
partial_evidence
evidence_ready_for_review
accepted_for_estimate_review
rejected
```

This checklist alone cannot produce accepted_for_estimate_review; that result requires actual transcript, guard, or workflow evidence.

Required evaluator boundary

Acceptance requires:

```
target_evaluator_named=1
technical_evaluator_scope=1
nontechnical_user_scope=0
production_operator_scope=0
daily_driver_scope=0
security_reliance_scope=0
```

Required reviewer question:

```
Can the intended evaluator understand that this is a local evaluation workflow, not a production
 product?
```

Required status and non-claim entry

Acceptance requires visible entry into:

```
current project status
current estimate posture
public non-claims
runtime authority denial
effect execution denial
product-readiness limitation
security-hardening limitation
```

Required evidence:

```
status_surface_reference:
non_claim_surface_reference:
evaluator_acknowledgement_or_review_note:
```

Required prerequisite check

Acceptance requires a platform prerequisite check for the evaluated platform.

Minimum prerequisite labels:

```
platform_identified
rust_toolchain_status
cargo_status
make_status
gui_dependency_status
local_path_status
network_required=0
root_required=0
```

Failure states must include:

```
unsupported_platform
missing_rust_toolchain
missing_gui_dependency
manual_review_required
```

Required launch evidence

Acceptance requires evidence that the evaluator can reach the Panel entry point or a documented fallback.

Required evidence:

```
launch_command:
launch_result:
fallback_command:
panel_available=0|1
fallback_available=0|1
```

The launch path must not grant:

```
runtime authority
network authority
root authority
effect authority
```

Required dry-run-first evidence

Acceptance requires the workflow to prove dry-run-first posture.

Required labels:

```
dry_run_enabled=1
dry_run_required_before_guarded_writes=1
runtime_authority_granted=0
effect_execution_performed=0
network_authority_granted=0
root_authority_required=0
production_ready=0
```

```
manual_review_required=1
```

Required reviewer question:

```
Can the evaluator tell, before proceeding, whether any local write is planned?
```

Required plan evidence

Acceptance requires a plan output or plan-equivalent evidence record.

Required evidence:

```
plan_generated=1
plan_reviewable=1
planned_artifact_paths_visible=1
planned_local_writes_visible=1
planned_runtime_effects_visible=1
planned_network_effects_visible=1
denied_authority_visible=1
```

The plan must distinguish:

```
dry-run artifacts
user-local artifacts
runtime effects
host effects
external effects
```

Required dry-run validation evidence

Acceptance requires a dry-run validation transcript or equivalent record.

Required evidence:

```
dry_run_started=1
dry_run_completed=0|1
dry_run_failed=0|1
failure_reason_visible=1
hidden_mutation_detected=0
effect_execution_performed=0
network_behavior_performed=0
runtime_authority_granted=0
```

If the dry-run fails, acceptance requires a visible failure label and remediation or manual-review note.

Required receipt and log evidence

Acceptance requires receipt and log visibility when the workflow says they should exist.

Required evidence:

```
receipt_expected=0|1
receipt_available=0|1
receipt_path_visible=0|1
engine_log_expected=0|1
engine_log_available=0|1
engine_log_path_visible=0|1
embedded_console_status_available=0|1
```

Failure states must include:

```
receipt_missing
log_missing
manual_review_required
```

Required reset or uninstall evidence

Acceptance requires a reset, cleanup, or uninstall path appropriate to the workflow evidence.

Required evidence:

```
reset_available=1
uninstall_or_cleanup_available=1
reset_dry_run_available=1
cleanup_scope_visible=1
```

```
local_artifact_scope_visible=1
reset_failed_label_available=1
```

If no local artifacts are created, the workflow must state:

```
local_artifacts_created=0
cleanup_required=0
```

Required failure-state coverage

Acceptance requires examples or declared handling for:

```
unsupported_platform
missing_rust_toolchain
missing_gui_dependency
panel_launch_failed
plan_generation_failed
dry_run_failed
receipt_missing
log_missing
reset_failed
operator_cancelled
manual_review_blocked
```

Every failure state must preserve:

```
no runtime authority
no network authority
no hidden mutation
visible remediation or manual-review note
```

Required known limitations

Acceptance requires visible limitations:

```
not a production installer
not a daily-driver product
not a security boundary
not malware prevention
not ransomware prevention
not a Fedora-approved package
not an Ubuntu package-readiness claim
not a macOS app-readiness claim
not an operating-system replacement
```

Required support boundary

Acceptance requires a support boundary:

```
supported_evaluator:
supported_platforms_for_this_evidence:
unsupported_platforms:
known_setup_limits:
known_runtime_limits:
where_to_report_documentation_issues:
where_to_report_security_issues:
```

Required evidence bundle

Before estimate review, collect:

```
workflow acceptance checklist result
platform prerequisite record
dry-run transcript
plan output example
receipt or receipt-like evidence
engine log example
embedded console status example
reset or uninstall transcript
failure-state examples
known limitations note
support boundary note
non-claim review
guard or test reference
```

Estimate-impact gate

Estimate review may be considered only if:

```
workflow_completed_by_target_evaluator=1
evidence_bundle_complete=1
guard_or_test_reference_present=1
non_claim_review_present=1
public_entrypoint_review_present=1
```

Checklist result:

```
estimate_change_recommended=no
reason=this checklist defines acceptance criteria only
```

Public-entrypoint gate

Public entrypoint review may be considered only if actual workflow evidence exists.

Checklist result:

```
README_update_required=no
STATUS_update_required=no
CURRENT_STATUS_update_required=no
project_notes_update_required=no
announcement_review_required=no
reason=no capability posture changes in this checklist
```

Non-claims

This checklist does not implement product readiness, Panel readiness, installer readiness, runtime behavior, effect execution, capability enforcement, cryptographic authority, signing authority, host behavior, network behavior, model execution, tool execution, shell execution, security hardening, malware prevention, ransomware prevention, sandboxing, operating-system behavior, or production support.

It records acceptance criteria only.

docs/strategy/2026-05-25-2226-cdt-panel-guided-local-evaluation-evidence-bundle-template.md

Source title: Latticra Panel-Guided Local Evaluation Evidence Bundle Template

Lines: 350 | Words: 553 | SHA-256: 45a8a547e147801bc0256ccf0f92c0574f255c388cd2a57f8eea0f059576ac5c

Latticra Panel-Guided Local Evaluation Evidence Bundle Template

Status: draft evidence-bundle template Created: 2026-05-25 22:26 CDT Decision: template only Promotion decision: no product-readiness promotion recommended Scope: evidence bundle structure for future Panel-guided local evaluation review.

Purpose

This template defines the evidence bundle that would be required before Panel-guided local evaluation can be reviewed as a bounded public-readiness workflow.

It does not claim any evidence has been captured. It defines the future bundle shape only.

Source checklist

This template follows:

```
docs/strategy/2026-05-25-2157-cdt-panel-guided-local-evaluation-acceptance-checklist.md
```

The source workflow remains:

```
Evaluate Latticra locally through Latticra Panel without granting runtime authority.
```

Bundle header

```
bundle name:
created:
review status: not_started|blocked|partial_evidence|evidence_ready_for_review|rejected
target evaluator:
evaluated platform:
repository commit:
workflow packet:
acceptance checklist:
review owner:
```

accepted_for_estimate_review must not be used until a reviewer confirms that all required evidence exists and the non-claim, public-entrypoint, and estimate-impact reviews are present.

Evidence manifest

Required manifest fields:

```
status_entry_record:
non_claim_entry_record:
platform_prerequisite_record:
launch_record:
dry_run_first_record:
plan_output_record:
dry_run_validation_record:
receipt_record:
engine_log_record:
embedded_console_record:
reset_or_uninstall_record:
failure_state_record:
known_limitations_record:
support_boundary_record:
non_claim_review_record:
guard_or_test_record:
public_entrypoint_review_record:
estimate_impact_review_record:
```

Each record should be a path, transcript id, status document, or explicit missing label.

Status and non-claim entry record

Required fields:

```
status_surface_reference:
estimate_surface_reference:
non_claim_surface_reference:
runtime_authority_denial_visible=0|1
effect_execution_denial_visible=0|1
product_readiness_limitation_visible=0|1
security_hardening_limitation_visible=0|1
evaluator_review_note:
record_status: missing|partial|complete
```

Platform prerequisite record

Required fields:

```
platform_identified:
platform_version:
rust_toolchain_status:
cargo_status:
make_status:
gui_dependency_status:
local_path_status:
network_required=0
root_required=0
unsupported_platform=0|1
missing_dependency_labels:
manual_review_required=0|1
record_status: missing|partial|complete
```

Launch record

Required fields:

```
launch_command:
launch_result:
fallback_command:
panel_available=0|1
fallback_available=0|1
runtime_authority_granted=0
network_authority_granted=0
root_authority_granted=0
effect_authority_granted=0
record_status: missing|partial|complete
```

Dry-run-first record

Required fields:

```
dry_run_enabled=1
dry_run_required_before_guarded_writes=1
local_write_planned=0|1
local_write_performed=0|1
runtime_authority_granted=0
effect_execution_performed=0
network_authority_granted=0
root_authority_required=0
production_ready=0
manual_review_required=1
record_status: missing|partial|complete
```

Plan output record

Required fields:

```
plan_generated=0|1
plan_reviewable=0|1
planned_artifact_paths_visible=0|1
planned_local_writes_visible=0|1
planned_runtime_effects_visible=0|1
planned_network_effects_visible=0|1
denied_authority_visible=0|1
dry_run_artifacts_identified=0|1
user_local_artifacts_identified=0|1
runtime_effects_identified=0|1
host_effects_identified=0|1
external_effects_identified=0|1
record_status: missing|partial|complete
```

Dry-run validation record

Required fields:

```
dry_run_started=0|1
dry_run_completed=0|1
dry_run_failed=0|1
failure_reason_visible=0|1
hidden_mutation_detected=0
effect_execution_performed=0
network_behavior_performed=0
runtime_authority_granted=0
remediation_or_manual_review_note:
record_status: missing|partial|complete
```

Receipt and log records

Receipt fields:

```
receipt_expected=0|1
receipt_available=0|1
receipt_path_visible=0|1
receipt_review_note:
record_status: missing|partial|complete
```

Engine log fields:

```
engine_log_expected=0|1
engine_log_available=0|1
engine_log_path_visible=0|1
engine_log_review_note:
record_status: missing|partial|complete
```

Embedded console fields:

```
embedded_console_status_available=0|1
embedded_console_status_summary:
record_status: missing|partial|complete
```

Reset or uninstall record

Required fields:

```
reset_available=0|1
uninstall_or_cleanup_available=0|1
reset_dry_run_available=0|1
cleanup_scope_visible=0|1
local_artifact_scope_visible=0|1
local_artifacts_created=0|1
cleanup_required=0|1
reset_failed=0|1
reset_failed_label_available=0|1
record_status: missing|partial|complete
```

Failure-state record

Required failure labels:

```
unsupported_platform:
missing_rust_toolchain:
missing_gui_dependency:
panel_launch_failed:
plan_generation_failed:
dry_run_failed:
receipt_missing:
log_missing:
reset_failed:
operator_cancelled:
manual_review_blocked:
```

For every failure label, record:

```
runtime_authority_granted=0
network_authority_granted=0
hidden_mutation_detected=0
remediation_or_manual_review_note:
```

Known limitations record

Required visible limitations:

```
not_a_production_installer=1
not_a_daily_driver_product=1
not_a_security_boundary=1
not_malware_prevention=1
not_ransomware_prevention=1
not_fedora_approved=1
not_ubuntu_package_readiness=1
not_macos_app_readiness=1
not_operating_system_replacement=1
record_status: missing|partial|complete
```

Support boundary record

Required fields:

```
supported_evaluator:
supported_platforms_for_this_evidence:
unsupported_platforms:
known_setup_limits:
known_runtime_limits:
documentation_issue_path:
security_issue_path:
record_status: missing|partial|complete
```

Review gate records

Non-claim review:

```
non_claim_review_present=0|1
non_claim_review_path:
```

```
claim_expansion_detected=0|1
```

Guard or test reference:

```
guard_or_test_reference_present=0|1
guard_or_test_path:
guard_or_test_result:
```

Public-entrypoint review:

```
public_entrypoint_review_present=0|1
README_update_required=0|1
STATUS_update_required=0|1
CURRENT_STATUS_update_required=0|1
project_notes_update_required=0|1
announcement_review_required=0|1
```

Estimate-impact review:

```
estimate_impact_review_present=0|1
estimate_change_recommended=0|1
reason:
```

Bundle completeness rule

The bundle is complete only if:

```
all_required_records_present=1
all_required_records_complete=1
non_claim_review_present=1
guard_or_test_reference_present=1
public_entrypoint_review_present=1
estimate_impact_review_present=1
claim_expansion_detected=0
```

This template result:

```
bundle_complete=0
estimate_change_recommended=0
public_entrypoint_change_recommended=0
reason=this file defines the future bundle shape only
```

Non-claims

This template does not provide workflow evidence, product readiness, Panel readiness, installer readiness, runtime behavior, effect execution, capability enforcement, cryptographic authority, signing authority, host behavior, network behavior, model execution, tool execution, shell execution, security hardening, malware prevention, ransomware prevention, sandboxing, operating-system behavior, or production support.

It records an evidence-bundle structure only.

docs/strategy/2026-05-25-2246-cdt-panel-guided-local-evaluation-evidence-capture-plan.md

Source title: Latticra Panel-Guided Local Evaluation Evidence Capture Plan

Lines: 394 | Words: 894 | SHA-256: bba5d5b72426fd075b0d5cba39e752b97d94bf711ee2d844f530e1287edab680

Latticra Panel-Guided Local Evaluation Evidence Capture Plan

Status: draft evidence-capture plan Created: 2026-05-25 22:46 CDT Decision: capture plan only Promotion decision: no product-readiness promotion recommended Scope: future evidence-capture sequence for Panel-guided local evaluation.

Purpose

This plan defines how future evidence should be captured for the Panel-guided local evaluation evidence bundle.

It does not capture evidence, run commands, implement guards, or change public product-readiness posture.

Source bundle

This plan follows:

```
docs/strategy/2026-05-25-2226-cdt-panel-guided-local-evaluation-evidence-bundle-template.md
```

The target workflow remains:

```
Evaluate Latticra locally through Latticra Panel without granting runtime authority.
```

Capture posture

The capture sequence must remain:

```
local
dry-run-first
operator-visible
no-root by default
no-network by default
no runtime authority
no effect execution
no product-readiness claim
```

If any step requires root, network access, runtime authority, hidden mutation, or unreviewed local writes, the capture must stop and be marked blocked.

Capture roles

Required roles:

```
capture operator:
review owner:
non-claim reviewer:
public-entrypoint reviewer:
estimate-impact reviewer:
```

The same person may hold more than one role, but the evidence bundle must name which role performed each review.

Capture phases

Use this phase order:

```
phase_0_scope_lock
phase_1_status_and_non_claim_entry
phase_2_platform_prerequisite_capture
phase_3_panel_launch_capture
phase_4_dry_run_first_capture
phase_5_plan_capture
phase_6_dry_run_validation_capture
phase_7_receipt_log_console_capture
phase_8_reset_or_uninstall_capture
phase_9_failure_state_capture
phase_10_limitations_and_support_capture
phase_11_review_gate_capture
phase_12_bundle_completeness_review
```

Do not skip phases. A skipped phase must be recorded as missing or blocked.

Phase 0: Scope Lock

Capture before running any workflow step:

```
repository commit:
target evaluator:
evaluated platform:
workflow packet path:
acceptance checklist path:
evidence bundle template path:
capture plan path:
```

Required scope assertions:

```
product_readiness_promotion_requested=0
estimate_change_requested=0
runtime_authority_requested=0
network_authority_requested=0
root_authority_requested=0
effect_execution_requested=0
```

Stop if any assertion cannot be preserved.

Phase 1: Status And Non-Claim Entry

Capture:

```
status_surface_reference
estimate_surface_reference
non_claim_surface_reference
runtime_authority_denial_visible
effect_execution_denial_visible
product_readiness_limitation_visible
security_hardening_limitation_visible
```

Stop if the evaluator cannot find current status or non-claims before launch.

Phase 2: Platform Prerequisite Capture

Capture:

```
platform identity
Rust toolchain status
Cargo status
Make status
GUI dependency status
local path status
network requirement status
root requirement status
```

Allowed result labels:

```
complete
partial
blocked
unsupported_platform
missing_dependency
```

Stop if prerequisites imply network or root authority that was not already documented as optional and outside the no-effect workflow.

Phase 3: Panel Launch Capture

Capture:

```
launch command
launch result
fallback command
panel availability
fallback availability
authority labels after launch
```

Required authority labels:

```
runtime_authority_granted=0
network_authority_granted=0
root_authority_granted=0
effect_authority_granted=0
```

Stop if launch behavior grants authority or performs hidden mutation.

Phase 4: Dry-Run-First Capture

Capture:

```
dry_run_enabled
dry_run_required_before_guarded_writes
local_write_planned
local_write_performed
manual_review_required
production_ready
```

Required labels:

```
dry_run_enabled=1
runtime_authority_granted=0
effect_execution_performed=0
network_authority_granted=0
root_authority_required=0
production_ready=0
manual_review_required=1
```

Stop if dry-run posture is ambiguous.

Phase 5: Plan Capture

Capture plan output or plan-equivalent evidence.

The plan must expose:

```
planned artifact paths
planned local writes
planned runtime effects
planned network effects
denied authority
dry-run artifacts
user-local artifacts
runtime effects
host effects
external effects
```

Stop if the evaluator cannot distinguish dry-run artifacts from local writes, runtime effects, host effects, or external effects.

Phase 6: Dry-Run Validation Capture

Capture:

```
dry_run_started
dry_run_completed
dry_run_failed
failure_reason_visible
hidden_mutation_detected
effect_execution_performed
network_behavior_performed
runtime_authority_granted
remediation_or_manual_review_note
```

Required preservation labels:

```
hidden_mutation_detected=0
effect_execution_performed=0
network_behavior_performed=0
runtime_authority_granted=0
```

Stop if any preservation label changes.

Phase 7: Receipt, Log, And Console Capture

Capture:

```
receipt expectation
receipt availability
receipt path visibility
engine log expectation
engine log availability
engine log path visibility
embedded console status availability
embedded console status summary
```

If any expected record is missing, mark the bundle partial_evidence or blocked, not complete.

Phase 8: Reset Or Uninstall Capture

Capture:

```
reset availability
uninstall or cleanup availability
```

```
reset dry-run availability
cleanup scope visibility
local artifact scope visibility
local artifacts created
cleanup required
reset failure label availability
```

Stop if local artifacts are created but no cleanup or reset boundary is visible.

Phase 9: Failure-State Capture

Capture declared handling for:

```
unsupported_platform
missing_rust_toolchain
missing_gui_dependency
panel_launch_failed
plan_generation_failed
dry_run_failed
receipt_missing
log_missing
reset_failed
operator_cancelled
manual_review_blocked
```

Each failure state must preserve:

```
runtime_authority_granted=0
network_authority_granted=0
hidden_mutation_detected=0
remediation_or_manual_review_note_present=1
```

Phase 10: Limitations And Support Capture

Capture visible limitations:

```
not a production installer
not a daily-driver product
not a security boundary
not malware prevention
not ransomware prevention
not Fedora approved
not Ubuntu package readiness
not macOS app readiness
not an operating-system replacement
```

Capture support boundary:

```
supported evaluator
supported platforms for this evidence
unsupported platforms
known setup limits
known runtime limits
documentation issue path
security issue path
```

Stop if limitations are hidden, softened into product claims, or contradicted by the workflow.

Phase 11: Review Gate Capture

Required reviews:

```
non-claim review
guard or test reference
public-entrypoint review
estimate-impact review
```

Review constraints:

```
non_claim_review_present=1
guard_or_test_reference_present=1
public_entrypoint_review_present=1
estimate_impact_review_present=1
claim_expansion_detected=0
```

Do not recommend estimate or public-entrypoint changes from capture evidence alone. Those reviews must explain the decision separately.

Phase 12: Bundle Completeness Review

The bundle may be marked evidence_ready_for_review only when:

```
all_required_records_present=1
all_required_records_complete=1
all_stop_conditions_cleared=1
non_claim_review_present=1
guard_or_test_reference_present=1
public_entrypoint_review_present=1
estimate_impact_review_present=1
claim_expansion_detected=0
```

This plan result:

```
evidence_captured=0
bundle_complete=0
estimate_change_recommended=0
public_entrypoint_change_recommended=0
reason=this file defines future capture sequence only
```

Non-claims

This plan does not capture evidence, implement a guard, validate the Panel workflow, provide product readiness, provide Panel readiness, provide installer readiness, grant runtime authority, execute effects, enforce capabilities, provide cryptographic authority, provide signing authority, perform host behavior, perform network behavior, execute models, execute tools, execute shell behavior, harden security, prevent malware, prevent ransomware, provide sandboxing, provide operating-system behavior, or provide production support.

It records an evidence-capture sequence only.

docs/strategy/2026-05-26-0019-cdt-panel-guided-local-evaluation-non-claim-review-template.md

Source title: Latticra Panel-Guided Local Evaluation Non-Claim Review Template

Lines: 293 | Words: 710 | SHA-256: c40f51f569956c36ee7f1062bbfacceeb6caa8607acda64a1c0b41ea98d6a979

Latticra Panel-Guided Local Evaluation Non-Claim Review Template

Status: draft non-claim review template Created: 2026-05-26 00:19 CDT Decision: review template only Promotion decision: no product-readiness promotion recommended Scope: non-claim review for future Panel-guided local evaluation evidence.

Purpose

This template defines the non-claim review required before any Panel-guided local evaluation evidence can be used in public product-readiness, public-entrypoint, or estimate-impact discussions.

It does not perform the review. It defines the review shape only.

Source plan

This template follows:

```
docs/strategy/2026-05-25-2246-cdt-panel-guided-local-evaluation-evidence-capture-plan.md
```

The target workflow remains:

```
Evaluate Latticra locally through Latticra Panel without granting runtime authority.
```

Review header

```
review name:
created:
reviewer:
review status: not_started|blocked|partial|complete|rejected
workflow evidence bundle:
capture plan:
evaluated platform:
repository commit:
```

Required review outcome

Use one outcome:

```
claim_safe_for_current_scope
claim_safe_with_required_edits
claim_unsafe_blocked
insufficient_evidence
```

This template result:

```
review_performed=0
claim_expansion_detected=0
product_readiness_promotion_recommended=0
estimate_change_recommended=0
public_entrypoint_change_recommended=0
reason=this file defines the future review shape only
```

Required source checks

The reviewer must inspect:

```
README.md
STATUS.md
docs/status/CURRENT_STATUS.md
docs/project_notes/CURRENT_DIRECTION.md
docs/project_notes/UPCOMING_WORK.md
docs/strategy/README.md
docs/strategy/2026-05-25-2114-cdt-public-product-readiness-promotion-packet.md
docs/strategy/2026-05-25-2137-cdt-panel-guided-local-evaluation-workflow-packet.md
docs/strategy/2026-05-25-2157-cdt-panel-guided-local-evaluation-acceptance-checklist.md
docs/strategy/2026-05-25-2226-cdt-panel-guided-local-evaluation-evidence-bundle-template.md
docs/strategy/2026-05-25-2246-cdt-panel-guided-local-evaluation-evidence-capture-plan.md
```

If any source is missing, mark the review blocked or insufficient_evidence.

Claims that must remain false

The review must confirm the workflow does not claim:

```
production_ready=0
daily_driver_ready=0
security_boundary=0
malware_prevention=0
ransomware_prevention=0
sandbox_provided=0
operating_system_replacement=0
runtime_authority_granted=0
effect_execution_performed=0
capability_enforcement_performed=0
cryptographic_authority_granted=0
signing_authority_granted=0
network_authority_granted=0
root_authority_required_by_default=0
model_execution_performed=0
tool_execution_performed=0
hidden_mutation_performed=0
```

Any true value in this section blocks the review unless a separate contract, implementation plan, guard, evidence record, public-entrypoint review, estimate-impact review, and non-claim update exist.

Product-readiness wording check

Allowed wording:

```
bounded local evaluation workflow
technical evaluator workflow
dry-run-first local workbench review
operator-visible evidence review
planning evidence
future evidence capture
no product-readiness promotion recommended
```

Blocked wording:

```
ready for users
production ready
daily driver
installer ready
secure product
protected workflow
safe installer
approved package
supported release
```

If blocked wording appears, the review outcome must be claim_safe_with_required_edits or claim_unsafe_blocked.

Security wording check

Allowed wording:

```
security-conscious design
defensive planning
non-claim review
threat-model-aware planning
no security boundary claimed
```

Blocked wording:

```
prevents malware
prevents ransomware
secure sandbox
hardened runtime
security boundary
verified protection
production cryptographic trust
```

Any security-protection wording requires separate enforcement evidence before it can be considered.

Installer and platform wording check

Allowed wording:

```
local evaluation
source-run workflow
dry-run path
user-local planning
platform prerequisite check
```

Blocked wording:

```
production installer
signed release
notarized app
Fedora approved
Ubuntu package ready
macOS app ready
LaunchAgent integration
privileged helper
system extension
network extension
```

Platform-specific readiness claims are blocked unless a separate platform evidence packet exists.

Authority wording check

The review must confirm that the workflow preserves:

```
runtime_authority_granted=0
effect_execution_performed=0
```

```
capability_enforcement_performed=0
network_authority_granted=0
root_authority_required_by_default=0
host_effect_performed=0
external_effect_performed=0
```

Any authority-bearing wording must be rejected unless it belongs to a separate contracted and evidenced lane.

Evidence wording check

Allowed wording:

```
template
plan
checklist
future evidence
missing evidence
partial evidence
evidence ready for review
```

Blocked wording:

```
evidence complete
workflow accepted
product readiness improved
estimate increase justified
public posture changed
```

Blocked evidence wording may become allowed only after the evidence bundle is complete and separately reviewed.

Required reviewer answers

```
Does the workflow preserve no product-readiness promotion? yes|no
Does the workflow preserve no security claim? yes|no
Does the workflow preserve no runtime authority? yes|no
Does the workflow preserve no effect execution? yes|no
Does the workflow preserve no hidden mutation? yes|no
Does the workflow preserve no network authority? yes|no
Does the workflow preserve no platform-readiness claim? yes|no
Does the workflow preserve no estimate change? yes|no
Does the workflow preserve no public-entrypoint change? yes|no
```

All answers must be yes for claim_safe_for_current_scope.

Required edit log

If edits are required, record:

```
source file:
claim text:
claim risk:
required replacement:
reviewer note:
```

Review gate output

```
non_claim_review_present=0|1
claim_expansion_detected=0|1
required_edits_present=0|1
blocking_claims_present=0|1
public_entrypoint_review_required=0|1
estimate_impact_review_required=0|1
review_outcome:
```

This template output:

```
non_claim_review_present=0
claim_expansion_detected=0
required_edits_present=0
blocking_claims_present=0
public_entrypoint_review_required=0
estimate_impact_review_required=0
review_outcome=not_performed
```

Non-claims

This template does not perform a non-claim review, validate workflow evidence, provide product readiness, provide Panel readiness, provide installer readiness, grant runtime authority, execute effects, enforce capabilities, provide cryptographic authority, provide signing authority, perform host behavior, perform network behavior, execute models, execute tools, execute shell behavior, harden security, prevent malware, prevent ransomware, provide sandboxing, provide operating-system behavior, or provide production support.

It records a non-claim review form only.

Lines: 275 | Words: 804 | SHA-256: afa41baa6f2f857cac8a1be0fe9d8a09e5f4353d0384ea2bded11b44cbc591e4

Latticra Panel-Guided Local Evaluation Public-Entrypoint Review Template

Status: draft public-entrypoint review template Created: 2026-05-26 00:34 CDT Decision: review template only Promotion decision: no product-readiness promotion recommended Scope: public-entrypoint review for future Panel-guided local evaluation evidence.

Purpose

This template defines when future Panel-guided local evaluation evidence may justify updates to public reader-facing entry points.

It does not perform the review, update public entry points, or change project posture.

Source review

This template follows:

```
docs/strategy/2026-05-26-0019-cdt-panel-guided-local-evaluation-non-claim-review-template.md
```

The target workflow remains:

```
Evaluate Latticra locally through Latticra Panel without granting runtime authority.
```

Review header

```
review name:
created:
reviewer:
review status: not_started|blocked|partial|complete|rejected
workflow evidence bundle:
non-claim review:
estimate-impact review:
repository commit:
```

Required review outcome

Use one outcome:

```
no_public_entrypoint_change
public_entrypoint_change_allowed_with_edits
public_entrypoint_change_blocked
insufficient_evidence
```

This template result:

```
review_performed=0
public_entrypoint_change_recommended=0
README_update_required=0
STATUS_update_required=0
```

```
CURRENT_STATUS_update_required=0
project_notes_update_required=0
announcement_review_required=0
reason=this file defines the future review shape only
```

Review prerequisites

Public-entrypoint review is blocked unless:

```
workflow_evidence_bundle_present=1
acceptance_checklist_result_present=1
non_claim_review_present=1
claim_expansion_detected=0
guard_or_test_reference_present=1
estimate_impact_review_present=1
```

If any prerequisite is missing, use:

```
review_outcome=insufficient_evidence
public_entrypoint_change_recommended=0
```

Entry points under review

Review only these public surfaces for this workflow:

```
README.md
STATUS.md
docs/status/CURRENT_STATUS.md
docs/project_notes/CURRENT_DIRECTION.md
docs/project_notes/UPCOMING_WORK.md
docs/strategy/README.md
```

Do not update broader foundation docs, announcement logs, package docs, installer docs, or platform docs from this review unless a separate review explicitly names them.

Allowed public-entrypoint changes

Allowed only after prerequisites pass:

```
add pointer to completed evidence bundle
add pointer to non-claim review
add pointer to estimate-impact review
clarify that Panel-guided local evaluation evidence exists
clarify limitations for technical evaluators
clarify no product-readiness promotion if estimate remains unchanged
```

Allowed wording:

```
Panel-guided local evaluation evidence bundle
technical evaluator workflow evidence
dry-run-first local evaluation evidence
operator-visible local evaluation record
no product-readiness promotion from this evidence alone
```

Blocked public-entrypoint changes

Blocked unless a separate capability promotion has been accepted:

```
increase public product-readiness estimate
claim production readiness
claim installer readiness
claim platform package readiness
claim daily-driver readiness
claim security protection
claim malware prevention
claim ransomware prevention
claim sandboxing
claim operating-system replacement
claim runtime authority
claim effect execution
claim capability enforcement
claim cryptographic trust
claim signing authority
```

If any blocked change is requested, the review outcome must be:

```
public_entrypoint_change_blocked
```

README review questions

```
Does README need a new link? yes|no
Does README wording stay bounded to local evaluation evidence? yes|no
Does README avoid product-readiness promotion? yes|no
Does README avoid security or installer claims? yes|no
Does README preserve current estimate wording unless estimate review changes it? yes|no
```

README update is allowed only if every preservation answer is yes.

STATUS.md review questions

```
Does STATUS.md need a new latest-note line? yes|no
Does STATUS.md need estimate table changes? yes|no
Does STATUS.md preserve planning-estimate caveats? yes|no
Does STATUS.md avoid capability posture promotion? yes|no
Does STATUS.md point to the evidence bundle only as evidence? yes|no
```

Estimate table changes require a separate estimate-impact review with estimate_change_recommended=1.

CURRENT_STATUS review questions

```
Does CURRENT_STATUS need a detailed evidence note? yes|no
Does CURRENT_STATUS preserve no runtime authority? yes|no
Does CURRENT_STATUS preserve no effect execution? yes|no
Does CURRENT_STATUS preserve no security-hardening promotion? yes|no
Does CURRENT_STATUS preserve no product-readiness promotion unless separately reviewed? yes|no
```

Project-notes review questions

```
Does CURRENT_DIRECTION need narrative alignment? yes|no
Does UPCOMING_WORK need queue alignment? yes|no
Does the current next-step rule remain unchanged? yes|no
Does the workflow evidence change near-term strategy? yes|no
```

If the current next-step rule changes, a strategy posture review is required.

Strategy index review questions

```
Does docs/strategy/README.md need only a link update? yes|no
Does the new entry remain dated and reviewable? yes|no
Does the index avoid implying capability promotion? yes|no
```

Strategy index link updates are allowed when a dated review record exists, even if no capability posture changes.

Announcement review trigger

Announcement review is required only if:

```
public capability posture changed=1
product_readiness_estimate_changed=1
security_hardening_posture_changed=1
runtime_authority_changed=1
user-facing workflow accepted for public posture=1
```

This template result:

```
announcement_review_required=0
reason=no evidence or posture change in this template
```

Required edit log

If public-entrypoint edits are allowed, record:

```
entrypoint:
edit type:
source evidence:
non-claim review:
estimate-impact review:
old wording:
new wording:
reviewer note:
```

Review gate output

```
public_entrypoint_review_present=0|1
public_entrypoint_change_recommended=0|1
README_update_required=0|1
STATUS_update_required=0|1
CURRENT_STATUS_update_required=0|1
project_notes_update_required=0|1
strategy_index_update_required=0|1
announcement_review_required=0|1
blocked_claim_detected=0|1
review_outcome:
```

This template output:

```
public_entrypoint_review_present=0
public_entrypoint_change_recommended=0
README_update_required=0
STATUS_update_required=0
CURRENT_STATUS_update_required=0
project_notes_update_required=0
strategy_index_update_required=0
announcement_review_required=0
blocked_claim_detected=0
review_outcome=not_performed
```

Non-claims

This template does not perform a public-entrypoint review, update README, update status files, update project notes, create an announcement, validate workflow evidence, provide product readiness, provide Panel readiness, provide installer readiness, grant runtime authority, execute effects, enforce capabilities, provide cryptographic authority, provide signing authority, perform host behavior, perform network behavior, execute models, execute tools, execute shell behavior, harden security, prevent malware, prevent ransomware, provide sandboxing, provide operating-system behavior, or provide production support.

It records a public-entrypoint review form only.

docs/strategy/2026-05-26-0119-cdt-panel-guided-local-evaluation-estimate-impact-review-template.md

Source title: Latticra Panel-Guided Local Evaluation Estimate-Impact Review Template

Lines: 290 | Words: 842 | SHA-256: 33065a753d21323a8e02ee13fdcbdb77f9a684a4886f2cdac08c9f256559b034

Latticra Panel-Guided Local Evaluation Estimate-Impact Review Template

Status: draft estimate-impact review template Created: 2026-05-26 01:19 CDT Decision: review template only Promotion decision: no product-readiness promotion recommended Scope: estimate-impact review for future Panel-guided local evaluation evidence.

Purpose

This template defines how future Panel-guided local evaluation evidence should be reviewed before any completion estimate changes are considered.

It does not perform the review, change estimates, or change public product-readiness posture.

Source review

This template follows:

```
docs/strategy/2026-05-26-0034-cdt-panel-guided-local-evaluation-public-entrypoint-review-templat
e.md
```

The target workflow remains:

```
Evaluate Latticra locally through Latticra Panel without granting runtime authority.
```

Review header

```
review name:
created:
reviewer:
review status: not_started|blocked|partial|complete|rejected
workflow evidence bundle:
acceptance checklist result:
non-claim review:
public-entrypoint review:
guard or test reference:
repository commit:
```

Required review outcome

Use one outcome:

```
no_estimate_change
estimate_change_allowed_with_public_entrypoint_review
estimate_change_blocked
insufficient_evidence
```

This template result:

```
review_performed=0
estimate_change_recommended=0
product_readiness_estimate_change_recommended=0
panel_estimate_change_recommended=0
public_documentation_estimate_change_recommended=0
strategy_status_funding_estimate_change_recommended=0
reason=this file defines the future review shape only
```

Review prerequisites

Estimate-impact review is blocked unless:

```
workflow_evidence_bundle_present=1
acceptance_checklist_result_present=1
acceptance_checklist_result=evidence_ready_for_review
non_claim_review_present=1
claim_expansion_detected=0
public_entrypoint_review_present=1
guard_or_test_reference_present=1
```

If any prerequisite is missing, use:

```
review_outcome=insufficient_evidence
estimate_change_recommended=0
```

Baseline estimate record

Record current estimates at review time:

```
baseline_record_date:
baseline_source_files:
overall_latticra_system:
latticra_panel_local_control_surface:
public_product_readiness:
public_documentation_posture:
strategy_status_funding_framework:
security_hardening_implementation:
runtime_operating_system_universe_direction:
```

Do not rely on estimates copied into older strategy templates. The reviewer must read the current public estimate table at review time.

Capability-posture questions

Answer before any estimate movement:

```
Does the evidence add a completed user-facing workflow? yes|no
Does the evidence show a target evaluator completed the workflow? yes|no
Does the evidence include dry-run-first proof? yes|no
Does the evidence include plan, receipt, log, and reset visibility? yes|no
```

```
Does the evidence include failure-state coverage? yes|no
Does the evidence include a support boundary? yes|no
Does the evidence include a guard or test reference? yes|no
Does the evidence preserve no runtime authority? yes|no
Does the evidence preserve no effect execution? yes|no
Does the evidence preserve no network authority? yes|no
Does the evidence preserve no product-readiness overclaim? yes|no
```

All answers must support the proposed estimate decision.

Estimate lanes under review

Allowed lanes for this workflow:

```
Latticra Panel / local control surface
Public product readiness
Public documentation posture
Strategy/status/funding framework
```

Blocked lanes for this workflow unless a separate evidence packet exists:

```
Runtime / operating-system-universe direction
Security-hardening implementation
Nucleus real task execution
Latticra Seal / local evidence layer
Nadia offline AI foundation
Lat / Latticra Programming Language
LIR / Intermediate Representation
```

Product-readiness estimate rule

Product-readiness estimate movement is blocked unless:

```
target_evaluator_completed_workflow=1
evidence_bundle_complete=1
non_claim_review_claim_safe=1
public_entrypoint_review_complete=1
support_boundary_present=1
known_limitations_present=1
guard_or_test_reference_present=1
```

Even when all requirements pass, product-readiness movement must remain conservative and must not imply production readiness.

Panel estimate rule

Panel local-control-surface estimate movement may be considered only if:

```
Panel launch evidence complete=1
dry-run-first evidence complete=1
plan evidence complete=1
receipt/log/console evidence complete=1
reset or uninstall evidence complete=1
failure-state evidence complete=1
```

Panel estimate movement must not imply installer readiness, platform approval, runtime authority, or production support.

Public documentation estimate rule

Public documentation posture movement may be considered only if:

```
workflow docs are complete=1
non-claims are visible=1
entrypoints are aligned=1
support boundary is visible=1
known limitations are visible=1
```

Documentation estimate movement must not be used as a substitute for product-readiness evidence.

Strategy/status/funding estimate rule

Strategy/status/funding framework movement may be considered only if:

```
strategy chain is complete=1
```

```
status surfaces are aligned=1
public-entrypoint review is complete=1
estimate-impact review is complete=1
no announcement mismatch exists=1
```

This lane must not move simply because a template was added.

Estimate-change proposal fields

If any estimate movement is proposed, record:

```
lane:
baseline estimate:
proposed estimate:
delta:
evidence basis:
non-claim review:
public-entrypoint review:
guard or test reference:
residual risk:
reviewer note:
```

Every proposed change must have a separate lane entry.

Blocked estimate changes

Block estimate changes when:

```
evidence bundle incomplete=1
non-claim review missing=1
claim expansion detected=1
guard or test reference missing=1
public-entrypoint review missing=1
workflow not completed by target evaluator=1
runtime authority changed=1
effect execution changed=1
security-hardening claim introduced=1
product-readiness wording overclaims=1
```

Required reviewer answers

```
Does this evidence change capability posture? yes|no
Does this evidence justify any estimate change? yes|no
Does this evidence require public-entrypoint updates? yes|no
Does this evidence require announcement review? yes|no
Does this evidence preserve all non-claims? yes|no
Does this evidence preserve current runtime authority posture? yes|no
Does this evidence preserve current security-hardening posture? yes|no
```

If any answer is ambiguous, use insufficient_evidence.

Review gate output

```
estimate_impact_review_present=0|1
estimate_change_recommended=0|1
product_readiness_estimate_change_recommended=0|1
panel_estimate_change_recommended=0|1
public_documentation_estimate_change_recommended=0|1
strategy_status_funding_estimate_change_recommended=0|1
announcement_review_required=0|1
public_entrypoint_update_required=0|1
review_outcome:
```

This template output:

```
estimate_impact_review_present=0
estimate_change_recommended=0
product_readiness_estimate_change_recommended=0
panel_estimate_change_recommended=0
public_documentation_estimate_change_recommended=0
strategy_status_funding_estimate_change_recommended=0
announcement_review_required=0
public_entrypoint_update_required=0
review_outcome=not_performed
```

Non-claims

This template does not perform an estimate-impact review, change estimates, update public entry points, validate workflow evidence, provide product readiness, provide Panel readiness, provide installer readiness, grant runtime authority, execute effects, enforce capabilities, provide cryptographic authority, provide signing authority, perform host behavior, perform network behavior, execute models, execute tools, execute shell behavior, harden security, prevent malware, prevent ransomware, provide sandboxing, provide operating-system behavior, or provide production support.

It records an estimate-impact review form only.

docs/strategy/2026-05-26-0306-cdt-panel-guided-local-evaluation-guard-test-reference-template.md

Source title: Latticra Panel-Guided Local Evaluation Guard/Test Reference Template

Lines: 251 | Words: 616 | SHA-256: 3b171ec2f3e88de4c4f5483c890d7728669a3e5c25ef7dfdb9b1c76c800b7a18

Latticra Panel-Guided Local Evaluation Guard/Test Reference Template

Status: draft guard/test reference template Created: 2026-05-26 03:06 CDT Decision: reference template only Promotion decision: no product-readiness promotion recommended Scope: guard or test reference requirements for future Panel-guided local evaluation evidence.

Purpose

This template defines how a future guard or test reference should be recorded for Panel-guided local evaluation evidence.

It does not implement a guard, run a test, validate a workflow, or change project posture.

Source review

This template follows:

```
docs/strategy/2026-05-26-0119-cdt-panel-guided-local-evaluation-estimate-impact-review-template.
md
```

The target workflow remains:

```
Evaluate Latticra locally through Latticra Panel without granting runtime authority.
```

Reference header

```
reference name:
created:
reviewer:
reference status: missing|planned|present|ran_passed|ran_failed|blocked
guard or test path:
guard or test type: shell|unit|integration|manual-transcript|workflow-harness|other
workflow evidence bundle:
acceptance checklist:
repository commit:
```

Required reference outcome

Use one outcome:

```
no_guard_or_test_reference
guard_or_test_reference_planned
guard_or_test_reference_present_not_run
guard_or_test_reference_ran_passed
guard_or_test_reference_ran_failed
guard_or_test_reference_blocked
```

This template result:

```
guard_or_test_reference_present=0
guard_or_test_ran=0
guard_or_test_passed=0
workflow_validated=0
estimate_change_recommended=0
reason=this file defines the future reference shape only
```

Required reference fields

```
guard_or_test_name:
guard_or_test_path:
guard_or_test_owner:
guard_or_test_scope:
guard_or_test_inputs:
guard_or_test_outputs:
guard_or_test_result:
guard_or_test_timestamp:
guard_or_test_environment:
guard_or_test_log:
```

If any required field is missing, the reference is incomplete.

Required coverage claims

A future guard or test reference must say whether it covers:

```
status_and_non_claim_entry=0|1
platform_prerequisite_capture=0|1
panel_launch_capture=0|1
dry_run_first_capture=0|1
plan_capture=0|1
dry_run_validation_capture=0|1
receipt_log_console_capture=0|1
reset_or_uninstall_capture=0|1
failure_state_capture=0|1
limitations_and_support_capture=0|1
review_gate_capture=0|1
```

Coverage must be explicit. Do not infer coverage from a broad test name.

Required preservation assertions

The guard or test reference must preserve:

```
runtime_authority_granted=0
effect_execution_performed=0
network_authority_granted=0
root_authority_required_by_default=0
hidden_mutation_detected=0
product_readiness_promotion=0
security_boundary_claim=0
installer_readiness_claim=0
```

If any assertion cannot be checked, record it as unchecked, not passed.

Allowed reference types

Allowed reference types:

```
existing guard script
new planned guard script
manual transcript review
workflow harness
focused integration check
documentation consistency check
status/index consistency check
```

Allowed only as planning references until they exist and are run:

```
planned guard
planned transcript
planned workflow harness
```

Blocked reference types

Blocked for this workflow unless a separate contract exists:

```
root-requiring test
network-requiring test
runtime-authority test
effect-execution test
host-mutation test
production installer test
security hardening test
malware-prevention test
ransomware-prevention test
platform package approval test
```

If a blocked reference type is needed, this workflow must be superseded by a separate capability-promotion packet.

Minimum pass evidence

A future passing guard or test reference must provide:

```
command or transcript id:
exit status or review result:
captured output path:
reviewed evidence bundle:
checked preservation assertions:
failure-state coverage result:
non-claim review link:
public-entrypoint review link:
estimate-impact review link:
```

Do not mark guard_or_test_reference_ran_passed without captured output or transcript evidence.

Failure handling

If the guard or test fails, record:

```
failure label:
failed phase:
failed assertion:
output path:
remediation note:
workflow blocked=1
estimate_change_recommended=0
public_entrypoint_change_recommended=0
```

Failure must not be reframed as product-readiness evidence.

Manual transcript reference rule

Manual transcript evidence may be referenced only if it includes:

```
operator:
date:
platform:
commands or UI steps:
observed outputs:
authority labels:
failure or success labels:
reset or cleanup notes:
reviewer signature or note:
```

Manual transcript evidence must still pass non-claim, public-entrypoint, and estimate-impact review before it affects posture.

Review gate output

```
guard_or_test_reference_present=0|1
guard_or_test_reference_complete=0|1
guard_or_test_ran=0|1
guard_or_test_passed=0|1
coverage_complete=0|1
preservation_assertions_complete=0|1
blocked_reference_type_detected=0|1
workflow_blocked=0|1
estimate_change_recommended=0|1
public_entrypoint_change_recommended=0|1
reference_outcome:
```

This template output:

```
guard_or_test_reference_present=0
guard_or_test_reference_complete=0
guard_or_test_ran=0
guard_or_test_passed=0
coverage_complete=0
preservation_assertions_complete=0
blocked_reference_type_detected=0
workflow_blocked=0
estimate_change_recommended=0
public_entrypoint_change_recommended=0
reference_outcome=not_performed
```

Non-claims

This template does not implement a guard, run a test, validate workflow evidence, provide product readiness, provide Panel readiness, provide installer readiness, grant runtime authority, execute effects, enforce capabilities, provide cryptographic authority, provide signing authority, perform host behavior, perform network behavior, execute models, execute tools, execute shell behavior, harden security, prevent malware, prevent ransomware, provide sandboxing, provide operating-system behavior, or provide production support.

It records a guard/test reference form only.

docs/strategy/2026-05-26-0410-cdt-panel-guided-local-evaluation-review-package-index.md

Source title: Latticra Panel-Guided Local Evaluation Review Package Index

Lines: 172 | Words: 622 | SHA-256: 3d1abe5be979db321538ea9d148ea9ec277d2c14dff17c5349f3c5778031fef4

Latticra Panel-Guided Local Evaluation Review Package Index

Status: active review-package index Created: 2026-05-26 04:10 CDT Decision: package index only Promotion decision: no product-readiness promotion recommended Scope: strategy package map for Panel-guided local evaluation planning records.

Purpose

This index organizes the Panel-guided local evaluation planning package.

It shows the intended reading order, dependency order, and review gates for future evidence work. It does not capture evidence, perform reviews, implement tests, or change project posture.

Package goal

The package goal is:

```
define how Panel-guided local evaluation could eventually be reviewed as a bounded
technical-evaluator workflow without granting runtime authority or making product-readiness
claims
```

Package order

Read and apply the records in this order:

1. 2026-05-25-2114-cdt-public-product-readiness-promotion-packet.md
2. 2026-05-25-2137-cdt-panel-guided-local-evaluation-workflow-packet.md
3. 2026-05-25-2157-cdt-panel-guided-local-evaluation-acceptance-checklist.md
4. 2026-05-25-2226-cdt-panel-guided-local-evaluation-evidence-bundle-template.md
5. 2026-05-25-2246-cdt-panel-guided-local-evaluation-evidence-capture-plan.md
6. 2026-05-26-0306-cdt-panel-guided-local-evaluation-guard-test-reference-template.md
7. 2026-05-26-0019-cdt-panel-guided-local-evaluation-non-claim-review-template.md
8. 2026-05-26-0034-cdt-panel-guided-local-evaluation-public-entrypoint-review-template.md
9. 2026-05-26-0119-cdt-panel-guided-local-evaluation-estimate-impact-review-template.md

Dependency map

```
product-readiness packet
  -&gt; workflow packet
    -&gt; acceptance checklist
      -&gt; evidence bundle template
        -&gt; evidence capture plan
          -&gt; guard/test reference
          -&gt; non-claim review
            -&gt; public-entrypoint review
              -&gt; estimate-impact review
```

The guard/test reference, non-claim review, public-entrypoint review, and estimate-impact review are all required before any estimate or public-entrypoint change can be considered.

Record responsibilities

```
public product-readiness promotion packet
  Defines why no product-readiness promotion is currently recommended.

workflow packet
  Selects Panel-guided local evaluation as the first planning path.

acceptance checklist
  Defines what future evidence must satisfy.

evidence bundle template
  Defines the shape of the evidence bundle.

evidence capture plan
  Defines the future capture sequence and stop conditions.

guard/test reference template
  Defines how future guard, test, harness, or transcript evidence should be cited.

non-claim review template
  Defines how to prevent product, security, installer, runtime, or platform claims.

public-entrypoint review template
  Defines when README, status, project notes, or strategy index updates may be justified.

estimate-impact review template
  Defines when completion estimate changes may be considered.
```

Current package status

Current status:

```
planning_package_defined=1
workflow_selected=1
acceptance_criteria_defined=1
evidence_bundle_shape_defined=1
capture_plan_defined=1
```

```
guard_test_reference_shape_defined=1
non_claim_review_shape_defined=1
public_entrypoint_review_shape_defined=1
estimate_impact_review_shape_defined=1
workflow_evidence_captured=0
guard_or_test_implemented=0
guard_or_test_run=0
non_claim_review_performed=0
public_entrypoint_review_performed=0
estimate_impact_review_performed=0
product_readiness_promotion_recommended=0
```

Required future promotion sequence

Any future promotion review must proceed in this order:

1. Capture evidence according to the evidence capture plan.
2. Complete the evidence bundle.
3. Attach a valid guard/test reference.
4. Complete the non-claim review.
5. Complete the public-entrypoint review.
6. Complete the estimate-impact review.
7. Decide whether public posture changes are justified.

Do not change estimates or public posture before step 7.

Stop conditions

Stop the package review if any of these appear:

```
root authority required by default
network authority required by default
runtime authority granted
effect execution performed
hidden mutation detected
cleanup boundary missing
non-claim review missing
guard/test reference missing
public-entrypoint review missing
estimate-impact review missing
product-readiness claim introduced
security boundary claim introduced
installer readiness claim introduced
platform approval claim introduced
```

Strategy index rule

The strategy index may link to planning records as they are created.

Index linking does not imply:

```
workflow evidence captured
workflow accepted
estimate changed
public posture changed
product readiness changed
runtime authority changed
security posture changed
```

Current next planning action

The next planning action after this index is:

```
decide whether to stop at planning package completion or begin a separate evidence-capture
request
```

Evidence capture should be a separate explicit request because it may involve running commands, collecting transcripts, or producing guard/test records.

Non-claims

This index does not capture evidence, run a guard, run a test, validate workflow evidence, provide product readiness, provide Panel readiness, provide installer readiness, grant runtime authority, execute effects, enforce capabilities, provide cryptographic authority, provide signing authority, perform host behavior, perform network behavior, execute models, execute tools, execute shell behavior, harden security, prevent malware, prevent ransomware, provide sandboxing, provide operating-system behavior, or provide production support.

It records a strategy package map only.

docs/strategy/2026-05-26-0949-cdt-panel-guided-local-evaluation-guard-test-reference-template.md

Source title: Latticra Panel-Guided Local Evaluation Guard/Test Reference Template

Latticra Panel-Guided Local Evaluation Guard/Test Reference Template

Status: draft guard/test reference template Created: 2026-05-26 09:49 CDT Decision: reference template only Promotion decision: no product-readiness promotion recommended Scope: guard or test reference requirements for future Panel-guided local evaluation evidence.

Purpose

This template defines how a future guard, test, workflow harness, or manual transcript should be referenced for Panel-guided local evaluation evidence.

It does not implement a guard, run a test, validate a workflow, capture evidence, or change project posture.

Source review

This template follows:

```
docs/strategy/2026-05-26-0119-cdt-panel-guided-local-evaluation-estimate-impact-review-template.
md
```

The target workflow remains:

```
Evaluate Latticra locally through Latticra Panel without granting runtime authority.
```

Reference header

```
reference name:
created:
reviewer:
reference status: missing|planned|present|ran_passed|ran_failed|blocked
guard or test path:
guard or test type: shell|unit|integration|manual-transcript|workflow-harness|other
workflow evidence bundle:
acceptance checklist:
repository commit:
```

Required reference outcome

Use one outcome:

```
no_guard_or_test_reference
guard_or_test_reference_planned
guard_or_test_reference_present_not_run
guard_or_test_reference_ran_passed
guard_or_test_reference_ran_failed
guard_or_test_reference_blocked
```

This template result:

```
guard_or_test_reference_present=0
guard_or_test_ran=0
guard_or_test_passed=0
workflow_validated=0
estimate_change_recommended=0
reason=this file defines the future reference shape only
```

Required reference fields

```
guard_or_test_name:
guard_or_test_path:
guard_or_test_owner:
guard_or_test_scope:
guard_or_test_inputs:
guard_or_test_outputs:
guard_or_test_result:
guard_or_test_timestamp:
guard_or_test_environment:
guard_or_test_log:
```

If any required field is missing, the reference is incomplete.

Required coverage claims

A future guard or test reference must say whether it covers:

```
status_and_non_claim_entry=0|1
platform_prerequisite_capture=0|1
panel_launch_capture=0|1
dry_run_first_capture=0|1
plan_capture=0|1
dry_run_validation_capture=0|1
receipt_log_console_capture=0|1
reset_or_uninstall_capture=0|1
failure_state_capture=0|1
limitations_and_support_capture=0|1
review_gate_capture=0|1
```

Coverage must be explicit. Do not infer coverage from a broad test name.

Required preservation assertions

The guard or test reference must preserve:

```
runtime_authority_granted=0
effect_execution_performed=0
network_authority_granted=0
root_authority_required_by_default=0
hidden_mutation_detected=0
product_readiness_promotion=0
security_boundary_claim=0
installer_readiness_claim=0
```

If any assertion cannot be checked, record it as unchecked, not passed.

Allowed reference types

Allowed reference types:

```
existing guard script
new planned guard script
manual transcript review
workflow harness
focused integration check
documentation consistency check
status/index consistency check
```

Allowed only as planning references until they exist and are run:

```
planned guard
planned transcript
planned workflow harness
```

Blocked reference types

Blocked for this workflow unless a separate contract exists:

```
root-requiring test
network-requiring test
runtime-authority test
effect-execution test
host-mutation test
production installer test
security hardening test
malware-prevention test
ransomware-prevention test
platform package approval test
```

If a blocked reference type is needed, this workflow must be superseded by a separate capability-promotion packet.

Minimum pass evidence

A future passing guard or test reference must provide:

```
command or transcript id:
exit status or review result:
captured output path:
reviewed evidence bundle:
checked preservation assertions:
failure-state coverage result:
non-claim review link:
public-entrypoint review link:
estimate-impact review link:
```

Do not mark guard_or_test_reference_ran_passed without captured output or transcript evidence.

Failure handling

If the guard or test fails, record:

```
failure label:
failed phase:
failed assertion:
output path:
remediation note:
workflow blocked=1
estimate_change_recommended=0
public_entrypoint_change_recommended=0
```

Failure must not be reframed as product-readiness evidence.

Manual transcript reference rule

Manual transcript evidence may be referenced only if it includes:

```
operator:
date:
platform:
commands or UI steps:
observed outputs:
authority labels:
failure or success labels:
reset or cleanup notes:
reviewer signature or note:
```

Manual transcript evidence must still pass non-claim, public-entrypoint, and estimate-impact review before it affects posture.

Review gate output

```
guard_or_test_reference_present=0|1
guard_or_test_reference_complete=0|1
guard_or_test_ran=0|1
guard_or_test_passed=0|1
coverage_complete=0|1
preservation_assertions_complete=0|1
blocked_reference_type_detected=0|1
workflow_blocked=0|1
estimate_change_recommended=0|1
public_entrypoint_change_recommended=0|1
reference_outcome:
```

This template output:

```
guard_or_test_reference_present=0
guard_or_test_reference_complete=0
guard_or_test_ran=0
guard_or_test_passed=0
coverage_complete=0
preservation_assertions_complete=0
blocked_reference_type_detected=0
workflow_blocked=0
estimate_change_recommended=0
public_entrypoint_change_recommended=0
reference_outcome=not_performed
```

Non-claims

This template does not implement a guard, run a test, validate workflow evidence, capture transcripts, provide product readiness, provide Panel readiness, provide installer readiness, grant runtime authority, execute effects, enforce capabilities, provide cryptographic authority, provide signing authority, perform host behavior, perform network behavior, execute models, execute tools, execute shell behavior, harden security, prevent malware, prevent ransomware, provide sandboxing, provide operating-system behavior, or provide production support.

It records a guard/test reference form only.

docs/strategy/2026-05-26-1356-cdt-panel-guided-local-evaluation-planning-completion-checkpoint.md

Source title: Latticra Panel-Guided Local Evaluation Planning Completion Checkpoint

Lines: 143 | Words: 458 | SHA-256: 0521b4401e46a2c0e5c3ba1373fb2c2ceb72a570105e5cbf8b946607679b2e98

Latticra Panel-Guided Local Evaluation Planning Completion Checkpoint

Status: planning completion checkpoint Created: 2026-05-26 13:56 CDT Decision: stop at planning package completion Promotion decision: no product-readiness promotion recommended Scope: completion checkpoint for the Panel-guided local evaluation strategy package.

Purpose

This checkpoint closes the current planning pass for Panel-guided local evaluation.

It records that the planning package is organized enough for future evidence work, but that no evidence capture, command execution, guard implementation, test execution, public-entrypoint update, estimate change, or product-readiness promotion should begin without a separate explicit request.

Source package

This checkpoint follows:

```
docs/strategy/2026-05-26-0410-cdt-panel-guided-local-evaluation-review-package-index.md
```

Latest guard/test reference template available at this checkpoint:

```
docs/strategy/2026-05-26-0949-cdt-panel-guided-local-evaluation-guard-test-reference-template.md
```

Decision

Current decision:

```
stop_at_planning_package_completion=1
begin_evidence_capture=0
run_commands=0
collect_transcripts=0
implement_guard_or_test=0
perform_non_claim_review=0
perform_public_entrypoint_review=0
perform_estimate_impact_review=0
change_public_posture=0
```

Completed planning records

The current package has records for:

```
public product-readiness promotion boundary
Panel-guided local evaluation workflow selection
acceptance criteria
evidence bundle shape
evidence capture sequence
guard/test reference requirements
non-claim review
public-entrypoint review
estimate-impact review
package index
```

Current package status

```
planning_package_complete_for_current_scope=1
workflow_selected=1
acceptance_criteria_defined=1
evidence_bundle_shape_defined=1
capture_sequence_defined=1
review_gates_defined=1
package_index_defined=1
workflow_evidence_captured=0
guard_or_test_implemented=0
guard_or_test_run=0
review_performed=0
estimate_change_recommended=0
public_entrypoint_change_recommended=0
product_readiness_promotion_recommended=0
```

Boundary for future evidence capture

Evidence capture must be a separate explicit request because it may require:

```
running local commands
opening or launching Latticra Panel
capturing transcripts
collecting logs or receipts
checking reset or uninstall behavior
creating or running guard scripts
reviewing public entry points
reviewing estimates
```

Those activities are outside this planning-only checkpoint.

Allowed next strategic moves

Allowed planning-only next moves:

```
choose a different promotion gate
create a new planning package for another lane
review overall strategy priorities
refresh strategy index organization
build a roadmap lane map
build a funding/support strategy record
build a public messaging boundary record
```

Blocked without separate request:

```
run Panel workflow
run installer commands
run guard scripts
capture evidence transcripts
update README or status as evidence-backed public posture
change completion estimates
announce product-readiness movement
```

Recommended next planning lane

Recommended next planning lane:

```
overall strategy priority map after Panel-guided local evaluation planning package completion
```

Reason:

```
the Panel-guided path is now organized; the project can step back and decide which
major lane deserves the next planning package before any evidence-capture work starts
```

Non-claims

This checkpoint does not capture evidence, run commands, launch Panel, run a guard, run a test, validate workflow evidence, perform a review, update public entry points, change estimates, provide product readiness, provide Panel readiness, provide installer readiness, grant runtime authority, execute effects, enforce capabilities, provide cryptographic authority, provide signing authority, perform host behavior, perform network behavior, execute models, execute tools, execute shell behavior, harden security, prevent malware, prevent ransomware, provide sandboxing, provide operating-system behavior, or provide production support.

It records planning package completion only.

installer/docs/INSTALL_BUTTON_EXECUTION_MODEL.md

Source title: Install Button Execution Model

Lines: 91 | Words: 412 | SHA-256: d48c8b43c008d3d7f108fdc137bb71f6cd03710158ef0845a8a9612977619939

Install Button Execution Model

The graphical Install button is intentionally real, but guarded.

Modes

Dry-install mode

Default.

```
safety.dry_run = true
```

The button executes the installer engine, emits progress phases, validates configuration, checks the component manifest, generates an install plan, and writes an operator receipt. It does not write into the install prefix.

Local-prefix install mode

Explicit.

```
safety.dry_run = false
safety.allow_host_mutation = true
```

The button creates a user-local install layout and writes selected component placeholders, markers, configuration files, and CLI shims. This is still not a production installer. It is a guarded early install path for development validation.

Local-prefix reset and uninstall modes

The reset and uninstall actions use the same authority posture as local-prefix install. In dry-run mode they preview removal and write a receipt. With guarded local-prefix writes enabled, they remove managed command wrappers, managed desktop entries, known Panel icons, and the selected guarded prefix.

Reset and uninstall intentionally share removal mechanics. Reset means "remove the managed local install so I can reinstall from new specifications." Uninstall means "remove the managed local install and stop using it."

State machine

```
Idle
  -&gt; Preparing files
  -&gt; Validating configuration
  -&gt; Loading component manifest
  -&gt; Resolving prefix
  -&gt; Building prefix layout
  -&gt; Materializing selected components
  -&gt; Writing receipt
  -&gt; Complete
```

Reset and uninstall use a shorter state sequence:

```
Idle
  -&gt; Resolving guarded prefix
  -&gt; Removing managed wrappers
  -&gt; Removing desktop metadata
  -&gt; Removing managed prefix
  -&gt; Writing reset receipt
  -&gt; Complete
```

Failure can occur at any step. A failure should leave the operator with a visible log and, when possible, a receipt.

Guardrails

The current installer must not:

- request root authority
- mutate system directories
- use the network
- claim production readiness
- silently overwrite existing files when preserve mode is enabled
- enable runtime enforcement from the installer path

UI behavior

The button label changes based on mode:

- Run Dry-Install when dry-run is active
- Install guarded local prefix when real local-prefix install is explicitly enabled
- Installing... while the engine is running

The reset action is separate:

- Preview local reset when dry-run is active
- Reset installed local prefix when guarded local-prefix writes are explicitly enabled

The uninstall action is also separate:

- Preview uninstall when dry-run is active

- Uninstall managed local install when guarded local-prefix writes are explicitly enabled

The progress bar follows emitted PHASE n/total messages from the install script.

installer/docs/INSTALLER_READINESS_CONTRACT.md

Source title: Installer Readiness Contract

Lines: 45 | Words: 202 | SHA-256: cc1076c43dac6d10679d4f286d745d686d904afaf23a7748daa5bcd6ec5ecf64

Installer Readiness Contract

The Latticra installer is allowed to exist before it is production-ready, but it must be honest about its authority and maturity.

Current authority

```
production_installer_ready=0
root_authority=0
network_authority=0
runtime_enforcement_authority=0
```

Current allowed behavior

- Generate configuration.
- Generate an install plan.
- Execute a dry-install.
- Write local operator receipts.
- Create a guarded user-local prefix when explicitly authorized.
- Create component markers and placeholder developer shims for validation.
- Reset or uninstall a guarded user-local prefix by removing managed wrappers, desktop metadata, known Panel icons, and the managed prefix.

Current forbidden behavior

- Do not request root.
- Do not write into /usr, /bin, /sbin, /etc, /System, or other system directories.
- Do not fetch dependencies from the network.
- Do not silently overwrite files when preserve mode is enabled.
- Do not claim the host is protected by Latticra Seal enforcement.
- Do not claim production installer readiness.

Promotion requirements

Before this installer can become a production installer, the repo needs documented evidence for:

- component manifest integrity
- artifact hashing
- rollback
- upgrade
- uninstall
- failed-install recovery

- Fedora/Linux target validation
- Latticra Seal report generation
- package-manager-safe integration strategy

installer/docs/README.md

Source title: Latticra Installer Documentation

Lines: 38 | Words: 212 | SHA-256: a7b42076acab23a03d6bdbf1ccf40a5a814cf86e26bdc55804ad990dde471bd8

Latticra Installer Documentation

Status: active installer documentation map Last updated: 2026-05-26 CDT Scope: Latticra Panel installer authority, UI configuration, install-button execution, receipts, evidence, and readiness boundaries.

Purpose

This folder records the installer-specific contracts that sit below the public Panel guide in ../README.md. These documents are about the guarded user-local installer path, not a production installer or system package manager integration.

Documents

```
| Document | Purpose |
| --- | --- |
| [`INSTALLER_READINESS_CONTRACT.md`](INSTALLER_READINESS_CONTRACT.md) | Defines current installer authority, allowed behavior, forbidden behavior, and promotion requirements. |
| [`UI_CONFIGURATION_MODEL.md`](UI_CONFIGURATION_MODEL.md) | Defines the Panel configuration model and how UI choices map to installer planning. |
| [`INSTALL_BUTTON_EXECUTION_MODEL.md`](INSTALL_BUTTON_EXECUTION_MODEL.md) | Defines the execution path behind installer UI actions. |
| [`RECEIPTS_AND_EVIDENCE.md`](RECEIPTS_AND_EVIDENCE.md) | Defines installer receipts, evidence expectations, and review surfaces. |
```

Reader Route

1. Start with ../README.md for the public Panel workflow.
2. Read INSTALLER_READINESS_CONTRACT.md before interpreting any installer behavior.
3. Use UI_CONFIGURATION_MODEL.md and INSTALL_BUTTON_EXECUTION_MODEL.md when changing or reviewing Panel controls.
4. Use RECEIPTS_AND_EVIDENCE.md when changing install, dry-run, verify, reset, uninstall, or evidence wording.

Current Boundary

```
production_installer_ready=0
root_authority=0
network_authority=0
runtime_enforcement_authority=0
user_local_prefix_allowed=1
dry_run_first_posture=1
```

The installer documentation must stay aligned with the root documentation hub at ../../docs/README.md, the root status shortcut at ../../STATUS.md, and the detailed current status record at ../../docs/status/CURRENT_STATUS.md.

installer/docs/RECEIPTS_AND_EVIDENCE.md

Source title: Receipts and Evidence

Lines: 32 | Words: 139 | SHA-256: 1edc9eb5d3343553b79ca798f0793309da2c9a7f64c41e279c3d10c9cb23f917

Receipts and Evidence

The installer should leave behind evidence that is understandable to a human operator.

The current receipt includes:

- UTC timestamp
- selected profile
- install prefix
- dry-run status
- host mutation authority status
- network authority status
- component choices
- behavior choices
- component manifest path
- installer script measurement
- config measurement
- generated install plan

The reset/uninstall receipt includes:

- UTC timestamp
- operation label
- operation mode
- install prefix
- command wrapper, desktop entry, icon, and prefix actions
- removed, planned, preserved, and missing counts
- authority baseline

The measurement is SHA-256 when sha256sum or shasum -a 256 is available. If neither exists, the script falls back to POSIX cksum and labels it clearly.

Receipts are not a substitute for cryptographic release signing. They are a development evidence trail.

installer/docs/UI_CONFIGURATION_MODEL.md

Source title: UI Configuration Model

Lines: 180 | Words: 1352 | SHA-256: ce7185e891f85f1f9b25e28079fb55d5e89b08231c2865ea3ea7274fc8ab0c68

UI Configuration Model

The Latticra Panel is now GUI-first. It exposes a guided first-run workbench rather than a numbered terminal menu, because the panel is expected to be the first major user-facing surface for Latticra.

The graphical panel uses one shared InstallerConfig model, generates the same plan preview used by the guarded installer engine, and keeps authority boundaries visible before any install path runs.

First-run design principles

- Strong safe defaults before manual toggles
- Visual guided profiles instead of numbered terminal choices
- Dry-run first, local writes later
- Visible authority status at all times
- Plan and receipt evidence before action
- Embedded panel-aware console instead of a separate TUI
- Adaptive maximized/resizable layout for Fedora workstations and smaller screens
- v0.5.0 keeps the selected workspace stable while installation runs, adds a focused run monitor with bounded recent engine output, keeps long engine lines from expanding the right evidence rail, and keeps the console command-focused during an active engine operation

Profiles

Guided Workbench

Default profile. Enables Lat tooling, LIR contracts, Seal report-only files, docs, and developer helpers while keeping dry-run enabled and host/network authority denied.

Seal Report-Only

Minimal report-only Seal-side layout and documentation for users who only want receipts, reports, and evidence posture.

Fedora Validation VM

For a Fedora or Fedora-like validation VM. Enables the Fedora validation workspace and keeps the run dry by default.

LC Standalone

Console-only profile. Enables the LC wrapper, profile presets, seed registry, and contract metadata while disabling Panel embedding. The dry-run preset previews it, and the local preset runs the guarded user-local standalone LC install.

Custom

Lets the operator manually choose components after the guided profiles are understood.

Components

- Latticra Console (LC)
- Lat language tooling
- LIR contracts
- Latticra Seal report-only subsystem
- Nadia offline AI foundation
- Fedora validation files
- Documentation and examples
- Developer CLI helpers

Safety and evidence

- Dry-run mode
- Explicit guarded local-prefix write authority
- Explicit network authority, currently disabled
- Component manifest requirement
- Artifact measurement requirement
- Verification-policy metadata requirement
- Operator receipt writing

Behavior

- Create prefix layout
- Create component markers
- Create CLI shims
- Preserve existing files

Program delivery

- Build the Latticra Panel binary when Cargo is available
- Build Latticra from source when a supported root build system is available
- Install the Latticra payload tree
- Install the desktop entry
- Install user-local command wrappers

Embedded Latticra Console

The embedded console is panel-aware and intentionally not an unrestricted shell. It supports quick operator commands such as:

```

The console exists inside the GUI so users can stay in one coherent Latticra control surface while still getting terminal-style feedback and procedure visibility.

LC is the standalone and Panel-installable console foundation for substrate interaction, host embedding planning, and future OS-base work. Its current Panel and standalone commands are metadata-only and do not execute external host commands.

Stage-40 prompt-evaluation result release receipt review disposition release receipt review contract adds a metadata-only prompt-evaluation result release receipt review disposition release receipt review surface for the next review contract boundary.

Stage-31, Stage-32, Stage-33, Stage-34, Stage-35, Stage-36, Stage-37, Stage-38, Stage-39, and Stage-40 console surfaces are metadata-only and remain covered by the Stage-40 metadata-only console posture.

installer/INSTALLER_ROADMAP.md

Source title: Latticra Installer Roadmap

Lines: 40 | Words: 205 | SHA-256: c409f64611f56cecabb528d2fe85bbb3d248e7bc67f9a18d28472c79937e8bac

Latticra Installer Roadmap

Current stage

The installer supports a guarded user-local installation under ~/.local/share/latticra with command wrappers in ~/.local/bin.

It currently installs:

- Latticra source/payload snapshot
- installer configuration
- component markers
- LIR contract workspace
- Latticra Seal report-only configuration
- receipts and measurements
- reset receipts for managed local uninstall
- latticra, lat, and latticra-seal command wrappers
- optional graphical installer binary when Cargo is available

Boundaries

The installer does not currently claim:

- production OS installer readiness
- kernel mutation authority
- systemd mutation authority
- SELinux mutation authority
- package-manager integration
- bootloader integration
- firmware/SeaBIOS/GRUB mutation authority
- network authority

Next stages

1. Add signed release artifact ingestion.

2. Add stronger manifest validation.
3. Add Fedora package integration plan.
4. Use the boot-preview preflight report to classify local QEMU/GRUB readiness before any VM validation mode runs.
5. Use the boot-preview evidence manifest, boot artifact manifest template, boot artifact manifest validation, boot-preview evidence capture template, boot-preview evidence validation, and QEMU argv template to record future artifact paths, serial logs, checksums, QEMU argv records, and recovery evidence only after the compatibility guard is satisfied.
6. Add failed-install recovery receipts.
7. Add system-level installer only after explicit design review.

installer/README.md

Source title: Latticra Panel

Lines: 453 | Words: 2888 | SHA-256: dbe337ca4ba12a12073620cc8cb38510bdc1e8c44a059e95c0f0c71d3f713040

Latticra Panel

Graphical installer and first-run control panel for Latticra, Lat, LIR, Latticra Seal, and the Nadia offline AI foundation. The current Panel package version is v0.5.0.

The panel is designed as the main first impression for Latticra. It opens as a maximized, resizable GUI workbench with guided defaults, visible authority boundaries, component configuration, delivery controls, plan/evidence review, and an embedded Latticra Console for panel-aware commands.

Installer-specific contracts are indexed in docs/README.md. Start there when reviewing installer authority, UI configuration, install-button behavior, receipts, or evidence wording.

Prerequisites

Ubuntu:

```
sudo apt-get update
sudo apt-get install -y rustc cargo make gcc pkg-config \
  libx11-dev libxcb1-dev libxcursor-dev libxrandr-dev libxi-dev \
  libxkbcommon-dev libgl1-mesa-dev libwayland-dev desktop-file-utils \
  libgtk-3-bin
```

Fedora:

```
sudo dnf install -y rust cargo make gcc pkgconf-pkg-config \
  libX11-devel libxcb-devel libXcursor-devel libXrandr-devel libXi-devel \
  libxkbcommon-devel mesa-libGL-devel wayland-devel desktop-file-utils gtk3
```

openSUSE:

```
sudo zypper refresh
sudo zypper install -y rust cargo make gcc pkgconf \
  libX11-devel libxcb-devel libXcursor-devel libXrandr-devel libXi-devel \
  libxkbcommon-devel Mesa-libGL-devel wayland-devel desktop-file-utils \
  gtk3-tools
```

User-local command path:

```
export PATH=&quot;$HOME/.local/bin:$PATH&quot;
```

Run from source

```
make -C installer gui
```

Equivalent direct command:

```
cd installer/latticra-installer
LATTICRA_INSTALLER_ROOT=&quot;$PWD/..&quot; cargo run
```

First-run flow

1. Open Guided Workbench.
2. Keep dry-run mode enabled.
3. Generate and inspect the plan.
4. Run Dry-Install to validate and write a receipt.
5. Review the embedded console, plan, and engine log.
6. Enable guarded local-prefix writes only after the dry-run evidence looks correct.

The LC Standalone profile narrows that flow to the Console component only. It records lc-standalone-install-v0, keeps lc.profile = "standalone", installs standalone/session/workspace/namespace/rootfs/packages/init contracts, disables Panel embedding for the installed console, and preserves the no-effect host and network authority floor.

SeaBIOS and GRUB compatibility boundary

The current Panel installer is compatible with SeaBIOS and GRUB hosts by staying out of the boot path. It installs only to a guarded user-local prefix and does not write firmware, partitions, boot sectors, EFI variables, GRUB configuration, kernel images, initramfs files, services, or drivers.

The guarded SeaBIOS and GRUB compatibility contract is ../docs/SEABIOS_GRUB_COMPATIBILITY_CONTRACT.md.

The SeaBIOS and GRUB boot-preview evidence contract is ../docs/SEABIOS_GRUB_BOOT_PREVIEW_EVIDENCE_CONTRACT.md. Its fixture manifest is manifests/seabios-grub-boot-preview.toml and preserves a non-booted preview lane for future QEMU, serial-console, checksum, and recovery-path evidence.

The SeaBIOS and GRUB boot-preview preflight is ../docs/SEABIOS_GRUB_BOOT_PREVIEW_PREFLIGHT.md. It is available as sh scripts/seabios-grub-boot-preview-preflight.sh and emits a no-effect tool-visibility and manifest-validity report.

The SeaBIOS and GRUB boot-preview evidence capture template is ../docs/SEABIOS_GRUB_BOOT_PREVIEW_EVIDENCE_CAPTURE_TEMPLATE.md. It is available as sh scripts/seabios-grub-boot-preview-evidence-template.sh and emits the future evidence bundle shape without running a VM.

The SeaBIOS and GRUB boot-preview evidence validation is ../docs/SEABIOS_GRUB_BOOT_PREVIEW_EVIDENCE_VALIDATION.md. It is available as sh scripts/seabios-grub-boot-preview-evidence-validate.sh and rejects forged QEMU, serial-console, recovery, and bootability claims from the current fixture lane.

The SeaBIOS and GRUB boot-preview QEMU argv template is ../docs/SEABIOS_GRUB_BOOT_PREVIEW_QEMU_ARGV_TEMPLATE.md. It is available as sh scripts/seabios-grub-boot-preview-qemu-argv-template.sh and emits future profile-specific QEMU argv record placeholders without running QEMU.

The SeaBIOS and GRUB boot-preview boot artifact manifest template is ../docs/SEABIOS_GRUB_BOOT_PREVIEW_BOOT_ARTIFACT_MANIFEST_TEMPLATE.md. It is available as sh scripts/seabios-grub-boot-preview-boot-artifact-manifest-template.sh and emits future artifact metadata placeholders without creating images or writing boot files.

The SeaBIOS and GRUB boot-preview boot artifact manifest validation is ../docs/SEABIOS_GRUB_BOOT_PREVIEW_BOOT_ARTIFACT_MANIFEST_VALIDATION.md. It is available as sh scripts/seabios-grub-boot-preview-boot-artifact-manifest-validate.sh and rejects premature bootable, GRUB, QEMU, or production OS claims from the current fixture lane.

```
installer_ready_for_user_local_panel=1
installer_boot_safe_by_absence=1
boot_preview_manifest_fixture_present=1
seabios_grub_boot_preview_preflight_present=1
seabios_grub_boot_preview_evidence_capture_template_present=1
seabios_grub_boot_preview_evidence_validation_present=1
seabios_grub_boot_preview_qemu_argv_template_present=1
seabios_grub_boot_preview_boot_artifact_manifest_template_present=1
seabios_grub_boot_preview_boot_artifact_manifest_validation_present=1
firmware_mutation_allowed=0
bootloader_write_allowed=0
partition_mutation_allowed=0
grub_install_allowed=0
efibootmgr_allowed=0
qemu_execution_allowed_by_guard=0
qemu_boot_execution_attempted=0
qemu_argv_record_ready=0
boot_evidence_record_ready=0
boot_evidence_candidate_ready=0
boot_artifact_manifest_candidate_ready=0
boot_artifact_manifest_ready=0
bootable_os_ready=0
production_installer_ready=0
```

Future OS-base work must add QEMU/VM evidence for SeaBIOS, GRUB 2 BIOS, and GRUB 2 UEFI paths before any bootable image claim changes.

Embedded Latticra Console

The console in the upper-right of the panel is not a shell. It is a panel-aware operator console for common actions and local navigation only:

```
help

tion-release-receipt-review-disposition-release
profile guided
profile seal
profile fedora
mode dry
mode local
pwd
cd <path>
clear
```

External host processes are not launched from the embedded console. Installation and dry-run behavior must use dedicated panel commands or buttons such as plan, save, dry-run, mode dry, and mode local.

Update from the Panel

Use the Updater workspace in Latticra Panel to preview and apply managed user-local updates from the current reviewed source checkout. The updater reuses the guarded installer engine, keeps network fetch authority disabled, and requires a successful updater dry-run before guarded apply by default.

The installed umbrella command can report the Panel-owned updater policy without launching the GUI:

```
latticra updater status
```

That report includes the configured source strategy, update channel, updater dry-run preview command, updater apply command, guarded apply mode, receipt setting, and disabled network/root/system mutation authority.

Dry-run

```
make -C installer dry-run
```

Standalone LC dry-run

```
make -C installer lc-standalone-dry-run
```

This uses configs/lc-standalone.installer.toml and previews a standalone LC wrapper, registry, profile presets, and contract files without requiring Panel at runtime.

Standalone LC local install

```
make -C installer lc-standalone-local
```

This uses configs/lc-standalone-local.installer.toml and runs the guarded user-local standalone LC install path. It keeps Panel GUI build and desktop integration disabled while installing the direct latticra-lc wrapper and LC metadata.

Install locally

```
make -C installer local-example
```

Verify

```
make -C installer verify-local
```

Open after install

```
latticra-panel
```

Or from the desktop app grid, open Latticra Panel.

Installed paths

```
~/.local/bin/latticra
~/.local/bin/&lt;lc.install.command_wrapper&gt; (default: latticra-lc; when LC wrapper enabled)
~/.local/bin/lat
~/.local/bin/latticra-seal
~/.local/bin/latticra-nadia (when enabled)
~/.local/bin/latticra-panel
~/.local/bin/latticra-installer (compatibility)
~/.local/share/applications/latticra-panel.desktop
~/.local/share/icons/hicolor/256x256/apps/latticra-panel.png
~/.local/share/latticra
```

Latticra Console (LC)

LC is installed as the configurable operator base for Latticra substrate, Panel, standalone console use, and future host-embedded workflows. In this first slice it is metadata-only:

The default direct wrapper is latticra-lc; custom Panel installs use lc.install.command_wrapper. It is also the standalone LC wrapper, does not require Panel at runtime, and the umbrella latticra lc ... route stays stable across wrapper names.

```
latticra lc status
latticra lc install-config
latticra-lc commands
latticra-lc install-config
latticra-lc session
latticra-lc workspace
latticra-lc namespace
latticra-lc rootfs
latticra-lc packages
latticra-lc init
latticra-lc substrate
latticra-lc host
latticra-lc os
```

The Panel LC workspace includes LC install configuration for the local config path, share path, wrapper command, profile presets, command registry, the session envelope contract, workspace envelope contract, namespace envelope contract, rootfs contract, packages contract, init contract, contract files, and embedded Panel bridge. External host command launch remains disabled.

LC does not launch external host commands, create runtime sessions, mount workspaces, mount namespaces, create or open rootfs images, read package catalogs, download packages, run package managers, install packages, claim PID 1, start services, supervise processes, mutate host files, use the network, grant runtime enforcement authority, boot hardware, or claim to be a production operating system.

Nadia offline AI foundation

Nadia is Latticra's planned offline AI companion for software development, systems engineering, and AI development work. The name honors Nobel Peace Prize laureate Nadia Murad and keeps human dignity, survivor-witness respect, community awareness, harm-aware development, and an absolute non-sexual-use boundary visible in the system direction. Documentation and code identify the solemn implementation identity as Nadia Witness Foundation while the human-facing interactive name remains Nadia.

In the current installer lane, Nadia includes Stage-46 prompt-evaluation result release receipt review disposition release receipt review disposition release receipt review disposition release contract metadata, Stage-45 prompt-evaluation result release receipt review disposition release receipt review disposition release receipt review disposition contract metadata, Stage-44 prompt-evaluation result release receipt review disposition release receipt review disposition release receipt review contract metadata, Stage-43 prompt-evaluation result release receipt review disposition release receipt review disposition release receipt contract metadata, Stage-42 prompt-evaluation result release receipt review disposition release receipt review disposition release contract metadata, Stage-41 prompt-evaluation result release receipt review disposition release receipt review disposition contract metadata, Stage-40 prompt-evaluation result release receipt review disposition release receipt review contract metadata, Stage-39 prompt-evaluation result release receipt review disposition release receipt contract metadata, Stage-38 prompt-evaluation result release receipt review disposition release contract metadata, Stage-37 prompt-evaluation result release receipt review disposition contract metadata, Stage-36 prompt-evaluation result release receipt review contract metadata, Stage-35 prompt-evaluation result release receipt contract metadata, Stage-34 prompt-evaluation result release contract metadata, Stage-33 prompt-evaluation result disposition contract metadata, Stage-32 prompt-evaluation result review contract metadata, Stage-31 prompt-evaluation result contract metadata, Stage-30 prompt-evaluation invocation contract metadata, Stage-29 prompt-evaluation runtime handoff contract metadata, Stage-28 prompt-evaluation-input contract metadata, Stage-27 context-window-assembly contract metadata, Stage-26 prompt-token-sequence contract metadata, Stage-25 prompt-tokenization contract metadata, Stage-24 tokenizer-runtime-attachment contract metadata, Stage-23 tokenizer-artifact-binding contract metadata, Stage-22 tokenizer-artifact-verification contract metadata, Stage-21 tokenizer-artifact-measurement contract metadata, Stage-20 tokenizer-artifact-inventory contract metadata, Stage-19 tokenizer-manifest contract metadata, Stage-18 tokenizer-specification contract metadata, Stage-17 tokenization-boundary contract metadata, Stage-16 prompt-evaluation handoff contract metadata, Stage-15 awareness-dialogue contract metadata, Stage-14 prompt-materialization contract metadata, Stage-13 prompt-receipt contract metadata, Stage-12 model-load contract metadata, Stage-11 runtime-invocation contract metadata, Stage-10 inference-readiness contract metadata, Stage-9 local model-registry contract metadata, Stage-8 prompt-evaluation contract metadata, Stage-7 report-only tool-preflight metadata, Stage-6 protective-safety metadata, Stage-5 productivity-ledger metadata, Stage-4 systems-engineering mode validation, Stage-3 prompt-plan metadata, Stage-2 runtime-profile metadata, Stage-1 local context-pack generation, Stage-0 identity, config, Console status, component marker, and productivity-ledger space. No sexual user functionality, dialogue generation, prompt text receipt, prompt text reading, prompt source reading, prompt buffer allocation, prompt tokenization, prompt token creation, prompt token sequence recording, prompt token ID recording, prompt token order recording, prompt token offset recording, context window assembly, prompt evaluation input creation, prompt evaluation runtime handoff, prompt-evaluation invocation request creation, prompt-evaluation result recording, prompt-evaluation result review recording, prompt-evaluation result disposition recording, disposition decision recording, prompt-evaluation result release recording, release decision recording, release publication, release packaging, release receipt creation, prompt-evaluation result release receipt recording, prompt-evaluation result release receipt review recording, review decision recording, review findings recording, receipt signing, receipt publication, model-output recording, prompt materialization, tokenizer artifact path resolution, tokenizer artifact opening, tokenizer artifact reading, tokenizer artifact scanning, tokenizer artifact hashing, tokenizer artifact measurement, tokenizer artifact digest recording, tokenizer artifact size recording, tokenizer artifact verification, tokenizer artifact digest comparison, tokenizer artifact size comparison, tokenizer artifact binding, tokenizer runtime attachment, runtime session creation, tokenizer manifest loading, tokenizer manifest parsing, tokenizer file access, tokenizer vocabulary loading, inference, prompt evaluation, tool execution, model installation, training, distillation, source mutation, or network authority are installed. Awareness-dialogue metadata defines future survivor-centered Q&A scope for official Nadia Initiative awareness topics, prompt-evaluation handoff metadata packages that evidence, tokenization-boundary metadata keeps prompt tokenization blocked, tokenizer-specification metadata records future review requirements, tokenizer-manifest metadata records future manifest review requirements, tokenizer-artifact-inventory metadata records future artifact measurement requirements, tokenizer-artifact-measurement metadata records future artifact verification requirements, tokenizer-artifact-verification metadata records future artifact binding requirements, tokenizer-artifact-binding metadata records future runtime attachment requirements, tokenizer-runtime-attachment metadata records future prompt tokenization requirements, prompt-tokenization metadata records future prompt token sequence requirements, prompt-token-sequence metadata records future context window assembly requirements, context-window-assembly metadata records future prompt evaluation input requirements, prompt-evaluation-input metadata records future prompt evaluation runtime handoff requirements, prompt-evaluation-runtime-handoff metadata records future prompt evaluation invocation requirements, prompt-evaluation-invocation metadata records future prompt evaluation result requirements, prompt-evaluation-result metadata records future prompt evaluation result review requirements, prompt-evaluation-result-review metadata records future prompt evaluation result disposition requirements, prompt-evaluation-result-disposition metadata records future prompt evaluation result release requirements, prompt-evaluation-result-release metadata records future prompt evaluation result release receipt requirements, prompt-evaluation-result-release-receipt metadata records future prompt evaluation result release receipt review requirements, prompt-evaluation-result-release-receipt-review metadata records future prompt evaluation result release receipt review disposition requirements, prompt-evaluation-result-release-receipt-review-disposition metadata records future prompt evaluation result release receipt review disposition release requirements, prompt-evaluation-result-release-receipt-review-disposition-release metadata records future prompt evaluation result release receipt review disposition release receipt requirements, prompt-evaluation-result-release-receipt-review-disposition-release-receipt metadata records future prompt evaluation result release receipt review disposition release receipt review requirements, prompt-evaluation-result-release-receipt-review-disposition-release-receipt-review metadata records future prompt evaluation result release receipt review disposition release receipt review disposition requirements, prompt-evaluation-result-release-receipt

-review-disposition-release-receipt-review-disposition metadata records future prompt evaluation result release receipt review disposition release receipt review disposition release requirements, prompt-evaluation-result-release-receipt-review-disposition-release-receipt-review-disposition-release metadata records future prompt evaluation result release receipt review disposition release receipt review disposition release receipt requirements, prompt-evaluation-result-release-receipt-review-disposition-release-receipt-review-disposition-release-receipt metadata records future prompt evaluation result release receipt review disposition release receipt review disposition release receipt review requirements, and prompt-evaluation-result-release-receipt-review-disposition-release-receipt-review-disposition-release-receipt-review metadata records future prompt evaluation result release receipt review disposition release receipt review disposition release receipt review disposition requirements, prompt-evaluation-result-release-receipt-review-disposition-release-receipt-review-disposition-release-receipt-review-disposition metadata records future prompt evaluation result release receipt review disposition release receipt review disposition release receipt review disposition release requirements, including prompt-evaluation result release receipt review disposition release receipt review disposition release receipt review disposition release metadata only, prompt-evaluation result release receipt review disposition release receipt review disposition release receipt review metadata only, prompt-evaluation result release receipt review disposition release receipt review disposition release receipt metadata only, prompt-evaluation result release receipt review disposition release receipt review disposition release metadata only, prompt-evaluation result release receipt review disposition release receipt review disposition metadata only, prompt-evaluation result release receipt review disposition release receipt review metadata only, prompt-evaluation result release receipt review disposition release receipt recording metadata only, prompt-evaluation result release receipt review disposition release recording metadata only, and prompt-evaluation result release receipt review disposition recording metadata only; none grants dialogue generation, live web lookup, prompt evaluation, token generation, inference, or tool execution authority.

Stage-40 adds latticra-nadia prompt-evaluation-result-release-receipt-review-disposition-release-receipt-review as prompt-evaluation result release receipt review disposition release receipt review metadata only. Prompt-evaluation result release receipt review disposition release receipt review recording remains blocked metadata only.

Stage-41 adds latticra-nadia prompt-evaluation-result-release-receipt-review-disposition-release-receipt-review-disposition as prompt-evaluation result release receipt review disposition release receipt review disposition metadata only. Prompt-evaluation result release receipt review disposition release receipt review disposition recording remains blocked metadata only.

Stage-42 adds latticra-nadia prompt-evaluation-result-release-receipt-review-disposition-release-receipt-review-disposition-release as prompt-evaluation result release receipt review disposition release receipt review disposition release metadata only. The prompt-evaluation result release receipt review disposition release receipt review disposition release recording remains blocked metadata only.

Stage-43 adds latticra-nadia prompt-evaluation-result-release-receipt-review-disposition-release-receipt-review-disposition-release-receipt as prompt-evaluation result release receipt review disposition release receipt review disposition release receipt metadata only. The prompt-evaluation result release receipt review disposition release receipt review disposition release receipt recording remains blocked metadata only.

Stage-44 adds latticra-nadia prompt-evaluation-result-release-receipt-review-disposition-release-receipt-review-disposition-release-receipt-review as prompt-evaluation result release receipt review disposition release receipt review disposition release receipt review metadata only. The prompt-evaluation result release receipt review disposition release receipt review disposition release receipt review recording remains blocked metadata only.

Stage-45 adds latticra-nadia prompt-evaluation-result-release-receipt-review-disposition-release-receipt-review-disposition-release-receipt-review-disposition as prompt-evaluation result release receipt review disposition release receipt review disposition release receipt review disposition metadata only. The prompt-evaluation result release receipt review disposition release receipt review disposition release receipt review disposition recording remains blocked metadata only.

Stage-46 adds latticra-nadia prompt-evaluation-result-release-receipt-review-disposition-release-receipt-review-disposition-release-receipt-review-disposition-release as prompt-evaluation result release receipt review disposition release receipt review disposition release receipt review disposition release metadata only. The prompt-evaluation result release receipt review disposition release receipt review disposition release receipt review disposition release recording remains blocked metadata only.

After a guarded local install with Nadia enabled:

```

Uninstall managed local install

```
make -C installer reset-dry-run
make -C installer reset-local
make -C installer uninstall-dry-run
make -C installer uninstall-local
latticra reset --dry-run
latticra reset
latticra uninstall --dry-run
latticra uninstall
```

Reset and uninstall remove the same managed artifacts: command wrappers, the Panel desktop entry, known Panel icons, and the selected local prefix. Use reset when the intent is to reinstall from new Panel specifications; use uninstall when the intent is to remove the local install. Unmanaged files in ~/.local/bin are preserved.

Clean full user-local uninstall

Use this only when normal reset/uninstall cannot clean up an old or broken user-local install. The commands below are intentionally scoped to Latticra user-local paths.

If LC was installed with a custom lc.install.command_wrapper, set LC_WRAPPER to that command name; the default is latticra-lc.

```
LATTICRA_PREFIX=&quot;${LATTICRA_PREFIX:-$HOME/.local/share/latticra}&quot;
LC_WRAPPER=&quot;${LC_WRAPPER:-latticra-lc}&quot;

rm -rf -- \
  &quot;$LATTICRA_PREFIX&quot; \
  &quot;$HOME/.local/share/latticra-validation&quot; \
  &quot;$HOME/.local/share/latticra-reset-receipts&quot;

rm -f -- \
  &quot;$HOME/.local/bin/latticra&quot; \
  &quot;$HOME/.local/bin/$LC_WRAPPER&quot; \
  &quot;$HOME/.local/bin/lat&quot; \
  &quot;$HOME/.local/bin/latticra-seal&quot; \
  &quot;$HOME/.local/bin/latticra-nadia&quot; \
  &quot;$HOME/.local/bin/latticra-panel&quot; \
  &quot;$HOME/.local/bin/latticra-installer&quot; \
  &quot;$HOME/.local/share/applications/latticra-panel.desktop&quot; \
  &quot;$HOME/.local/share/applications/latticra-installer.desktop&quot; \
  &quot;$HOME/.local/share/icons/hicolor/256x256/apps/latticra-panel.png&quot; \
  &quot;$HOME/.local/share/icons/hicolor/256x256/apps/latticra-installer.png&quot; \
  &quot;$HOME/.local/share/icons/hicolor/256x256/apps/latticra-seal.png&quot;
```

If those exact paths are root-owned because an earlier command was run with sudo, repeat the same exact cleanup with sudo:

```
LATTICRA_PREFIX=&quot;${LATTICRA_PREFIX:-$HOME/.local/share/latticra}&quot;
LC_WRAPPER=&quot;${LC_WRAPPER:-latticra-lc}&quot;

sudo rm -rf -- \
  &quot;$LATTICRA_PREFIX&quot; \
  &quot;$HOME/.local/share/latticra-validation&quot; \
  &quot;$HOME/.local/share/latticra-reset-receipts&quot;

sudo rm -f -- \
  &quot;$HOME/.local/bin/latticra&quot; \
  &quot;$HOME/.local/bin/$LC_WRAPPER&quot; \
  &quot;$HOME/.local/bin/lat&quot; \
  &quot;$HOME/.local/bin/latticra-seal&quot; \
```

```
&quot;$HOME/.local/bin/latticra-nadia&quot; \
&quot;$HOME/.local/bin/latticra-panel&quot; \
&quot;$HOME/.local/bin/latticra-installer&quot; \
&quot;$HOME/.local/share/applications/latticra-panel.desktop&quot; \
&quot;$HOME/.local/share/applications/latticra-installer.desktop&quot; \
&quot;$HOME/.local/share/icons/hicolor/256x256/apps/latticra-panel.png&quot; \
&quot;$HOME/.local/share/icons/hicolor/256x256/apps/latticra-installer.png&quot; \
&quot;$HOME/.local/share/icons/hicolor/256x256/apps/latticra-seal.png&quot;
```

Do not run sudo rm -rf against broad paths such as ~/.local, /usr, /, or unreviewed wildcards.

Safety baseline

```
no root
no kernel mutation
no systemd mutation
no SELinux mutation
no network authority
user-local prefix only
```

Source title: Nadia Awareness Dialogue Contract Stage-15

Lines: 146 | Words: 371 | SHA-256: ed6eb4726aa3e6ff7e3fa603c402356a22b01d69bf455c1a421908b0835ec679

Nadia Awareness Dialogue Contract Stage-15

Status: Stage-15 implementation contract Date: 2026-05-25 Scope: future Q&A dialogue scope for Nadia Initiative awareness topics before prompt evaluation, dialogue generation, token generation, inference, or tool execution.

Purpose

Stage-15 gives Nadia an awareness-dialogue contract for future Q&A about the work Nadia Initiative actively raises awareness about.

The contract consumes a Stage-14 prompt-materialization contract, verifies inherited non-executing prompt, runtime, model, tool, and protective-safety posture, and records the awareness topic register and dialogue safety rules that must exist before any future prompt-evaluation handoff.

Capability

Stage-15 adds:

```
nadia_stage_15_awareness_dialogue_contract_present=1
nadia_awareness_dialogue_contract_generator_present=1
awareness_dialogue_contract_command=scripts/nadia-awareness-dialogue-contract.sh
installed_awareness_dialogue_contract_command=latticra-nadia awareness-dialogue
future_qa_dialogue_capability_planned=1
awareness_dialogue_contract_status=contract_only
awareness_dialogue_stage=contract-only
awareness_dialogue_authority=0
awareness_dialogue_allowed=0
dialogue_generation_authority=0
dialogue_generation_allowed=0
qa_dialogue_generated=0
dialogue_turns_generated=0
question_generated=0
answer_generated=0
answer_text_generated=0
dialogue_scope=official-nadia-initiative-awareness-work
dialogue_format=question-and-answer
q_and_a_format_required=1
survivor_centered_dialogue_required=1
respectful_tone_required=1
plain_language_required=1
source_attribution_required=1
official_source_grounding_required=1
source_snapshot_policy=operator-reviewed-offline
active_topic_update_authority=0
live_web_lookup_authority=0
dialogue_decision=blocked_contract_only
requires_official_source_snapshot=1
awareness_dialogue_promotion_allowed=0
```

Stage-15 does not generate dialogue, receive prompt text, read prompt sources, allocate prompt buffers, materialize prompt text, tokenize prompts, evaluate prompts, load model weights, invoke a runtime, generate tokens, run inference, execute tools, mutate source, train, distill, download, or use the network.

Awareness Topic Register

Nadia's future Q&A scope is limited to official Nadia Initiative awareness work and must remain non-graphic, respectful, and survivor-centered:

```
topic_yazidi_genocide_awareness=1
topic_survivor_voice_and_dignity=1
topic_conflict_related_sexual_violence_awareness_non_graphic=1
topic_genocide_prevention=1
```

```
topic_justice_and_accountability=1
topic_women_peace_justice_security=1
topic_sinjar_reconstruction=1
topic_security_and_safe_return=1
topic_education_restoration=1
topic_healthcare_and_mental_health=1
topic_livelihoods_and_food_security=1
topic_wash_clean_water_sanitation_hygiene=1
topic_womens_empowerment=1
topic_legal_rights_and_reparations_awareness=1
topic_cultural_preservation_and_memorialization=1
topic_community_driven_survivor_centric_development=1
topic_responsible_support_and_digital_activism=1
```

Protective Dialogue Rules

```
sexual_user_request_authority=0
sexual_content_generation=0
sexualized_dialogue_generation=0
graphic_sexual_detail_allowed=0
erotic_content_allowed=0
roleplay_allowed=0
survivor_impersonation_allowed=0
survivor_identifying_speculation_allowed=0
victim_blaming_allowed=0
genocide_denial_allowed=0
hate_or_collective_blame_allowed=0
medical_advice_authority=0
legal_advice_authority=0
trauma_counseling_authority=0
crisis_intervention_authority=0
sexual_request_refusal=always
manipulation_resistance=required
```

Official Source Register

Future dialogue must be grounded in operator-reviewed offline snapshots from official Nadia Initiative sources:

```
source_nadia_initiative_home=https://www.nadiasinitiative.org/home
source_nadia_initiative_about=https://www.nadiasinitiative.org/nadias-initiative
source_nadia_initiative_approach=https://www.nadiasinitiative.org/our-approach
source_nadia_initiative_advocacy=https://www.nadiasinitiative.org/advocacy
source_nadia_initiative_womens_empowerment=https://www.nadiasinitiative.org/womens-empowerment
source_snapshot_generated=0
source_snapshot_loaded=0
source_fetch_performed=0
```

Stage-15 does not give Nadia live browsing authority.

Usage

With explicit evidence input:

```
sh scripts/nadia-awareness-dialogue-contract.sh \
  --prompt-materialization /path/to/latest-prompt-materialization-contract.txt \
  --request-class awareness-education \
  --output &quot;$(mktemp -d &quot;${TMPDIR:-/tmp}/latticra-nadia-awareness-dialogue.
XXXXXX&quot;)&quot;
```

After a guarded local install with Nadia enabled:

```
latticra-nadia awareness-dialogue
```

Non-Claims

Stage-15 Nadia is not yet a Q&A assistant, dialogue generator, prompt evaluator, model loader, inference runtime, runtime process launcher, token generator, model selector, tool executor, shell runner, network client, source mutator, training system, distillation system, security product, sexual assistant, roleplay surface, adult-content generator, legal adviser, medical adviser, trauma counselor, crisis intervention service, or production AI assistant.

Validation

```
sh scripts/test-nadia-awareness-dialogue-contract-stage-15.sh
```

Expected result:

```
nadia_awareness_dialogue_contract_stage_15: ok
```

docs/NADIA_CONTEXT_WINDOW_ASSEMBLY_CONTRACT_STAGE_27.md

Source title: Nadia Context Window Assembly Contract Stage-27

Lines: 170 | Words: 548 | SHA-256: 9ada0d30021d836ce4482166f2c17033be7c98e36eab1795f09c40de464d1b4d

Nadia Context Window Assembly Contract Stage-27

Status: Stage-27 implementation contract

Scope: context-window assembly metadata before context window assembly, prompt evaluation input creation, runtime invocation, prompt evaluation, dialogue generation, token generation, inference, or tool execution.

Purpose

Stage-27 gives Nadia a context-window assembly contract after the prompt-token-sequence contract is present.

The contract records how future reviewed context-window assembly must reference the Stage-26 prompt-token-sequence contract, prompt-tokenization boundary, tokenizer-runtime-attachment boundary, prompt-materialization boundary, prompt-receipt boundary, context-window layout policy, token-budget policy, truncation policy, ordering policy, attention-mask policy, position-ID policy, and prompt-evaluation-input policy. It preserves the absolute rule that Nadia cannot yet read prompt text, assemble context windows, create prompt evaluation inputs, invoke a runtime, evaluate prompts, generate dialogue, generate tokens, or run inference. The script only measures the Stage-26 contract report as evidence that the prerequisite metadata exists.

Contract Fields

Stage-27 adds:

```
nadia_stage_27_context_window_assembly_contract_present=1
nadia_context_window_assembly_contract_generator_present=1
context_window_assembly_contract_command=scripts/nadia-context-window-assembly-contract.sh
installed_context_window_assembly_contract_command=latticra-nadia context-window-assembly
context_window_assembly_contract_status=contract_only
context_window_assembly_stage=contract-only
context_window_assembly_authority=0
context_window_assembly_allowed=0
context_window_assembly_performed=0
context_window_assembly_metadata_present=1
context_window_family=operator-reviewed-context-window-assembly
context_window_format=contract-only-offline-context-window
context_window_assembly_decision=blocked_contract_only
context_window_assembly_evidence_present=1
context_window_assembly_source_policy=operator-reviewed-offline
context_window_assembly_plan_recorded=1
context_window_assembly_method_planned=offline-context-window-policy-review
context_window_assembly_result_recorded=0
context_window_assembly_runtime_invoked=0
requires_prompt_token_sequence_contract=1
requires_prompt_tokenization_contract=1
requires_tokenizer_runtime_attachment_contract=1
requires_tokenizer_artifact_binding_contract=1
requires_tokenizer_artifact_verification_contract=1
requires_tokenizer_artifact_measurement_contract=1
requires_tokenizer_artifact_inventory_contract=1
requires_tokenizer_manifest_contract=1
requires_tokenizer_specification_contract=1
requires_tokenization_boundary_contract=1
requires_prompt_materialization_contract=1
```

```
requires_prompt_receipt_contract=1
requires_future_prompt_evaluation_input_contract=1
context_window_assembly_promotion_allowed=0
```

Stage-27 does not generate dialogue, receive prompt text, read prompt sources, allocate prompt buffers, materialize prompt text, create prompt token buffers, create prompt tokens, count prompt tokens, record prompt token IDs, record prompt token order, record prompt token offsets, create attention masks, create position IDs, assemble context windows, serialize context windows, create prompt evaluation inputs, open tokenizer manifests, read tokenizer manifests, parse tokenizer manifests, validate tokenizer manifests, load tokenizer manifests, resolve tokenizer artifact paths, scan artifact directories, stat tokenizer artifacts, open tokenizer artifacts, read tokenizer artifacts, hash tokenizer artifacts, bind tokenizer artifacts, attach tokenizers to a runtime, create runtime sessions, open tokenizer files, read tokenizer files, load tokenizer vocabularies, evaluate prompts, load model weights, invoke a runtime, generate tokens, run inference, execute tools, mutate source, train, distill, download, or use the network.

Assembly Requirements

The context-window assembly contract names future review requirements:

```
requires_prompt_token_sequence_reference=1
requires_prompt_tokenization_reference=1
requires_tokenizer_runtime_attachment_reference=1
requires_prompt_materialization_reference=1
requires_prompt_receipt_reference=1
requires_context_window_layout_policy=1
requires_context_window_token_budget_policy=1
requires_context_window_truncation_policy=1
requires_context_window_ordering_policy=1
requires_attention_mask_policy=1
requires_position_id_policy=1
requires_prompt_evaluation_input_policy=1
requires_operator_approval_record=1
requires_official_source_snapshot=1
requires_no_context_window_assembly=1
requires_no_prompt_evaluation_input_creation=1
requires_no_runtime_invocation=1
requires_no_prompt_evaluation=1
requires_no_dialogue_generation=1
requires_no_inference=1
requires_refusal_policy_link=1
requires_survivor_centered_language_review=1
```

Denial Boundary

Stage-27 preserves explicit context-window denial fields:

```
context_window_assembly_authority=0
context_window_assembly_allowed=0
context_window_assembly_open_authority=0
context_window_assembly_read_authority=0
context_window_assembly_write_authority=0

```

Commands

Repository command:

```
sh scripts/nadia-context-window-assembly-contract.sh \
  --prompt-token-sequence
reports/nadia/prompt-token-sequence/latest-prompt-token-sequence-contract.txt \
  --output &quot;$(mktemp -d &quot;${TMPDIR:-/tmp}/latticra-nadia-context-window-assembly.
XXXXXX&quot;)&quot;
```

Installed command:

```
latticra-nadia context-window-assembly
```

Non-Claims

Stage-27 Nadia is not yet a Q&A assistant, dialogue generator, prompt evaluator, prompt reader, prompt materializer, tokenizer, tokenizer loader, tokenizer registry, tokenizer manifest loader, tokenizer manifest parser, tokenizer artifact scanner, tokenizer artifact inventory reader, tokenizer artifact hasher, tokenizer artifact measurer, tokenizer artifact verifier, tokenizer artifact binder, tokenizer runtime attachment layer, prompt tokenizer, token counter, token sequence recorder, token ID recorder, token offset recorder, context-window assembler, prompt-evaluation-input creator, model loader, inference runtime, runtime process launcher, token generator, model selector, tool executor, shell runner, network client, source mutator, training system, distillation system, security product, sexual assistant, roleplay surface, adult-content generator, legal adviser, medical adviser, trauma counselor, crisis intervention service, or production AI assistant.

Validation

Run:

```
sh scripts/test-nadia-context-window-assembly-contract-stage-27.sh
```

Expected output:

```
nadia_context_window_assembly_contract_stage_27: ok
```

docs/NADIA_DEVELOPER_WORKBENCH_STAGE_3.md

Source title: Nadia Developer Workbench Stage-3

Lines: 102 | Words: 239 | SHA-256: cd71bf7daec3f0c9e40f41c1704e0485bd1faf82365a3156e76ef3d1708bdc1e

Nadia Developer Workbench Stage-3

Status: Stage-3 implementation contract Date: 2026-05-25 Scope: prompt-plan generation from local context-pack and runtime-profile evidence.

Purpose

Stage-3 gives Nadia a developer-workbench planning surface before prompt evaluation exists.

The workbench combines Stage-1 context-pack evidence and Stage-2 runtime-profile evidence into an auditable prompt plan. The plan is designed for future offline inference, but the current stage stops before prompt execution.

Capability

Stage-3 adds:

```
nadia_stage_3_developer_workbench_present=1
nadia_prompt_plan_generator_present=1
prompt_plan_command=scripts/nadia-prompt-plan.sh
installed_prompt_plan_command=latticra-nadia prompt-plan
requires_context_pack=1
requires_runtime_profile=1
context_pack_measured=1
runtime_profile_measured=1
network_authority=0
model_runtime_invoked=0
inference_performed=0
prompt_evaluated=0
tool_execution_authority=0
source_mutation_authority=0
training_performed=0
```

Stage-3 does not summarize with AI, call an inference runtime, evaluate a prompt, mutate source, execute tools, or use the network.

Inputs

The prompt-plan generator requires:

```
context_pack=Stage-1 Nadia local context pack
runtime_profile=Stage-2 Nadia runtime profile
task=operator-provided task label
```

The default task label is latticra-development-planning.

Outputs

The prompt-plan generator writes:

```
nadia-prompt-plan-&lt;timestamp&gt;.txt
latest-prompt-plan.txt
```

The prompt plan records:

```
stage=3-developer-workbench-planning
context_pack_measurement=&lt;local measurement&gt;
runtime_profile_measurement=&lt;local measurement&gt;
task=&lt;operator task label&gt;
prompt_evaluated=0
inference_performed=0
source_mutation_authority=0
```

Usage

With explicit evidence files:

```
sh scripts/nadia-prompt-plan.sh \
  --context-pack /path/to/latest-context-pack.txt \
  --runtime-profile /path/to/latest-runtime-profile.txt \
  --task &quot;runtime boundary refactor planning&quot; \
  --output &quot;$(mktemp -d &quot;${TMPDIR:-/tmp}/latticra-nadia-plans.XXXXXX&quot;)&quot;
```

After a guarded local install with Nadia enabled:

```
latticra-nadia prompt-plan
```

Non-Claims

Stage-3 Nadia is not an inference runtime, prompt evaluator, code generator, autonomous coding agent, source mutator, training system, network retriever, security product, or production AI assistant.

Validation

```
sh scripts/test-nadia-developer-workbench-stage-3.sh
```

Expected result:

```
nadia_developer_workbench_stage_3: ok
```

docs/NADIA_GUARDED_TOOL_AUTHORITY_STAGE_7.md

Source title: Nadia Guarded Tool Authority Stage-7

Lines: 121 | Words: 263 | SHA-256: 6a50e3b2b3d39d5663d04949d3ba6712f1b836921cdaf8600a73fc3e104b4211

Nadia Guarded Tool Authority Stage-7

Status: Stage-7 implementation contract Date: 2026-05-25 Scope: report-only tool-authority preflight after protective-safety validation.

Purpose

Stage-7 gives Nadia a tool-authority preflight without granting tool execution.

The preflight consumes a Stage-6 protective-safety report, verifies the non-sexual-use and anti-manipulation boundary, and records whether a proposed tool class is inside a report-only planning boundary. It does not run the tool.

Capability

Stage-7 adds:

```
nadia_stage_7_guarded_tool_authority_present=1
nadia_tool_authority_preflight_present=1
tool_authority_preflight_command=scripts/nadia-tool-authority-preflight.sh
installed_tool_authority_preflight_command=latticra-nadia tool-preflight
requires_protective_safety=1
protective_safety_stage_required=6-protective-safety-boundary
tool_authority_stage=preflight-only
preflight_decision=report_only_no_execution
tool_execution_authority=0
tool_execution_performed=0
tool_selection_authority=0
shell_execution_authority=0
network_tool_authority=0
source_mutation_authority=0
destructive_action_authority=0
credential_access_authority=0
requires_operator_approval=1
requires_nucleus_gate=1
requires_runtime_boundary_gate=1
requires_seal_receipt=1
requires_protective_safety_boundary=1
authority_transition_allowed=0
sexual_content_generation=0
sexual_request_refusal=always
manipulation_resistance=required
```

Stage-7 does not execute tools, evaluate prompts, call an inference runtime, mutate source, train, distill, or use the network.

Inputs

The tool-authority preflight requires:

```
protective_safety=Stage-6 Nadia protective-safety report
tool_class=operator-proposed tool class label
```

```
action=operator-reviewed action label
```

Initial report-only tool classes are:

```
metadata-read
report-only
test-recommendation
documentation-plan
local-evidence-review
```

Network, shell, destructive, source-mutation, credential, and secret-bearing classes fail closed.

Outputs

The preflight writes:

```
nadia-tool-preflight-&lt;timestamp&gt;.txt
latest-tool-preflight.txt
```

The report records:

```
stage=7-guarded-tool-authority-preflight
preflight_decision=report_only_no_execution
tool_execution_authority=0
tool_execution_performed=0
requires_protective_safety_boundary=1
authority_transition_allowed=0
```

Usage

With an explicit protective-safety report:

```
sh scripts/nadia-tool-authority-preflight.sh \
  --protective-safety /path/to/latest-protective-safety.txt \
  --tool-class local-evidence-review \
  --action &quot;review generated receipts&quot; \
  --output &quot;$(mktemp -d &quot;${TMPDIR:-/tmp}/latticra-nadia-tools.XXXXXX&quot;)&quot;
```

After a guarded local install with Nadia enabled:

```
latticra-nadia tool-preflight
```

Non-Claims

Stage-7 Nadia is not a tool executor, shell runner, network client, source mutator, credential reader, inference runtime, prompt evaluator, sexual assistant, roleplay surface, adult-content generator, training system, distillation system, security product, or production AI assistant.

Validation

```
sh scripts/test-nadia-guarded-tool-authority-stage-7.sh
```

Expected result:

```
nadia_guarded_tool_authority_stage_7: ok
```

docs/NADIA_INFERENCE_READINESS_CONTRACT_STAGE_10.md

Source title: Nadia Inference Readiness Contract Stage-10

Lines: 139 | Words: 288 | SHA-256: 9f44a992afb5fe0e6b3977d50e20227d04d793d54818a76119faecdb372f9b66

Nadia Inference Readiness Contract Stage-10

Status: Stage-10 implementation contract Date: 2026-05-25 Scope: inference-readiness metadata before runtime invocation, model loading, prompt evaluation, inference, or tool execution.

Purpose

Stage-10 gives Nadia an inference-readiness contract without running inference.

The contract consumes a Stage-9 local model-registry contract, verifies inherited non-executing model, prompt, runtime, tool, and protective-safety posture, and records the review fields that would be required before any later runtime invocation contract can exist.

Capability

Stage-10 adds:

```
nadia_stage_10_inference_readiness_contract_present=1
nadia_inference_readiness_contract_generator_present=1
inference_readiness_contract_command=scripts/nadia-inference-readiness-contract.sh

prompt_materialized=0
prompt_evaluation_authority=0
prompt_evaluated=0
model_runtime_present=0
model_runtime_invoked=0
runtime_invoked=0
inference_authority=0
inference_performed=0
model_weights_installed=0
model_weights_loaded=0
model_weights_downloaded=0
model_weights_inspected=0
tool_execution_authority=0
source_mutation_authority=0
network_authority=0
training_performed=0
distillation_performed=0
sexual_content_generation=0
sexual_request_refusal=always
manipulation_resistance=required
```

Stage-10 does not materialize prompts, evaluate prompts, load model weights, invoke a runtime, run inference, execute tools, mutate source, train, distill, download, or use the network.

Inputs

The inference-readiness contract requires:

```
model_registry=Stage-9 Nadia local model-registry contract
request_class=operator request classification label
```

Sexualized request classifications fail closed.

Outputs

The contract writes:

```
nadia-inference-readiness-contract-&lt;timestamp&gt;.txt
latest-inference-readiness-contract.txt
```

The report records:

```
stage=10-inference-readiness-contract
inference_readiness_contract_status=contract_only
inference_readiness_authority=0
inference_ready=0
readiness_decision=blocked_contract_only
runtime_invocation_authority=0
model_runtime_invoked=0
inference_authority=0
inference_performed=0
model_weights_loaded=0
sexual_request_refusal=always
```

Usage

With explicit evidence input:

```
sh scripts/nadia-inference-readiness-contract.sh \
  --model-registry /path/to/latest-model-registry-contract.txt \
  --request-class software-development \
  --output &quot;$(mktemp -d &quot;${TMPDIR:-/tmp}/latticra-nadia-inference-readiness.
XXXXXX&quot;)&quot;
```

After a guarded local install with Nadia enabled:

```
latticra-nadia inference-readiness
```

Non-Claims

Stage-10 Nadia is not an inference runtime, model loader, prompt evaluator, prompt materializer, model selector, tool executor, shell runner, network client, source mutator, training system, distillation system, security product, sexual assistant, roleplay surface, adult-content generator, or production AI assistant.

Validation

```
sh scripts/test-nadia-inference-readiness-contract-stage-10.sh
```

Expected result:

```
nadia_inference_readiness_contract_stage_10: ok
```

docs/NADIA_LOCAL_CONTEXT_ENGINE_STAGE_1.md

Source title: Nadia Local Context Engine Stage-1

Lines: 113 | Words: 260 | SHA-256: 86700657c465735c8333536fb5c2010778413a2cd65f6687cb6d54c9130c5b51

Nadia Local Context Engine Stage-1

Status: Stage-1 implementation contract Date: 2026-05-25 Scope: no-network local context-pack generation for Nadia.

Purpose

Stage-1 gives Nadia a deterministic local context engine before any model runtime exists.

The context engine creates auditable context packs from local Latticra project files so future offline inference can begin from explicit, measured, inspectable source material instead of hidden memory or network retrieval.

Capability

Stage-1 adds:

```
nadia_stage_1_local_context_engine_present=1
nadia_context_pack_generator_present=1
context_pack_command=scripts/nadia-context-pack.sh
installed_context_pack_command=latticra-nadia context-pack
local_file_read_for_indexing=operator_invoked
local_context_pack_write=operator_selected_output
network_authority=0
model_runtime_present=0
model_weights_installed=0
tool_execution_authority=0
source_mutation_authority=0
training_performed=0
```

The context engine records file paths, file classes, line counts, byte counts, and local measurements. It does not summarize with AI, embed text, call a model, use the network, or mutate source.

Inputs

The default context-pack roots are:

```
README.md
STATUS.md
SECURITY.md
CONTRIBUTING.md
docs/
include/
src/
tests/
scripts/
installer/
seal/
```

Generated build outputs, local receipts, and existing Nadia context-pack outputs are excluded.

Outputs

The context-pack generator writes:

```
nadia-context-pack-&lt;timestamp&gt;.txt
nadia-context-file-index-&lt;timestamp&gt;.tsv
latest-context-pack.txt
latest-file-index.tsv
```

The pack includes:

```
system_name=Latticra Nadia Witness Foundation
public_name=Nadia
interactive_name=Nadia
implementation_name=Nadia Witness Foundation
documentation_code_name=Nadia Witness Foundation
stage=1-local-context-engine
network_authority=0
model_runtime_present=0
model_weights_installed=0
tool_execution_authority=0
source_mutation_authority=0
human_dignity_principle=1
community_awareness_posture=1
```

Usage

From the repository:

```
sh scripts/nadia-context-pack.sh --repo . --output &quot;$(mktemp -d
&quot;${TMPDIR:-/tmp}/latticra-nadia-context.XXXXXX&quot;)&quot;
```

After a guarded local install with Nadia enabled:

```
latticra-nadia context-pack
```

The installed command writes under the user-local Nadia context-pack directory.

Non-Claims

Stage-1 Nadia is not an inference runtime, autonomous coding agent, embedding service, training system, source mutator, network retriever, security product, or production AI assistant.

Validation

```
sh scripts/test-nadia-local-context-engine-stage-1.sh
```

Expected result:

```
nadia_local_context_engine_stage_1: ok
```

docs/NADIA_LOCAL_MODEL_REGISTRY_CONTRACT_STAGE_9.md

Source title: Nadia Local Model Registry Contract Stage-9

Lines: 140 | Words: 321 | SHA-256: 3d4b739788a6010f81d9e793865249703fc508583783ec1062393b92829ed7a0

Nadia Local Model Registry Contract Stage-9

Status: Stage-9 implementation contract Date: 2026-05-25 Scope: local model-registry metadata before model selection, model installation, prompt evaluation, inference, or tool execution.

Purpose

Stage-9 gives Nadia a local model-registry contract without selecting or running a model.

The contract consumes a Stage-8 prompt-evaluation contract and a Stage-2 runtime profile, verifies the inherited non-executing safety posture, and records a local model candidate as metadata for later operator review.

Capability

Stage-9 adds:

```
nadia_stage_9_local_model_registry_contract_present=1
nadia_model_registry_contract_generator_present=1
model_registry_contract_command=scripts/nadia-local-model-registry-contract.sh
installed_model_registry_contract_command=latticra-nadia model-registry
requires_prompt_contract=1
prompt_contract_stage_required=8-prompt-evaluation-contract
requires_runtime_profile=1
runtime_profile_stage_required=2-runtime-profile-boundary
registry_contract_status=metadata_only
local_model_registry_stage=contract-only
model_registry_authority=0
candidate_recorded=1
candidate_review_status=operator_review_required
candidate_usable_for_inference=0
candidate_selected_for_runtime=0
model_selection_authority=0
model_install_authority=0
model_download_authority=0
model_copy_authority=0
model_load_authority=0
model_benchmark_authority=0
model_weight_inspection_authority=0
registry_promotion_allowed=0
prompt_materialized=0
prompt_evaluation_authority=0
prompt_evaluated=0
model_runtime_present=0
model_runtime_invoked=0
inference_performed=0
model_weights_installed=0
model_weights_loaded=0
model_weights_copied=0
model_weights_downloaded=0
model_weights_inspected=0
```

```
tool_execution_authority=0
source_mutation_authority=0
network_authority=0
training_performed=0
distillation_performed=0
sexual_content_generation=0
sexual_request_refusal=always
manipulation_resistance=required
```

Stage-9 does not download, install, copy, load, inspect, benchmark, or execute model weights. It does not materialize prompts, evaluate prompts, run inference, execute tools, mutate source, train, distill, or use the network.

Inputs

The local model-registry contract requires:

```
prompt_contract=Stage-8 Nadia prompt-evaluation contract
runtime_profile=Stage-2 Nadia runtime profile
model_id=operator-provided local candidate label
model_family=operator-provided family label
model_format=operator/runtime profile format label
quantization=operator-provided quantization label
source=operator-provided local provenance label
license=operator review label
```

Sexualized candidate labels fail closed.

Outputs

The contract writes:

```
nadia-model-registry-contract-&lt;timestamp&gt;.txt
latest-model-registry-contract.txt
```

The report records:

```
stage=9-local-model-registry-contract
registry_contract_status=metadata_only
local_model_registry_stage=contract-only
model_registry_authority=0
candidate_review_status=operator_review_required
candidate_usable_for_inference=0
model_selection_authority=0
model_install_authority=0
model_runtime_invoked=0
inference_performed=0
model_weights_installed=0
sexual_request_refusal=always
```

Usage

With explicit evidence inputs:

```
sh scripts/nadia-local-model-registry-contract.sh \
  --prompt-contract /path/to/latest-prompt-contract.txt \
  --runtime-profile /path/to/latest-runtime-profile.txt \
  --model-id local-coding-assistant-candidate \
  --quantization q4_k_m \
  --output &quot;$(mktemp -d &quot;${TMPDIR:-/tmp}/latticra-nadia-model-registry.XXXXXX&quot;
)&quot;
```

After a guarded local install with Nadia enabled:

```
latticra-nadia model-registry
```

Non-Claims

Stage-9 Nadia is not a model selector, inference runtime, model installer, model distributor, model downloader, weight inspector, benchmark runner, prompt evaluator, tool executor, shell runner, network client, source mutator, training system, distillation system, security product, sexual assistant, roleplay surface, adult-content generator, or production AI assistant.

Validation

```
sh scripts/test-nadia-local-model-registry-contract-stage-9.sh
```

Expected result:

```
nadia_local_model_registry_contract_stage_9: ok
```

docs/NADIA_MODEL_LOAD_CONTRACT_STAGE_12.md

Source title: Nadia Model Load Contract Stage-12

Lines: 155 | Words: 347 | SHA-256: 7a4c67dfcd0b146f76b9d469d8b7d73243a69a74b9b6ac000ef027a77b06cb66

Nadia Model Load Contract Stage-12

Status: Stage-12 implementation contract Date: 2026-05-25 Scope: model-load metadata before model file opening, weight mapping, weight verification, weight loading, runtime attachment, token generation, inference, prompt evaluation, or tool execution.

Purpose

Stage-12 gives Nadia a model-load contract without loading a model.

The contract consumes a Stage-11 runtime-invocation contract, verifies inherited non-executing invocation, readiness, model, prompt, runtime, tool, and protective-safety posture, and records the review fields that would be required before any later prompt-receipt contract can exist.

Capability

Stage-12 adds:

```
nadia_stage_12_model_load_contract_present=1
nadia_model_load_contract_generator_present=1
model_load_contract_command=scripts/nadia-model-load-contract.sh
installed_model_load_contract_command=latticra-nadia model-load
requires_runtime_invocation_contract=1

source_mutation_authority=0
network_authority=0
training_performed=0
distillation_performed=0
sexual_content_generation=0
sexual_request_refusal=always
manipulation_resistance=required
```

Stage-12 does not materialize prompts, evaluate prompts, open model files, map model weights, verify model weights, load model weights, attach weights to a runtime, spawn a runtime process, create a runtime session, generate tokens, run inference, execute tools, mutate source, train, distill, download, or use the network.

Inputs

The model-load contract requires:

```
runtime_invocation=Stage-11 Nadia runtime-invocation contract
request_class=operator request classification label
```

Sexualized request classifications fail closed.

Outputs

The contract writes:

```
nadia-model-load-contract-&lt;timestamp&gt;.txt
latest-model-load-contract.txt
```

The report records:

```
stage=12-model-load-contract
model_load_contract_status=contract_only
model_load_authority=0
model_load_allowed=0
model_loaded=0
load_decision=blocked_contract_only

model_weights_mapped=0
model_weights_loaded=0
model_load_performed=0
token_generation_performed=0
inference_performed=0
sexual_request_refusal=always
```

Usage

With explicit evidence input:

```
sh scripts/nadia-model-load-contract.sh \
  --runtime-invocation /path/to/latest-runtime-invocation-contract.txt \
  --request-class software-development \
  --output &quot;$(mktemp -d &quot;${TMPDIR:-/tmp}/latticra-nadia-model-load.XXXXXX&quot;)&quot;
```

After a guarded local install with Nadia enabled:

```
latticra-nadia model-load
```

Non-Claims

Stage-12 Nadia is not a model loader, model file reader, model weight mapper, model verifier, inference runtime, runtime process launcher, prompt evaluator, prompt materializer, token generator, model selector, tool executor, shell runner, network client, source mutator, training system, distillation system, security product, sexual assistant, roleplay surface, adult-content generator, or production AI assistant.

Validation

```
sh scripts/test-nadia-model-load-contract-stage-12.sh
```

Expected result:

```
nadia_model_load_contract_stage_12: ok
```

docs/NADIA_OFFLINE_AI_FOUNDATION.md

Source title: Nadia Offline AI Foundation

Lines: 2346 | Words: 7777 | SHA-256: edfe63393a19051849ea87b4e627ba8d1eb1d32259cdb9671cdbb909d1375f4a

Nadia Offline AI Foundation

Status: Stage-0 foundation contract Date: 2026-05-25 Scope: Latticra-native offline AI identity, installation surface, Console interoperability, local evidence posture, and staged development plan.

Name

The Latticra offline AI is named Nadia.

Nadia is named after Nobel Peace Prize laureate Nadia Murad, whose testimony and advocacy have helped bring public attention to the enslavement and abuse of thousands of women in Iraq and Syria.

This name gives the Latticra offline AI a human-rights awareness posture: technical capability should be bound to dignity, witness, community responsibility, and careful authority.

Nadia's Latticra component identity is:

```
public_name=Nadia
system_name=Latticra Nadia Witness Foundation
interactive_name=Nadia
implementation_name=Nadia Witness Foundation
documentation_code_name=Nadia Witness Foundation
command_name=latticra-nadia
component_key=nadia_offline_ai
```

Purpose

Nadia is the future offline AI companion for Latticra software development, systems engineering, and AI development workflows.

Her long-term role is to help operators:

- understand and improve Latticra source, contracts, tests, and evidence;
- reason about C, constrained C++, Rust Panel code, Lat, LIR, L-UI, Nucleus, Runtime Boundary, and Seal surfaces;
- plan bounded implementation slices before tool authority is granted;
- use local project context without requiring network access;
- learn from accepted local work through operator-reviewed productivity evidence;

- keep community-awareness principles visible while building powerful local AI tools.

Stage-0 Foundation

Stage-0 makes Nadia visible and installable without claiming model capability.

Stage-0 establishes:

```
nadia_stage_0_foundation_present=1
panel_install_surface_present=1
console_interop_surface_present=1
local_config_surface_present=1
local_component_marker_present=1
offline_by_default=1
network_authority=0
tool_execution_authority=0
model_runtime_present=0
model_weights_installed=0
self_modification_authority=0
production_ai_claimed=0
```

Stage-0 does not install model weights, run inference, execute tools, mutate source, train a model, use the network, or claim autonomous software-development capability.

Awareness Principles

Nadia's development should remain aligned with the reason for her name:

```
human_dignity_principle=1
survivor_witness_respect=1
community_awareness_posture=1
harm_aware_development=1
sensationalism_allowed=0
coercive_use_allowed=0
dehumanizing_use_allowed=0
```

This does not make Stage-0 a policy engine or content-moderation system. It establishes a naming and design commitment that later AI capability must honor through explicit contracts, evidence, and operator-visible boundaries.

Local Layout

When enabled through Latticra Panel, Nadia reserves a user-local foundation under the guarded Latticra prefix:

```
etc/latticra/nadia.toml
share/latticra/nadia/README.md
share/latticra/nadia/context-packs/
share/latticra/nadia/model-registry/
share/latticra/nadia/productivity-ledger/
share/latticra/nadia/runtime-invocation/
share/latticra/nadia/model-load/
share/latticra/nadia/prompt-receipt/
share/latticra/nadia/prompt-materialization/
share/latticra/nadia/awareness-dialogue/
share/latticra/nadia/prompt-evaluation-handoff/
share/latticra/nadia/tokenization-boundary/
share/latticra/nadia/tokenizer-specification/
share/latticra/nadia/tokenizer-manifest/
share/latticra/nadia/tokenizer-artifact-inventory/
share/latticra/nadia/tokenizer-artifact-measurement/

share/latticra/nadia/prompt-evaluation-result/
share/latticra/nadia/prompt-evaluation-result-review/
share/latticra/nadia/prompt-evaluation-result-disposition/
share/latticra/nadia/prompt-evaluation-result-release/
share/latticra/nadia/prompt-evaluation-result-release-receipt/
share/latticra/nadia/prompt-evaluation-result-release-receipt-review/
```

```
share/latticra/nadia/prompt-evaluation-result-release-receipt-review-disposition/
share/latticra/nadia/prompt-evaluation-result-release-receipt-review-disposition-release/
share/latticra/nadia/prompt-evaluation-result-release-receipt-review-disposition-release-receipt
/
share/latticra/nadia/prompt-evaluation-result-release-receipt-review-disposition-release-receipt
-review/
share/latticra/components/nadia-offline-ai.installed
bin/latticra-nadia
```

These paths are placeholders for future offline capability. They are intentionally local, inspectable, and receipt-visible.

Console Interoperability

Nadia must interoperate with the embedded Latticra Console before receiving any broader authority.

Stage-0 Console behavior is metadata-only:

```
nadia status
nadia commands
```

The nadia status command reports whether the Panel configuration has selected the Nadia component and repeats the denied authority posture. The nadia commands command lists the Stage-1 through Stage-46 command map. Neither command launches an external host process.

After user-local installation, the CLI surface is:

```
latticra-nadia status
latticra-nadia commands
latticra nadia status
latticra nadia commands
```

The installed shim reports Stage-0 metadata and a no-effect command map only.

Productivity Learning

Nadia's learning loop must begin as a local productivity ledger, not as silent self-training.

Stage-0 reserves the ledger path and policy vocabulary:

```
productivity_ledger=operator-reviewed-local
accepted_patch_memory=planned
test_outcome_memory=planned
retrieval_index_updates=planned
weight_training=0
silent_self_modification=0
```

Future stages may let Nadia learn from accepted patches, test outcomes, rejected plans, and operator notes. That learning must remain local, auditable, reversible, and separated from model-weight training unless a later contract explicitly permits it.

Development Stages

Stage-0: Foundation

Establish name, component identity, Panel install surface, Console status surface, local config, local directories, CLI shim, status record, and deterministic guard.

Stage-1: Local Context Engine

Build a no-network project indexer for docs, headers, sources, tests, scripts, installer configs, and status records. Produce context packs for Latticra-specific coding tasks without running inference.

Current Stage-1 status:

```
nadia_stage_1_local_context_engine_present=1
context_pack_command=scripts/nadia-context-pack.sh
installed_context_pack_command=latticra-nadia context-pack
local_file_read_for_indexing=operator_invoked
```

```
source_mutation_authority=0
network_authority=0
model_runtime_present=0
```

See NADIA_LOCAL_CONTEXT_ENGINE_STAGE_1.md.

Stage-2: Offline Inference Runtime

Add a pluggable local runtime boundary for operator-provided models, likely GGUF-compatible first. Record model hashes, quantization, context length, hardware profile, and memory budget before use.

Current Stage-2 status:

```
nadia_stage_2_runtime_profile_present=1
runtime_profile_command=scripts/nadia-runtime-profile.sh
installed_runtime_profile_command=latticra-nadia runtime-profile
model_file_measurement=operator_provided_optional
runtime_family=llama.cpp-compatible
model_format=gguf
model_runtime_invoked=0
inference_performed=0
prompt_evaluated=0
```

See NADIA_RUNTIME_PROFILE_STAGE_2.md.

Stage-3: Developer Workbench

Integrate Nadia with Latticra Console and Panel workflows for code navigation, patch planning, test selection, and evidence review. Keep source mutation behind explicit operator action.

Current Stage-3 status:

```
nadia_stage_3_developer_workbench_present=1
prompt_plan_command=scripts/nadia-prompt-plan.sh
installed_prompt_plan_command=latticra-nadia prompt-plan
requires_context_pack=1
requires_runtime_profile=1
model_runtime_invoked=0
inference_performed=0
prompt_evaluated=0
source_mutation_authority=0
```

See NADIA_DEVELOPER_WORKBENCH_STAGE_3.md.

Stage-4: Systems Engineering Mode

Specialize prompt-plan validation with mode labels and validator sets for C, constrained C++, Rust Panel code, Lat/LIR/L-UI, Runtime Boundary, Seal, AI infrastructure, awareness safety, and Linux/Fedora integration.

```
nadia_stage_4_systems_engineering_mode_present=1
mode_validation_command=scripts/nadia-mode-validate.sh
installed_mode_validation_command=latticra-nadia mode-validate
requires_prompt_plan=1
mode_taxonomy_present=1
mode_allowed=1
model_runtime_invoked=0
inference_performed=0
prompt_evaluated=0
source_mutation_authority=0
```

See NADIA_SYSTEMS_ENGINEERING_MODE_STAGE_4.md.

Stage-5: Productivity Loop

Use the local productivity ledger to improve retrieval, ranking, plan templates, test recommendations, and project-specific memory. Any model training or distillation remains a separate future contract.

```
nadia_stage_5_productivity_loop_present=1
productivity_ledger_command=scripts/nadia-productivity-ledger.sh
installed_productivity_ledger_command=latticra-nadia productivity-ledger
```

```
requires_mode_validation=1
learning_scope=operator-reviewed-local-productivity
ledger_append_only=1
project_memory_scope=local-metadata-only
model_runtime_invoked=0
inference_performed=0
prompt_evaluated=0
training_performed=0
distillation_performed=0
source_mutation_authority=0
```

See NADIA_PRODUCTIVITY_LOOP_STAGE_5.md.

Stage-6: Protective Safety Boundary

Make Nadia's absolute protective boundary explicit before any prompt evaluation, model runtime, retrieval, or tool authority is considered.

```
nadia_stage_6_protective_safety_boundary_present=1
protective_safety_command=scripts/nadia-protective-safety-boundary.sh
installed_protective_safety_command=latticra-nadia protective-safety
requires_productivity_entry=1
absolute_protective_boundary=1
sexual_user_request_authority=0
sexual_content_generation=0
sexual_roleplay_authority=0
sexualized_namesake_or_survivor_content=0
sexual_request_refusal=always
user_override_authority=0
prompt_injection_override_authority=0
manipulation_resistance=required
policy_bypass_authority=0
namesake_cause_awareness=1
awareness_context=non_sensational_human_rights
model_runtime_invoked=0
inference_performed=0
prompt_evaluated=0
training_performed=0
distillation_performed=0
source_mutation_authority=0
```

See NADIA_PROTECTIVE_SAFETY_BOUNDARY_STAGE_6.md.

Stage-7: Guarded Tool Authority

Add a report-only tool-authority preflight after the protective-safety boundary. Stage-7 can classify a proposed tool class but cannot execute tools.

```
nadia_stage_7_guarded_tool_authority_present=1
tool_authority_preflight_command=scripts/nadia-tool-authority-preflight.sh
installed_tool_authority_preflight_command=latticra-nadia tool-preflight
requires_protective_safety=1
tool_authority_stage=preflight-only
preflight_decision=report_only_no_execution
tool_execution_authority=0
tool_execution_performed=0
tool_selection_authority=0
shell_execution_authority=0
network_tool_authority=0
source_mutation_authority=0
destructive_action_authority=0
credential_access_authority=0
requires_operator_approval=1
requires_nucleus_gate=1
requires_runtime_boundary_gate=1
requires_seal_receipt=1
requires_protective_safety_boundary=1
authority_transition_allowed=0
sexual_content_generation=0
sexual_request_refusal=always
manipulation_resistance=required
```

See NADIA_GUARDED_TOOL_AUTHORITY_STAGE_7.md.

Stage-8: Prompt Evaluation Contract

Define the contract required before any future prompt evaluation. Stage-8 can verify Stage-7 tool preflight evidence and write receipt fields, but it cannot materialize or evaluate prompts.

```
nadia_stage_8_prompt_evaluation_contract_present=1
prompt_evaluation_contract_command=scripts/nadia-prompt-evaluation-contract.sh
installed_prompt_evaluation_contract_command=latticra-nadia prompt-contract
requires_tool_preflight=1
prompt_evaluation_stage=contract-only
prompt_contract_status=contract_only
prompt_materialized=0
prompt_text_materialized=0
prompt_evaluation_authority=0
prompt_evaluated=0
prompt_receipt_required=1
refusal_policy_required=1
protective_safety_required=1
tool_preflight_required=1
runtime_profile_required=1
model_registry_review_required=1
operator_review_required=1
contract_promotion_allowed=0
sexual_content_generation=0
sexual_request_refusal=always
manipulation_resistance=required
tool_execution_authority=0
tool_execution_performed=0
model_runtime_invoked=0
inference_performed=0
source_mutation_authority=0
```

See NADIA_PROMPT_EVALUATION_CONTRACT_STAGE_8.md.

Stage-9: Local Model Registry Contract

Record local model-candidate metadata after prompt-evaluation contracts, protective-safety refusal behavior, runtime-profile metadata, and tool-denial behavior are present. Stage-9 can record candidate labels, runtime/profile linkage, provenance labels, license review labels, context budget, and quantization metadata, but it cannot select, install, load, inspect, benchmark, or run a model.

```
nadia_stage_9_local_model_registry_contract_present=1
model_registry_contract_command=scripts/nadia-local-model-registry-contract.sh
installed_model_registry_contract_command=latticra-nadia model-registry
requires_prompt_contract=1
requires_runtime_profile=1
local_model_registry_stage=contract-only
registry_contract_status=metadata_only
model_registry_authority=0
candidate_recorded=1
candidate_review_status=operator_review_required
candidate_usable_for_inference=0
candidate_selected_for_runtime=0
model_selection_authority=0
model_install_authority=0
model_download_authority=0
model_copy_authority=0
model_load_authority=0
model_weight_inspection_authority=0
registry_promotion_allowed=0
prompt_materialized=0
prompt_evaluation_authority=0
prompt_evaluated=0
model_runtime_invoked=0
inference_performed=0
model_weights_installed=0
model_weights_loaded=0
model_weights_downloaded=0
tool_execution_authority=0
source_mutation_authority=0
network_authority=0
sexual_content_generation=0
sexual_request_refusal=always
manipulation_resistance=required
```

See NADIA_LOCAL_MODEL_REGISTRY_CONTRACT_STAGE_9.md.

Stage-10: Inference Readiness Contract

Record inference-readiness metadata after local model-registry metadata, prompt-evaluation contracts, protective-safety refusal behavior, runtime-profile metadata, and tool-denial behavior are present. Stage-10 can verify prerequisite evidence and record a blocked readiness decision, but it cannot load model weights, invoke a runtime, generate tokens, materialize or evaluate prompts, or run inference.

```
nadia_stage_10_inference_readiness_contract_present=1
inference_readiness_contract_command=scripts/nadia-inference-readiness-contract.sh
installed_inference_readiness_contract_command=latticra-nadia inference-readiness
requires_model_registry_contract=1
inference_readiness_stage=contract-only
inference_readiness_contract_status=contract_only
inference_readiness_authority=0
inference_ready=0
readiness_decision=blocked_contract_only
readiness_evidence_present=1
requires_prompt_contract=1
requires_runtime_profile=1
requires_protective_safety_boundary=1
requires_tool_preflight=1
requires_operator_review=1
requires_future_runtime_invocation_contract=1
readiness_promotion_allowed=0
runtime_invocation_authority=0
token_generation_authority=0
model_session_authority=0
model_selection_authority=0
model_load_authority=0
prompt_materialized=0
prompt_evaluation_authority=0
prompt_evaluated=0
model_runtime_present=0
model_runtime_invoked=0
runtime_invoked=0
inference_authority=0

tool_execution_authority=0
source_mutation_authority=0
network_authority=0
sexual_content_generation=0
sexual_request_refusal=always
manipulation_resistance=required
```

See NADIA_INFERENCE_READINESS_CONTRACT_STAGE_10.md.

Stage-11: Runtime Invocation Contract

Record runtime-invocation metadata after inference-readiness metadata, local model-registry metadata, prompt-evaluation contracts, protective-safety refusal behavior, runtime-profile metadata, and tool-denial behavior are present. Stage-11 can verify prerequisite evidence and record a blocked invocation decision, but it cannot spawn a runtime process, execute a runtime binary, create a runtime session, load model weights, generate tokens, materialize or evaluate prompts, or run inference.

```
nadia_stage_11_runtime_invocation_contract_present=1
runtime_invocation_contract_command=scripts/nadia-runtime-invocation-contract.sh
installed_runtime_invocation_contract_command=latticra-nadia runtime-invocation
requires_inference_readiness_contract=1
runtime_invocation_stage=contract-only
runtime_invocation_contract_status=contract_only
runtime_invocation_authority=0
runtime_invocation_allowed=0
runtime_invoked=0
invocation_decision=blocked_contract_only
invocation_evidence_present=1
requires_model_registry_contract=1
requires_prompt_contract=1
requires_runtime_profile=1
```

```
requires_protective_safety_boundary=1
requires_tool_preflight=1
requires_operator_review=1
requires_future_model_load_contract=1
invocation_promotion_allowed=0
runtime_process_spawn_authority=0
runtime_binary_execution_authority=0
runtime_session_authority=0
model_session_authority=0
token_generation_authority=0
model_runtime_present=0
model_runtime_invoked=0

inference_performed=0
tool_execution_authority=0
source_mutation_authority=0
network_authority=0
sexual_content_generation=0
sexual_request_refusal=always
manipulation_resistance=required
```

See NADIA_RUNTIME_INVOCATION_CONTRACT_STAGE_11.md.

Stage-12: Model Load Contract

Record model-load metadata after runtime-invocation metadata, inference-readiness metadata, local model-registry metadata, prompt-evaluation contracts, protective-safety refusal behavior, runtime-profile metadata, and tool-denial behavior are present. Stage-12 can verify prerequisite evidence and record a blocked model-load decision, but it cannot open model files, map model weights, verify weights, load weights, attach weights to a runtime, generate tokens, materialize or evaluate prompts, or run inference.

```
nadia_stage_12_model_load_contract_present=1
model_load_contract_command=scripts/nadia-model-load-contract.sh
installed_model_load_contract_command=latticra-nadia model-load
requires_runtime_invocation_contract=1
model_load_stage=contract-only

source_mutation_authority=0
network_authority=0
sexual_content_generation=0
sexual_request_refusal=always
manipulation_resistance=required
```

See NADIA_MODEL_LOAD_CONTRACT_STAGE_12.md.

Stage-13: Prompt Receipt Contract

Record prompt-receipt metadata after model-load metadata, runtime-invocation metadata, inference-readiness metadata, local model-registry metadata, prompt-evaluation contracts, protective-safety refusal behavior, runtime-profile metadata, and tool-denial behavior are present. Stage-13 can verify prerequisite evidence and record a blocked prompt-receipt decision, but it cannot receive prompt text, read prompt sources, store prompt content, hash prompt content, classify prompt content, materialize prompts, evaluate prompts, generate tokens, or run inference.

```
nadia_stage_13_prompt_receipt_contract_present=1
prompt_receipt_contract_command=scripts/nadia-prompt-receipt-contract.sh
installed_prompt_receipt_contract_command=latticra-nadia prompt-receipt
requires_model_load_contract=1

```

```
network_authority=0
sexual_content_generation=0
sexual_request_refusal=always
manipulation_resistance=required
```

See NADIA_PROMPT_RECEIPT_CONTRACT_STAGE_13.md.

Stage-14: Prompt Materialization Contract

Record prompt-materialization metadata after prompt-receipt metadata, model-load metadata, runtime-invocation metadata, inference-readiness metadata, local model-registry metadata, prompt-evaluation contracts, protective-safety refusal behavior, runtime-profile metadata, and tool-denial behavior are present. Stage-14 can verify prerequisite evidence and record a blocked prompt-materialization decision, but it cannot allocate prompt buffers, materialize prompt text, tokenize prompts, evaluate prompts, generate tokens, or run inference.

```
nadia_stage_14_prompt_materialization_contract_present=1
prompt_materialization_contract_command=scripts/nadia-prompt-materialization-contract.sh
installed_prompt_materialization_contract_command=latticra-nadia prompt-materialization
requires_prompt_receipt_contract=1
prompt_materialization_stage=contract-only
prompt_materialization_contract_status=contract_only

sexual_content_generation=0
sexual_request_refusal=always
manipulation_resistance=required
```

See NADIA_PROMPT_MATERIALIZATION_CONTRACT_STAGE_14.md.

Stage-15: Awareness Dialogue Contract

Record awareness-dialogue metadata after prompt-materialization metadata, prompt-receipt metadata, model-load metadata, runtime-invocation metadata, inference-readiness metadata, local model-registry metadata, prompt-evaluation contracts, protective-safety refusal behavior, runtime-profile metadata, and tool-denial behavior are present. Stage-15 can define Nadia Initiative Q&A awareness scope and respectful dialogue requirements, but it cannot generate dialogue, evaluate prompts, generate tokens, run inference, or use the network.

```
nadia_stage_15_awareness_dialogue_contract_present=1
awareness_dialogue_contract_command=scripts/nadia-awareness-dialogue-contract.sh
installed_awareness_dialogue_contract_command=latticra-nadia awareness-dialogue

See NADIA_PROMPT_EVALUATION_HANDOFF_CONTRACT_STAGE_16.md.

Stage-17: Tokenization Boundary Contract

Record tokenization-boundary metadata after prompt-evaluation handoff metadata, awareness-dialogue metadata, prompt-materialization metadata, prompt-receipt metadata, model-load metadata, runtime-invocation metadata, inference-readiness metadata, local model-registry metadata, prompt-evaluation contracts, protective-safety refusal behavior, runtime-profile metadata, and tool-denial behavior are present. Stage-17 can verify prompt-evaluation handoff evidence and package a blocked tokenization boundary, but it cannot open tokenizer files, load vocabularies, tokenize prompts, evaluate prompts, generate dialogue, generate tokens, run inference, or use the network.

```
nadia_stage_17_tokenization_boundary_contract_present=1
tokenization_boundary_contract_command=scripts/nadia-tokenization-boundary-contract.sh
installed_tokenization_boundary_contract_command=latticra-nadia tokenization-boundary

See NADIA_TOKENIZATION_BOUNDARY_CONTRACT_STAGE_17.md.

Stage-18: Tokenizer Specification Contract

Record tokenizer-specification metadata after tokenization-boundary metadata, prompt-evaluation handoff metadata, awareness-dialogue metadata, prompt-materialization metadata, prompt-receipt metadata, model-load metadata, runtime-invocation metadata, inference-readiness metadata, local model-registry metadata, prompt-evaluation contracts, protective-safety refusal behavior, runtime-profile metadata, and tool-denial behavior are present. Stage-18 can define future tokenizer review requirements, but it cannot load tokenizer manifests, open tokenizer files, load vocabularies, tokenize prompts, evaluate prompts, generate dialogue, generate tokens, run inference, or use the network.

```
nadia_stage_18_tokenizer_specification_contract_present=1
tokenizer_specification_contract_command=scripts/nadia-tokenizer-specification-contract.sh
installed_tokenizer_specification_contract_command=latticra-nadia tokenizer-specification

qa_dialogue_generated=0
sexual_request_refusal=always
manipulation_resistance=required
```

See NADIA_PROMPT_TOKENIZATION_CONTRACT_STAGE_25.md.

Stage-26: Prompt Token Sequence Contract

Record prompt-token-sequence metadata after prompt-tokenization metadata, tokenizer-runtime-attachment metadata, tokenizer-artifact-binding metadata, tokenizer-artifact-verification metadata, tokenizer-artifact-measurement metadata, tokenizer-artifact-inventory metadata, tokenizer-manifest metadata, tokenizer-specification metadata, tokenization-boundary metadata, prompt-evaluation handoff metadata, awareness-dialogue metadata, prompt-materialization metadata, prompt-receipt metadata, model-load metadata, runtime-invocation metadata, inference-readiness metadata, local model-registry metadata, prompt-evaluation contracts, protective-safety refusal behavior, runtime-profile metadata, and tool-denial behavior are present. Stage-26 can define future context-window assembly review requirements, but it cannot read prompt text, create prompt tokens, record token IDs, record token order, record token offsets, create attention masks, create position IDs, assemble context windows, create prompt evaluation inputs, attach tokenizers to a runtime, create runtime sessions, evaluate prompts, generate dialogue, generate tokens, run inference, or use the network.

Stage-27 now consumes this prompt-token-sequence contract without granting prompt token ID recording, token order recording, token offset recording, attention mask creation, position ID creation, context-window assembly, prompt-evaluation-input creation, runtime invocation, prompt evaluation, dialogue generation, token generation, inference, or tool execution authority.

```
nadia_stage_26_prompt_token_sequence_contract_present=1

```

See NADIA_PROMPT_TOKEN_SEQUENCE_CONTRACT_STAGE_26.md.

Stage-27 preserves the Stage-26 proof that prompt-token-sequence recording, prompt token ID recording, token order recording, token offset recording, attention mask creation, position ID creation, context window assembly, prompt evaluation input creation, runtime invocation, prompt evaluation, dialogue generation, token generation, inference, tool execution, source mutation, and network authority remain denied.

Before Stage-28 starts, the context-window assembly contract must remain contract-only and keep context window assembly, prompt evaluation input creation, runtime invocation, prompt evaluation, dialogue generation, token generation, inference, and tool execution blocked.

Before Stage-41 starts, the context-window assembly contract must remain contract-only and keep context window assembly, prompt evaluation input creation, runtime handoff, runtime invocation, prompt evaluation, dialogue generation, token generation, inference, and tool execution blocked.

Before Stage-42 starts, the context-window assembly contract must remain contract-only and keep context window assembly, prompt evaluation input creation, runtime handoff, runtime invocation, prompt evaluation, dialogue generation, token generation, inference, and tool execution blocked.

Stage-27: Context Window Assembly Contract

Record context-window assembly metadata after prompt-token-sequence metadata, prompt-tokenization metadata, tokenizer-runtime-attachment metadata, tokenizer-artifact-binding metadata, tokenizer-artifact-verification metadata, tokenizer-artifact-measurement metadata, tokenizer-artifact-inventory metadata, tokenizer-manifest metadata, tokenizer-specification metadata, tokenization-boundary metadata, prompt-evaluation handoff metadata, awareness-dialogue metadata, prompt-materialization metadata, prompt-receipt metadata, model-load metadata, runtime-invocation metadata, inference-readiness metadata, local model-registry metadata, prompt-evaluation contracts, protective-safety refusal behavior, runtime-profile metadata, and tool-denial behavior are present. Stage-27 can define future prompt-evaluation-input review requirements, but it cannot read prompt text, assemble context windows, create prompt evaluation inputs, attach tokenizers to a runtime, create runtime sessions, evaluate prompts, generate dialogue, generate tokens, run inference, or use the network.

```

Non-Claims

The current Nadia foundation is not:

- a production AI assistant;
- an autonomous coding agent;
- a sexual assistant, roleplay surface, or adult-content generator;
- a model runtime;
- a model distribution channel;
- a training system;
- a network service;
- a sandbox;
- a security product;
- a replacement for Latticra Seal, Nucleus, or Runtime Boundary.

Promotion Gate

Before Stage-47 starts, Latticra should keep these guards passing:

```

Before prompt evaluation result release starts, a separate prompt evaluation result release contract must exist and name prompt-evaluation result disposition metadata, prompt-evaluation result review metadata, prompt-evaluation result metadata, invocation metadata, runtime handoff metadata, evaluation input metadata, context-window assembly denial fields, prompt-token-sequence denial fields, prompt-tokenization denial fields, tokenizer-runtime-attachment denial fields, tokenizer-artifact-binding denial fields, tokenizer-artifact-verification denial fields, tokenizer-artifact-measurement denial fields, tokenizer-artifact-inventory denial fields, tokenizer-manifest denial fields, tokenizer-file denial fields, prompt-materialization denial fields, refusal boundary inheritance, operator review gates, and non-claims.

Stage-33: Prompt Evaluation Result Disposition Contract

Record prompt-evaluation result disposition metadata after prompt-evaluation result review metadata, prompt-evaluation result metadata, prompt-evaluation invocation metadata, prompt-evaluation runtime handoff metadata, prompt-evaluation-input metadata, context-window assembly metadata, prompt-token-sequence metadata, prompt-tokenization metadata, tokenizer-runtime-attachment metadata, runtime-invocation metadata, model-load metadata, inference-readiness metadata, local model-registry metadata, awareness-dialogue metadata, protective-safety refusal behavior, runtime-profile metadata, and tool-denial behavior are present. Stage-33 can define future prompt-evaluation result release requirements, but it cannot create prompt-evaluation result disposition records, create release records, create prompt-evaluation result review records, read model output, record model output, record generated answer text, invoke a runtime, evaluate prompts, generate dialogue, generate tokens, run inference, use tools, mutate source, use the network, or provide sexual user functionality.

This stage produces only disposition-contract metadata. It does not decide a disposition, apply a disposition, create release records, read model output, record model output, generate dialogue, or make Nadia usable as a runtime assistant.

Stage-34: Prompt Evaluation Result Release Contract

Record prompt-evaluation result release metadata after prompt-evaluation result disposition metadata, prompt-evaluation result review metadata, prompt-evaluation result metadata, prompt-evaluation invocation metadata, prompt-evaluation runtime handoff metadata, prompt-evaluation-input metadata, context-window assembly metadata, prompt-token-sequence metadata, prompt-tokenization metadata, tokenizer-runtime-attachment metadata, runtime-invocation metadata, model-load metadata, inference-readiness metadata, local model-registry metadata, awareness-dialogue metadata, protective-safety refusal behavior, runtime-profile metadata, and tool-denial behavior are present. Stage-34 can define future prompt-evaluation result release receipt requirements, but it cannot create prompt-evaluation result release records, record release decisions, publish releases, package releases, create release receipts, apply dispositions, create prompt-evaluation result review records, read model output, record model output, record generated answer text, invoke a runtime, evaluate prompts, generate dialogue, generate tokens, run inference, use tools, mutate source, use the network, or provide sexual user functionality.

docs/NADIA_PRODUCTIVITY_LOOP_STAGE_5.md

Source title: Nadia Productivity Loop Stage-5

Lines: 106 | Words: 247 | SHA-256: a153b60dd4c44a09de6c248613d2daa412bed5dc80fd136d7e6baf85454a0e31

Nadia Productivity Loop Stage-5

Status: Stage-5 implementation contract Date: 2026-05-25 Scope: operator-reviewed local productivity ledger before training, inference, or tool authority.

Purpose

Stage-5 gives Nadia a local productivity ledger.

The ledger records operator-reviewed outcomes from Stage-4 mode-validation work. These records can later help retrieval ranking, plan-template selection, test recommendations, and project memory, but this stage does not train or distill a model.

Capability

Stage-5 adds:

```
nadia_stage_5_productivity_loop_present=1
nadia_productivity_ledger_generator_present=1
productivity_ledger_command=scripts/nadia-productivity-ledger.sh
installed_productivity_ledger_command=latticra-nadia productivity-ledger
requires_mode_validation=1
mode_validation_stage_required=4-systems-engineering-mode-validation
learning_scope=operator-reviewed-local-productivity
ledger_append_only=1
project_memory_scope=local-metadata-only
network_authority=0
model_runtime_invoked=0
inference_performed=0
prompt_evaluated=0
tool_execution_authority=0
source_mutation_authority=0
training_performed=0
distillation_performed=0
```

Stage-5 does not summarize with AI, call an inference runtime, evaluate a prompt, mutate source, execute tools, train, distill, or use the network.

Inputs

The productivity-ledger generator requires:

```
mode_validation=Stage-4 Nadia mode-validation report
outcome=operator-reviewed productivity outcome label
recommendation=operator-reviewed recommendation label
```

The default outcome is operator-reviewed-planning. The default recommendation is run-stage-guards.

Outputs

The productivity-ledger generator writes:

```
nadia-productivity-entry-&lt;timestamp&gt;.txt
latest-productivity-entry.txt
productivity-ledger-index.tsv
```

The entry records:

```
stage=5-productivity-ledger-loop
learning_scope=operator-reviewed-local-productivity
mode_validation_stage=4-systems-engineering-mode-validation
ledger_append_only=1
project_memory_scope=local-metadata-only
training_performed=0
distillation_performed=0
source_mutation_authority=0
```

Usage

With an explicit mode-validation report:

```
sh scripts/nadia-productivity-ledger.sh \
  --mode-validation /path/to/latest-mode-validation.txt \
```

```
    --outcome &quot;accepted planning surface&quot; \
    --recommendation &quot;run stage guards&quot; \
    --output &quot;$(mktemp -d &quot;${TMPDIR:-/tmp}/latticra-nadia-productivity.XXXXXX&quot;
  )&quot;
```

After a guarded local install with Nadia enabled:

```
latticra-nadia productivity-ledger
```

Non-Claims

Stage-5 Nadia is not an inference runtime, prompt evaluator, code generator, autonomous coding agent, source mutator, training system, distillation system, network retriever, security product, or production AI assistant.

Validation

```
sh scripts/test-nadia-productivity-loop-stage-5.sh
```

Expected result:

```
nadia_productivity_loop_stage_5: ok
```

docs/NADIA_PROMPT_EVALUATION_CONTRACT_STAGE_8.md

Source title: Nadia Prompt Evaluation Contract Stage-8

Lines: 118 | Words: 254 | SHA-256: 7b37c7d9c23c63f9a9a4ebc3045697cdb08c8af80fd70cde7790e3aeab64a197

Nadia Prompt Evaluation Contract Stage-8

Status: Stage-8 implementation contract Date: 2026-05-25 Scope: prompt-evaluation contract before prompt materialization, prompt evaluation, inference, or tool execution.

Purpose

Stage-8 gives Nadia a prompt-evaluation contract without evaluating prompts.

The contract consumes a Stage-7 guarded tool-authority preflight, verifies report-only tool posture and protective-safety restrictions, and records the receipt fields that would be required before any future prompt evaluation path can exist.

Capability

Stage-8 adds:

```
nadia_stage_8_prompt_evaluation_contract_present=1
nadia_prompt_evaluation_contract_generator_present=1
prompt_evaluation_contract_command=scripts/nadia-prompt-evaluation-contract.sh
installed_prompt_evaluation_contract_command=latticra-nadia prompt-contract
requires_tool_preflight=1
tool_preflight_stage_required=7-guarded-tool-authority-preflight
prompt_evaluation_stage=contract-only
prompt_contract_status=contract_only
prompt_materialized=0
prompt_text_materialized=0
prompt_evaluation_authority=0
prompt_evaluated=0
prompt_receipt_required=1
refusal_policy_required=1
protective_safety_required=1
tool_preflight_required=1
runtime_profile_required=1
model_registry_review_required=1
operator_review_required=1
contract_promotion_allowed=0
sexual_content_generation=0
sexual_request_refusal=always
manipulation_resistance=required
tool_execution_authority=0
tool_execution_performed=0
source_mutation_authority=0
model_runtime_invoked=0
```

```
inference_performed=0
network_authority=0
training_performed=0
distillation_performed=0
```

Stage-8 does not materialize prompts, evaluate prompts, call an inference runtime, execute tools, mutate source, train, distill, or use the network.

Inputs

The prompt-evaluation contract requires:

```
tool_preflight=Stage-7 Nadia guarded tool-authority preflight
request_class=operator request classification label
```

Sexualized request classifications fail closed.

Outputs

The contract writes:

```
nadia-prompt-contract-&lt;timestamp&gt;.txt
latest-prompt-contract.txt
```

The report records:

```
stage=8-prompt-evaluation-contract
prompt_evaluation_stage=contract-only
prompt_evaluation_authority=0
prompt_materialized=0
prompt_evaluated=0
model_runtime_invoked=0
inference_performed=0
tool_execution_authority=0
sexual_request_refusal=always
```

Usage

With an explicit tool preflight:

```
sh scripts/nadia-prompt-evaluation-contract.sh \
  --tool-preflight /path/to/latest-tool-preflight.txt \
  --request-class software-development \
  --output &quot;$(mktemp -d &quot;${TMPDIR:-/tmp}/latticra-nadia-prompt-contracts.XXXXXX&quot;
)&quot;
```

After a guarded local install with Nadia enabled:

```
latticra-nadia prompt-contract
```

Non-Claims

Stage-8 Nadia is not a prompt evaluator, inference runtime, tool executor, shell runner, network client, source mutator, credential reader, sexual assistant, roleplay surface, adult-content generator, training system, distillation system, security product, or production AI assistant.

Validation

```
sh scripts/test-nadia-prompt-evaluation-contract-stage-8.sh
```

Expected result:

```
nadia_prompt_evaluation_contract_stage_8: ok
```

docs/NADIA_PROMPT_EVALUATION_HANDOFF_CONTRACT_STAGE_16.md

Source title: Nadia Prompt Evaluation Handoff Contract Stage-16

Lines: 120 | Words: 310 | SHA-256: 515a2611c02a82c1b79095335affd0a5cc31c276b51eed08a717f0cc89b741f1

Nadia Prompt Evaluation Handoff Contract Stage-16

Status: Stage-16 implementation contract Date: 2026-05-25 Scope: prompt-evaluation handoff metadata before prompt tokenization, prompt evaluation, dialogue generation, token generation, inference, or tool execution.

Purpose

Stage-16 gives Nadia a prompt-evaluation handoff contract after the awareness-dialogue contract is present.

The contract consumes a Stage-15 awareness-dialogue contract, verifies inherited non-executing dialogue, prompt, runtime, model, tool, and protective-safety posture, and records that the next promotion point is a separate tokenization boundary contract. It does not evaluate prompts.

Capability

Stage-16 adds:

```
nadia_stage_16_prompt_evaluation_handoff_contract_present=1

answer_text_generated=0
```

Stage-16 does not generate dialogue, receive prompt text, read prompt sources, allocate prompt buffers, materialize prompt text, tokenize prompts, evaluate prompts, load model weights, invoke a runtime, generate tokens, run inference, execute tools, mutate source, train, distill, download, or use the network.

Inherited Awareness Boundary

The handoff contract preserves the Stage-15 Nadia Initiative awareness scope:

```
future_qa_dialogue_capability_planned=1
dialogue_scope=official-nadia-initiative-awareness-work
dialogue_format=question-and-answer
q_and_a_format_required=1
survivor_centered_dialogue_required=1
respectful_tone_required=1
plain_language_required=1
source_attribution_required=1
official_source_grounding_required=1
source_snapshot_policy=operator-reviewed-offline
live_web_lookup_authority=0
topic_yazidi_genocide_awareness=1
topic_conflict_related_sexual_violence_awareness_non_graphic=1
topic_womens_empowerment=1
```

Protective Boundary

```
sexual_user_request_authority=0
sexual_content_generation=0
sexualized_dialogue_generation=0
graphic_sexual_detail_allowed=0
erotic_content_allowed=0
roleplay_allowed=0
survivor_impersonation_allowed=0
victim_blaming_allowed=0
genocide_denial_allowed=0
hate_or_collective_blame_allowed=0
medical_advice_authority=0
legal_advice_authority=0
trauma_counseling_authority=0
crisis_intervention_authority=0
sexual_request_refusal=always
manipulation_resistance=required
```

Usage

With explicit evidence input:

```
sh scripts/nadia-prompt-evaluation-handoff-contract.sh \
  --awareness-dialogue /path/to/latest-awareness-dialogue-contract.txt \
  --request-class awareness-education \
  --output &quot;$(mktemp -d &quot;${TMPDIR:-/tmp}/latticra-nadia-prompt-evaluation-handoff.
XXXXXX&quot;)&quot;
```

After a guarded local install with Nadia enabled:

```
latticra-nadia prompt-evaluation-handoff
```

Non-Claims

Stage-16 Nadia is not yet a Q&A assistant, dialogue generator, prompt evaluator, tokenizer, model loader, inference runtime, runtime process launcher, token generator, model selector, tool executor, shell runner, network client, source mutator, training system, distillation system, security product, sexual assistant, roleplay surface, adult-content generator, legal adviser, medical adviser, trauma counselor, crisis intervention service, or production AI assistant.

Validation

```
sh scripts/test-nadia-prompt-evaluation-handoff-contract-stage-16.sh
```

Expected result:

```
nadia_prompt_evaluation_handoff_contract_stage_16: ok
```

docs/NADIA_PROMPT_EVALUATION_INPUT_CONTRACT_STAGE_28.md

Source title: Nadia Prompt Evaluation Input Contract Stage-28

Lines: 165 | Words: 557 | SHA-256: f632993f079f70f7ff5ea846d3d7dacdd82e657fb9442942f086a2d324e57bc6

Nadia Prompt Evaluation Input Contract Stage-28

Status: Stage-28 implementation contract

Scope: prompt-evaluation-input metadata before prompt evaluation input creation, runtime invocation, prompt evaluation, dialogue generation, token generation, inference, or tool execution.

Purpose

Stage-28 gives Nadia a prompt-evaluation-input contract after the context-window assembly contract is present.

The contract records how future reviewed prompt-evaluation input packaging must reference the Stage-27 context-window assembly contract, prompt-token-sequence boundary, prompt-tokenization boundary, tokenizer-runtime-attachment boundary, context-window policy, token-budget policy, truncation policy, ordering policy, attention-mask policy, position-ID policy, input-schema policy, safety-envelope policy, and runtime-denial policy. It preserves the absolute rule that Nadia cannot yet read prompt text, assemble context windows, create prompt evaluation inputs, invoke a runtime, evaluate prompts, generate dialogue, generate tokens, or run inference. The script only measures the Stage-27 contract report as evidence that the prerequisite metadata exists.

Contract Fields

Stage-28 adds:

```
nadia_stage_28_prompt_evaluation_input_contract_present=1
nadia_prompt_evaluation_input_contract_generator_present=1
prompt_evaluation_input_contract_command=scripts/nadia-prompt-evaluation-input-contract.sh
installed_prompt_evaluation_input_contract_command=latticra-nadia prompt-evaluation-input
prompt_evaluation_input_contract_status=contract_only
prompt_evaluation_input_stage=contract-only
prompt_evaluation_input_authority=0
prompt_evaluation_input_allowed=0
prompt_evaluation_input_created=0
prompt_evaluation_input_metadata_present=1
prompt_evaluation_input_family=operator-reviewed-prompt-evaluation-input
prompt_evaluation_input_format=contract-only-offline-evaluation-input
prompt_evaluation_input_decision=blocked_contract_only
prompt_evaluation_input_evidence_present=1
prompt_evaluation_input_source_policy=operator-reviewed-offline
prompt_evaluation_input_plan_recorded=1
prompt_evaluation_input_method_planned=offline-prompt-evaluation-input-policy-review
prompt_evaluation_input_result_recorded=0
prompt_evaluation_input_runtime_invoked=0
requires_context_window_assembly_contract=1
requires_prompt_token_sequence_contract=1
requires_prompt_tokenization_contract=1
requires_tokenizer_runtime_attachment_contract=1
requires_tokenizer_artifact_binding_contract=1
requires_tokenizer_artifact_verification_contract=1
requires_tokenizer_artifact_measurement_contract=1
requires_tokenizer_artifact_inventory_contract=1
requires_tokenizer_manifest_contract=1
requires_tokenizer_specification_contract=1
requires_tokenization_boundary_contract=1
requires_prompt_materialization_contract=1
requires_prompt_receipt_contract=1
requires_future_prompt_evaluation_runtime_handoff_contract=1
prompt_evaluation_input_promotion_allowed=0
```

Stage-28 does not generate dialogue, receive prompt text, read prompt sources, allocate prompt buffers, materialize prompt text, create prompt token buffers, create prompt tokens, count prompt tokens, record prompt token IDs, record prompt token order, record prompt token offsets, create attention masks, create position IDs, assemble context windows, serialize context windows, create prompt evaluation inputs, validate prompt evaluation inputs, serialize prompt evaluation inputs, write prompt evaluation inputs, open tokenizer manifests, read tokenizer manifests, parse tokenizer manifests, validate tokenizer manifests, load tokenizer manifests, resolve tokenizer artifact paths, scan artifact directories, stat tokenizer artifacts, open tokenizer artifacts, read tokenizer artifacts, hash tokenizer artifacts, bind tokenizer artifacts, attach tokenizers to a runtime, create runtime sessions, open tokenizer files, read tokenizer files, load tokenizer vocabularies, evaluate prompts, load model weights, invoke a runtime, generate tokens, run inference, execute tools, mutate source, train, distill, download, or use the network.

Input Requirements

The prompt-evaluation-input contract names future review requirements:

```
requires_context_window_assembly_reference=1
requires_context_window_policy_reference=1
requires_context_window_token_budget_policy=1
requires_context_window_truncation_policy=1
```

```
requires_context_window_ordering_policy=1

Source title: Nadia Prompt Evaluation Invocation Contract Stage-30

Lines: 166 | Words: 468 | SHA-256: fcb03493b72da7959a5ab060c156b563e93567a343aa31d89204597d0b9e1639

Nadia Prompt Evaluation Invocation Contract Stage-30

Status: Stage-30 implementation contract

Scope: prompt-evaluation invocation metadata before invocation request creation, runtime invocation, prompt evaluation, dialogue generation, token generation, inference, or tool execution.

Purpose

Stage-30 gives Nadia a prompt-evaluation invocation contract after the prompt-evaluation runtime handoff contract is present.

The contract records how future reviewed prompt-evaluation invocation packaging must reference the Stage-29 prompt-evaluation runtime handoff contract, Stage-28 prompt-evaluation-input contract, context-window assembly boundary, prompt-token-sequence boundary, prompt-tokenization boundary, tokenizer-runtime-attachment boundary, runtime-profile boundary, runtime-invocation contract, model-load contract, inference-readiness contract, model-registry contract, runtime-denial policy, token-generation denial policy, prompt-evaluation result policy, and survivor-centered safety policy. It preserves the absolute rule that Nadia cannot yet submit invocation requests, invoke a runtime, evaluate prompts, generate dialogue, generate tokens, or run inference. The script only measures the Stage-29 contract report as evidence that the prerequisite metadata exists.

Contract Fields

Stage-30 adds:

```
nadia_stage_30_prompt_evaluation_invocation_contract_present=1
nadia_prompt_evaluation_invocation_contract_generator_present=1
prompt_evaluation_invocation_contract_command=scripts/nadia-prompt-evaluation-invocation-contrac
t.sh
```

```
installed_prompt_evaluation_invocation_contract_command=latticra-nadia
prompt-evaluation-invocation
prompt_evaluation_invocation_contract_status=contract_only
prompt_evaluation_invocation_stage=contract-only
prompt_evaluation_invocation_authority=0
prompt_evaluation_invocation_allowed=0
prompt_evaluation_invocation_performed=0
prompt_evaluation_invocation_metadata_present=1
prompt_evaluation_invocation_family=operator-reviewed-prompt-evaluation-invocation
prompt_evaluation_invocation_format=contract-only-offline-evaluation-invocation
prompt_evaluation_invocation_decision=blocked_contract_only
prompt_evaluation_invocation_evidence_present=1
prompt_evaluation_invocation_source_policy=operator-reviewed-offline
prompt_evaluation_invocation_plan_recorded=1
prompt_evaluation_invocation_method_planned=offline-prompt-evaluation-invocation-policy-review
prompt_evaluation_invocation_result_recorded=0
prompt_evaluation_invocation_runtime_invoked=0
requires_prompt_evaluation_runtime_handoff_contract=1
requires_prompt_evaluation_input_contract=1

```

Installed command:

```
latticra-nadia prompt-evaluation-invocation
```

Non-Claims

Stage-30 Nadia is not yet a Q&A assistant, dialogue generator, prompt evaluator, prompt reader, prompt materializer, tokenizer, tokenizer loader, tokenizer registry, context-window assembler, prompt-evaluation-input creator, prompt-evaluation runtime handoff layer, prompt-evaluation invocation layer, prompt-evaluation result layer, model loader, inference runtime, runtime process launcher, token generator, model selector, tool executor, shell runner, network client, source mutator, training system, distillation system, security product, sexual assistant, roleplay surface, adult-content generator, legal adviser, medical adviser, trauma counselor, crisis intervention service, or production AI assistant.

Validation

Run:

```
sh scripts/test-nadia-prompt-evaluation-invocation-contract-stage-30.sh
```

Expected output:

```
nadia_prompt_evaluation_invocation_contract_stage_30: ok
```

docs/NADIA_PROMPT_EVALUATION_RESULT_CONTRACT_STAGE_31.md

Source title: Nadia Prompt Evaluation Result Contract Stage-31

Lines: 177 | Words: 469 | SHA-256: 234558cc99db4abf3aed6f0a2e07f4d08f6aba930b19ad7ec70192ab6fea6605

Nadia Prompt Evaluation Result Contract Stage-31

Status: Stage-31 implementation contract

Scope: prompt-evaluation result metadata before result recording, model-output recording, runtime invocation, prompt evaluation, dialogue generation, token generation, inference, or tool execution.

Purpose

Stage-31 gives Nadia a prompt-evaluation result contract after the prompt-evaluation invocation contract is present.

The contract records how future reviewed prompt-evaluation result handling must reference the Stage-30 prompt-evaluation invocation contract, Stage-29 prompt-evaluation runtime handoff contract, Stage-28 prompt-evaluation-input contract, context-window assembly boundary, prompt-token-sequence boundary, prompt-tokenization boundary, runtime-invocation contract, model-load contract, inference-readiness contract, model-registry contract, generated-text denial policy, runtime-denial policy, token-generation denial policy, and survivor-centered safety policy. It preserves the absolute rule that Nadia cannot yet record result content, record model output, record generated text, invoke a runtime, evaluate prompts, generate dialogue, generate tokens, or run inference.

Contract Fields

Stage-31 adds:

```
nadia_stage_31_prompt_evaluation_result_contract_present=1
nadia_prompt_evaluation_result_contract_generator_present=1
prompt_evaluation_result_contract_command=scripts/nadia-prompt-evaluation-result-contract.sh
installed_prompt_evaluation_result_contract_command=latticra-nadia prompt-evaluation-result
prompt_evaluation_result_contract_status=contract_only
prompt_evaluation_result_stage=contract-only
prompt_evaluation_result_authority=0
prompt_evaluation_result_allowed=0
prompt_evaluation_result_recorded=0
prompt_evaluation_result_created=0
prompt_evaluation_result_performed=0
prompt_evaluation_result_metadata_present=1
prompt_evaluation_result_family=operator-reviewed-prompt-evaluation-result
prompt_evaluation_result_format=contract-only-offline-evaluation-result
prompt_evaluation_result_decision=blocked_contract_only
prompt_evaluation_result_evidence_present=1

XXXXXX&quot;)&quot;
```

Installed command:

```
latticra-nadia prompt-evaluation-result
```

Non-Claims

Stage-31 Nadia is not yet a Q&A assistant, dialogue generator, prompt evaluator, prompt reader, prompt materializer, tokenizer, context-window assembler, prompt-evaluation-input creator, prompt-evaluation runtime handoff layer, prompt-evaluation invocation layer, prompt-evaluation result layer, prompt-evaluation result reviewer, model-output recorder, answer generator, model loader, inference runtime, runtime process launcher, token generator, model selector, tool executor, shell runner, network client, source mutator, training system, distillation system, security product, sexual assistant, roleplay surface, adult-content generator, legal adviser, medical adviser, trauma counselor, crisis intervention service, or production AI assistant.

Validation

Run:

```
sh scripts/test-nadia-prompt-evaluation-result-contract-stage-31.sh
```

Expected output:

```
nadia_prompt_evaluation_result_contract_stage_31: ok
```

docs/NADIA_PROMPT_EVALUATION_RESULT_DISPOSITION_CONTRACT_STAGE_33.md

Source title: Nadia Prompt Evaluation Result Disposition Contract Stage-33

Lines: 179 | Words: 524 | SHA-256: ed15fb514bee7dd03b365f09b54576d839a8a7a715f7b2d75d13edfee3284999

Nadia Prompt Evaluation Result Disposition Contract Stage-33

Status: Stage-33 implementation contract

Scope: prompt-evaluation result disposition metadata before disposition recording, release recording, result-review recording, result recording, model-output recording, runtime invocation, prompt evaluation, dialogue generation, token generation, inference, or tool execution.

Purpose

Stage-33 gives Nadia a prompt-evaluation result disposition contract after the prompt-evaluation result review contract is present.

The contract records how future release decisions must reference the Stage-32 prompt-evaluation result review contract, Stage-31 prompt-evaluation result contract, Stage-30 prompt-evaluation invocation contract, Stage-29 prompt-evaluation runtime handoff contract, Stage-28 prompt-evaluation-input contract, context-window assembly boundary, prompt-token-sequence boundary, prompt-tokenization boundary, runtime-invocation contract, model-load contract, inference-readiness contract, model-registry contract, generated-text denial policy, runtime-denial policy, token-generation denial policy, and survivor-centered safety policy. It preserves the absolute rule that Nadia cannot yet create disposition records, release records, review records, result records, read or record model output, record generated text, invoke a runtime, evaluate prompts, generate dialogue, generate tokens, or run inference.

Contract Fields

Stage-33 adds:

Source title: Nadia Prompt Evaluation Result Release Contract Stage-34

Lines: 192 | Words: 583 | SHA-256: a45e8d8e8587bec75f800919119aff7bca8d078fd1f366e8dabb89b980733605

Nadia Prompt Evaluation Result Release Contract Stage-34

Status: Stage-34 implementation contract

Scope: prompt-evaluation result release metadata before release recording, release decision recording, release publication, release packaging, release receipt creation, disposition recording, result-review recording, result recording, model-output recording, runtime invocation, prompt evaluation, dialogue generation, token generation, inference, or tool execution.

Purpose

Stage-34 gives Nadia a prompt-evaluation result release contract after the prompt-evaluation result disposition contract is present.

The contract records how a future release lane must reference the Stage-33 prompt-evaluation result disposition contract, Stage-32 prompt-evaluation result review contract, Stage-31 prompt-evaluation result contract, Stage-30 prompt-evaluation invocation contract, Stage-29 prompt-evaluation runtime handoff contract, Stage-28 prompt-evaluation-input contract, context-window assembly boundary, prompt-token-sequence boundary, prompt-tokenization boundary, runtime-invocation contract, model-load contract, inference-readiness contract, model-registry contract, generated-text denial policy, runtime-denial policy, token-generation denial policy, and survivor-centered safety policy. It preserves the absolute rule that Nadia cannot yet create release records, publish releases, package releases, create release receipts, apply dispositions, create review records, create result records, read or record model output, record generated text, invoke a runtime, evaluate prompts, generate dialogue, generate tokens, or run inference.

Contract Fields

Stage-34 adds:

```

Nadia Prompt Evaluation Result Release Receipt Review Contract Stage-36

Status: Stage-36 implementation contract

Scope: prompt-evaluation result release receipt review metadata before review recording, review decisions, review findings, receipt recording, receipt signing, receipt publication, release recording, model-output recording, runtime invocation, prompt evaluation, dialogue generation, token generation, inference, or tool execution.

Purpose

Stage-36 gives Nadia a prompt-evaluation result release receipt review contract after the prompt-evaluation result release receipt contract is present.

The contract records how a future receipt-review disposition lane must reference the Stage-35 prompt-evaluation result release receipt contract, Stage-34 prompt-evaluation result release contract, Stage-33 prompt-evaluation result disposition contract, Stage-32 prompt-evaluation result review contract, Stage-31 prompt-evaluation result contract, Stage-30 prompt-evaluation invocation contract, Stage-29 prompt-evaluation runtime handoff contract, Stage-28 prompt-evaluation-input contract, context-window assembly boundary, prompt-token-sequence boundary, prompt-tokenization boundary, runtime-invocation contract, model-load contract, inference-readiness contract, model-registry contract, generated-text denial policy, runtime-denial policy, token-generation denial policy, and survivor-centered safety policy. It preserves the absolute rule that Nadia cannot yet create review records, record review decisions, approve receipts, reject receipts, create release receipts, sign receipts, emit receipts, publish receipts, create release records, read or record model output, record generated text, invoke a runtime, evaluate prompts, generate dialogue, generate tokens, or run inference.

Contract Fields

Stage-36 adds:

  --prompt-evaluation-result-release-receipt reports/nadia/prompt-evaluation-result-release-rece
ipt/latest-prompt-evaluation-result-release-receipt-contract.txt \
  --output &quot;$(mktemp -d
&quot;${TMPDIR:-/tmp}/latticra-nadia-prompt-evaluation-result-release-receipt-review.
XXXXXX&quot;)&quot;
```

Installed command:

```
latticra-nadia prompt-evaluation-result-release-receipt-review
```

Non-Claims

Stage-36 Nadia is not yet a Q&A assistant, dialogue generator, prompt evaluator, prompt reader, prompt materializer, tokenizer, context-window assembler, prompt-evaluation-input creator, prompt-evaluation runtime handoff layer, prompt-evaluation invocation layer, prompt-evaluation result layer, prompt-evaluation result reviewer, prompt-evaluation result disposition recorder, prompt-evaluation result release recorder, prompt-evaluation result release publisher, prompt-evaluation result release packager, prompt-evaluation result release receipt creator, receipt signer, receipt publisher, release receipt reviewer, receipt review disposition layer, model-output reader, model-output recorder, answer generator, model loader, inference runtime, runtime process launcher, token generator, model selector, tool executor, shell runner, network client, source mutator, training system, distillation system, security product, sexual assistant, roleplay surface, adult-content generator, legal adviser, medical adviser, trauma counselor, crisis intervention service, or production AI assistant.

Validation

Run:

```
sh scripts/test-nadia-prompt-evaluation-result-release-receipt-review-contract-stage-36.sh
```

Expected output:

```
nadia_prompt_evaluation_result_release_receipt_review_contract_stage_36: ok
```

Source title: Nadia Prompt Evaluation Result Release Receipt Review Disposition Release Receipt Contract Stage-39

Lines: 179 | Words: 687 | SHA-256: d3b9f9a28db25c77c218ec7ba24b900129ff600cb8c7d37efd29ef0a155b9f7c

Nadia Prompt Evaluation Result Release Receipt Review Disposition Release Receipt Contract Stage-39

Status: Stage-39 implementation contract

Scope: prompt-evaluation result release receipt review disposition release receipt metadata before disposition-release-receipt recording, receipt emission, receipt signing, receipt publication, disposition-release recording, release decisions, release publication, release packaging, disposition recording, review recording, model-output recording, runtime invocation, prompt evaluation, dialogue generation, token generation, inference, or tool execution.

Purpose

Stage-39 gives Nadia a prompt-evaluation result release receipt review disposition release receipt contract after the prompt-evaluation result release receipt review disposition release contract is present.

The contract records how a future review-disposition-release receipt lane must reference the Stage-38 prompt-evaluation result release receipt review disposition release contract, Stage-37 prompt-evaluation result release receipt review disposition contract, Stage-36 prompt-evaluation result release receipt review contract, Stage-35 prompt-evaluation result release receipt contract, Stage-34 prompt-evaluation result release contract, Stage-33 prompt-evaluation result disposition contract, Stage-32 prompt-evaluation result review contract, Stage-31 prompt-evaluation result contract, Stage-30 prompt-evaluation invocation contract, Stage-29 prompt-evaluation runtime handoff contract, Stage-28 prompt-evaluation-input contract, context-window assembly boundary, prompt-token-sequence boundary, prompt-tokenization boundary, runtime-invocation contract, model-load contract, inference-readiness contract, model-registry contract, generated-text denial policy, runtime-denial policy, token-generation denial policy, and survivor-centered safety policy. It preserves the absolute rule that Nadia cannot yet create disposition-release-receipt records, emit receipts, sign receipts, publish receipts, package receipts, create disposition-release records, record release decisions, publish releases, package releases, create disposition records, record disposition decisions, create review records, read or record model output, record generated text, invoke a runtime, evaluate prompts, generate dialogue, generate tokens, or run inference.

Contract Fields

Stage-39 adds:

Source title: Nadia Prompt Evaluation Result Release Receipt Review Disposition Release Receipt Review Contract Stage-40

Lines: 99 | Words: 391 | SHA-256: 40b7cc6e57b59aa324f310932c4796512c1d321fdc58fe070fedf7e6f91155e7

Nadia Prompt Evaluation Result Release Receipt Review Disposition Release Receipt Review Contract Stage-40

Status: Stage-40 implementation contract

Scope: prompt-evaluation result release receipt review disposition release receipt review metadata before release-receipt-review records, review decisions, review findings, disposition records, receipt signing, receipt publication, model-output recording, runtime invocation, prompt evaluation, dialogue generation, token generation, inference, or tool execution.

Purpose

Stage-40 gives Nadia a prompt-evaluation result release receipt review disposition release receipt review contract after the Stage-39 prompt-evaluation result release receipt review disposition release receipt contract is present.

The contract records how a future review-disposition-release receipt review lane must reference the Stage-39 release receipt contract, Stage-38 release-disposition contract, Stage-37 review-disposition contract, Stage-36 receipt-review contract, Stage-35 release receipt contract, Stage-34 release contract, Stage-33 disposition contract, Stage-32 review contract, and Stage-31 result contract. It preserves the absolute rule that Nadia cannot yet review receipts, decide reviews, record review findings, create dispositions, sign receipts, publish receipts, read or record model output, invoke a runtime, evaluate prompts, generate dialogue, generate tokens, run inference, execute tools, mutate source, train, distill, download, or use the network.

Source title: Nadia Prompt Evaluation Result Release Receipt Review Disposition Release Receipt Review Disposition Release Contract Stage-42

Lines: 178 | Words: 689 | SHA-256: e71ae81cc24e932dd328ad89758c978484c0c8270e5072884e737d92c1eaf431

Nadia Prompt Evaluation Result Release Receipt Review Disposition Release Receipt Review Disposition Release Contract Stage-42

Status: Stage-42 implementation contract

Scope: prompt-evaluation result release receipt review disposition release receipt review disposition release metadata before disposition-release recording, release decisions, release publication, release packaging, release receipt creation, disposition recording, review recording, receipt recording, model-output recording, runtime invocation, prompt evaluation, dialogue generation, token generation, inference, or tool execution.

Purpose

Stage-42 gives Nadia a prompt-evaluation result release receipt review disposition release receipt review disposition release contract after the prompt-evaluation result release receipt review disposition release receipt review disposition contract is present.

The contract records how a future review-disposition-release receipt lane must reference the Stage-41 prompt-evaluation result release receipt review disposition release receipt review disposition contract, Stage-36 prompt-evaluation result release receipt review contract, Stage-35 prompt-evaluation result release receipt contract, Stage-34 prompt-evaluation result release contract, Stage-33 prompt-evaluation result disposition contract, Stage-32 prompt-evaluation result review contract, Stage-31 prompt-evaluation result contract, Stage-30 prompt-evaluation invocation contract, Stage-29 prompt-evaluation runtime handoff contract, Stage-28 prompt-evaluation-input contract, context-window assembly boundary, prompt-token-sequence boundary, prompt-tokenization boundary, runtime-invocation contract, model-load contract, inference-readiness contract, model-registry contract, generated-text denial policy, runtime-denial policy, token-generation denial policy, and survivor-centered safety policy. It preserves the absolute rule that Nadia cannot yet create disposition-release records, record release decisions, publish releases, package releases, create release receipts, create disposition records, record disposition decisions, create review records, sign receipts, read or record model output, record generated text, invoke a runtime, evaluate prompts, generate dialogue, generate tokens, or run inference.

Contract Fields

Source title: Nadia Prompt Evaluation Result Release Receipt Review Disposition Release Receipt Review Disposition Release Receipt Review Contract Stage-44

Lines: 99 | Words: 407 | SHA-256: 9326d02954a8bed5172c465641318367509eb46c6fe83b7c97245fe86b64e783

Nadia Prompt Evaluation Result Release Receipt Review Disposition Release Receipt Review Disposition Release Receipt Review Contract Stage-44

Status: Stage-44 implementation contract

Scope: prompt-evaluation result release receipt review disposition release receipt review disposition release receipt review metadata before release-receipt-review records, review decisions, review findings, disposition records, receipt signing, receipt publication, model-output recording, runtime invocation, prompt evaluation, dialogue generation, token generation, inference, or tool execution.

Purpose

Stage-44 gives Nadia a prompt-evaluation result release receipt review disposition release receipt review disposition release receipt review contract after the Stage-43 prompt-evaluation result release receipt review disposition release receipt review disposition release receipt contract is present.

The contract records how a future review-disposition-release receipt review lane must reference the Stage-43 release receipt contract, Stage-38 release-disposition contract, Stage-37 review-disposition contract, Stage-36 receipt-review contract, Stage-35 release receipt contract, Stage-34 release contract, Stage-33 disposition contract, Stage-32 review contract, and Stage-31 result contract. It preserves the absolute rule that Nadia cannot yet review receipts, decide reviews, record review findings, create dispositions, sign receipts, publish receipts, read or record model output, invoke a runtime, evaluate prompts, generate dialogue, generate tokens, run inference, execute tools, mutate source, train, distill, download, or use the network.

```

docs/NADIA_PROMPT_EVALUATION_RESULT_REVIEW_CONTRACT_STAGE_32.md

Source title: Nadia Prompt Evaluation Result Review Contract Stage-32

Lines: 181 | Words: 498 | SHA-256: 752752e70ff4841dd3171bcdbad7837d690be969c8e1fc882dc1fb4ae4fccabc

Nadia Prompt Evaluation Result Review Contract Stage-32

Status: Stage-32 implementation contract

Scope: prompt-evaluation result review metadata before review recording, result recording, model-output recording, runtime invocation, prompt evaluation, dialogue generation, token generation, inference, or tool execution.

Purpose

Stage-32 gives Nadia a prompt-evaluation result review contract after the prompt-evaluation result contract is present.

The contract records how future reviewed result disposition must reference the Stage-31 prompt-evaluation result contract, Stage-30 prompt-evaluation invocation contract, Stage-29 prompt-evaluation runtime handoff contract, Stage-28 prompt-evaluation-input contract, context-window assembly boundary, prompt-token-sequence boundary, prompt-tokenization boundary, runtime-invocation contract, model-load contract, inference-readiness contract, model-registry contract, generated-text denial policy, runtime-denial policy, token-generation denial policy, and survivor-centered safety policy. It preserves the absolute rule that Nadia cannot yet create review records, record result content, read or record model output, record generated text, invoke a runtime, evaluate prompts, generate dialogue, generate tokens, or run inference.

Contract Fields

Stage-32 adds:

```
nadia_stage_32_prompt_evaluation_result_review_contract_present=1

docs/NADIA_PROMPT_EVALUATION_RUNTIME_HANDOFF_CONTRACT_STAGE_29.md

Source title: Nadia Prompt Evaluation Runtime Handoff Contract Stage-29

Lines: 165 | Words: 457 | SHA-256: b3753b73b67c30b6821e3ae31c41146073f21fc823cd10abaf2e6ff1a944aafc

Nadia Prompt Evaluation Runtime Handoff Contract Stage-29

Status: Stage-29 implementation contract

Scope: prompt-evaluation runtime handoff metadata before runtime handoff, runtime invocation, prompt evaluation, dialogue generation, token generation, inference, or tool execution.

Purpose

Stage-29 gives Nadia a prompt-evaluation runtime handoff contract after the prompt-evaluation-input contract is present.

The contract records how future reviewed runtime handoff packaging must reference the Stage-28 prompt-evaluation-input contract, context-window assembly boundary, prompt-token-sequence boundary, prompt-tokenization boundary, tokenizer-runtime-attachment boundary, runtime-profile boundary, runtime-invocation contract, model-load contract, inference-readiness contract, model-registry contract, safety-envelope policy, runtime-denial policy, and prompt-evaluation invocation policy. It preserves the absolute rule that Nadia cannot yet create runtime handoff requests, invoke a runtime, evaluate prompts, generate dialogue, generate tokens, or run inference. The script only measures the Stage-28 contract report as evidence that the prerequisite metadata exists.

Contract Fields

Stage-29 adds:

```
nadia_stage_29_prompt_evaluation_runtime_handoff_contract_present=1
nadia_prompt_evaluation_runtime_handoff_contract_generator_present=1
prompt_evaluation_runtime_handoff_contract_command=scripts/nadia-prompt-evaluation-runtime-hando

Repository command:

```
sh scripts/nadia-prompt-evaluation-runtime-handoff-contract.sh \
  --prompt-evaluation-input
reports/nadia/prompt-evaluation-input/latest-prompt-evaluation-input-contract.txt \
  --output &quot;$(mktemp -d
&quot;${TMPDIR:-/tmp}/latticra-nadia-prompt-evaluation-runtime-handoff.XXXXXX&quot;)&quot;
```

Installed command:

```
latticra-nadia prompt-evaluation-runtime-handoff
```

Non-Claims

Stage-29 Nadia is not yet a Q&A assistant, dialogue generator, prompt evaluator, prompt reader, prompt materializer, tokenizer, tokenizer loader, tokenizer registry, context-window assembler, prompt-evaluation-input creator, prompt-evaluation runtime handoff layer, prompt-evaluation invocation layer, model loader, inference runtime, runtime process launcher, token generator, model selector, tool executor, shell runner, network client, source mutator, training system, distillation system, security product, sexual assistant, roleplay surface, adult-content generator, legal adviser, medical adviser, trauma counselor, crisis intervention service, or production AI assistant.

Validation

Run:

```
sh scripts/test-nadia-prompt-evaluation-runtime-handoff-contract-stage-29.sh
```

Expected output:

```
nadia_prompt_evaluation_runtime_handoff_contract_stage_29: ok
```

docs/NADIA_PROMPT_MATERIALIZATION_CONTRACT_STAGE_14.md

Source title: Nadia Prompt Materialization Contract Stage-14

Lines: 163 | Words: 355 | SHA-256: 2b890f793f39f8093236a53ad2d1af9ad9178dc69dc478dfc7a7e30bc68c9bef

Nadia Prompt Materialization Contract Stage-14

Status: Stage-14 implementation contract Date: 2026-05-25 Scope: prompt-materialization metadata before prompt buffer allocation, prompt text materialization, prompt tokenization, prompt evaluation, token generation, inference, or tool execution.

Purpose

Stage-14 gives Nadia a prompt-materialization contract without materializing prompt text.

The contract consumes a Stage-13 prompt-receipt contract, verifies inherited non-executing prompt, model-load, runtime, model, tool, and protective-safety posture, and records the review fields that would be required before any later prompt-evaluation handoff contract can exist.

Capability

Stage-14 adds:

```
nadia_stage_14_prompt_materialization_contract_present=1
nadia_prompt_materialization_contract_generator_present=1
prompt_materialization_contract_command=scripts/nadia-prompt-materialization-contract.sh

sexual_content_generation=0
sexual_request_refusal=always
manipulation_resistance=required
```

Stage-14 does not receive prompt text, read prompt sources, allocate a prompt buffer, materialize prompt text, tokenize prompts, store prompt content, hash prompt content, classify prompt content, evaluate prompts, load model weights, invoke a runtime, generate tokens, run inference, execute tools, mutate source, train, distill, download, or use the network.

Inputs

The prompt-materialization contract requires:

```
prompt_receipt=Stage-13 Nadia prompt-receipt contract
request_class=operator request classification label
```

Sexualized request classifications fail closed.

Outputs

The contract writes:

```
nadia-prompt-materialization-contract-&lt;timestamp&gt;.txt
latest-prompt-materialization-contract.txt
```

The report records:

```
stage=14-prompt-materialization-contract
prompt_materialization_contract_status=contract_only
prompt_materialization_authority=0
```

```
prompt_materialization_allowed=0
prompt_materialized=0

materialization_decision=blocked_contract_only
prompt_buffer_allocated=0
prompt_tokenized=0
prompt_evaluated=0
token_generation_performed=0
inference_performed=0
sexual_request_refusal=always
```

Usage

With explicit evidence input:

```
sh scripts/nadia-prompt-materialization-contract.sh \
  --prompt-receipt /path/to/latest-prompt-receipt-contract.txt \
  --request-class software-development \
  --output &quot;$(mktemp -d &quot;${TMPDIR:-/tmp}/latticra-nadia-prompt-materialization.
XXXXXX&quot;)&quot;
```

After a guarded local install with Nadia enabled:

```
latticra-nadia prompt-materialization
```

Non-Claims

Stage-14 Nadia is not a prompt materializer, prompt tokenizer, prompt receiver, prompt reader, prompt store, prompt evaluator, model loader, inference runtime, runtime process launcher, token generator, model selector, tool executor, shell runner, network client, source mutator, training system, distillation system, security product, sexual assistant, roleplay surface, adult-content generator, or production AI assistant.

Validation

```
sh scripts/test-nadia-prompt-materialization-contract-stage-14.sh
```

Expected result:

```
nadia_prompt_materialization_contract_stage_14: ok
```

nadia_prompt_receipt_contract_stage_13: ok
```

docs/NADIA_PROMPT_TOKEN_SEQUENCE_CONTRACT_STAGE_26.md

Source title: Nadia Prompt Token Sequence Contract Stage-26

Lines: 184 | Words: 584 | SHA-256: 3b226772c4e571e0dbcdd7fc83216397334452c5c5e6f9238f2dedfbaaf5570c

Nadia Prompt Token Sequence Contract Stage-26

Status: Stage-26 implementation contract

Scope: prompt-token-sequence metadata before prompt token ID recording, token order recording, token offset recording, attention mask creation, position ID creation, context window assembly, prompt evaluation input creation, runtime invocation, dialogue generation, token generation, inference, or tool execution.

Purpose

Stage-26 gives Nadia a prompt-token-sequence contract after the prompt-tokenization contract is present.

The contract records how future reviewed prompt token sequencing must reference the Stage-25 prompt-tokenization contract, tokenizer-runtime-attachment boundary, prompt-materialization boundary, prompt-receipt boundary, prompt token count policy, token order policy, token ID visibility policy, token offset policy, and context-window policy.

It preserves the absolute rule that Nadia cannot yet read prompt text, create prompt tokens, record prompt token IDs, record token order, record token offsets, assemble a context window, create prompt evaluation input, invoke a runtime, evaluate prompts, generate dialogue, generate tokens, or run inference. The script only measures the Stage-25 contract report as evidence that the prerequisite metadata exists.

Contract Fields

Stage-26 adds:

```
nadia_stage_26_prompt_token_sequence_contract_present=1
nadia_prompt_token_sequence_contract_generator_present=1
prompt_token_sequence_contract_command=scripts/nadia-prompt-token-sequence-contract.sh
installed_prompt_token_sequence_contract_command=latticra-nadia prompt-token-sequence
prompt_token_sequence_contract_status=contract_only
prompt_token_sequence_stage=contract-only
prompt_token_sequence_authority=0
prompt_token_sequence_allowed=0
prompt_token_sequence_recorded=0
prompt_token_sequence_metadata_present=1
prompt_token_sequence_family=operator-reviewed-prompt-token-sequence
prompt_token_sequence_format=contract-only-offline-sequence
prompt_token_sequence_decision=blocked_contract_only
prompt_token_sequence_evidence_present=1
prompt_token_sequence_source_policy=operator-reviewed-offline
prompt_token_sequence_plan_recorded=1
prompt_token_sequence_method_planned=offline-token-sequence-policy-review
prompt_token_sequence_result_recorded=0
prompt_token_sequence_count_recorded=0
prompt_token_sequence_order_recorded=0
prompt_token_sequence_runtime_invoked=0
requires_prompt_tokenization_contract=1
requires_tokenizer_runtime_attachment_contract=1
requires_tokenizer_artifact_binding_contract=1
requires_tokenizer_artifact_verification_contract=1
requires_tokenizer_artifact_measurement_contract=1
requires_tokenizer_artifact_inventory_contract=1
requires_tokenizer_manifest_contract=1
requires_tokenizer_specification_contract=1
requires_tokenization_boundary_contract=1
requires_prompt_materialization_contract=1
requires_prompt_receipt_contract=1
requires_future_context_window_assembly_contract=1
prompt_token_sequence_promotion_allowed=0
```

Stage-26 does not generate dialogue, receive prompt text, read prompt sources, allocate prompt buffers, materialize prompt text, create prompt token buffers, create prompt tokens, count prompt tokens, record prompt token IDs, record prompt token order, record prompt token offsets, create attention masks, create position IDs, assemble context windows, create prompt evaluation inputs, open tokenizer manifests, read tokenizer manifests, parse tokenizer manifests, validate tokenizer manifests, load tokenizer manifests, resolve tokenizer artifact paths, scan artifact directories, stat tokenizer artifacts, open tokenizer artifacts, read tokenizer artifacts, hash tokenizer artifacts, bind tokenizer artifacts, attach tokenizers to a runtime, create runtime sessions, open tokenizer files, read tokenizer files, load tokenizer vocabularies, evaluate prompts, load model weights, invoke a runtime, generate tokens, run inference, execute tools, mutate source, train, distill, download, or use the network.

Sequence Requirements

The prompt-token-sequence contract names future review requirements:

```
requires_prompt_tokenization_reference=1
requires_prompt_tokenization_contract_reference=1
requires_tokenizer_runtime_attachment_reference=1
requires_prompt_materialization_reference=1
requires_prompt_receipt_reference=1
requires_prompt_token_count_policy=1
requires_prompt_token_order_policy=1
requires_prompt_token_id_visibility_policy=1
requires_prompt_token_offset_policy=1
requires_context_window_policy=1
```

```
requires_operator_approval_record=1
requires_official_source_snapshot=1
requires_no_prompt_token_ids_recorded=1
requires_no_prompt_token_order_recording=1
requires_no_prompt_token_offset_recording=1
requires_no_attention_mask_creation=1
requires_no_position_id_creation=1
requires_no_context_window_assembly=1
requires_no_runtime_invocation=1
requires_no_prompt_evaluation=1
requires_no_dialogue_generation=1
requires_no_inference=1
requires_refusal_policy_link=1
requires_survivor_centered_language_review=1
```

Denial Boundary

Stage-26 preserves explicit prompt token sequence denial fields:

```
prompt_token_sequence_authority=0
prompt_token_sequence_allowed=0
prompt_token_sequence_open_authority=0
prompt_token_sequence_read_authority=0
prompt_token_sequence_write_authority=0

prompt_token_sequence_count_recorded=0
prompt_token_sequence_order_recorded=0
prompt_token_sequence_runtime_invoked=0
prompt_token_sequence_file_written=0
prompt_token_ids_recorded=0
prompt_token_order_recorded=0
prompt_token_offsets_recorded=0
prompt_token_byte_offsets_recorded=0
prompt_attention_mask_created=0
prompt_position_ids_created=0
context_window_assembled=0
prompt_evaluation_input_created=0
prompt_text_read=0
prompt_text_received=0
prompt_text_materialized=0
prompt_buffer_allocated=0
prompt_buffer_written=0
prompt_tokens_created=0
prompt_token_count_recorded=0
prompt_token_sequence_recorded=0
prompt_token_buffer_created=0
prompt_token_buffer_written=0
prompt_tokenized=0
tokenizer_runtime_attachment_performed=0
tokenizer_attached_to_runtime=0
runtime_session_created=0
runtime_invoked=0
tokenizer_artifact_binding_performed=0
tokenizer_artifact_file_opened=0
tokenizer_artifact_file_read=0
tokenizer_artifact_hash_computed=0
tokenizer_manifest_loaded=0
tokenizer_manifest_parsed=0
tokenizer_file_opened=0
tokenizer_vocab_loaded=0
prompt_evaluated=0
qa_dialogue_generated=0
```

Commands

Repository command:

```
sh scripts/nadia-prompt-token-sequence-contract.sh \
  --prompt-tokenization
reports/nadia/prompt-tokenization/latest-prompt-tokenization-contract.txt \
  --output &quot;$(mktemp -d &quot;${TMPDIR:-/tmp}/latticra-nadia-prompt-token-sequence.
XXXXXX&quot;)&quot;
```

Installed command:

```
latticra-nadia prompt-token-sequence
```

Non-Claims

Stage-26 Nadia is not yet a Q&A assistant, dialogue generator, prompt evaluator, prompt reader, prompt materializer, tokenizer, tokenizer loader, tokenizer registry, tokenizer manifest loader, tokenizer manifest parser, tokenizer artifact scanner, tokenizer artifact inventory reader, tokenizer artifact hasher, tokenizer artifact measurer, tokenizer artifact verifier, tokenizer artifact binder, tokenizer runtime attachment layer, prompt tokenizer, token counter, token sequence recorder, token ID recorder, token offset recorder, context-window assembler, model loader, inference runtime, runtime process launcher, token generator, model selector, tool executor, shell runner, network client, source mutator, training system, distillation system, security product, sexual assistant, roleplay surface, adult-content generator, legal adviser, medical adviser, trauma counselor, crisis intervention service, or production AI assistant.

Validation

Run:

```
sh scripts/test-nadia-prompt-token-sequence-contract-stage-26.sh
```

Expected output:

```
nadia_prompt_token_sequence_contract_stage_26: ok
```

docs/NADIA_PROMPT_TOKENIZATION_CONTRACT_STAGE_25.md

Source title: Nadia Prompt Tokenization Contract Stage-25

Lines: 167 | Words: 512 | SHA-256: 85e7bed2035bf22cf970b7724faeacc66155999ece952214c98f29bff0f79631

Nadia Prompt Tokenization Contract Stage-25

Status: Stage-25 implementation contract

Scope: prompt-tokenization metadata before prompt text reading, prompt text materialization, prompt buffer allocation, prompt token creation, prompt token sequence recording, tokenizer runtime attachment, tokenizer manifest loading, tokenizer file access, tokenizer vocabulary loading, prompt evaluation, dialogue generation, token generation, inference, or tool execution.

Purpose

Stage-25 gives Nadia a prompt-tokenization contract after the tokenizer-runtime-attachment contract is present.

The contract records how future reviewed prompt tokenization must reference the Stage-24 tokenizer-runtime-attachment contract, prompt-materialization boundary, prompt-receipt boundary, bound tokenizer artifact, and tokenization policy, while preserving the absolute rule that Nadia cannot yet read prompt text, create prompt tokens, record token sequences, invoke a runtime, evaluate prompts, generate dialogue, generate tokens, or run inference. The script only measures the Stage-24 contract report as evidence that the prerequisite metadata exists.

Contract Fields

Stage-25 adds:

```
nadia_stage_25_prompt_tokenization_contract_present=1
nadia_prompt_tokenization_contract_generator_present=1
prompt_tokenization_contract_command=scripts/nadia-prompt-tokenization-contract.sh
installed_prompt_tokenization_contract_command=latticra-nadia prompt-tokenization
prompt_tokenization_contract_status=contract_only
prompt_tokenization_stage=contract-only
prompt_tokenization_authority=0
prompt_tokenization_allowed=0
prompt_tokenization_performed=0
prompt_tokenization_metadata_present=1
prompt_tokenization_family=operator-reviewed-prompt-tokenization
prompt_tokenization_format=contract-only-offline-tokenization
prompt_tokenization_decision=blocked_contract_only
prompt_tokenization_evidence_present=1
prompt_tokenization_source_policy=operator-reviewed-offline
prompt_tokenization_plan_recorded=1
prompt_tokenization_method_planned=offline-tokenization-policy-review
prompt_tokenization_result_recorded=0
prompt_tokenization_token_count_recorded=0
prompt_tokenization_token_sequence_recorded=0
prompt_tokenization_runtime_invoked=0
requires_tokenizer_runtime_attachment_contract=1
requires_tokenizer_artifact_binding_contract=1
requires_tokenizer_artifact_verification_contract=1
requires_tokenizer_artifact_measurement_contract=1
requires_tokenizer_artifact_inventory_contract=1
requires_tokenizer_manifest_contract=1
requires_tokenizer_specification_contract=1
requires_tokenization_boundary_contract=1
requires_prompt_materialization_contract=1
requires_prompt_receipt_contract=1
requires_future_prompt_token_sequence_contract=1
prompt_tokenization_promotion_allowed=0
```

Stage-25 does not generate dialogue, receive prompt text, read prompt sources, allocate prompt buffers, materialize prompt text, create prompt token buffers, create prompt tokens, count prompt tokens, record prompt token sequences, open tokenizer manifests, read tokenizer manifests, parse tokenizer manifests, validate tokenizer manifests, load tokenizer manifests, resolve tokenizer artifact paths, scan artifact directories, stat tokenizer artifacts, open tokenizer artifacts, read tokenizer artifacts, hash tokenizer artifacts, bind tokenizer artifacts, attach tokenizers to a runtime, create runtime sessions, open tokenizer files, read tokenizer files, load tokenizer vocabularies, evaluate prompts, load model weights, invoke a runtime, generate tokens, run inference, execute tools, mutate source, train, distill, download, or use the network.

Tokenization Requirements

The prompt-tokenization contract names future review requirements:

```
requires_tokenizer_runtime_attachment_reference=1
requires_prompt_materialization_reference=1
requires_prompt_receipt_reference=1
requires_bound_tokenizer_artifact_reference=1
requires_tokenizer_specification_reference=1
requires_tokenization_policy=1
requires_token_count_policy=1
requires_token_sequence_policy=1
requires_operator_approval_record=1
requires_official_source_snapshot=1
requires_no_prompt_text_read=1
requires_no_prompt_token_creation=1
requires_no_prompt_token_sequence_recording=1
requires_no_runtime_invocation=1
requires_no_prompt_evaluation=1
requires_no_dialogue_generation=1
requires_no_inference=1
requires_refusal_policy_link=1
requires_survivor_centered_language_review=1
```

Denial Boundary

Stage-25 preserves explicit prompt tokenization denial fields:

```
prompt_tokenization_authority=0
prompt_tokenization_allowed=0
prompt_tokenization_open_authority=0
prompt_tokenization_read_authority=0
prompt_tokenization_write_authority=0
prompt_tokenization_execute_authority=0
prompt_tokenization_runtime_authority=0
prompt_tokenization_token_create_authority=0
prompt_tokenization_sequence_record_authority=0
prompt_tokenization_opened=0
prompt_tokenization_read=0
prompt_tokenization_validated=0
prompt_tokenization_loaded=0
prompt_tokenization_bytes_read=0
prompt_tokenization_hash_computed=0
prompt_tokenization_entries_loaded=0
prompt_tokenization_performed=0
prompt_tokenization_result_recorded=0
prompt_tokenization_token_count_recorded=0
prompt_tokenization_token_sequence_recorded=0
prompt_tokenization_runtime_invoked=0
prompt_tokenization_file_written=0
prompt_text_read=0
prompt_text_received=0
prompt_text_materialized=0
prompt_buffer_allocated=0
prompt_buffer_written=0
prompt_tokens_created=0
prompt_token_count_recorded=0
prompt_token_sequence_recorded=0
prompt_token_buffer_created=0
prompt_token_buffer_written=0
prompt_tokenized=0
tokenizer_runtime_attachment_performed=0
tokenizer_attached_to_runtime=0
runtime_session_created=0
runtime_invoked=0
tokenizer_artifact_binding_performed=0
tokenizer_artifact_file_opened=0
tokenizer_artifact_file_read=0
tokenizer_artifact_hash_computed=0
tokenizer_manifest_loaded=0
tokenizer_manifest_parsed=0
tokenizer_file_opened=0
tokenizer_vocab_loaded=0
prompt_evaluated=0
qa_dialogue_generated=0
```

Commands

Repository command:

```
sh scripts/nadia-prompt-tokenization-contract.sh \
  --tokenizer-runtime-attachment
reports/nadia/tokenizer-runtime-attachment/latest-tokenizer-runtime-attachment-contract.txt \
  --output &quot;$(mktemp -d &quot;${TMPDIR:-/tmp}/latticra-nadia-prompt-tokenization.
XXXXXX&quot;)&quot;
```

Installed command:

```
latticra-nadia prompt-tokenization
```

Non-Claims

Stage-25 Nadia is not yet a Q&A assistant, dialogue generator, prompt evaluator, prompt reader, prompt materializer, tokenizer, tokenizer loader, tokenizer registry, tokenizer manifest loader, tokenizer manifest parser, tokenizer artifact scanner, tokenizer artifact inventory reader, tokenizer artifact hasher, tokenizer artifact measurer, tokenizer artifact verifier, tokenizer artifact binder, tokenizer runtime attachment layer, prompt tokenizer, token counter, token sequence recorder, model loader, inference runtime, runtime process launcher, token generator, model selector, tool executor, shell runner, network client, source mutator, training system, distillation system, security product, sexual assistant, roleplay surface, adult-content generator, legal adviser, medical adviser, trauma counselor, crisis intervention service, or production AI assistant.

Validation

Run:

```
sh scripts/test-nadia-prompt-tokenization-contract-stage-25.sh
```

Expected output:

```
nadia_prompt_tokenization_contract_stage_25: ok
```

Nadia Protective Safety Boundary Stage-6

Status: Stage-6 implementation contract Date: 2026-05-25 Scope: non-sexual-use, anti-manipulation, and namesake-cause awareness boundary before prompt evaluation, model runtime, or tool authority.

Purpose

Stage-6 makes Nadia's protective boundary explicit and testable.

Nadia is not a sexualized assistant, companion, roleplay surface, or adult-content generator. She exists for Latticra software development, systems engineering, AI development, and dignified awareness of Nadia Murad's cause. This boundary is absolute and must remain upstream of any future runtime, prompt evaluation, retrieval, or tool authority.

Capability

Stage-6 adds:

```
nadia_stage_6_protective_safety_boundary_present=1
nadia_protective_safety_generator_present=1
protective_safety_command=scripts/nadia-protective-safety-boundary.sh
installed_protective_safety_command=latticra-nadia protective-safety
requires_productivity_entry=1
productivity_entry_stage_required=5-productivity-ledger-loop
absolute_protective_boundary=1
sexual_user_request_authority=0
sexual_content_generation=0
sexual_roleplay_authority=0
sexualized_namesake_or_survivor_content=0
sexual_request_refusal=always
user_override_authority=0
prompt_injection_override_authority=0
manipulation_resistance=required
policy_bypass_authority=0
namesake_cause_awareness=1
awareness_context=non_sensational_human_rights
network_authority=0
```

```
model_runtime_invoked=0
inference_performed=0
prompt_evaluated=0
tool_execution_authority=0
source_mutation_authority=0
training_performed=0
distillation_performed=0
```

Sexualized request classes fail closed. Stage-6 does not summarize with AI, call an inference runtime, evaluate a prompt, mutate source, execute tools, train, distill, or use the network.

Inputs

The protective-safety boundary requires:

```
productivity_entry=Stage-5 Nadia productivity-ledger entry
request_class=operator request classification label
```

The default request class is software-development.

Outputs

The protective-safety boundary writes:

```
nadia-protective-safety-&lt;timestamp&gt;.txt
latest-protective-safety.txt
```

The report records:

```
stage=6-protective-safety-boundary
absolute_protective_boundary=1
sexual_content_generation=0
sexual_request_refusal=always
manipulation_resistance=required
namesake_cause_awareness=1
source_mutation_authority=0
```

Usage

With an explicit productivity-ledger entry:

```
sh scripts/nadia-protective-safety-boundary.sh \
  --productivity-entry /path/to/latest-productivity-entry.txt \
  --request-class software-development \
  --output &quot;$(mktemp -d &quot;${TMPDIR:-/tmp}/latticra-nadia-safety.XXXXXX&quot;)&quot;
```

After a guarded local install with Nadia enabled:

```
latticra-nadia protective-safety
```

Non-Claims

Stage-6 Nadia is not an inference runtime, prompt evaluator, sexual assistant, roleplay surface, adult-content generator, code generator, autonomous coding agent, source mutator, training system, distillation system, network retriever, security product, or production AI assistant.

Validation

```
sh scripts/test-nadia-protective-safety-boundary-stage-6.sh
```

Expected result:

```
nadia_protective_safety_boundary_stage_6: ok
```

docs/NADIA_RUNTIME_INVOCATION_CONTRACT_STAGE_11.md

Source title: Nadia Runtime Invocation Contract Stage-11

Lines: 144 | Words: 314 | SHA-256: 6108b4635c6107ba96efbd42205d19ebf38443b882975578388b1008e05ed93d

Nadia Runtime Invocation Contract Stage-11

Status: Stage-11 implementation contract Date: 2026-05-25 Scope: runtime-invocation metadata before runtime process spawning, model session creation, model loading, token generation, inference, prompt evaluation, or tool execution.

Purpose

Stage-11 gives Nadia a runtime-invocation contract without invoking a runtime.

The contract consumes a Stage-10 inference-readiness contract, verifies inherited non-executing readiness, model, prompt, runtime, tool, and protective-safety posture, and records the review fields that would be required before any later model-load contract can exist.

Capability

Stage-11 adds:

```
nadia_stage_11_runtime_invocation_contract_present=1
nadia_runtime_invocation_contract_generator_present=1
runtime_invocation_contract_command=scripts/nadia-runtime-invocation-contract.sh
installed_runtime_invocation_contract_command=latticra-nadia runtime-invocation
requires_inference_readiness_contract=1
inference_readiness_stage_required=10-inference-readiness-contract
runtime_invocation_contract_status=contract_only
runtime_invocation_stage=contract-only
runtime_invocation_authority=0
runtime_invocation_allowed=0
runtime_invoked=0
invocation_decision=blocked_contract_only
invocation_evidence_present=1
requires_model_registry_contract=1
requires_prompt_contract=1
requires_runtime_profile=1
requires_protective_safety_boundary=1
requires_tool_preflight=1
requires_operator_review=1
requires_model_provenance_review=1
requires_model_license_review=1
requires_model_safety_review=1
requires_refusal_policy_review=1
requires_runtime_boundary_gate=1
requires_nucleus_gate=1
requires_seal_receipt=1
requires_future_model_load_contract=1
invocation_promotion_allowed=0
runtime_process_spawn_authority=0
runtime_binary_execution_authority=0
runtime_session_authority=0
model_session_authority=0
token_generation_authority=0
model_runtime_present=0
model_runtime_invoked=0
runtime_process_spawned=0
runtime_binary_executed=0
runtime_session_created=0
model_weights_loaded=0
prompt_materialized=0
prompt_evaluation_authority=0
prompt_evaluated=0
token_generation_performed=0
inference_authority=0
inference_performed=0
tool_execution_authority=0
source_mutation_authority=0
network_authority=0
training_performed=0
distillation_performed=0
sexual_content_generation=0
sexual_request_refusal=always
manipulation_resistance=required
```

Stage-11 does not materialize prompts, evaluate prompts, load model weights, spawn a runtime process, execute a runtime binary, create a runtime session, generate tokens, run inference, execute tools, mutate source, train, distill, download, or use the network.

Inputs

The runtime-invocation contract requires:

```
inference_readiness=Stage-10 Nadia inference-readiness contract
request_class=operator request classification label
```

Sexualized request classifications fail closed.

Outputs

The contract writes:

```
nadia-runtime-invocation-contract-&lt;timestamp&gt;.txt
latest-runtime-invocation-contract.txt
```

The report records:

```
stage=11-runtime-invocation-contract
runtime_invocation_contract_status=contract_only
runtime_invocation_authority=0
runtime_invocation_allowed=0
runtime_invoked=0
invocation_decision=blocked_contract_only
model_runtime_invoked=0
runtime_process_spawned=0
runtime_session_created=0
model_weights_loaded=0
token_generation_performed=0
inference_performed=0
sexual_request_refusal=always
```

Usage

With explicit evidence input:

```
sh scripts/nadia-runtime-invocation-contract.sh \
  --inference-readiness /path/to/latest-inference-readiness-contract.txt \
  --request-class software-development \
  --output &quot;$(mktemp -d &quot;${TMPDIR:-/tmp}/latticra-nadia-runtime-invocation.
XXXXXX&quot;)&quot;
```

After a guarded local install with Nadia enabled:

```
latticra-nadia runtime-invocation
```

Non-Claims

Stage-11 Nadia is not an inference runtime, runtime process launcher, model loader, prompt evaluator, prompt materializer, token generator, model selector, tool executor, shell runner, network client, source mutator, training system, distillation system, security product, sexual assistant, roleplay surface, adult-content generator, or production AI assistant.

Validation

```
sh scripts/test-nadia-runtime-invocation-contract-stage-11.sh
```

Expected result:

```
nadia_runtime_invocation_contract_stage_11: ok
```

docs/NADIA_RUNTIME_PROFILE_STAGE_2.md

Source title: Nadia Runtime Profile Stage-2

Lines: 95 | Words: 251 | SHA-256: 08cb69afdd80ff4f03a9525c72c78e8cc5da525f7be40a8b673cb5ac74f840d1

Nadia Runtime Profile Stage-2

Status: Stage-2 implementation contract Date: 2026-05-25 Scope: offline runtime and model-profile metadata before inference.

Purpose

Stage-2 gives Nadia a local runtime-profile boundary before any model is run.

The runtime-profile boundary records operator-selected runtime settings and optional operator-provided model-file measurements. It creates evidence that a future inference run can inspect before prompt evaluation, while keeping execution denied.

Capability

Stage-2 adds:

```
nadia_stage_2_runtime_profile_present=1
nadia_runtime_profile_generator_present=1
runtime_profile_command=scripts/nadia-runtime-profile.sh
installed_runtime_profile_command=latticra-nadia runtime-profile
model_file_measurement=operator_provided_optional
runtime_family=llama.cpp-compatible
model_format=gguf
network_authority=0
model_runtime_invoked=0
inference_performed=0
prompt_evaluated=0
model_weights_installed=0
tool_execution_authority=0
source_mutation_authority=0
training_performed=0
```

This stage can measure a local model file when the operator provides a path. It does not download, install, copy, load, mmap, execute, or evaluate model weights.

Profile Fields

The runtime-profile generator records:

```
runtime_family
runtime_binary
model_format
model_file
model_file_present
model_file_bytes
model_file_measurement
context_window_tokens
memory_budget_mib
thread_policy
gpu_policy
```

The default runtime family is llama.cpp-compatible because GGUF-oriented local runtimes are a practical first target for offline development, but Stage-2 does not vendor or execute llama.cpp.

Usage

Without a model file:

```
sh scripts/nadia-runtime-profile.sh --output &quot;$(mktemp -d
&quot;${TMPDIR:-/tmp}/latticra-nadia-runtime.XXXXXX&quot;)&quot;
```

With an operator-provided local model file:

```
sh scripts/nadia-runtime-profile.sh \
  --model /path/to/model.gguf \
  --context-tokens 8192 \
  --memory-mib 16384 \
  --output &quot;$(mktemp -d &quot;${TMPDIR:-/tmp}/latticra-nadia-runtime.XXXXXX&quot;)&quot;
```

After a guarded local install with Nadia enabled:

```
latticra-nadia runtime-profile
```

Non-Claims

Stage-2 Nadia is not an inference runtime, model installer, model distributor, prompt evaluator, autonomous coding agent, embedding service, training system, source mutator, network retriever, security product, or production AI assistant.

Validation

```
sh scripts/test-nadia-runtime-profile-stage-2.sh
```

Expected result:

```
nadia_runtime_profile_stage_2: ok
```

docs/NADIA_SYSTEMS_ENGINEERING_MODE_STAGE_4.md

Source title: Nadia Systems Engineering Mode Stage-4

Lines: 120 | Words: 255 | SHA-256: d037adcd73cc8f05ec5f86be26e1063852029a65bc24a89cfcfc709d3421bb3c

Nadia Systems Engineering Mode Stage-4

Status: Stage-4 implementation contract Date: 2026-05-25 Scope: systems-engineering mode taxonomy and prompt-plan validation before prompt evaluation.

Purpose

Stage-4 gives Nadia a mode taxonomy for software-development work before any prompt evaluation exists.

The mode validator reads a Stage-3 prompt plan, checks that it is still a planning artifact, and records which systems-engineering mode and validator set should govern the future prompt surface.

Capability

Stage-4 adds:

```
nadia_stage_4_systems_engineering_mode_present=1
nadia_mode_validation_generator_present=1
mode_validation_command=scripts/nadia-mode-validate.sh
installed_mode_validation_command=latticra-nadia mode-validate
requires_prompt_plan=1
prompt_plan_stage_required=3-developer-workbench-planning
mode_taxonomy_present=1
mode_allowed=1
network_authority=0
model_runtime_invoked=0
inference_performed=0
prompt_evaluated=0
tool_execution_authority=0
source_mutation_authority=0
training_performed=0
```

Stage-4 does not summarize with AI, call an inference runtime, evaluate a prompt, mutate source, execute tools, or use the network.

Modes

The initial mode taxonomy is:

```
systems-engineering
ai-development
c-substrate
cpp-authority
rust-panel
lat-lir-l-ui
seal-boundary
runtime-boundary
fedora-validation
awareness-safety
```

Unknown modes fail closed.

Inputs

The validator requires:

```
prompt_plan=Stage-3 Nadia prompt plan
mode=operator-selected systems-engineering mode label
```

The default mode is systems-engineering.

Outputs

The mode validator writes:

```
nadia-mode-validation-&lt;timestamp&gt;.txt
latest-mode-validation.txt
```

The validation report records:

```
stage=4-systems-engineering-mode-validation
mode=&lt;operator mode&gt;
prompt_plan_stage=3-developer-workbench-planning
mode_allowed=1
validator_set=&lt;mode validator set&gt;
prompt_evaluated=0
inference_performed=0
source_mutation_authority=0
```

Usage

With an explicit prompt plan:

```
sh scripts/nadia-mode-validate.sh \
  --prompt-plan /path/to/latest-prompt-plan.txt \
  --mode runtime-boundary \
  --output &quot;$(mktemp -d &quot;${TMPDIR:-/tmp}/latticra-nadia-mode.XXXXXX&quot;)&quot;
```

After a guarded local install with Nadia enabled:

```
latticra-nadia mode-validate
```

Non-Claims

Stage-4 Nadia is not an inference runtime, prompt evaluator, code generator, autonomous coding agent, source mutator, training system, network retriever, security product, or production AI assistant.

Validation

```
sh scripts/test-nadia-systems-engineering-mode-stage-4.sh
```

Expected result:

```
nadia_systems_engineering_mode_stage_4: ok
```

docs/NADIA_TOKENIZATION_BOUNDARY_CONTRACT_STAGE_17.md

Source title: Nadia Tokenization Boundary Contract Stage-17

Lines: 144 | Words: 359 | SHA-256: bf1f61a7d96c98ab0b6109656252eb3e05339cb957078ac36695097ae6beb3b7

Nadia Tokenization Boundary Contract Stage-17

Status: Stage-17 implementation contract Date: 2026-05-25 Scope: tokenization-boundary metadata before tokenizer file access, tokenizer vocabulary loading, prompt tokenization, prompt evaluation, dialogue generation, token generation, inference, or tool execution.

Purpose

Stage-17 gives Nadia a tokenization-boundary contract after the prompt-evaluation handoff contract is present.

The contract consumes a Stage-16 prompt-evaluation handoff contract, verifies inherited non-executing dialogue, prompt, runtime, model, tool, and protective-safety posture, and records that the next promotion point is a separate tokenizer specification contract. It does not tokenize prompts.

Capability

Stage-17 adds:

```
nadia_stage_17_tokenization_boundary_contract_present=1
nadia_tokenization_boundary_contract_generator_present=1
tokenization_boundary_contract_command=scripts/nadia-tokenization-boundary-contract.sh
installed_tokenization_boundary_contract_command=latticra-nadia tokenization-boundary
tokenization_boundary_contract_status=contract_only
tokenization_boundary_stage=contract-only
tokenization_boundary_authority=0
tokenization_boundary_allowed=0
tokenization_boundary_performed=0
prompt_tokenization_authority=0
prompt_tokenization_allowed=0
prompt_tokenized=0
prompt_tokens_created=0
tokenizer_file_opened=0
tokenizer_vocab_loaded=0
prompt_evaluation_authority=0
prompt_evaluated=0
tokenization_decision=blocked_contract_only
tokenization_evidence_present=1
requires_prompt_evaluation_handoff_contract=1
requires_awareness_dialogue_contract=1
requires_prompt_materialization_contract=1
requires_prompt_receipt_contract=1
requires_prompt_buffer_boundary=1
requires_protective_safety_boundary=1
requires_operator_review=1
requires_official_source_snapshot=1
requires_future_tokenizer_specification_contract=1
tokenization_boundary_promotion_allowed=0
qa_dialogue_generated=0
question_generated=0
answer_generated=0
answer_text_generated=0
```

Stage-17 does not generate dialogue, receive prompt text, read prompt sources, allocate prompt buffers, materialize prompt text, open tokenizer files, read tokenizer files, load tokenizer vocabularies, tokenize prompts, evaluate prompts, load model weights, invoke a runtime, generate tokens, run inference, execute tools, mutate source, train, distill, download, or use the network.

Tokenizer Denial Boundary

```
tokenizer_file_open_authority=0
tokenizer_file_read_authority=0
tokenizer_vocab_load_authority=0
tokenizer_vocab_mapping_authority=0
tokenizer_runtime_attach_authority=0
tokenizer_file_opened=0
tokenizer_file_read=0
tokenizer_vocab_loaded=0
tokenizer_vocab_mapped=0
tokenizer_attached_to_runtime=0
tokenizer_bytes_read=0
tokenizer_hash_computed=0
```

Inherited Awareness Boundary

The tokenization boundary preserves the Stage-15 Nadia Initiative awareness scope and the Stage-16 prompt-evaluation handoff denial:

```
future_qa_dialogue_capability_planned=1
dialogue_scope=official-nadia-initiative-awareness-work
dialogue_format=question-and-answer
q_and_a_format_required=1
survivor_centered_dialogue_required=1
respectful_tone_required=1
```

```
plain_language_required=1
source_attribution_required=1
official_source_grounding_required=1
source_snapshot_policy=operator-reviewed-offline
live_web_lookup_authority=0
prompt_evaluation_handoff_authority=0
prompt_evaluation_handoff_performed=0
```

Protective Boundary

```
sexual_user_request_authority=0
sexual_content_generation=0
sexualized_dialogue_generation=0
graphic_sexual_detail_allowed=0
erotic_content_allowed=0
roleplay_allowed=0
survivor_impersonation_allowed=0
victim_blaming_allowed=0
genocide_denial_allowed=0
hate_or_collective_blame_allowed=0
medical_advice_authority=0
legal_advice_authority=0
trauma_counseling_authority=0
crisis_intervention_authority=0
sexual_request_refusal=always
manipulation_resistance=required
```

Usage

With explicit evidence input:

```
sh scripts/nadia-tokenization-boundary-contract.sh \
  --prompt-evaluation-handoff /path/to/latest-prompt-evaluation-handoff-contract.txt \
  --request-class awareness-education \
  --output &quot;$(mktemp -d &quot;${TMPDIR:-/tmp}/latticra-nadia-tokenization-boundary.
XXXXXX&quot;)&quot;
```

After a guarded local install with Nadia enabled:

```
latticra-nadia tokenization-boundary
```

Non-Claims

Stage-17 Nadia is not yet a Q&A assistant, dialogue generator, prompt evaluator, tokenizer, tokenizer loader, tokenizer registry, model loader, inference runtime, runtime process launcher, token generator, model selector, tool executor, shell runner, network client, source mutator, training system, distillation system, security product, sexual assistant, roleplay surface, adult-content generator, legal adviser, medical adviser, trauma counselor, crisis intervention service, or production AI assistant.

Validation

```
sh scripts/test-nadia-tokenization-boundary-contract-stage-17.sh
```

Expected result:

```
nadia_tokenization_boundary_contract_stage_17: ok
```

docs/NADIA_TOKENIZER_ARTIFACT_BINDING_CONTRACT_STAGE_23.md

Source title: Nadia Tokenizer Artifact Binding Contract Stage-23

Lines: 159 | Words: 481 | SHA-256: f026b108093123919b9e1497f3b5fa5e49c85a1c06fe7d8cfc6ea03e6b78fe14

Nadia Tokenizer Artifact Binding Contract Stage-23

Status: Stage-23 implementation contract

Scope: tokenizer-artifact-binding metadata before tokenizer artifact opening, artifact reading, artifact hashing, artifact verification, artifact binding, tokenizer runtime attachment, tokenizer manifest loading, tokenizer file access, tokenizer vocabulary loading, prompt tokenization, prompt evaluation, dialogue generation, token generation, inference, or tool execution.

Purpose

Stage-23 gives Nadia a tokenizer-artifact-binding contract after the tokenizer-artifact-verification contract is present.

The contract records how future verified tokenizer artifacts must be associated with manifest entries, tokenizer specification requirements, and operator review records, while preserving the absolute rule that Nadia cannot yet open, read, hash, verify, bind, validate, load, or attach tokenizer artifacts. The script only measures the Stage-22 contract report as evidence that the prerequisite metadata exists.

Contract Fields

Stage-23 adds:

```
nadia_stage_23_tokenizer_artifact_binding_contract_present=1
nadia_tokenizer_artifact_binding_contract_generator_present=1
tokenizer_artifact_binding_contract_command=scripts/nadia-tokenizer-artifact-binding-contract.sh
installed_tokenizer_artifact_binding_contract_command=latticra-nadia tokenizer-artifact-binding
tokenizer_artifact_binding_contract_status=contract_only
tokenizer_artifact_binding_stage=contract-only
tokenizer_artifact_binding_authority=0
tokenizer_artifact_binding_allowed=0
tokenizer_artifact_binding_performed=0
tokenizer_artifact_binding_metadata_present=1
tokenizer_artifact_binding_family=operator-reviewed-tokenizer-artifact-binding
tokenizer_artifact_binding_format=contract-only-offline-binding
tokenizer_artifact_binding_decision=blocked_contract_only
tokenizer_artifact_binding_evidence_present=1
tokenizer_artifact_binding_source_policy=operator-reviewed-offline
tokenizer_artifact_binding_plan_recorded=1
tokenizer_artifact_binding_method_planned=offline-manifest-artifact-role-binding-review
tokenizer_artifact_binding_result_recorded=0
tokenizer_artifact_binding_record_created=0
tokenizer_artifact_binding_manifest_reference_recorded=0
tokenizer_artifact_binding_artifact_reference_recorded=0
tokenizer_artifact_binding_runtime_attach_recorded=0
requires_tokenizer_artifact_verification_contract=1
requires_tokenizer_artifact_measurement_contract=1
requires_tokenizer_artifact_inventory_contract=1
requires_tokenizer_manifest_contract=1
requires_tokenizer_specification_contract=1
requires_tokenization_boundary_contract=1
requires_future_tokenizer_runtime_attachment_contract=1
tokenizer_artifact_binding_promotion_allowed=0
```

Stage-23 does not generate dialogue, receive prompt text, read prompt sources, allocate prompt buffers, materialize prompt text, open tokenizer manifests, read tokenizer manifests, parse tokenizer manifests, validate tokenizer manifests, load tokenizer manifests, resolve tokenizer artifact paths, scan artifact directories, stat tokenizer artifacts, open tokenizer artifacts, read tokenizer artifacts, hash tokenizer artifacts, record tokenizer artifact digests, record tokenizer artifact sizes, compare tokenizer artifact digests, compare tokenizer artifact sizes, verify tokenizer artifacts, bind tokenizer artifacts, attach tokenizers to a runtime, open tokenizer files, read tokenizer files, load tokenizer vocabularies, tokenize prompts, evaluate prompts, load model weights, invoke a runtime, generate tokens, run inference, execute tools, mutate source, train, distill, download, or use the network.

Binding Requirements

The tokenizer-artifact-binding contract names future review requirements:

```
requires_verified_artifact_reference=1
requires_artifact_identity=1
requires_artifact_role_classification=1
requires_verification_contract_reference=1
requires_measurement_contract_reference=1
requires_inventory_entry_reference=1
requires_manifest_entry_reference=1
```

```
requires_tokenizer_specification_reference=1
requires_expected_digest_policy=1
requires_observed_digest_policy=1
requires_digest_comparison_policy=1
requires_size_comparison_policy=1
requires_digest_match_record=1
requires_size_match_record=1
requires_source_snapshot_reference=1
requires_license_and_source_review=1
requires_operator_approval_record=1
requires_official_source_snapshot=1
requires_no_runtime_attachment=1
requires_refusal_policy_link=1
requires_survivor_centered_language_review=1
```

Denial Boundary

Stage-23 preserves explicit binding denial fields:

```
tokenizer_artifact_binding_authority=0
tokenizer_artifact_binding_allowed=0
tokenizer_artifact_binding_open_authority=0
tokenizer_artifact_binding_read_authority=0
tokenizer_artifact_binding_write_authority=0
tokenizer_artifact_binding_hash_authority=0
tokenizer_artifact_binding_validation_authority=0
tokenizer_artifact_binding_load_authority=0
tokenizer_artifact_binding_attach_authority=0
tokenizer_artifact_binding_runtime_attach_authority=0
tokenizer_artifact_binding_manifest_bind_authority=0
tokenizer_artifact_binding_tokenizer_bind_authority=0
tokenizer_artifact_binding_opened=0
tokenizer_artifact_binding_read=0
tokenizer_artifact_binding_validated=0
tokenizer_artifact_binding_loaded=0
tokenizer_artifact_binding_bytes_read=0
tokenizer_artifact_binding_hash_computed=0
tokenizer_artifact_binding_entries_loaded=0
tokenizer_artifact_binding_performed=0
tokenizer_artifact_binding_bound=0
tokenizer_artifact_binding_record_created=0
tokenizer_artifact_binding_manifest_reference_loaded=0
tokenizer_artifact_binding_artifact_reference_loaded=0
tokenizer_artifact_binding_manifest_reference_recorded=0
tokenizer_artifact_binding_artifact_reference_recorded=0
tokenizer_artifact_binding_runtime_attach_recorded=0
tokenizer_artifact_binding_runtime_attachment_performed=0
tokenizer_artifact_binding_result_recorded=0
tokenizer_artifact_binding_file_written=0
tokenizer_artifact_bound_to_manifest=0
tokenizer_artifact_bound_to_tokenizer=0
tokenizer_attached_to_runtime=0
tokenizer_runtime_attachment_performed=0
tokenizer_artifact_verification_performed=0
tokenizer_artifact_file_opened=0
tokenizer_artifact_file_read=0
tokenizer_artifact_hash_computed=0
prompt_tokenized=0
prompt_evaluated=0
```

Commands

Repository command:

```
sh scripts/nadia-tokenizer-artifact-binding-contract.sh \
  --tokenizer-artifact-verification reports/nadia/tokenizer-artifact-verification/latest-tokeniz
er-artifact-verification-contract.txt \
  --output &quot;$(mktemp -d &quot;${TMPDIR:-/tmp}/latticra-nadia-tokenizer-artifact-binding.
XXXXXX&quot;)&quot;
```

Installed command:

```
latticra-nadia tokenizer-artifact-binding
```

Non-Claims

Stage-23 Nadia is not yet a Q&A assistant, dialogue generator, prompt evaluator, tokenizer, tokenizer loader, tokenizer registry, tokenizer manifest loader, tokenizer manifest parser, tokenizer artifact scanner, tokenizer artifact inventory reader, tokenizer artifact hasher, tokenizer artifact measurer, tokenizer artifact verifier, tokenizer artifact binder, tokenizer runtime attachment layer, model loader, inference runtime, runtime process launcher, token generator, model selector, tool executor, shell runner, network client, source mutator, training system, distillation system, security product, sexual assistant, roleplay surface, adult-content generator, legal adviser, medical adviser, trauma counselor, crisis intervention service, or production AI assistant.

Validation

Run:

```
sh scripts/test-nadia-tokenizer-artifact-binding-contract-stage-23.sh
```

Expected output:

```
nadia_tokenizer_artifact_binding_contract_stage_23: ok
```

docs/NADIA_TOKENIZER_ARTIFACT_INVENTORY_CONTRACT_STAGE_20.md

Source title: Nadia Tokenizer Artifact Inventory Contract Stage-20

Lines: 156 | Words: 454 | SHA-256: 9de93caefa3c9289bf418e5ad6ec5fd7596f462923f9f969ad6975c951e5737a

Nadia Tokenizer Artifact Inventory Contract Stage-20

Status: Stage-20 implementation contract

Scope: tokenizer-artifact-inventory metadata before tokenizer artifact path resolution, artifact scanning, artifact stat calls, artifact hashing, tokenizer manifest loading, tokenizer file access, tokenizer vocabulary loading, prompt tokenization, prompt evaluation, dialogue generation, token generation, inference, or tool execution.

Purpose

Stage-20 gives Nadia a tokenizer-artifact-inventory contract after the tokenizer-manifest contract is present.

The contract consumes a Stage-19 tokenizer-manifest contract, verifies inherited non-executing tokenizer, manifest, prompt, dialogue, runtime, model, tool, and protective-safety posture, and records the requirements a future tokenizer artifact measurement contract must satisfy. It does not resolve artifact paths, scan directories, stat files, open tokenizer artifacts, read tokenizer artifacts, or hash tokenizer artifacts.

Contract Fields

Stage-20 adds:

```
nadia_stage_20_tokenizer_artifact_inventory_contract_present=1
nadia_tokenizer_artifact_inventory_contract_generator_present=1
tokenizer_artifact_inventory_contract_command=scripts/nadia-tokenizer-artifact-inventory-contrac
t.sh
installed_tokenizer_artifact_inventory_contract_command=latticra-nadia
tokenizer-artifact-inventory
tokenizer_artifact_inventory_contract_status=contract_only
tokenizer_artifact_inventory_stage=contract-only
tokenizer_artifact_inventory_authority=0
tokenizer_artifact_inventory_allowed=0
tokenizer_artifact_inventory_performed=0
tokenizer_artifact_inventory_metadata_present=1
tokenizer_artifact_inventory_family=operator-reviewed-tokenizer-artifact-inventory
```

```
tokenizer_artifact_inventory_format=contract-only-offline-inventory
tokenizer_artifact_inventory_decision=blocked_contract_only
tokenizer_artifact_inventory_evidence_present=1
tokenizer_artifact_inventory_source_policy=operator-reviewed-offline
tokenizer_artifact_inventory_path_recorded=0
tokenizer_artifact_inventory_schema_planned=1
tokenizer_artifact_inventory_entry_count=0
tokenizer_artifact_inventory_file_count=0
requires_tokenizer_manifest_contract=1
requires_tokenizer_specification_contract=1
requires_tokenization_boundary_contract=1
requires_future_tokenizer_artifact_measurement_contract=1
tokenizer_artifact_inventory_promotion_allowed=0
tokenizer_artifact_path_resolved=0
tokenizer_artifact_file_opened=0
tokenizer_artifact_file_read=0
tokenizer_artifact_hash_computed=0
tokenizer_artifact_measurement_performed=0
tokenizer_manifest_loaded=0
tokenizer_manifest_parsed=0
tokenizer_file_opened=0
tokenizer_file_read=0
tokenizer_vocab_loaded=0
prompt_tokenized=0
prompt_evaluated=0
qa_dialogue_generated=0
sexual_request_refusal=always
manipulation_resistance=required
```

Stage-20 does not generate dialogue, receive prompt text, read prompt sources, allocate prompt buffers, materialize prompt text, open tokenizer manifests, read tokenizer manifests, parse tokenizer manifests, validate tokenizer manifests, load tokenizer manifests, resolve tokenizer artifact paths, scan artifact directories, stat tokenizer artifacts, open tokenizer artifacts, read tokenizer artifacts, hash tokenizer artifacts, open tokenizer files, read tokenizer files, load tokenizer vocabularies, tokenize prompts, evaluate prompts, load model weights, invoke a runtime, generate tokens, run inference, execute tools, mutate source, train, distill, download, or use the network.

Inventory Requirements

The tokenizer-artifact-inventory contract names future inventory review requirements:

```
requires_artifact_identity=1
requires_artifact_role_classification=1
requires_manifest_entry_reference=1
requires_vocab_artifact_entry=1
requires_merges_artifact_entry_review=1
requires_tokenizer_model_artifact_entry=1
requires_special_tokens_artifact_entry=1
requires_chat_template_artifact_entry=1
requires_normalization_policy_artifact_entry=1
requires_unicode_policy_artifact_entry=1
requires_license_artifact_entry=1
requires_source_snapshot_reference=1
requires_relative_path_policy_review=1
requires_no_absolute_host_path_claim=1
requires_no_runtime_binding=1
requires_operator_approval_record=1
requires_refusal_policy_link=1
requires_survivor_centered_language_review=1
```

These are requirements for later review only. They do not authorize artifact discovery, artifact reading, tokenizer loading, prompt tokenization, or inference.

Denial Boundary

Stage-20 preserves explicit artifact denial fields:

```
tokenizer_artifact_inventory_open_authority=0
tokenizer_artifact_inventory_read_authority=0
tokenizer_artifact_inventory_parse_authority=0
tokenizer_artifact_inventory_validation_authority=0
tokenizer_artifact_inventory_load_authority=0
tokenizer_artifact_path_resolution_authority=0
tokenizer_artifact_scan_authority=0
```

```
tokenizer_artifact_stat_authority=0
tokenizer_artifact_hash_authority=0
tokenizer_artifact_measurement_authority=0
tokenizer_artifact_copy_authority=0
tokenizer_artifact_load_authority=0
tokenizer_artifact_inventory_opened=0
tokenizer_artifact_inventory_read=0
tokenizer_artifact_inventory_parsed=0
tokenizer_artifact_inventory_loaded=0
tokenizer_artifact_inventory_entries_loaded=0
tokenizer_artifact_path_resolved=0
tokenizer_artifact_scan_performed=0
tokenizer_artifact_stat_performed=0
tokenizer_artifact_file_opened=0
tokenizer_artifact_file_read=0
tokenizer_artifact_bytes_read=0
tokenizer_artifact_hash_computed=0
tokenizer_artifact_measurement_performed=0
tokenizer_vocab_artifact_loaded=0
tokenizer_merges_artifact_loaded=0
tokenizer_model_artifact_loaded=0
tokenizer_special_tokens_artifact_loaded=0
prompt_tokenization_authority=0
prompt_tokenized=0
```

Command

From the repository:

```
sh scripts/nadia-tokenizer-artifact-inventory-contract.sh \
  --tokenizer-manifest reports/nadia/tokenizer-manifest/latest-tokenizer-manifest-contract.txt \
  --output &quot;$(mktemp -d &quot;${TMPDIR:-/tmp}/latticra-nadia-tokenizer-artifact-inventory.
XXXXXX&quot;)&quot;
```

After guarded local install:

```
latticra-nadia tokenizer-artifact-inventory
```

Non-Claims

Stage-20 Nadia is not yet a Q&A assistant, dialogue generator, prompt evaluator, tokenizer, tokenizer loader, tokenizer registry, tokenizer manifest loader, tokenizer manifest parser, tokenizer artifact scanner, tokenizer artifact inventory reader, tokenizer artifact hasher, model loader, inference runtime, runtime process launcher, token generator, model selector, tool executor, shell runner, network client, source mutator, training system, distillation system, security product, sexual assistant, roleplay surface, adult-content generator, legal adviser, medical adviser, trauma counselor, crisis intervention service, or production AI assistant.

Validation

```
sh scripts/test-nadia-tokenizer-artifact-inventory-contract-stage-20.sh
```

Expected:

```
nadia_tokenizer_artifact_inventory_contract_stage_20: ok
```

docs/NADIA_TOKENIZER_ARTIFACT_MEASUREMENT_CONTRACT_STAGE_21.md

Source title: Nadia Tokenizer Artifact Measurement Contract Stage-21

Nadia Tokenizer Artifact Measurement Contract Stage-21

Status: Stage-21 implementation contract

Scope: tokenizer-artifact-measurement metadata before tokenizer artifact opening, artifact reading, artifact hashing, artifact size recording, artifact digest recording, tokenizer manifest loading, tokenizer file access, tokenizer vocabulary loading, prompt tokenization, prompt evaluation, dialogue generation, token generation, inference, or tool execution.

Purpose

Stage-21 gives Nadia a tokenizer-artifact-measurement contract after the tokenizer-artifact-inventory contract is present.

The contract records how future tokenizer artifacts must be measured, reviewed, and promoted, while preserving the absolute rule that Nadia cannot yet open, read, hash, size, validate, or load tokenizer artifacts. The script only measures the Stage-20 contract report as evidence that the prerequisite metadata exists.

Contract Fields

Stage-21 adds:

```

measurement.XXXXXX&quot;)&quot;
```

Installed command:

```
latticra-nadia tokenizer-artifact-measurement
```

Non-Claims

Stage-21 Nadia is not yet a Q&A assistant, dialogue generator, prompt evaluator, tokenizer, tokenizer loader, tokenizer registry, tokenizer manifest loader, tokenizer manifest parser, tokenizer artifact scanner, tokenizer artifact inventory reader, tokenizer artifact hasher, tokenizer artifact measurer, tokenizer artifact verifier, model loader, inference runtime, runtime process launcher, token generator, model selector, tool executor, shell runner, network client, source mutator, training system, distillation system, security product, sexual assistant, roleplay surface, adult-content generator, legal adviser, medical adviser, trauma counselor, crisis intervention service, or production AI assistant.

Validation

Run:

```
sh scripts/test-nadia-tokenizer-artifact-measurement-contract-stage-21.sh
```

Expected output:

```
nadia_tokenizer_artifact_measurement_contract_stage_21: ok
```

docs/NADIA_TOKENIZER_ARTIFACT_VERIFICATION_CONTRACT_STAGE_22.md

Source title: Nadia Tokenizer Artifact Verification Contract Stage-22

Lines: 147 | Words: 455 | SHA-256: 5ebaea614a5b22a4ba469c8ead65a6ea3628fd6dc8758492c51731379f814e45

Nadia Tokenizer Artifact Verification Contract Stage-22

Status: Stage-22 implementation contract

Scope: tokenizer-artifact-verification metadata before tokenizer artifact opening, artifact reading, artifact hashing, artifact digest comparison, artifact size comparison, artifact verification, artifact binding, tokenizer manifest loading, tokenizer file access, tokenizer vocabulary loading, prompt tokenization, prompt evaluation, dialogue generation, token generation, inference, or tool execution.

Purpose

Stage-22 gives Nadia a tokenizer-artifact-verification contract after the tokenizer-artifact-measurement contract is present.

The contract records how future tokenizer artifacts must be verified, reviewed, and promoted, while preserving the absolute rule that Nadia cannot yet open, read, hash, compare, verify, bind, validate, or load tokenizer artifacts. The script only measures the Stage-21 contract report as evidence that the prerequisite metadata exists.

Contract Fields

Stage-22 adds:

```

docs/NADIA_TOKENIZER_MANIFEST_CONTRACT_STAGE_19.md

Source title: Nadia Tokenizer Manifest Contract Stage-19

Lines: 143 | Words: 400 | SHA-256: 091ecbb47a5810961b94110b9ee0acf90e229fee0746db8d0cf594742663e46d

Nadia Tokenizer Manifest Contract Stage-19

Status: Stage-19 implementation contract

Scope: tokenizer-manifest metadata before tokenizer manifest loading, tokenizer manifest parsing, tokenizer file access, tokenizer vocabulary loading, prompt tokenization, prompt evaluation, dialogue generation, token generation, inference, or tool execution.

Purpose

Stage-19 gives Nadia a tokenizer-manifest contract after the tokenizer-specification contract is present.

The contract consumes a Stage-18 tokenizer-specification contract, verifies inherited non-executing tokenizer, prompt, dialogue, runtime, model, tool, and protective-safety posture, and records the requirements a future tokenizer artifact inventory must satisfy. It does not load tokenizer manifests, parse manifests, open tokenizer files, or tokenize prompts.

Contract Fields

Stage-19 adds:

```
nadia_stage_19_tokenizer_manifest_contract_present=1
nadia_tokenizer_manifest_contract_generator_present=1
tokenizer_manifest_contract_command=scripts/nadia-tokenizer-manifest-contract.sh
installed_tokenizer_manifest_contract_command=latticra-nadia tokenizer-manifest
tokenizer_manifest_contract_status=contract_only
tokenizer_manifest_stage=contract-only
tokenizer_manifest_authority=0
tokenizer_manifest_allowed=0
tokenizer_manifest_performed=0
tokenizer_manifest_metadata_present=1
tokenizer_manifest_family=operator-reviewed-tokenizer-manifest
tokenizer_manifest_format=contract-only-offline-manifest
tokenizer_manifest_decision=blocked_contract_only
tokenizer_manifest_evidence_present=1
tokenizer_manifest_source_policy=operator-reviewed-offline
tokenizer_manifest_path_recorded=0
tokenizer_manifest_schema_planned=1
```

```
requires_tokenizer_specification_contract=1
requires_tokenization_boundary_contract=1
requires_future_tokenizer_artifact_inventory_contract=1
tokenizer_manifest_promotion_allowed=0
tokenizer_manifest_loaded=0
tokenizer_manifest_opened=0
tokenizer_manifest_read=0
tokenizer_manifest_parsed=0
tokenizer_manifest_validated=0
tokenizer_file_opened=0
tokenizer_file_read=0
tokenizer_vocab_loaded=0
prompt_tokenized=0
prompt_evaluated=0
qa_dialogue_generated=0
sexual_request_refusal=always
manipulation_resistance=required
```

Stage-19 does not generate dialogue, receive prompt text, read prompt sources, allocate prompt buffers, materialize prompt text, open tokenizer manifests, read tokenizer manifests, parse tokenizer manifests, validate tokenizer manifests, load tokenizer manifests, open tokenizer files, read tokenizer files, load tokenizer vocabularies, tokenize prompts, evaluate prompts, load model weights, invoke a runtime, generate tokens, run inference, execute tools, mutate source, train, distill, download, or use the network.

Manifest Review Requirements

The tokenizer-manifest contract names the minimum future manifest review requirements:

```
requires_manifest_identity=1
requires_manifest_schema_review=1
requires_model_tokenizer_compatibility_reference=1
requires_tokenizer_family_match=1
requires_tokenizer_format_match=1
requires_tokenizer_file_inventory=1
requires_vocabulary_file_entry=1
requires_merges_file_entry_review=1
requires_special_tokens_entry=1
requires_bos_eos_policy_entry=1
requires_chat_template_entry=1
requires_prompt_template_boundary_entry=1
requires_unicode_policy_entry=1
requires_normalization_policy_entry=1
requires_context_window_entry=1
requires_stop_sequence_entry=1
requires_license_and_source_entry=1
requires_source_snapshot_reference=1
requires_operator_approval_record=1
requires_refusal_policy_link=1
requires_survivor_centered_language_review=1
```

These are requirements for later review only. They do not authorize manifest loading, tokenizer loading, prompt tokenization, or inference.

Denial Boundary

Stage-19 preserves explicit manifest denial fields:

```
tokenizer_manifest_open_authority=0
tokenizer_manifest_read_authority=0
tokenizer_manifest_parse_authority=0
tokenizer_manifest_validation_authority=0
tokenizer_manifest_load_authority=0
tokenizer_manifest_opened=0
tokenizer_manifest_read=0
tokenizer_manifest_parsed=0
tokenizer_manifest_validated=0
tokenizer_manifest_loaded=0
tokenizer_manifest_bytes_read=0
tokenizer_manifest_hash_computed=0
tokenizer_manifest_entries_loaded=0
tokenizer_file_path_resolved=0
tokenizer_vocab_path_resolved=0
tokenizer_file_open_authority=0
tokenizer_file_read_authority=0
tokenizer_vocab_load_authority=0
```

```
prompt_tokenization_authority=0
prompt_tokenized=0
```

Command

From the repository:

```
sh scripts/nadia-tokenizer-manifest-contract.sh \
  --tokenizer-specification
reports/nadia/tokenizer-specification/latest-tokenizer-specification-contract.txt \
  --output &quot;$(mktemp -d &quot;${TMPDIR:-/tmp}/latticra-nadia-tokenizer-manifest.
XXXXXX&quot;)&quot;
```

After guarded local install:

```
latticra-nadia tokenizer-manifest
```

Non-Claims

Stage-19 Nadia is not yet a Q&A assistant, dialogue generator, prompt evaluator, tokenizer, tokenizer loader, tokenizer registry, tokenizer manifest loader, tokenizer manifest parser, tokenizer file inventory reader, model loader, inference runtime, runtime process launcher, token generator, model selector, tool executor, shell runner, network client, source mutator, training system, distillation system, security product, sexual assistant, roleplay surface, adult-content generator, legal adviser, medical adviser, trauma counselor, crisis intervention service, or production AI assistant.

Validation

```
sh scripts/test-nadia-tokenizer-manifest-contract-stage-19.sh
```

Expected:

```
nadia_tokenizer_manifest_contract_stage_19: ok
```

docs/NADIA_TOKENIZER_RUNTIME_ATTACHMENT_CONTRACT_STAGE_24.md

Source title: Nadia Tokenizer Runtime Attachment Contract Stage-24

Lines: 165 | Words: 504 | SHA-256: 4f68f9b8b7ad402fba6e09696bb3fa5d515a97f74e71aee9e6fd287f87914ec9

Nadia Tokenizer Runtime Attachment Contract Stage-24

Status: Stage-24 implementation contract

Scope: tokenizer-runtime-attachment metadata before tokenizer artifact opening, artifact reading, artifact hashing, tokenizer artifact binding, tokenizer runtime attachment, runtime session creation, tokenizer manifest loading, tokenizer file access, tokenizer vocabulary loading, prompt tokenization, prompt evaluation, dialogue generation, token generation, inference, or tool execution.

Purpose

Stage-24 gives Nadia a tokenizer-runtime-attachment contract after the tokenizer-artifact-binding contract is present.

The contract records how a future reviewed tokenizer attachment must reference a bound tokenizer artifact, runtime profile, runtime invocation contract, and model-load boundary, while preserving the absolute rule that Nadia cannot yet attach tokenizers to a runtime, create runtime sessions, tokenize prompts, evaluate prompts, generate tokens, or run inference. The script only measures the Stage-23 contract report as evidence that the prerequisite metadata exists.

Contract Fields

Stage-24 adds:

```
nadia_stage_24_tokenizer_runtime_attachment_contract_present=1
```

```
nadia_tokenizer_runtime_attachment_contract_generator_present=1
tokenizer_runtime_attachment_contract_command=scripts/nadia-tokenizer-runtime-attachment-contrac
t.sh
installed_tokenizer_runtime_attachment_contract_command=latticra-nadia
tokenizer-runtime-attachment
tokenizer_runtime_attachment_contract_status=contract_only
tokenizer_runtime_attachment_stage=contract-only
tokenizer_runtime_attachment_authority=0
tokenizer_runtime_attachment_allowed=0
tokenizer_runtime_attachment_performed=0
tokenizer_runtime_attachment_metadata_present=1
tokenizer_runtime_attachment_family=operator-reviewed-tokenizer-runtime-attachment
tokenizer_runtime_attachment_format=contract-only-offline-attachment
tokenizer_runtime_attachment_decision=blocked_contract_only
tokenizer_runtime_attachment_evidence_present=1
tokenizer_runtime_attachment_source_policy=operator-reviewed-offline
tokenizer_runtime_attachment_plan_recorded=1
tokenizer_runtime_attachment_method_planned=offline-runtime-tokenizer-attachment-review
tokenizer_runtime_attachment_result_recorded=0
tokenizer_runtime_attachment_record_created=0
tokenizer_runtime_attachment_runtime_reference_recorded=0
tokenizer_runtime_attachment_tokenizer_reference_recorded=0
tokenizer_runtime_attachment_session_created=0
requires_tokenizer_artifact_binding_contract=1
requires_tokenizer_artifact_verification_contract=1
requires_tokenizer_artifact_measurement_contract=1
requires_tokenizer_artifact_inventory_contract=1
requires_tokenizer_manifest_contract=1
requires_tokenizer_specification_contract=1
requires_tokenization_boundary_contract=1
requires_runtime_profile_contract=1
requires_runtime_invocation_contract=1
requires_model_load_contract=1
requires_future_prompt_tokenization_contract=1
tokenizer_runtime_attachment_promotion_allowed=0
```

Stage-24 does not generate dialogue, receive prompt text, read prompt sources, allocate prompt buffers, materialize prompt text, open tokenizer manifests, read tokenizer manifests, parse tokenizer manifests, validate tokenizer manifests, load tokenizer manifests, resolve tokenizer artifact paths, scan artifact directories, stat tokenizer artifacts, open tokenizer artifacts, read tokenizer artifacts, hash tokenizer artifacts, record tokenizer artifact digests, record tokenizer artifact sizes, compare tokenizer artifact digests, compare tokenizer artifact sizes, verify tokenizer artifacts, bind tokenizer artifacts, attach tokenizers to a runtime, create runtime sessions, open tokenizer files, read tokenizer files, load tokenizer vocabularies, tokenize prompts, evaluate prompts, load model weights, invoke a runtime, generate tokens, run inference, execute tools, mutate source, train, distill, download, or use the network.

Runtime Attachment Requirements

The tokenizer-runtime-attachment contract names future review requirements:

```
requires_bound_tokenizer_artifact_reference=1
requires_binding_contract_reference=1
requires_verified_artifact_reference=1
requires_artifact_identity=1
requires_artifact_role_classification=1
requires_runtime_profile_reference=1
requires_runtime_invocation_reference=1
requires_model_load_reference=1
requires_manifest_entry_reference=1
requires_tokenizer_specification_reference=1
requires_digest_match_record=1
requires_size_match_record=1
requires_operator_approval_record=1
requires_official_source_snapshot=1
requires_no_runtime_invocation=1
requires_no_runtime_session_creation=1
requires_no_prompt_tokenization=1
requires_no_prompt_evaluation=1
requires_no_inference=1
requires_refusal_policy_link=1
requires_survivor_centered_language_review=1
```

Denial Boundary

Stage-24 preserves explicit runtime attachment denial fields:

```
tokenizer_runtime_attachment_authority=0
tokenizer_runtime_attachment_allowed=0
tokenizer_runtime_attachment_open_authority=0
tokenizer_runtime_attachment_read_authority=0
tokenizer_runtime_attachment_write_authority=0
tokenizer_runtime_attachment_validation_authority=0
tokenizer_runtime_attachment_load_authority=0
tokenizer_runtime_attachment_attach_authority=0
tokenizer_runtime_attachment_runtime_invoke_authority=0
tokenizer_runtime_attachment_session_authority=0
tokenizer_runtime_attachment_tokenizer_bind_authority=0
tokenizer_runtime_attachment_opened=0
tokenizer_runtime_attachment_read=0
tokenizer_runtime_attachment_validated=0
tokenizer_runtime_attachment_loaded=0
tokenizer_runtime_attachment_bytes_read=0
tokenizer_runtime_attachment_hash_computed=0

```

Commands

Repository command:

```
sh scripts/nadia-tokenizer-runtime-attachment-contract.sh \
  --tokenizer-artifact-binding
reports/nadia/tokenizer-artifact-binding/latest-tokenizer-artifact-binding-contract.txt \
  --output &quot;$(mktemp -d &quot;${TMPDIR:-/tmp}/latticra-nadia-tokenizer-runtime-attachment.
XXXXXX&quot;)&quot;
```

Installed command:

```
latticra-nadia tokenizer-runtime-attachment
```

Non-Claims

Stage-24 Nadia is not yet a Q&A assistant, dialogue generator, prompt evaluator, tokenizer, tokenizer loader, tokenizer registry, tokenizer manifest loader, tokenizer manifest parser, tokenizer artifact scanner, tokenizer artifact inventory reader, tokenizer artifact hasher, tokenizer artifact measurer, tokenizer artifact verifier, tokenizer artifact binder, tokenizer runtime attachment layer, prompt tokenizer, model loader, inference runtime, runtime process launcher, token generator, model selector, tool executor, shell runner, network client, source mutator, training system, distillation system, security product, sexual assistant, roleplay surface, adult-content generator, legal adviser, medical adviser, trauma counselor, crisis intervention service, or production AI assistant.

Validation

Run:

```
sh scripts/test-nadia-tokenizer-runtime-attachment-contract-stage-24.sh
```

Expected output:

```
nadia_tokenizer_runtime_attachment_contract_stage_24: ok
```

docs/NADIA_TOKENIZER_SPECIFICATION_CONTRACT_STAGE_18.md

Source title: Nadia Tokenizer Specification Contract Stage-18

Lines: 145 | Words: 358 | SHA-256: 367cd8ccb5649687901a83a7d4508470834284d52513fa7b9c9053e72296c8e5

Nadia Tokenizer Specification Contract Stage-18

Status: Stage-18 implementation contract Date: 2026-05-25 Scope: tokenizer-specification metadata before tokenizer manifest loading, tokenizer file access, tokenizer vocabulary loading, prompt tokenization, prompt evaluation, dialogue generation, token generation, inference, or tool execution.

Purpose

Stage-18 gives Nadia a tokenizer-specification contract after the tokenization-boundary contract is present.

The contract consumes a Stage-17 tokenization-boundary contract, verifies inherited non-executing tokenizer, prompt, dialogue, runtime, model, tool, and protective-safety posture, and records the requirements a future tokenizer manifest must satisfy. It does not load tokenizer files or tokenize prompts.

Capability

Stage-18 adds:

```
nadia_stage_18_tokenizer_specification_contract_present=1
nadia_tokenizer_specification_contract_generator_present=1
tokenizer_specification_contract_command=scripts/nadia-tokenizer-specification-contract.sh
installed_tokenizer_specification_contract_command=latticra-nadia tokenizer-specification
tokenizer_specification_contract_status=contract_only
tokenizer_specification_stage=contract-only
tokenizer_specification_authority=0
tokenizer_specification_allowed=0
tokenizer_specification_performed=0
tokenizer_specification_metadata_present=1
tokenizer_family=model-compatible-tokenizer
tokenizer_format=operator-reviewed-offline-specification
tokenizer_specification_decision=blocked_contract_only
tokenizer_specification_evidence_present=1
tokenizer_source_policy=operator-reviewed-offline
tokenizer_path_recorded=0
tokenizer_manifest_loaded=0
tokenizer_file_measurement_performed=0
requires_tokenization_boundary_contract=1
requires_prompt_evaluation_handoff_contract=1
requires_awareness_dialogue_contract=1
requires_prompt_materialization_contract=1
requires_prompt_receipt_contract=1
requires_prompt_buffer_boundary=1
requires_protective_safety_boundary=1
requires_operator_review=1
requires_official_source_snapshot=1
requires_future_tokenizer_manifest_contract=1
tokenizer_specification_promotion_allowed=0
```

Stage-18 does not generate dialogue, receive prompt text, read prompt sources, allocate prompt buffers, materialize prompt text, open tokenizer files, read tokenizer files, load tokenizer vocabularies, load tokenizer manifests, tokenize prompts, evaluate prompts, load model weights, invoke a runtime, generate tokens, run inference, execute tools, mutate source, train, distill, download, or use the network.

Specification Requirements

```
requires_model_tokenizer_compatibility_review=1
requires_tokenizer_format_review=1
requires_unicode_policy_review=1
requires_normalization_policy_review=1
requires_special_token_policy_review=1
requires_bos_eos_policy_review=1
requires_chat_template_policy_review=1
requires_prompt_template_boundary=1
requires_context_window_policy_review=1
requires_stop_sequence_policy_review=1
requires_survivor_centered_language_review=1
requires_refusal_policy_review=1
```

Tokenizer Denial Boundary

```
tokenizer_file_open_authority=0
tokenizer_file_read_authority=0
tokenizer_vocab_load_authority=0
tokenizer_vocab_mapping_authority=0
tokenizer_runtime_attach_authority=0
tokenizer_file_opened=0
tokenizer_file_read=0
tokenizer_vocab_loaded=0
tokenizer_vocab_mapped=0
tokenizer_attached_to_runtime=0
tokenizer_bytes_read=0
tokenizer_hash_computed=0
prompt_tokenization_authority=0
prompt_tokenization_allowed=0
prompt_tokenized=0
prompt_tokens_created=0
prompt_evaluation_authority=0
prompt_evaluated=0
```

Protective Boundary

```
sexual_user_request_authority=0
sexual_content_generation=0
sexualized_dialogue_generation=0
graphic_sexual_detail_allowed=0
erotic_content_allowed=0
roleplay_allowed=0
survivor_impersonation_allowed=0
victim_blaming_allowed=0
genocide_denial_allowed=0
hate_or_collective_blame_allowed=0
medical_advice_authority=0
legal_advice_authority=0
trauma_counseling_authority=0
crisis_intervention_authority=0
sexual_request_refusal=always
manipulation_resistance=required
```

Usage

With explicit evidence input:

```
sh scripts/nadia-tokenizer-specification-contract.sh \
  --tokenization-boundary /path/to/latest-tokenization-boundary-contract.txt \
  --request-class awareness-education \
  --tokenizer-family model-compatible-tokenizer \
  --tokenizer-format operator-reviewed-offline-specification \
  --output &quot;$(mktemp -d &quot;${TMPDIR:-/tmp}/latticra-nadia-tokenizer-specification.
XXXXXX&quot;)&quot;
```

After a guarded local install with Nadia enabled:

```
latticra-nadia tokenizer-specification
```

Non-Claims

Stage-18 Nadia is not yet a Q&A assistant, dialogue generator, prompt evaluator, tokenizer, tokenizer loader, tokenizer registry, tokenizer manifest loader, model loader, inference runtime, runtime process launcher, token generator, model selector, tool executor, shell runner, network client, source mutator, training system, distillation system, security product, sexual assistant, roleplay surface, adult-content generator, legal adviser, medical adviser, trauma counselor, crisis intervention service, or production AI assistant.

Validation

```
sh scripts/test-nadia-tokenizer-specification-contract-stage-18.sh
```

Expected result:

```
nadia_tokenizer_specification_contract_stage_18: ok
```

docs/KERNEL_CONTEXT_SWITCH_SEED.md

Source title: Kernel Context Switch Seed

Lines: 73 | Words: 172 | SHA-256: b8a796daacadf83b13ef51e39b449684144bfd1bac6a678a4fb37e621dcffd83

Kernel Context Switch Seed

Status: controlled context switch metadata seed Scope: report-only bridge from run queue metadata to context switch intent.

Purpose

This slice connects the run queue seed to deterministic context switch metadata.

It does not save registers, restore registers, switch stacks, switch address spaces, dispatch work, mutate run queues, wake processes, preempt execution, or touch hardware. It records candidate switch declarations that future scheduler work can refine behind explicit authority gates.

Files

```
include/latticra/kernel_context_switch.h
src/kernel_context_switch.c
tests/kernel_context_switch.c
tools/kernel_context_switch_report.c
scripts/test-kernel-context-switch.sh
scripts/test-kernel-context-switch-report-runner.sh
.github/workflows/kernel-context-switch.yml
docs/KERNEL_CONTEXT_SWITCH_SEED.md
```

Current posture

The default request evaluates the run queue seed and emits:

```
switch_status=context-switch-seed-ready
run_queue_status=run-queue-seed-ready
scheduler_tick_status=scheduler-tick-seed-ready
timer_source_status=timer-source-seed-ready
switch_count=4
no_effect=1
```

Authority remains denied:

```
context_switch_allowed=0
register_save_allowed=0
register_restore_allowed=0
stack_switch_allowed=0
address_space_switch_allowed=0
dispatch_allowed=0
run_queue_mutation_allowed=0
preemption_allowed=0
time_accounting_allowed=0
process_wake_allowed=0
hardware_effect_allowed=0
host_effect_allowed=0
```

Validation

Run:

```
sh scripts/test-kernel-context-switch.sh
sh scripts/test-kernel-context-switch-report-runner.sh
```

Expected output:

```
kernel_context_switch: ok
kernel_context_switch_report_runner: ok
```

Non-claims

This slice does not schedule execution, mutate run queues, perform context switches, wake processes, account CPU time, dispatch interrupts, perform I/O, boot hardware, or replace an operating system.

docs/KERNEL_IMPLEMENTATION.md

Source title: Kernel Seed Implementation

Lines: 103 | Words: 236 | SHA-256: 2b297b41af2b831e25c27c3c5b9b98b80a3ba12e2eef6c4a9a0b4fe2359eecbe

Kernel Seed Implementation

Status: first kernel implementation surface Scope: compiled no-effect kernel seed, deterministic kernel report, and operator-facing report runner.

Purpose

This slice creates the first Latticra kernel surface.

The kernel seed is not a bootable kernel. It is a compiled C interface that owns kernel identity, kernel status labels, subsystem status labels, and a deterministic kernel report while coordinating the already merged system bootstrap surface.

This is the next system-building step after SYSTEM_BOOTSTRAP_IMPLEMENTATION.md.

Files

```
include/latticra/kernel.h
src/kernel.c
tests/kernel.c
scripts/test-kernel.sh
tools/kernel_report.c
scripts/test-kernel-report-runner.sh
.github/workflows/kernel.yml
docs/KERNEL_IMPLEMENTATION.md
```

Public API

```
latticra_kernel_default_request
latticra_kernel_initialize
latticra_kernel_report
```

Kernel report fields

The deterministic report emits:

```
LATTICRA KERNEL REPORT
kernel_id
kernel_mode
kernel_status
boot_status
runtime_status
scheduler_status
memory_status
process_status
filesystem_status
network_status
device_status
security_status
bootstrap_status
bootstrap_runtime_entry_status
bootstrap_no_effect
no_effect
execution_allowed
mutation_allowed
file_io_allowed
network_allowed
server_allowed
recovery_allowed
hardware_allowed
```

```
boot_allowed
evidence_level
source_identity
```

Current kernel posture

The kernel seed reports:

```
kernel_mode=seed-kernel
kernel_status=initialized-report-only
boot_status=not-booted
runtime_status=not-entered
scheduler_status=not-started
memory_status=metadata-only
process_status=not-started
filesystem_status=disabled
network_status=disabled
device_status=disabled
security_status=not-production-boundary
no_effect=1
```

Validation

Run:

```
sh scripts/test-kernel.sh
sh scripts/test-kernel-report-runner.sh
```

The guards compile the kernel seed, verify no-effect invariants, render the deterministic kernel report, and verify stable report fields.

Boundary

This implementation does not add a bootloader, bootable image, hardware control, interrupts, paging, scheduler execution, process execution, system calls, filesystem I/O, network I/O, mutation, server interaction, recovery behavior, sandboxing, malware prevention, ransomware prevention, production security boundary, or operating-system replacement.

It is the first compiled kernel identity and report surface.

docs/KERNEL_LIFECYCLE_ROLLBACK_PLAN.md

Source title: Kernel Lifecycle Rollback Plan

Lines: 136 | Words: 353 | SHA-256: 33d53ed02fd0f073345765382664b76b831f7885cb73285738cf5c36b649ddf9

Kernel Lifecycle Rollback Plan

Status: planning and guardrail record Scope: rollback semantics for the bounded kernel lifecycle sequence.

Purpose

The kernel lifecycle can currently move a local in-memory state machine from created to memory-map-ready when an explicit gate allows the sequence.

This plan defines how Latticra should reason about failed, partial, or interrupted lifecycle progress before any rollback implementation exists.

The goal is to make failure handling auditable before adding more kernel surfaces.

Rollback meaning

Rollback means:

```
record the last safe lifecycle state
classify the incomplete transition
report the reason rollback would be required
preserve the no-external-effect boundary
```

Rollback does not yet mean:

```
restore persisted state
write recovery metadata
restart a runtime
undo hardware work
operate devices
spawn or stop processes
```

Current lifecycle ladder

```
created
initialized
registry-ready
scheduler-ready
memory-map-ready
```

The current approved forward path remains:

```
created -&gt; initialized
initialized -&gt; registry-ready
registry-ready -&gt; scheduler-ready
scheduler-ready -&gt; memory-map-ready
```

Rollback trigger classes

Planned rollback classification should cover:

```
null-request
invalid-target
target-before-current
step-limit-reached
no-forward-step
step-request-failed
step-failed
step-did-not-advance
external-effect-blocked
```

Planned report fields

A later implementation may emit fields such as:

```
rollback_plan_status=planned
rollback_required=1
rollback_performed=0
rollback_reason=step-limit-reached
last_safe_state=registry-ready
attempted_target=memory-map-ready
final_state=registry-ready
state_mutated_before_stop=1
external_effect_performed=0
persistence_allowed=0
recovery_authority_allowed=0
```

Safety rule

Rollback planning must remain report-only until a separate authority contract exists.

The first implementation should only classify and report rollback posture. It should not persist state, start execution, use host recovery actions, or claim operating-system readiness.

Guardrail checklist

Any future rollback implementation must preserve:

```
external_effect_performed=0
persistence_allowed=0
recovery_authority_allowed=0
runtime_entry_allowed=0
```

It must also keep rollback reports deterministic and testable through a focused guard.

Implementation sequence

Recommended order:

1. Add rollback classification structs.
2. Add a no-effect rollback evaluator.
3. Add tests for complete, limited, invalid, and denied lifecycle paths.
4. Add a report runner.
5. Add status/docs alignment only after the implementation guard passes.

Validation

This planning slice is validated by:

```
sh scripts/test-kernel-lifecycle-rollback-plan.sh
```

Expected output:

```
kernel_lifecycle_rollback_plan: ok
```

Non-claims

This plan does not implement rollback. It only records the rules that a future rollback classifier must follow.

docs/KERNEL_LIFECYCLE_SEED.md

Source title: Kernel Lifecycle Seed

Lines: 177 | Words: 461 | SHA-256: 8649cf0381073d2297fd4a6a587380af623402c951d260ce3eb2866d90eca382

Kernel Lifecycle Seed

Status: controlled in-memory lifecycle runner Scope: bounded lifecycle sequence over the kernel state machine.

Purpose

This slice builds on the kernel state machine.

The state machine can mutate one in-memory state object through gated steps. This lifecycle seed runs the approved sequence through that state machine and records the final state, step count, state-change count, completion flag, and external-effect flag.

The companion report runner emits the deterministic lifecycle report from a deliberately allowed lifecycle request so the current kernel sequence evidence can be inspected through a small operator-facing tool.

Files

```
include/latticra/kernel_lifecycle.h
src/kernel_lifecycle.c
tests/kernel_lifecycle.c
tools/kernel_lifecycle_report.c
scripts/test-kernel-lifecycle.sh
scripts/test-kernel-lifecycle-report-runner.sh
.github/workflows/kernel-sequence.yml
docs/KERNEL_LIFECYCLE_SEED.md
```

Lifecycle target

The default lifecycle target is:

```
scheduler-run-entry-ready
```

The approved sequence is:

```
created -&gt; initialized
initialized -&gt; registry-ready
registry-ready -&gt; scheduler-ready
scheduler-ready -&gt; memory-map-ready
memory-map-ready -&gt; process-table-ready
process-table-ready -&gt; syscall-table-ready
syscall-table-ready -&gt; ipc-table-ready
ipc-table-ready -&gt; vfs-namespace-ready
vfs-namespace-ready -&gt; device-registry-ready
```

```
device-registry-ready -&gt; driver-catalog-ready
driver-catalog-ready -&gt; interrupt-table-ready
interrupt-table-ready -&gt; timer-source-ready
timer-source-ready -&gt; scheduler-tick-ready
scheduler-tick-ready -&gt; run-queue-ready
run-queue-ready -&gt; context-switch-ready
context-switch-ready -&gt; time-accounting-ready
time-accounting-ready -&gt; preemption-ready
preemption-ready -&gt; scheduler-credit-ready
scheduler-credit-ready -&gt; scheduler-selection-ready
scheduler-selection-ready -&gt; scheduler-dispatch-ready
scheduler-dispatch-ready -&gt; scheduler-handoff-ready
scheduler-handoff-ready -&gt; scheduler-activation-ready
scheduler-activation-ready -&gt; scheduler-run-entry-ready
```

Controlled effect boundary

This slice allows internal state-machine mutation only.

The result may report:

```
state_change_count=23
lifecycle_complete=1
```

The result must still report:

```
external_effect_performed=0
```

This means no Latticra runtime filesystem effect, network effect, process effect, device effect, runtime-entry effect, or host mutation is introduced.

The report runner only prints the deterministic lifecycle report for validation and operator inspection. The guard captures that report as test output while preserving the project boundary that the kernel lifecycle itself performs no external effects.

Report runner

Run:

```
sh scripts/test-kernel-lifecycle-report-runner.sh
```

Expected output:

```
kernel_lifecycle_report_runner: ok
```

The guard verifies:

```
LATTICRA KERNEL LIFECYCLE REPORT
lifecycle_status=lifecycle-complete
policy_status=gate-allowed
final_state=scheduler-run-entry-ready
step_count=23
state_change_count=23
lifecycle_complete=1
external_effect_performed=0
machine_log_count=23
evidence_level=10
```

It also verifies the first and final transition log entries.

Validation

Run:

```
sh scripts/test-kernel-lifecycle.sh
sh scripts/test-kernel-lifecycle-report-runner.sh
```

Expected output:

```
kernel_lifecycle: ok
kernel_lifecycle_report_runner: ok
```

The guards verify:

```
default request is denied
allowed lifecycle reaches scheduler-run-entry-ready
intermediate target stops correctly
step limit is respected
```

```
report includes lifecycle completion and transition log
report runner emits deterministic lifecycle evidence
external_effect_performed=0 remains true
```

Non-claims

This slice does not add:

```
filesystem writes in the Latticra kernel lifecycle
network access
process execution
runtime entry
hardware behavior
device operation
scheduler tick
run queue mutation
context switching
time accounting
process wakeups
timer arming
preemption
quota updates
scheduler credit updates
scheduler selection
scheduler dispatch
scheduler handoff
scheduler activation
scheduler run-entry
time reads
scheduler execution
memory allocation
production security boundary
operating-system replacement
```

Next possible lane

A later slice may add lifecycle rollback, lifecycle-to-subsystem summary reporting, or state persistence planning before any external effects are introduced.

docs/KERNEL_LIFECYCLE_SUBSYSTEM_SUMMARY.md

Source title: Kernel Lifecycle Subsystem Summary

Lines: 206 | Words: 510 | SHA-256: ebd8a02cf85ff3116e8332001b9d6f851ca8d7709c5b952b60653ff89b71830b

Kernel Lifecycle Subsystem Summary

Status: controlled lifecycle-to-subsystem summary Scope: report-only integration between the kernel lifecycle runner and the kernel subsystem registry.

Purpose

This slice connects two existing kernel evidence surfaces:

```
kernel lifecycle runner
kernel subsystem registry
```

The lifecycle runner can move a local in-memory kernel state machine from created to scheduler-run-entry-ready through gated internal state changes.

The subsystem registry exposes boot, runtime, scheduler, memory, process, filesystem, network, device, and security subsystem posture.

The summary combines those surfaces into one deterministic report so the project can answer:

```
Which kernel subsystems are lifecycle-ready?
Which subsystems still deny authority?
Did the lifecycle stay externally inert?
Is the registry still no-effect?
```

Files

```
include/latticra/kernel_lifecycle_subsystem_summary.h
src/kernel_lifecycle_subsystem_summary.c
tests/kernel_lifecycle_subsystem_summary.c
tools/kernel_lifecycle_subsystem_summary_report.c
scripts/test-kernel-lifecycle-subsystem-summary.sh
scripts/test-kernel-lifecycle-subsystem-summary-report-runner.sh
.github/workflows/kernel-lifecycle-subsystem-summary.yml
docs/KERNEL_LIFECYCLE_SUBSYSTEM_SUMMARY.md
```

Default target

The default summary request allows the lifecycle runner to reach:

```
scheduler-run-entry-ready
```

That produces:

```
summary_status=summary-ready
final_state=scheduler-run-entry-ready
lifecycle_complete=1
lifecycle_step_count=23
lifecycle_state_change_count=23
external_effect_performed=0
registry_no_effect=1
no_external_effect_chain=1
```

Subsystem posture

Expected readiness examples:

```
boot -&gt; boot-sequence-seeded
scheduler -&gt; scheduler-run-entry-ready
memory -&gt; memory-map-ready
process -&gt; ipc-table-ready
filesystem -&gt; vfs-namespace-ready
network -&gt; network-syscall-metadata-ready
device -&gt; interrupt-table-ready
runtime -&gt; runtime-not-entered
security -&gt; security-not-production-boundary
```

Authority remains denied:

```
runtime_entry_allowed=0
scheduler_execution_allowed=0
scheduler_selection_allowed=0
scheduler_dispatch_allowed=0
scheduler_handoff_allowed=0
scheduler_activation_allowed=0
scheduler_run_entry_allowed=0
memory_allocation_allowed=0
process_spawn_allowed=0
syscall_dispatch_allowed=0
ipc_send_allowed=0
ipc_receive_allowed=0
ipc_queue_mutation_allowed=0
filesystem_lookup_allowed=0
filesystem_read_allowed=0
filesystem_write_allowed=0
namespace_mutation_allowed=0
device_open_allowed=0
device_read_allowed=0
device_write_allowed=0
driver_probe_allowed=0
driver_load_allowed=0
driver_bind_allowed=0
interrupt_allowed=0
interrupt_mask_allowed=0
interrupt_unmask_allowed=0
interrupt_dispatch_allowed=0

timer_arm_allowed=0
timer_disarm_allowed=0
scheduler_tick_allowed=0
run_queue_mutation_allowed=0
enqueue_allowed=0
dequeue_allowed=0
```

```
dispatch_allowed=0
context_switch_allowed=0
register_save_allowed=0
register_restore_allowed=0
stack_switch_allowed=0
address_space_switch_allowed=0
preemption_allowed=0
time_accounting_allowed=0
time_read_allowed=0
cpu_usage_write_allowed=0
quota_update_allowed=0
scheduler_credit_update_allowed=0
process_wake_allowed=0
dma_allowed=0
hardware_effect_allowed=0
```

Subsystem authority labels include:

```
boot-denied
runtime-entry-denied
scheduler-execution-denied
memory-allocation-denied
process-execution-denied
filesystem-denied
network-denied
device-denied
not-production-boundary
```

Controlled boundary

This slice may report internal lifecycle state mutation:

```
lifecycle_state_mutated=1
```

It must still report:

```
external_effect_performed=0
no_external_effect_chain=1
```

This is a summary/reporting slice only. It does not expand kernel authority or claim product readiness.

Validation

Run:

```
sh scripts/test-kernel-lifecycle-subsystem-summary.sh
sh scripts/test-kernel-lifecycle-subsystem-summary-report-runner.sh
```

Expected output:

```
kernel_lifecycle_subsystem_summary: ok
kernel_lifecycle_subsystem_summary_report_runner: ok
```

The guards verify:

```
default request targets scheduler-run-entry-ready
summary reaches scheduler-run-entry-ready
summary marks boot/scheduler/memory/process/filesystem as lifecycle-ready metadata
runtime remains not entered
runtime entry remains denied
scheduler execution remains denied
memory allocation remains denied
process spawn remains denied
syscall dispatch remains denied

external_effect_performed=0 remains true
```

Non-claims

This slice does not make Latticra bootable, runnable as an operating system, product-ready, or authority-expanded.

Next possible lane

A later slice may add lifecycle rollback planning, virtual device binding metadata, or scheduler-to-timer handoff metadata. Those should remain report-only unless a separate authority contract is introduced first.

docs/KERNEL_MEMORY_MAP_SEED.md

Source title: Kernel Memory Map Seed

Lines: 65 | Words: 184 | SHA-256: 10e8a9b83a19ecd41c5d530d5c3a05f743f9ce648f7fa1e6a798f1fb71ee28bd

Kernel Memory Map Seed

Status: kernel memory-map seed implementation Scope: fixed kernel memory-region metadata and deterministic report surface.

Purpose

This slice adds the first kernel memory-map seed surface on top of the kernel scheduler seed.

The memory-map seed does not allocate memory, map pages, change permissions, write to memory, or execute memory. It records deterministic region metadata so the kernel can describe its future memory lanes before behavior exists.

Files

```
include/latticra/kernel_memory_map.h
src/kernel_memory_map.c
tests/kernel_memory_map.c
scripts/test-kernel-memory-map.sh
tools/kernel_memory_map_report.c
scripts/test-kernel-memory-map-report-runner.sh
.github/workflows/kernel-map-metadata.yml
docs/KERNEL_MEMORY_MAP_SEED.md
```

Validation

Run:

```
sh scripts/test-kernel-memory-map.sh
sh scripts/test-kernel-memory-map-report-runner.sh
```

Expected output:

```
kernel_memory_map: ok
kernel_memory_map_report_runner: ok
```

The guards verify:

```
map_status=memory-map-seed-ready
policy_status=report-only
scheduler_status=scheduler-seed-ready
region_count=4
mapping_allowed=0
write_allowed=0
execute_allowed=0
region[0].label=kernel-text-metadata
region[1].label=kernel-data-metadata
region[2].label=kernel-stack-metadata
region[3].label=kernel-report-metadata
region[0].map_status=metadata-only
no_effect=1
```

Boundary

This is metadata and reporting only.

It does not allocate memory, map virtual pages, edit page tables, write memory, execute mapped regions, enter runtime execution, perform I/O, operate devices, enforce a production security boundary, boot hardware, or replace an operating system.

The memory-map seed exists so future work can add memory policy, region validation, and safe memory-state modeling one guarded slice at a time.

docs/KERNEL_PREEMPTION_SEED.md

Source title: Kernel Preemption Seed

Lines: 73 | Words: 174 | SHA-256: 531b4395aba6476170658828b4e18212e6d5bfa3b59d6cfd580f83d5f5e06bfc

Kernel Preemption Seed

Status: controlled preemption metadata seed Scope: report-only bridge from time accounting metadata to preemption decision intent.

Purpose

This slice connects the time accounting seed to deterministic preemption decision metadata.

It does not read time, arm timers, preempt execution, dispatch work, switch contexts, mutate run queues, update scheduler credits, wake processes, or touch hardware. It records candidate preemption declarations that future scheduler work can refine behind explicit authority gates.

Files

```
include/latticra/kernel_preemption.h
src/kernel_preemption.c
tests/kernel_preemption.c
tools/kernel_preemption_report.c
scripts/test-kernel-preemption.sh
scripts/test-kernel-preemption-report-runner.sh
.github/workflows/kernel-preemption.yml
docs/KERNEL_PREEMPTION_SEED.md
```

Current Posture

The default request evaluates the time accounting seed and emits:

```
preemption_status=preemption-seed-ready
time_accounting_status=time-accounting-seed-ready
context_switch_status=context-switch-seed-ready
run_queue_status=run-queue-seed-ready
scheduler_tick_status=scheduler-tick-seed-ready
timer_source_status=timer-source-seed-ready
decision_count=4
no_effect=1
```

Authority remains denied:

```
preemption_allowed=0
time_read_allowed=0
time_accounting_allowed=0
context_switch_allowed=0
dispatch_allowed=0
run_queue_mutation_allowed=0
scheduler_credit_update_allowed=0
process_wake_allowed=0
hardware_effect_allowed=0
host_effect_allowed=0
```

Validation

Run:

```
sh scripts/test-kernel-preemption.sh
sh scripts/test-kernel-preemption-report-runner.sh
```

Expected output:

```
kernel_preemption: ok
kernel_preemption_report_runner: ok
```

Non-claims

This slice does not schedule execution, mutate run queues, perform context switches, read clocks, account CPU time, preempt execution, wake processes, dispatch interrupts, perform I/O, boot hardware, or replace an operating system.

docs/KERNEL_RUN_QUEUE_SEED.md

Source title: Kernel Run Queue Seed

Lines: 72 | Words: 170 | SHA-256: 0a0b0577e53ebd3a569b5e9ae940c8d314cd66ae0b6f630d0418570eb95a5b1b

Kernel Run Queue Seed

Status: controlled run queue metadata seed Scope: report-only bridge from scheduler tick metadata to run queue intent.

Purpose

This slice connects the scheduler tick seed to deterministic run queue metadata.

It does not enqueue processes, dequeue processes, dispatch work, mutate run queues, switch contexts, account CPU time, wake processes, preempt execution, or touch hardware. It records queue declarations that future scheduler work can refine behind explicit authority gates.

Files

```
include/latticra/kernel_run_queue.h
src/kernel_run_queue.c
tests/kernel_run_queue.c
tools/kernel_run_queue_report.c
scripts/test-kernel-run-queue.sh
scripts/test-kernel-run-queue-report-runner.sh
.github/workflows/kernel-run-queue.yml
docs/KERNEL_RUN_QUEUE_SEED.md
```

Current posture

The default request evaluates the scheduler tick seed and emits:

```
queue_status=run-queue-seed-ready
scheduler_tick_status=scheduler-tick-seed-ready
timer_source_status=timer-source-seed-ready
interrupt_table_status=interrupt-table-seed-ready
scheduler_status=scheduler-seed-ready
queue_count=4
no_effect=1
```

Authority remains denied:

```
run_queue_mutation_allowed=0
enqueue_allowed=0
dequeue_allowed=0
dispatch_allowed=0
context_switch_allowed=0
preemption_allowed=0
time_accounting_allowed=0
process_wake_allowed=0
hardware_effect_allowed=0
```

```
host_effect_allowed=0
```

Validation

Run:

```
sh scripts/test-kernel-run-queue.sh
sh scripts/test-kernel-run-queue-report-runner.sh
```

Expected output:

```
kernel_run_queue: ok
kernel_run_queue_report_runner: ok
```

Non-claims

This slice does not schedule execution, mutate run queues, perform context switches, wake processes, account CPU time, dispatch interrupts, perform I/O, boot hardware, or replace an operating system.

docs/KERNEL_SCHEDULER_ACTIVATION_SEED.md

Source title: Kernel Scheduler Activation Seed

Lines: 85 | Words: 228 | SHA-256: 27293ea80c11b0f64932080bd536914f74da00aeb3da66b03c8317cdeab2e267

Kernel Scheduler Activation Seed

Status: controlled scheduler activation metadata seed Scope: report-only bridge from scheduler handoff metadata to scheduler activation intent.

Purpose

This slice connects the scheduler handoff seed to deterministic scheduler activation metadata.

It does not activate execution, hand control to a process, dispatch a runnable process, dequeue or enqueue work, mutate run queues, switch contexts, enter runtime, update scheduler credits, update quotas, write CPU usage, preempt execution, wake processes, persist state, or touch hardware. It records activation declarations that future scheduler work can refine behind explicit authority gates.

scripts/test-kernel-scheduler-handoff-report-runner.sh
.github/workflows/kernel-scheduler-handoff.yml
docs/KERNEL_SCHEDULER_HANDOFF_SEED.md
```

Current Posture

The default request evaluates the scheduler dispatch seed and emits:

```
handoff_status=scheduler-handoff-seed-ready
scheduler_dispatch_status=scheduler-dispatch-seed-ready
scheduler_selection_status=scheduler-selection-seed-ready
scheduler_credit_status=scheduler-credit-seed-ready
preemption_status=preemption-seed-ready
time_accounting_status=time-accounting-seed-ready
context_switch_status=context-switch-seed-ready
run_queue_status=run-queue-seed-ready
scheduler_tick_status=scheduler-tick-seed-ready
timer_source_status=timer-source-seed-ready
handoff_count=4
no_effect=1
```

Authority remains denied:

```
scheduler_handoff_allowed=0
scheduler_dispatch_allowed=0
scheduler_selection_allowed=0
dispatch_allowed=0
run_queue_mutation_allowed=0
context_switch_allowed=0
preemption_allowed=0
scheduler_credit_update_allowed=0
quota_update_allowed=0
cpu_usage_write_allowed=0
time_accounting_allowed=0
time_read_allowed=0
process_wake_allowed=0
hardware_effect_allowed=0
host_effect_allowed=0
```

Validation

Run:

```
sh scripts/test-kernel-scheduler-handoff.sh
sh scripts/test-kernel-scheduler-handoff-report-runner.sh
```

Expected output:

```
kernel_scheduler_handoff: ok
kernel_scheduler_handoff_report_runner: ok
```

Non-claims

This slice does not schedule execution, hand off execution to a process, dispatch a runnable process, mutate run queues, enqueue or dequeue work, perform context switches, read clocks, account CPU time, update quotas, update scheduler credits, preempt execution, wake processes, dispatch interrupts, perform I/O, boot hardware, or replace an operating system.

docs/KERNEL_SCHEDULER_RUN_ENTRY_SEED.md

Source title: Kernel Scheduler Run Entry Seed

Lines: 64 | Words: 152 | SHA-256: dfa1703aa6a13235f289b22081a21a6ab7711c01523079ded35b7371ab935eb3

Kernel Scheduler Run Entry Seed

Status: controlled scheduler run-entry metadata seed Scope: report-only bridge from scheduler activation metadata to runtime entry intent.

This slice connects the scheduler activation seed to deterministic scheduler run-entry metadata. It does not enter runtime execution, activate a process, switch CPU context, mutate a run queue, read time, update accounting, dispatch scheduler work, or touch hardware.

Files

```
include/latticra/kernel_scheduler_run_entry.h
src/kernel_scheduler_run_entry.c
tests/kernel_scheduler_run_entry.c
tools/kernel_scheduler_run_entry_report.c
scripts/test-kernel-scheduler-run-entry.sh
scripts/test-kernel-scheduler-run-entry-report-runner.sh
.github/workflows/kernel-scheduler-run-entry.yml
```

Evidence

The seed report emits a deterministic, no-effect boundary:

```
run_entry_status=scheduler-run-entry-seed-ready
policy_status=report-only
scheduler_activation_status=scheduler-activation-seed-ready
scheduler_handoff_status=scheduler-handoff-seed-ready
run_entry_count=4
scheduler_run_entry_allowed=0
scheduler_activation_allowed=0
dispatch_allowed=0
run_queue_mutation_allowed=0
context_switch_allowed=0
runtime_entry_allowed=0
hardware_effect_allowed=0
host_effect_allowed=0
```

The first declared run-entry record is the kernel report process metadata:

```
run_entry[0].process_label=kernel-report-process-metadata
run_entry[0].run_entry_class=kernel-report-scheduler-run-entry
run_entry[0].activation_token=0
run_entry[0].run_entry_rank=1
run_entry[0].run_entry_declared=1
run_entry[0].run_entry_planned=0
run_entry[0].run_entry_prepared=0
run_entry[0].execution_entered=0
run_entry[0].no_effect=1
```

The seed keeps the scheduler path honest: the lifecycle can now name the next metadata point after activation while preserving the denial of runtime entry.

Validation

```
sh scripts/test-kernel-scheduler-run-entry.sh
sh scripts/test-kernel-scheduler-run-entry-report-runner.sh
```

docs/KERNEL_SCHEDULER_SEED.md

Source title: Kernel Scheduler Seed

Lines: 61 | Words: 172 | SHA-256: 7295d79be7ca7fcbece059ddd49563f01d818a5d2ecef51738fdb19c89c289b2

Kernel Scheduler Seed

Status: kernel scheduler seed implementation Scope: compiled scheduler-slot metadata and deterministic report surface.

Purpose

This slice adds the first kernel scheduler seed surface on top of the kernel subsystem registry.

The scheduler seed does not schedule execution. It evaluates the kernel subsystem registry, records deterministic scheduler-slot metadata, and emits a report that proves the scheduler lane is present while remaining no-effect.

Files

```
include/latticra/kernel_scheduler.h
src/kernel_scheduler.c
tests/kernel_scheduler.c
scripts/test-kernel-scheduler.sh
tools/kernel_scheduler_report.c
scripts/test-kernel-scheduler-report-runner.sh
.github/workflows/kernel-scheduler.yml
docs/KERNEL_SCHEDULER_SEED.md
```

Validation

Run:

```
sh scripts/test-kernel-scheduler.sh
sh scripts/test-kernel-scheduler-report-runner.sh
```

Expected output:

```
kernel_scheduler: ok
kernel_scheduler_report_runner: ok
```

The guards verify:

```
scheduler_status=scheduler-seed-ready
policy_status=report-only
registry_status=registry-ready
slot_count=3
slot[0].label=idle-metadata
slot[1].label=kernel-report-metadata
slot[2].label=operator-report-metadata
slot[0].selection_status=not-selected
no_effect=1
```

Boundary

This is metadata and reporting only.

It does not start scheduler behavior, select runnable work, switch contexts, run processes, mutate memory, enter runtime execution, perform I/O, operate devices, enforce a production security boundary, boot hardware, or replace an operating system.

The scheduler seed exists so future work can add scheduler policy, queues, and state machines one guarded slice at a time.

docs/KERNEL_SCHEDULER_SELECTION_SEED.md

Source title: Kernel Scheduler Selection Seed

Lines: 78 | Words: 198 | SHA-256: 777b17b2815688c8ac060ba3b9fcebd1697c5c1878eac356c61cd37f6f0868e9

Kernel Scheduler Selection Seed

Status: controlled scheduler selection metadata seed Scope: report-only bridge from scheduler credit metadata to scheduler candidate selection intent.

Purpose

This slice connects the scheduler credit seed to deterministic scheduler selection metadata.

It does not select a runnable process, enqueue or dequeue work, dispatch, switch contexts, update scheduler credits, update quotas, write CPU usage, preempt execution, wake processes, persist state, or touch hardware. It records candidate selection declarations that future scheduler work can refine behind explicit authority gates.

Files

time_accounting_allowed=0
time_read_allowed=0
process_wake_allowed=0
hardware_effect_allowed=0
host_effect_allowed=0
```

Validation

Run:

```
sh scripts/test-kernel-scheduler-selection.sh
sh scripts/test-kernel-scheduler-selection-report-runner.sh
```

Expected output:

```
kernel_scheduler_selection: ok
kernel_scheduler_selection_report_runner: ok
```

Non-claims

This slice does not schedule execution, select a runnable process, mutate run queues, perform context switches, read clocks, account CPU time, update quotas, update scheduler credits, preempt execution, wake processes, dispatch interrupts, perform I/O, boot hardware, or replace an operating system.

docs/KERNEL_SCHEDULER_TICK_SEED.md

Source title: Kernel Scheduler Tick Seed

Lines: 71 | Words: 169 | SHA-256: dc5d9a60ebb26265010da5bfa7b622076f09c1cc394d4fca8befe5516d6a1df5

Kernel Scheduler Tick Seed

Status: controlled scheduler tick metadata seed Scope: report-only bridge from timer-source metadata to scheduler tick intent.

Purpose

This slice connects the timer source seed to scheduler-facing tick metadata.

It does not dispatch timer interrupts, mutate run queues, switch contexts, account CPU time, wake processes, preempt execution, read clocks, or touch hardware. It records deterministic tick declarations that future scheduler work can refine behind explicit authority gates.

Files

```
include/latticra/kernel_scheduler_tick.h
src/kernel_scheduler_tick.c
tests/kernel_scheduler_tick.c
tools/kernel_scheduler_tick_report.c
scripts/test-kernel-scheduler-tick.sh
scripts/test-kernel-scheduler-tick-report-runner.sh
.github/workflows/kernel-scheduler-tick.yml
docs/KERNEL_SCHEDULER_TICK_SEED.md
```

Current posture

The default request evaluates the timer source and emits:

```
tick_status=scheduler-tick-seed-ready
timer_source_status=timer-source-seed-ready
interrupt_table_status=interrupt-table-seed-ready
scheduler_status=scheduler-seed-ready
tick_count=4
no_effect=1
```

Authority remains denied:

```
timer_tick_allowed=0
scheduler_tick_allowed=0

context_switch_allowed=0
preemption_allowed=0
time_accounting_allowed=0
time_read_allowed=0
process_wake_allowed=0
hardware_effect_allowed=0
host_effect_allowed=0
```

Validation

Run:

```
sh scripts/test-kernel-scheduler-tick.sh
sh scripts/test-kernel-scheduler-tick-report-runner.sh
```

Expected output:

```
kernel_scheduler_tick: ok
```

```
kernel_scheduler_tick_report_runner: ok
```

Non-claims

This slice does not schedule execution, mutate run queues, perform context switches, wake processes, account CPU time, read hardware clocks, dispatch interrupts, perform I/O, boot hardware, or replace an operating system.

docs/KERNEL_STATE_MACHINE.md

Source title: Kernel State Machine

Lines: 122 | Words: 298 | SHA-256: b84f89289e280a83937d74e6949912de2c9422eb7be7f7eec4901b8b9b84229f

Kernel State Machine

Status: controlled in-memory state machine implementation Scope: bounded kernel state object, sequential step function, transition log, and deterministic report surface.

Purpose

This slice builds on the kernel state mutation seed.

The previous slice proved one gated in-memory transition can report state_change_performed=1 while keeping external_effect_performed=0.

This slice adds a real mutable in-memory kernel state object. The machine starts in created, can be stepped forward through the approved kernel state ladder, records each step in a bounded transition log, and emits a deterministic state-machine report.

Files

```
include/latticra/kernel_state_machine.h
src/kernel_state_machine.c
tests/kernel_state_machine.c
scripts/test-kernel-state-machine.sh
tools/kernel_state_machine_report.c
scripts/test-kernel-state-machine-report-runner.sh
.github/workflows/kernel-state-machine.yml
docs/KERNEL_STATE_MACHINE.md
```

State ladder

The machine uses the same sequential state ladder as the kernel state mutation seed:

```
created
initialized
registry-ready
scheduler-ready
memory-map-ready
process-table-ready
syscall-table-ready
ipc-table-ready
vfs-namespace-ready
device-registry-ready
driver-catalog-ready
interrupt-table-ready
timer-source-ready
scheduler-tick-ready
run-queue-ready
context-switch-ready
time-accounting-ready
preemption-ready
scheduler-credit-ready
scheduler-selection-ready
scheduler-dispatch-ready
scheduler-handoff-ready
scheduler-activation-ready
scheduler-run-entry-ready
```

Controlled effect boundary

This slice allows internal machine mutation only:

```
state_mutated=1
```

The machine must still report:

```
external_effect_performed=0
```

This means the state machine mutates only its own in-memory struct and transition log.

Validation

Run:

```
sh scripts/test-kernel-state-machine.sh
sh scripts/test-kernel-state-machine-report-runner.sh
```

Expected output:

```
kernel_state_machine: ok
kernel_state_machine_report_runner: ok
```

The guards verify:

```
machine starts in created
default step is denied and logged
allowed step mutates machine state
sequential steps advance the state ladder
illegal step is denied without mutation
report includes transition log
external_effect_performed=0 remains true
```

Non-claims

This slice does not add:

```
filesystem writes
network access
process execution
runtime entry
hardware behavior
boot behavior
device operation
scheduler execution
memory allocation
production security boundary
operating-system replacement
```

Next possible lane

A later slice may connect the state machine to a kernel operator command or add rollback classification for in-memory state transitions before any external effects are introduced.

docs/KERNEL_STATE_MUTATION_SEED.md

Source title: Kernel State Mutation Seed

Lines: 159 | Words: 384 | SHA-256: a1fad9eb4698d2df28b5070cc9d66f9e65e76a7f830d1fba1d017dba79122fa2

Kernel State Mutation Seed

Status: first controlled-effect implementation slice Scope: gated in-memory kernel state transition.

Purpose

This slice adds the first controlled effect-bearing kernel surface.

The effect is intentionally narrow:

```
in-memory kernel state transition only
```

The state transition layer can move from one kernel state label to the next when an explicit gate allows it. It records the previous state, target state, next state, gate status, transition status, and whether a state change actually happened.

Files

```
include/latticra/kernel_state.h
src/kernel_state.c
tests/kernel_state.c
scripts/test-kernel-state.sh
tools/kernel_state_report.c
scripts/test-kernel-state-report-runner.sh
.github/workflows/kernel-state.yml
docs/KERNEL_STATE_MUTATION_SEED.md
```

State ladder

The current guarded ladder is:

```
created
initialized
registry-ready
scheduler-ready
memory-map-ready
process-table-ready
syscall-table-ready
ipc-table-ready
vfs-namespace-ready
device-registry-ready
driver-catalog-ready
interrupt-table-ready
timer-source-ready
scheduler-tick-ready
run-queue-ready
context-switch-ready
time-accounting-ready
preemption-ready
scheduler-credit-ready
scheduler-selection-ready
scheduler-dispatch-ready
scheduler-handoff-ready
scheduler-activation-ready
scheduler-run-entry-ready
```

Allowed transitions are intentionally sequential:

```
created -&gt; initialized
initialized -&gt; registry-ready
registry-ready -&gt; scheduler-ready
scheduler-ready -&gt; memory-map-ready
memory-map-ready -&gt; process-table-ready
process-table-ready -&gt; syscall-table-ready
syscall-table-ready -&gt; ipc-table-ready
ipc-table-ready -&gt; vfs-namespace-ready
vfs-namespace-ready -&gt; device-registry-ready
device-registry-ready -&gt; driver-catalog-ready
driver-catalog-ready -&gt; interrupt-table-ready
interrupt-table-ready -&gt; timer-source-ready
timer-source-ready -&gt; scheduler-tick-ready
scheduler-tick-ready -&gt; run-queue-ready
run-queue-ready -&gt; context-switch-ready
context-switch-ready -&gt; time-accounting-ready
time-accounting-ready -&gt; preemption-ready
preemption-ready -&gt; scheduler-credit-ready
scheduler-credit-ready -&gt; scheduler-selection-ready
scheduler-selection-ready -&gt; scheduler-dispatch-ready
scheduler-dispatch-ready -&gt; scheduler-handoff-ready
scheduler-handoff-ready -&gt; scheduler-activation-ready
scheduler-activation-ready -&gt; scheduler-run-entry-ready
```

No-op transitions are allowed when the gate allows them.

Non-sequential transitions are denied and do not change state.

Effect boundary

This slice changes the project posture from permanent no-effect reporting to controlled, explicit, test-covered internal effects.

The only effect this slice allows is:

```
state_change_performed=1
```

The result must still report:

```
external_effect_performed=0
```

This means no filesystem effect, network effect, process effect, device effect, boot effect, or host mutation is introduced.

Validation

Run:

```
sh scripts/test-kernel-state.sh
sh scripts/test-kernel-state-report-runner.sh
```

Expected output:

```
kernel_state: ok
kernel_state_report_runner: ok
```

The guards verify:

```
default gate denies state change
allowed sequential transition changes state
illegal transition is denied
no-op transition is stable
state_change_performed=1 only on actual allowed transition
external_effect_performed=0 always
```

Non-claims

This slice does not add:

```
filesystem writes
network access
process execution
runtime entry
hardware behavior
boot behavior
device operation
scheduler execution
memory allocation
production security boundary
operating-system replacement
```

Next possible lane

A later slice may add state persistence planning or rollback classification, but external effects should remain blocked until a separate effect contract and rollback policy exist.

docs/KERNEL_SUBSYSTEM_REGISTRY.md

Source title: Kernel Subsystem Registry

Lines: 59 | Words: 142 | SHA-256: 205f92dc6d9a7b2eaed2d1ec2de5010eaa32d732dc731505100a4ce2ab791d81

Kernel Subsystem Registry

Status: kernel subsystem registry implementation Scope: compiled metadata registry for first kernel subsystem posture.

Purpose

This slice adds a compiled kernel subsystem registry on top of the kernel seed.

The registry evaluates the current kernel seed and exposes deterministic entries for:

```
boot
runtime
scheduler
memory
process
filesystem
network
device
security
```

Implementation files

```
include/latticra/kernel_subsystem_registry.h
src/kernel_subsystem_registry.c
tests/kernel_subsystem_registry.c
scripts/test-kernel-subsystem-registry.sh
tools/kernel_subsystem_registry_report.c
scripts/test-kernel-subsystem-registry-report-runner.sh
.github/workflows/kernel-subsystem-registry.yml
docs/KERNEL_SUBSYSTEM_REGISTRY.md
```

Validation

Run:

```
sh scripts/test-kernel-subsystem-registry.sh
sh scripts/test-kernel-subsystem-registry-report-runner.sh
```

Expected output:

```
kernel_subsystem_registry: ok
kernel_subsystem_registry_report_runner: ok
```

Boundary

This registry is metadata-only and report-only.

It does not start the scheduler, allocate memory, create processes, mount filesystems, open network channels, operate devices, enforce a production security boundary, boot hardware, or replace an operating system.

The registry records subsystem posture so later implementation slices can grow one subsystem at a time under tests.

docs/KERNEL_TIME_ACCOUNTING_SEED.md

Source title: Kernel Time Accounting Seed

Lines: 73 | Words: 177 | SHA-256: 20163f7e7d332addbc4fa49822c1622421c99c2380a8b3a837d5026e97720f9e

Kernel Time Accounting Seed

Status: controlled time accounting metadata seed Scope: report-only bridge from context switch metadata to CPU charge intent.

Purpose

This slice connects the context switch seed to deterministic time accounting metadata.

It does not read time, charge CPU usage, write process usage counters, update quotas, update scheduler credits, mutate run queues, wake processes, preempt execution, or touch hardware. It records candidate accounting declarations that future scheduler work can refine behind explicit authority gates.

Files

```
include/latticra/kernel_time_accounting.h
src/kernel_time_accounting.c
tests/kernel_time_accounting.c
tools/kernel_time_accounting_report.c
scripts/test-kernel-time-accounting.sh
scripts/test-kernel-time-accounting-report-runner.sh
.github/workflows/kernel-time-accounting.yml
docs/KERNEL_TIME_ACCOUNTING_SEED.md
```

Current Posture

The default request evaluates the context switch seed and emits:

```
accounting_status=time-accounting-seed-ready
context_switch_status=context-switch-seed-ready
run_queue_status=run-queue-seed-ready
scheduler_tick_status=scheduler-tick-seed-ready
timer_source_status=timer-source-seed-ready
account_count=4
no_effect=1
```

Authority remains denied:

```
time_accounting_allowed=0
time_read_allowed=0
cpu_usage_write_allowed=0
quota_update_allowed=0
scheduler_credit_update_allowed=0
context_switch_allowed=0
run_queue_mutation_allowed=0
preemption_allowed=0
process_wake_allowed=0
hardware_effect_allowed=0
host_effect_allowed=0
```

Validation

Run:

```
sh scripts/test-kernel-time-accounting.sh
sh scripts/test-kernel-time-accounting-report-runner.sh
```

Expected output:

```
kernel_time_accounting: ok
kernel_time_accounting_report_runner: ok
```

Non-claims

This slice does not schedule execution, mutate run queues, perform context switches, read clocks, account CPU time, wake processes, dispatch interrupts, perform I/O, boot hardware, or replace an operating system.

docs/LATTICRA_OS_IMAGE_BUILD_RECIPE_CONTRACT.md

Source title: Latticra OS Image Build Recipe Contract

Lines: 200 | Words: 430 | SHA-256: 44c19c7b620a5c7060f4102fbcafd75f1bac595c523fead2272d5c3682872d7e

Latticra OS Image Build Recipe Contract

Status: contract record Evidence level: 10 target, build recipe and preflight only Scope: define the local build inputs and command recipe required before a future Latticra ISO or VM image can be produced.

Purpose

This contract makes the future image build path inspectable before any artifact is built.

It does not create an ISO, create a QCOW2 image, stage a root filesystem, install GRUB, write USB media, run QEMU, or claim operating-system readiness.

```
latticra_os_image_build_recipe_contract_present=1
os_image_build_preflight_present=1
os_image_build_recipe_template_present=1
os_image_build_execution_allowed=0
os_image_input_bundle_manifest_template_present=1
os_image_input_bundle_manifest_validation_present=1
os_image_input_bundle_manifest_candidate_present=0
os_image_input_bundle_ready_for_build_preflight=0
kernel_image_input_present=0
initramfs_input_present=0
rootfs_input_present=0
build_inputs_ready=0
build_toolchain_ready=0
os_image_build_recipe_ready=0
iso_created=0
vm_image_created=0
bootable_os_ready=0
production_os_claim=0
```

Required Inputs

A future build candidate must provide explicit inputs:

```
input_bundle_manifest_path=&lt;recorded&gt;
kernel_image_input_path=&lt;recorded&gt;
initramfs_input_path=&lt;recorded&gt;
rootfs_input_path=&lt;recorded&gt;
output_dir=&lt;recorded&gt;
```

The current default local paths are placeholders:

```
build/os-image/kernel
build/os-image/initramfs.img
build/os-image/rootfs.tar
artifacts/os-images/local-candidate/
```

Input Bundle Manifest Boundary

The input bundle manifest is the reviewable handoff into the image build lane:

```
LATTICRA OS IMAGE INPUT BUNDLE MANIFEST
manifest_version=1
bundle_kind=os-image-build-inputs
source_commit=&lt;recorded&gt;
build_environment=&lt;recorded&gt;
kernel_image_input_path=&lt;path&gt;
kernel_image_input_sha256=&lt;sha256&gt;
initramfs_input_path=&lt;path&gt;
initramfs_input_sha256=&lt;sha256&gt;
rootfs_input_path=&lt;path&gt;
rootfs_input_format=&lt;tar-or-tar.gz&gt;
rootfs_input_sha256=&lt;sha256&gt;
operator_recovery_path=&lt;recorded-or-none&gt;
bootable_os_ready=0
production_os_claim=0
```

The validator may prove path and checksum consistency, but it must preserve:

```
os_image_input_bundle_ready_for_build_preflight=&lt;0-or-1&gt;
os_image_build_execution_allowed=0
hardware_install_ready=0
full_os_install_ready=0
bootable_os_ready=0
production_os_claim=0
```

Required Tools

The preflight reports local visibility for:

```
qemu-img
xorriso
grub-mkrescue
tar
gzip
sha256sum or shasum
```

Missing tools must block the build recipe from being marked ready.

Commands

Run the build preflight:

```
sh scripts/latticra-os-image-build-preflight.sh
```

Generate the input bundle manifest template:

```
sh scripts/latticra-os-image-input-bundle-template.sh
```

Validate the current fixture or a future input bundle manifest:

```
sh scripts/latticra-os-image-input-bundle-validate.sh
sh scripts/latticra-os-image-input-bundle-validate.sh --input-manifest
build/os-image/input-bundle.txt
```

Run it with explicit candidate inputs:

```
sh scripts/latticra-os-image-build-preflight.sh --kernel build/os-image/kernel --initramfs
build/os-image/initramfs.img --rootfs build/os-image/rootfs.tar --output-dir
artifacts/os-images/local-candidate
```

The preflight prints future command shapes, including:

```
future_iso_build_command=grub-mkrescue ...
future_vm_image_create_command=qemu-img create ...
future_input_bundle_validation_command=sh scripts/latticra-os-image-input-bundle-validate.sh ...
future_artifact_manifest_validation_command=sh
scripts/latticra-os-image-artifact-manifest-validate.sh ...
```

It must preserve:

```
grub_mkrescue_invoked=0
qemu_img_invoked=0
iso_created=0
vm_image_created=0
artifact_manifest_written=0
usb_write_executed=0
qemu_run_performed=0
host_mutation_performed=0
```

Build Recipe Promotion Gates

Before a future implementation may run the recipe, reviewed evidence must show:

```
kernel_image_input_present=1
initramfs_input_present=1
rootfs_input_present=1
os_image_input_bundle_ready_for_build_preflight=1
qemu_img_available=1
xorriso_available=1
grub_mkrescue_available=1
source_tag_recorded=1
build_environment_recorded=1
recovery_path_recorded=1
operator_consent_recorded=1
```

Even when those are present, this contract alone must keep:

```
os_image_build_execution_allowed=0
hardware_install_ready=0
full_os_install_ready=0
bootable_os_ready=0
production_os_claim=0
```

Guard Validation

This contract is guarded by:

```
sh scripts/test-latticra-os-image-build-preflight.sh
sh scripts/test-latticra-os-image-input-bundle-template.sh
sh scripts/test-latticra-os-image-input-bundle-validate.sh
```

Expected output:

```
latticra_os_image_build_preflight: ok
latticra_os_image_input_bundle_template: ok
latticra_os_image_input_bundle_validate: ok
```

Non-claims

This contract is not a kernel, not an initramfs, not a root filesystem, not an ISO builder, not a VM image builder, not a boot proof, not a USB installer, not hardware install readiness, not full OS readiness, and not a production OS claim.

docs/LATTICRA_OS_IMAGE_RELEASE_READINESS_CONTRACT.md

Source title: Latticra OS Image Release Readiness Contract

Lines: 293 | Words: 671 | SHA-256: 0e540e50c9688bf1cf9d4a029c9c85130f750841fab0cdedc6258f8b8287816d

Latticra OS Image Release Readiness Contract

Status: contract record Evidence level: 10 target, ISO USB and VM image readiness contract only Scope: prepare the release lane for a future Latticra ISO, USB write command, and virtual machine image without claiming that a bootable operating system artifact exists yet.

Purpose

This contract defines what must be present before Latticra can offer users a hardware install path from a USB ISO and a virtual machine image for testing.

It is a release-preparation lane. It does not create an ISO, create a VM image, write a USB device, run QEMU, install a bootloader, install a kernel, mutate firmware, or claim that Latticra is ready as a full operating system.

```
latticra_os_image_release_readiness_contract_present=1
iso_artifact_present=0
os_image_artifact_manifest_template_present=1
os_image_artifact_manifest_validation_present=1
os_image_artifact_manifest_candidate_present=0
os_image_build_preflight_present=1
os_image_build_execution_allowed=0
usb_write_command_template_present=1
usb_write_execution_allowed=0
vm_image_artifact_present=0
vm_test_command_template_present=1
qemu_execution_allowed_by_guard=0
hardware_install_ready=0
full_os_install_ready=0
bootable_os_ready=0
production_os_claim=0
```

Current Manifest

The current fixture manifest is:

```
installer/manifests/latticra-os-image-release.toml
```

The manifest records the future artifact names, target profiles, and blocked authority flags for:

```
x86_64-usb-iso
x86_64-qemu-qcow2
x86_64-qemu-iso
```

Required Release Artifact Set

A future reviewed release candidate should use a deterministic artifact directory such as:

```
artifacts/os-images/&lt;version&gt;/
```

Minimum hardware-install artifacts:

```
latticra-x86_64.iso
latticra-x86_64.iso.sha256
latticra-x86_64.iso.sig
manifest.txt
sbom.spdx.json
```

Minimum VM-test artifacts:

```
latticra-x86_64.qcow2
latticra-x86_64.qcow2.sha256
latticra-x86_64.qcow2.sig
manifest.txt
sbom.spdx.json
```

The ISO and VM image may not be described as ready until checksums, signatures or explicit unsigned-local status, SBOM metadata, boot evidence, recovery steps, and install evidence are reviewed.

Artifact Manifest Boundary

The future artifact manifest must be line-oriented and deterministic:

```
LATTICRA OS IMAGE ARTIFACT MANIFEST
manifest_version=1
artifact_set=os-image-release
artifact_version=&lt;recorded&gt;
source_commit=&lt;recorded&gt;
source_tag=&lt;recorded-or-none&gt;
build_environment=&lt;recorded&gt;
iso_artifact_path=&lt;path-or-none&gt;
iso_artifact_sha256=&lt;sha256-or-none&gt;
iso_signature_path=&lt;path-or-none&gt;
iso_sbom_path=&lt;path-or-none&gt;
vm_image_path=&lt;path-or-none&gt;
vm_image_format=&lt;qcow2-or-raw-or-none&gt;
vm_image_sha256=&lt;sha256-or-none&gt;
vm_signature_path=&lt;path-or-none&gt;
vm_sbom_path=&lt;path-or-none&gt;
usb_write_command_template_present=1
vm_test_command_template_present=1
operator_recovery_path=&lt;recorded-or-none&gt;
bootable_os_ready=0
production_os_claim=0
```

The validator may verify artifact path and checksum consistency, but it must preserve:

```
artifact_manifest_ready_for_operator_review=&lt;0-or-1&gt;
hardware_install_ready=0
full_os_install_ready=0
bootable_os_ready=0
production_os_claim=0
```

Commands

Preflight the fixture:

```
sh scripts/latticra-os-image-release-preflight.sh
```

Preflight the future local image build inputs:

```
sh scripts/latticra-os-image-build-preflight.sh
```

Generate the artifact manifest template:

```
sh scripts/latticra-os-image-artifact-manifest-template.sh
```

Validate the current fixture or a future artifact manifest candidate:

```
sh scripts/latticra-os-image-artifact-manifest-validate.sh
sh scripts/latticra-os-image-artifact-manifest-validate.sh --artifact-manifest
artifacts/os-images/&lt;version&gt;/manifest.txt
```

Generate a Linux USB write command for operator review:

```
sh scripts/latticra-os-image-usb-write-command.sh --iso
artifacts/os-images/&lt;version&gt;/latticra-x86_64.iso --device /dev/sdX --platform linux
```

Generate a macOS USB write command for operator review:

```
sh scripts/latticra-os-image-usb-write-command.sh --iso
artifacts/os-images/&lt;version&gt;/latticra-x86_64.iso --device /dev/rdiskN --platform macos
```

Generate a QEMU VM test command for operator review:

```
sh scripts/latticra-os-image-vm-test-command.sh --image
artifacts/os-images/&lt;version&gt;/latticra-x86_64.qcow2 --format qcow2 --firmware seabios
```

These scripts print commands and evidence fields. They do not run the USB write command or QEMU command.

USB Write Command Boundary

The command generator may print a command shaped like:

```
usb_write_command=sudo dd if=&#x27;&lt;iso-path&gt;&#x27; of=&#x27;&lt;target-device&gt;&#x27;
bs=4M conv=fsync status=progress
post_write_command=sync
```

Before an operator runs a printed write command, the release evidence must include:

```
iso_artifact_present=1
iso_artifact_sha256_recorded=1
iso_checksum_verified_by_operator=1
target_device_verified_removable=1
target_device_contains_no_required_data=1
operator_recovery_path_recorded=1
operator_consent_recorded=1
```

The generator must preserve:

```
usb_write_execution_allowed=0
usb_write_executed=0
partition_mutation_performed=0
host_mutation_performed=0
```

VM Image Test Boundary

The VM command generator may print a command shaped like:

```
qemu_test_command=qemu-system-x86_64 ...
```

Before a VM image can become accepted test evidence, the release evidence must include:

```
vm_image_artifact_present=1
vm_image_sha256_recorded=1
vm_image_checksum_verified_by_operator=1
qemu_argv_recorded=1
serial_console_boot_log_recorded=1
read_only_vm_evidence_recorded=1
operator_recovery_path_recorded=1
```

The generator must preserve:

```
qemu_execution_allowed_by_guard=0
qemu_run_performed=0
qemu_boot_execution_recorded=0
host_mutation_performed=0
```

Required Promotion Evidence

Before any future claim changes from 0 to 1, the project needs reviewed evidence for:

```
source_tag_recorded=1
build_environment_recorded=1
iso_build_command_recorded=1
vm_image_build_command_recorded=1
artifact_reproducibility_reviewed=1
artifact_sha256_recorded=1
artifact_signature_recorded_or_unsigned_local_status_declared=1
sbom_recorded=1
license_metadata_recorded=1
bootloader_configuration_recorded=1
kernel_image_recorded=1
initramfs_recorded=1
hardware_usb_write_transcript_recorded=1
hardware_install_transcript_recorded=1
vm_boot_transcript_recorded=1
serial_console_boot_log_recorded=1
rollback_or_recovery_path_recorded=1
post_install_verification_recorded=1
uninstall_or_reimage_recovery_recorded=1
multi_machine_validation_recorded=1
```

Guard Validation

This lane is guarded by:

```
sh scripts/test-latticra-os-image-release-readiness-contract.sh
sh scripts/test-latticra-os-image-artifact-manifest-template.sh
sh scripts/test-latticra-os-image-artifact-manifest-validate.sh
sh scripts/test-latticra-os-image-usb-write-command.sh
sh scripts/test-latticra-os-image-vm-test-command.sh
```

Expected outputs:

```
latticra_os_image_release_readiness_contract: ok
latticra_os_image_artifact_manifest_template: ok
latticra_os_image_artifact_manifest_validate: ok
latticra_os_image_usb_write_command: ok
latticra_os_image_vm_test_command: ok
```

Current Classification

```
os_image_release_readiness_contract_present=1
os_image_release_manifest_fixture_present=1
iso_artifact_present=0
os_image_artifact_manifest_template_present=1
os_image_artifact_manifest_validation_present=1
os_image_artifact_manifest_candidate_present=0
os_image_build_preflight_present=1
os_image_build_execution_allowed=0
vm_image_artifact_present=0
usb_write_command_template_present=1
vm_test_command_template_present=1
hardware_install_ready=0
full_os_install_ready=0
bootable_os_ready=0
production_os_claim=0
```

Non-claims

This contract is not a bootable ISO, not a VM image, not a USB writer, not a hardware installer, not a production installer, not operating-system completeness, not a daily-driver readiness claim, not security hardening, not sandboxing, not malware prevention, not ransomware prevention, and not a production OS claim.

docs/SEABIOS_GRUB_BOOT_PREVIEW_BOOT_ARTIFACT_MANIFEST_TEMPLATE.md

Source title: SeaBIOS and GRUB Boot Preview Boot Artifact Manifest Template

Lines: 120 | Words: 296 | SHA-256: 77a49831e3d1e68b46321a8ad1c8b2b8d45fdd4c02eb2f98a334f9a39fa51c19

SeaBIOS and GRUB Boot Preview Boot Artifact Manifest Template

Status: no-effect boot-preview boot artifact manifest template Evidence level: 8 target, manifest template only Scope: future boot artifact metadata for SeaBIOS, GRUB 2 BIOS, and GRUB 2 UEFI boot-preview profiles.

Purpose

This template defines the boot artifact manifest shape required before any future disk image, ISO, kernel, initramfs, or GRUB configuration can become boot evidence.

It is not a boot artifact. It does not create a disk image, create an ISO, install GRUB, generate GRUB config, install a kernel, write an initramfs, run QEMU, or mutate host boot state.

```
seabios_grub_boot_preview_boot_artifact_manifest_template_present=1
boot_artifact_manifest_template_mode=no-effect-template
boot_artifact_manifest_template_decision=blocked-template-only-no-artifact
boot_artifact_manifest_ready=0
boot_artifact_manifest_present=0
disk_image_created=0
```

```
disk_image_written=0
bootable_os_ready=0
production_os_claim=0
```

Command

```
sh scripts/seabios-grub-boot-preview-boot-artifact-manifest-template.sh
```

Optional manifest override:

```
sh scripts/seabios-grub-boot-preview-boot-artifact-manifest-template.sh --manifest
installer/manifests/seabios-grub-boot-preview.toml
```

Boot artifact manifest validation

The current fixture is checked by:

```
sh scripts/seabios-grub-boot-preview-boot-artifact-manifest-validate.sh
```

The validation gate rejects premature bootable, GRUB, QEMU, or production OS claims while keeping the artifact manifest incomplete.

Required Future Manifest Fields

A future completed boot artifact manifest must record:

```
artifact_id
artifact_format
artifact_path
artifact_sha256
target_firmware
target_bootloader
partition_scheme
bios_boot_partition_declared
efi_system_partition_declared
grub_config_path
grub_config_sha256
kernel_image_path
kernel_image_sha256
initramfs_path
initramfs_sha256
serial_console_enabled
operator_recovery_path
rollback_or_recovery_path
sbom_path
sbom_sha256
signature_path
signature_sha256
```

Required Profile Templates

The template keeps separate blocked manifests for:

```
x86_64-seabios-grub-preview
x86_64-grub2-bios-preview
x86_64-grub2-uefi-preview
```

Each profile remains incomplete until artifact, checksum, partition, bootloader, kernel, initramfs, serial-console, and recovery metadata exists.

Required Non-Effects

The template must always preserve:

```
boot_artifact_manifest_written=0
disk_image_created=0
disk_image_written=0
iso_created=0
grub_install_invoked=0
grub_mkconfig_invoked=0
grub_mkrescue_invoked=0
kernel_install_performed=0
initramfs_write_performed=0
qemu_boot_execution_attempted=0
host_mutation_performed=0
```

Guard

```
sh scripts/test-seabios-grub-boot-preview-boot-artifact-manifest-template.sh
```

Expected output:

```
seabios_grub_boot_preview_boot_artifact_manifest_template: ok
```

Non-claims

This template does not prove artifact integrity, create boot media, create a bootable Latticra OS image, prove SeaBIOS compatibility, prove GRUB BIOS compatibility, prove GRUB UEFI compatibility, or make Latticra production installer ready.

docs/SEABIOS_GRUB_BOOT_PREVIEW_BOOT_ARTIFACT_MANIFEST_VALIDATION.md

Source title: SeaBIOS and GRUB Boot Preview Boot Artifact Manifest Validation

Lines: 109 | Words: 337 | SHA-256: ac503415550e7d16780e12a131e4e699e34b8280a9c60febb93ee9fdaaa59deb

SeaBIOS and GRUB Boot Preview Boot Artifact Manifest Validation

Status: no-effect boot-preview boot artifact manifest validation Evidence level: 8 target, validation gate only Scope: current fixture validation for future SeaBIOS, GRUB 2 BIOS, and GRUB 2 UEFI boot artifact manifests.

Purpose

This validation gate makes the boot artifact manifest lane checkable before any boot media exists.

It validates that the current fixture remains incomplete, non-authoritative, and unable to promote a boot claim. It does not accept a production artifact, create a disk image, create an ISO, invoke GRUB, install a kernel, write an initramfs, run QEMU, or mutate host boot state.

```
seabios_grub_boot_preview_boot_artifact_manifest_validation_present=1
boot_artifact_manifest_validation_mode=no-effect-readiness-check
boot_artifact_manifest_validation_decision=blocked-fixture-only-incomplete
boot_artifact_manifest_candidate_ready=0
boot_artifact_manifest_present=0
boot_artifact_checksum_recorded=0
boot_artifact_signature_recorded=0
qemu_execution_allowed_by_guard=0
bootable_os_ready=0
production_os_claim=0
```

Command

```
sh scripts/seabios-grub-boot-preview-boot-artifact-manifest-validate.sh
```

Optional manifest override:

```
sh scripts/seabios-grub-boot-preview-boot-artifact-manifest-validate.sh --manifest
installer/manifests/seabios-grub-boot-preview.toml
```

Required Fixture Fields

The validator requires the current preview fixture to keep these blocked fields:

```
status = &quot;fixture-only&quot;
boot_artifact_manifest_present = false
boot_artifact_checksum_recorded = false
boot_artifact_signature_recorded = false
bootable_os_ready = false
production_os_claim = false
qemu_execution_allowed_by_guard = false
seabios_grub_boot_claim_allowed = false
```

```
grub_bootloader_write_allowed = false
```

The artifact section must remain a placeholder:

```
format = &quot;none&quot;
disk_image_path = &quot;none&quot;
disk_image_sha256 = &quot;none&quot;
signature_path = &quot;none&quot;
sbom_path = &quot;none&quot;
kernel_image_path = &quot;none&quot;
initramfs_path = &quot;none&quot;
grub_config_path = &quot;none&quot;
operator_recovery_path = &quot;none&quot;
```

Required Profiles

The validator requires all preview profiles to remain present:

```
x86_64-seabios-grub-preview
x86_64-grub2-bios-preview
x86_64-grub2-uefi-preview
```

Each profile remains blocked until artifact metadata, checksums, QEMU argv records, serial-console logs, and recovery paths are recorded by a later evidence lane.

Required Rejections

The validator must reject premature claims for:

```
boot_artifact_manifest_present = true
boot_artifact_checksum_recorded = true
boot_artifact_signature_recorded = true
bootable_os_ready = true
production_os_claim = true
qemu_execution_allowed_by_guard = true
seabios_grub_boot_claim_allowed = true
grub_bootloader_write_allowed = true
```

Guard

```
sh scripts/test-seabios-grub-boot-preview-boot-artifact-manifest-validate.sh
```

Expected output:

```
seabios_grub_boot_preview_boot_artifact_manifest_validate: ok
```

Non-claims

This validator does not prove artifact integrity, create boot media, create a bootable Latticra OS image, prove SeaBIOS compatibility, prove GRUB BIOS compatibility, prove GRUB UEFI compatibility, authorize QEMU execution, or make Latticra production installer ready.

docs/SEABIOS_GRUB_BOOT_PREVIEW_EVIDENCE_CAPTURE_TEMPLATE.md

Source title: SeaBIOS and GRUB Boot Preview Evidence Capture Template

Lines: 134 | Words: 375 | SHA-256: 317822ab6762c05bbd95c4e5c4f70b32da08f4b546ac3a5906734cefe3a38d98

SeaBIOS and GRUB Boot Preview Evidence Capture Template

Status: no-effect boot-preview evidence capture template Evidence level: 8 target, template only Scope: future QEMU evidence bundle shape for SeaBIOS, GRUB 2 BIOS, and GRUB 2 UEFI boot-preview profiles.

Purpose

This template defines what a future boot evidence bundle must record before Latticra can make any boot-preview claim.

It is a capture template only. It does not execute QEMU, invoke GRUB, create an ISO, create a disk image, write bootloader state, record a serial log, or promote Latticra to a bootable operating system.

```
seabios_grub_boot_preview_evidence_capture_template_present=1
capture_template_mode=no-effect-template
capture_template_decision=blocked-template-only-no-boot-execution
capture_template_complete=0
boot_evidence_record_ready=0
qemu_execution_allowed_by_guard=0
qemu_boot_execution_attempted=0
bootable_os_ready=0
production_os_claim=0
```

Command

```
sh scripts/seabios-grub-boot-preview-evidence-template.sh
```

Optional manifest override:

```
sh scripts/seabios-grub-boot-preview-evidence-template.sh --manifest
installer/manifests/seabios-grub-boot-preview.toml
```

The command emits a deterministic evidence-record template to stdout.

The QEMU argv template companion is:

```
sh scripts/seabios-grub-boot-preview-qemu-argv-template.sh
```

It prints future profile-specific QEMU argv record placeholders without running QEMU.

The Boot artifact manifest template companion is:

```
sh scripts/seabios-grub-boot-preview-boot-artifact-manifest-template.sh
```

It prints future boot artifact metadata placeholders without creating disk images, installing GRUB, or writing boot files.

The Boot-preview evidence validation companion is:

```
sh scripts/seabios-grub-boot-preview-evidence-validate.sh
```

It checks the current fixture for premature QEMU, serial-console, recovery, or bootability claims before any future evidence bundle is accepted.

The Boot artifact manifest validation companion is:

```
sh scripts/seabios-grub-boot-preview-boot-artifact-manifest-validate.sh
```

It checks the current fixture for premature bootable, GRUB, QEMU, or production OS claims before any future artifact manifest is accepted.

Required Future Evidence Fields

A future completed evidence bundle must record:

```
operator_review_id
preflight_report_path
preflight_report_sha256
boot_preview_manifest_path
boot_preview_manifest_sha256
boot_artifact_manifest_path
boot_artifact_manifest_sha256
boot_artifact_manifest_template_path
boot_artifact_manifest_validation_report_path
boot_artifact_manifest_validation_report_sha256
boot_evidence_validation_report_path
boot_evidence_validation_report_sha256
disk_image_path
disk_image_sha256
artifact_format
target_firmware
target_bootloader
qemu_machine
qemu_binary
qemu_argv_record_path
qemu_argv_template_path
serial_console_boot_log_path
serial_console_boot_log_sha256
boot_result
```

```
operator_console_boot_path
operator_recovery_path
rollback_or_recovery_path
host_mutation_performed
firmware_mutation_performed
bootloader_write_performed
```

Required Profiles

The template keeps separate placeholders for:

```
x86_64-seabios-grub-preview
x86_64-grub2-bios-preview
x86_64-grub2-uefi-preview
```

Each remains blocked until artifact, QEMU argv, serial-log, and recovery evidence exist.

Guard

```
sh scripts/test-seabios-grub-boot-preview-evidence-template.sh
```

Expected output:

```
seabios_grub_boot_preview_evidence_template: ok
```

Non-claims

This template does not create a boot artifact manifest, boot a VM, run QEMU, invoke GRUB, create a disk image, create an ISO, install a kernel, install an initramfs, mutate firmware, write bootloader state, change host boot state, prove SeaBIOS compatibility, prove GRUB compatibility, or make Latticra installer-ready as a production OS.

docs/SEABIOS_GRUB_BOOT_PREVIEW_EVIDENCE_CONTRACT.md

Source title: SeaBIOS and GRUB Boot Preview Evidence Contract

Lines: 255 | Words: 554 | SHA-256: 5411bc578f0607a39a90f8fb8e1c09ac41a720d95b7da5f9e7fa710f6c6dee13

SeaBIOS and GRUB Boot Preview Evidence Contract

Status: boot-preview-evidence contract Evidence level: 8 target, manifest fixture only Scope: future QEMU evidence for SeaBIOS, GRUB 2 BIOS, and GRUB 2 UEFI boot-preview profiles.

Purpose

Latticra needs a disciplined path from installer-safe compatibility to real boot evidence.

This contract defines the next preview lane without claiming that a bootable Latticra operating-system image exists today.

```
seabios_grub_boot_preview_evidence_contract_present=1
boot_preview_manifest_fixture_present=1
boot_preview_manifest_validated=1
boot_artifact_manifest_present=0
qemu_boot_execution_recorded=0
serial_console_boot_log_recorded=0
operator_console_boot_path_recorded=0
bootable_os_ready=0
production_os_claim=0
```

Manifest fixture

The fixture manifest is:

```
installer/manifests/seabios-grub-boot-preview.toml
```

It records the fields that future boot evidence must replace with real artifact paths, digests, and logs.

The fixture must preserve:

```
status=&quot;fixture-only&quot;
boot_artifact_manifest_present=false
bootable_os_ready=false
production_os_claim=false
host_mutation_authority=false
firmware_mutation_allowed=false
bootloader_write_allowed=false
partition_mutation_allowed=false
mbr_write_allowed=false
gpt_write_allowed=false
efi_variable_write_allowed=false
esp_write_allowed=false
qemu_execution_allowed_by_guard=false
```

Required preview profiles

Future evidence must keep separate records for:

```
x86_64-seabios-grub-preview
x86_64-grub2-bios-preview
x86_64-grub2-uefi-preview
```

Each profile must record:

```
target_firmware
target_bootloader
qemu_machine
qemu_binary
disk_image_path
disk_image_sha256
boot_log_path
serial_console_enabled
host_bootloader_mutation
firmware_mutation
operator_recovery_path
```

Promotion requirements

No boot-preview status may be promoted until these fields are true:

```
boot_artifact_manifest_present=1
boot_artifact_checksum_recorded=1
qemu_i440fx_seabios_boot_validation_completed=1
qemu_grub2_bios_boot_validation_completed=1
qemu_ovmf_grub2_uefi_boot_validation_completed=1
serial_console_boot_log_recorded=1
operator_console_boot_path_recorded=1
read_only_vm_evidence_recorded=1
operator_recovery_runbook_present=1
no_host_bootloader_mutation=1
no_firmware_mutation=1
```

Until then:

```
seabios_grub_boot_claim_allowed=0
grub_bootloader_write_allowed=0
qemu_boot_execution_allowed_by_guard=0
production_os_claim=0
```

Boot-preview preflight

The no-effect boot-preview preflight is:

```
sh scripts/seabios-grub-boot-preview-preflight.sh
```

It validates this fixture lane and reports local tool visibility without running QEMU, invoking GRUB, creating disk images, writing bootloader state, or recording boot evidence.

```
seabios_grub_boot_preview_preflight_present=1
preflight_mode=no-effect-report
preflight_decision=blocked-fixture-only-no-boot-execution
manifest_fixture_valid=1
qemu_boot_execution_attempted=0
grub_install_invoked=0
disk_image_created=0
host_mutation_performed=0
```

Boot-preview evidence capture template

The no-effect evidence capture template is:

```
sh scripts/seabios-grub-boot-preview-evidence-template.sh
```

It prints the required future evidence bundle fields without running QEMU, invoking GRUB, creating disk images, or promoting any boot claim.

```
seabios_grub_boot_preview_evidence_capture_template_present=1
capture_template_mode=no-effect-template
capture_template_decision=blocked-template-only-no-boot-execution
capture_template_complete=0
boot_evidence_record_ready=0
qemu_boot_execution_attempted=0
bootable_os_ready=0
```

Boot-preview evidence validation

The no-effect boot-preview evidence validation gate is:

```
sh scripts/seabios-grub-boot-preview-evidence-validate.sh
```

It classifies the current fixture and rejects premature QEMU, serial-console, recovery, and bootability claims before future boot evidence can be accepted.

```
seabios_grub_boot_preview_evidence_validation_present=1
boot_evidence_validation_mode=no-effect-readiness-check
boot_evidence_validation_decision=blocked-fixture-only-no-boot-evidence
boot_evidence_candidate_ready=0
qemu_i440fx_seabios_boot_validation_completed=0
qemu_grub2_bios_boot_validation_completed=0
qemu_ovmf_grub2_uefi_boot_validation_completed=0
serial_console_boot_log_recorded=0
operator_recovery_runbook_present=0
bootable_os_ready=0
production_os_claim=0
```

Boot artifact manifest template

The no-effect boot artifact manifest template is:

```
sh scripts/seabios-grub-boot-preview-boot-artifact-manifest-template.sh
```

It records the future artifact metadata shape without creating images, invoking GRUB, installing kernels, writing initramfs files, or creating a boot artifact manifest.

```
seabios_grub_boot_preview_boot_artifact_manifest_template_present=1
boot_artifact_manifest_template_mode=no-effect-template
boot_artifact_manifest_template_decision=blocked-template-only-no-artifact
boot_artifact_manifest_ready=0
boot_artifact_manifest_present=0
disk_image_created=0
bootable_os_ready=0
```

Boot artifact manifest validation

The no-effect boot artifact manifest validation gate is:

```
sh scripts/seabios-grub-boot-preview-boot-artifact-manifest-validate.sh
```

It classifies the current fixture and rejects premature bootable, GRUB, QEMU, or production OS claims before a future artifact manifest can be accepted.

```
seabios_grub_boot_preview_boot_artifact_manifest_validation_present=1
boot_artifact_manifest_validation_mode=no-effect-readiness-check
boot_artifact_manifest_validation_decision=blocked-fixture-only-incomplete
boot_artifact_manifest_candidate_ready=0
boot_artifact_manifest_present=0
bootable_os_ready=0
production_os_claim=0
```

QEMU argv template

The no-effect QEMU argv template is:

```
sh scripts/seabios-grub-boot-preview-qemu-argv-template.sh
```

It records the future profile-specific argv shape without running QEMU or creating boot evidence.

```
seabios_grub_boot_preview_qemu_argv_template_present=1
qemu_argv_template_mode=no-effect-template
qemu_argv_template_decision=blocked-template-only-no-qemu-execution
qemu_argv_record_ready=0
qemu_run_performed=0
qemu_boot_execution_attempted=0
bootable_os_ready=0
```

Guard validation

This preview lane is guarded by:

```
sh scripts/test-seabios-grub-boot-preview-evidence-contract.sh
sh scripts/test-seabios-grub-boot-preview-preflight.sh
sh scripts/test-seabios-grub-boot-preview-evidence-template.sh
sh scripts/test-seabios-grub-boot-preview-evidence-validate.sh
sh scripts/test-seabios-grub-boot-preview-qemu-argv-template.sh
sh scripts/test-seabios-grub-boot-preview-boot-artifact-manifest-template.sh
sh scripts/test-seabios-grub-boot-preview-boot-artifact-manifest-validate.sh
```

Expected output:

```
seabios_grub_boot_preview_evidence_contract: ok
```

Non-claims

This contract does not create an ISO, disk image, bootloader configuration, kernel, initramfs, QEMU launcher, VM run, serial log, or operating-system release.

It does not authorize firmware writes, GRUB writes, partition mutation, MBR writes, GPT writes, EFI variable writes, ESP writes, kernel installation, initramfs writes, service installation, driver loading, root escalation, network access, or host boot changes.

docs/SEABIOS_GRUB_BOOT_PREVIEW_EVIDENCE_VALIDATION.md

Source title: SeaBIOS and GRUB Boot Preview Evidence Validation

Lines: 104 | Words: 308 | SHA-256: 03a010a0d752ada841babcb955fdd6f1231be69755dbb99ba73291f7032d20f4

SeaBIOS and GRUB Boot Preview Evidence Validation

Status: no-effect boot-preview evidence validation Evidence level: 8 target, validation gate only Scope: current fixture validation for future SeaBIOS, GRUB 2 BIOS, and GRUB 2 UEFI boot evidence bundles.

Purpose

This validation gate makes the boot evidence lane checkable before any VM boot evidence exists.

It validates that the current fixture remains unbooted, incomplete, and unable to promote a boot-preview claim. It does not accept a serial log, run QEMU, invoke GRUB, create a disk image, create an ISO, write firmware state, write bootloader state, mutate partitions, or claim Latticra is bootable.

```
seabios_grub_boot_preview_evidence_validation_present=1
boot_evidence_validation_mode=no-effect-readiness-check
boot_evidence_validation_decision=blocked-fixture-only-no-boot-evidence
boot_evidence_candidate_ready=0
qemu_i440fx_seabios_boot_validation_completed=0
qemu_grub2_bios_boot_validation_completed=0
qemu_ovmf_grub2_uefi_boot_validation_completed=0
serial_console_boot_log_recorded=0
operator_console_boot_path_recorded=0
read_only_vm_evidence_recorded=0
operator_recovery_runbook_present=0
bootable_os_ready=0
production_os_claim=0
```

Command

```
sh scripts/seabios-grub-boot-preview-evidence-validate.sh
```

Optional manifest override:

```
sh scripts/seabios-grub-boot-preview-evidence-validate.sh --manifest
installer/manifests/seabios-grub-boot-preview.toml
```

Required Fixture Fields

The validator requires the current preview fixture to preserve:

```
boot_artifact_manifest_present = false
boot_artifact_checksum_recorded = false
qemu_i440fx_seabios_boot_validation_completed = false
qemu_grub2_bios_boot_validation_completed = false
qemu_ovmf_grub2_uefi_boot_validation_completed = false
serial_console_boot_log_recorded = false
operator_console_boot_path_recorded = false
read_only_vm_evidence_recorded = false
operator_recovery_runbook_present = false
seabios_grub_boot_claim_allowed = false
grub_bootloader_write_allowed = false
bootable_os_ready = false
production_os_claim = false
```

The protected non-mutation fields must remain:

```
host_mutation_authority = false
firmware_mutation_allowed = false
bootloader_write_allowed = false
partition_mutation_allowed = false
qemu_execution_allowed_by_guard = false
no_host_bootloader_mutation = true
no_firmware_mutation = true
```

Required Rejections

The validator must reject premature claims for:

```
qemu_i440fx_seabios_boot_validation_completed = true
qemu_grub2_bios_boot_validation_completed = true
qemu_ovmf_grub2_uefi_boot_validation_completed = true
serial_console_boot_log_recorded = true
operator_console_boot_path_recorded = true
read_only_vm_evidence_recorded = true
operator_recovery_runbook_present = true
seabios_grub_boot_claim_allowed = true
bootable_os_ready = true
production_os_claim = true
```

Guard

```
sh scripts/test-seabios-grub-boot-preview-evidence-validate.sh
```

Expected output:

```
seabios_grub_boot_preview_evidence_validate: ok
```

Non-claims

This validator does not run QEMU, create or verify a boot log, prove SeaBIOS boot, prove GRUB BIOS boot, prove GRUB UEFI boot, create a bootable Latticra OS image, authorize bootloader writes, or make Latticra production installer ready.

docs/SEABIOS_GRUB_BOOT_PREVIEW_PREFLIGHT.md

Source title: SeaBIOS and GRUB Boot Preview Preflight

Lines: 114 | Words: 286 | SHA-256: ef1aed43b19c7fb9fe35406663e519ea5dddb46afe66742264290eeca73d1c91

SeaBIOS and GRUB Boot Preview Preflight

Status: no-effect boot-preview preflight Evidence level: 8 target, local report only Scope: operator-readable readiness check before any future SeaBIOS, GRUB 2 BIOS, or GRUB 2 UEFI QEMU evidence run.

Purpose

This preflight makes the boot-preview lane operationally checkable without executing it.

It validates the fixture manifest, reports whether common local tooling is visible, and preserves the current non-claim posture:

```
seabios_grub_boot_preview_preflight_present=1
preflight_mode=no-effect-report
preflight_decision=blocked-fixture-only-no-boot-execution
manifest_fixture_valid=1
boot_artifact_manifest_present=0
qemu_execution_allowed_by_guard=0
qemu_boot_execution_attempted=0
qemu_boot_execution_recorded=0
bootable_os_ready=0
production_os_claim=0
```

Command

```
sh scripts/seabios-grub-boot-preview-preflight.sh
```

Optional manifest override:

```
sh scripts/seabios-grub-boot-preview-preflight.sh --manifest
installer/manifests/seabios-grub-boot-preview.toml
```

Reported Tool Visibility

The preflight reports local visibility only:

```
qemu_system_x86_64_available=&lt;0-or-1&gt;
grub_mkrescue_available=&lt;0-or-1&gt;
grub_install_available=&lt;0-or-1&gt;
xorriso_available=&lt;0-or-1&gt;
ovmf_firmware_detected=&lt;0-or-1&gt;
```

Tool visibility is not boot evidence. Missing tools do not fail the contract guard because the current lane is still fixture-only.

The evidence capture template for the next non-executing step is:

```
sh scripts/seabios-grub-boot-preview-evidence-template.sh
```

The QEMU argv template for future profile-specific command records is:

```
sh scripts/seabios-grub-boot-preview-qemu-argv-template.sh
```

The boot artifact manifest template for future artifact metadata is:

```
sh scripts/seabios-grub-boot-preview-boot-artifact-manifest-template.sh
```

The boot artifact manifest validation for the current blocked fixture is:

```
sh scripts/seabios-grub-boot-preview-boot-artifact-manifest-validate.sh
```

The boot-preview evidence validation for future QEMU and serial-console evidence is:

```
sh scripts/seabios-grub-boot-preview-evidence-validate.sh
```

Required Non-Effects

The preflight must always report:

```
qemu_boot_execution_attempted=0
grub_install_invoked=0
grub_mkrescue_invoked=0
disk_image_created=0
disk_image_written=0
firmware_mutation_performed=0
bootloader_write_performed=0
```

```
partition_mutation_performed=0
host_mutation_performed=0
network_performed=0
root_authority=0
```

Guard

```
sh scripts/test-seabios-grub-boot-preview-preflight.sh
```

Expected output:

```
seabios_grub_boot_preview_preflight: ok
```

Non-claims

This preflight does not create an ISO, create a disk image, write a bootloader, call grub-install, call grub-mkrescue, run QEMU, boot a VM, record a serial log, install a kernel, install an initramfs, mutate firmware, change host boot state, or promote Latticra to a bootable operating system.

docs/SEABIOS_GRUB_BOOT_PREVIEW_QEMU_ARGV_TEMPLATE.md

Source title: SeaBIOS and GRUB Boot Preview QEMU Argv Template

Lines: 95 | Words: 214 | SHA-256: 0f35b5a459310cbb18d119b553b57dbeeb6738d3826c8a26a1143081afde8e75

SeaBIOS and GRUB Boot Preview QEMU Argv Template

Status: no-effect boot-preview QEMU argv template Evidence level: 8 target, argv template only Scope: future QEMU invocation records for SeaBIOS, GRUB 2 BIOS, and GRUB 2 UEFI boot-preview profiles.

Purpose

This template defines how future QEMU argv records must be captured before any boot-preview evidence can be promoted.

It is not a VM launcher. It does not execute QEMU, create a disk image, invoke GRUB, write firmware state, write bootloader state, or claim that Latticra is bootable.

```
seabios_grub_boot_preview_qemu_argv_template_present=1
qemu_argv_template_mode=no-effect-template
qemu_argv_template_decision=blocked-template-only-no-qemu-execution
qemu_argv_record_ready=0
qemu_execution_allowed_by_guard=0
qemu_boot_execution_attempted=0
bootable_os_ready=0
production_os_claim=0
```

Command

```
sh scripts/seabios-grub-boot-preview-qemu-argv-template.sh
```

Optional manifest override:

```
sh scripts/seabios-grub-boot-preview-qemu-argv-template.sh --manifest
installer/manifests/seabios-grub-boot-preview.toml
```

Required Future Inputs

A future argv record must not be accepted unless these inputs exist:

```
operator_review_id
boot_artifact_manifest_template_path
boot_artifact_manifest_validation_report_path
boot_evidence_validation_report_path
boot_artifact_manifest_path
disk_image_path
disk_image_sha256
serial_console_boot_log_path
qemu_argv_record_path
operator_recovery_path
rollback_or_recovery_path
```

The UEFI profile also requires:

```
ovmf_code_path
ovmf_vars_template_path
ovmf_vars_ephemeral_copy_path
```

Required Non-Effects

The template must always preserve:

```
qemu_run_performed=0
qemu_boot_execution_attempted=0
qemu_boot_execution_recorded=0
grub_install_invoked=0
grub_mkrescue_invoked=0
disk_image_created=0
disk_image_written=0
firmware_mutation_performed=0
bootloader_write_performed=0
host_mutation_performed=0
network_performed=0
root_authority=0
```

Guard

```
sh scripts/test-seabios-grub-boot-preview-qemu-argv-template.sh
```

Expected output:

```
seabios_grub_boot_preview_qemu_argv_template: ok
```

Non-claims

This template does not prove SeaBIOS boot, GRUB BIOS boot, GRUB UEFI boot, QEMU compatibility, kernel readiness, initramfs readiness, artifact integrity, recovery safety, or production OS readiness.

docs/SEABIOS_GRUB_COMPATIBILITY_CONTRACT.md

Source title: SeaBIOS and GRUB Compatibility Contract

Lines: 155 | Words: 372 | SHA-256: 7f0dc02a5584178b5ad3b24fa8cde0a00e44a7719c5d72a421913eeb10c5b58b

SeaBIOS and GRUB Compatibility Contract

Status: compatibility-readiness contract Evidence level: 8 target, contract and guard only Scope: installer and future OS-base compatibility boundaries for SeaBIOS, legacy BIOS, GRUB, and GRUB 2.

Purpose

Latticra is moving toward an advanced operating-system direction for operators, but the current repository must keep boot claims evidence-bound.

This contract defines what may be said today:

```
seabios_grub_compatibility_contract_present=1
installer_ready_for_user_local_panel=1
installer_boot_safe_by_absence=1
production_installer_ready=0
bootable_os_ready=0
daily_driver_install_ready=0
```

The current Latticra Panel installer is compatible with SeaBIOS and GRUB in the narrow sense that it is a guarded user-local installer and does not write firmware, partitions, boot sectors, EFI variables, GRUB configuration, or bootloader entries.

It is not yet a SeaBIOS-bootable Latticra image, a GRUB-bootable Latticra image, a production OS installer, or a daily-driver operating system.

Current installer boundary

The current installer and Panel lane must preserve:

```
user_local_prefix_only=1
root_authority=0
network_authority=0
host_mutation_authority=0
runtime_enforcement_authority=0
firmware_mutation_allowed=0
bootloader_write_allowed=0
partition_mutation_allowed=0
mbr_write_allowed=0
gpt_write_allowed=0
efi_variable_write_allowed=0
esp_write_allowed=0
grub_cfg_write_allowed=0
grub_install_allowed=0
grub_mkconfig_allowed=0
efibootmgr_allowed=0
kernel_install_allowed=0
initramfs_write_allowed=0
driver_load_allowed=0
service_install_allowed=0
```

That boundary lets the installer be used on hosts that boot through SeaBIOS and GRUB without becoming a bootloader participant.

Future compatibility targets

Future OS-base work may target these profiles only after explicit evidence records exist:

```
x86_64-seabios-grub-preview
x86_64-grub2-bios-preview
x86_64-grub2-uefi-preview
x86_64-qemu-operator-console-preview
```

Required future validation before any bootable claim:

```
qemu_i440fx_seabios_boot_validation_completed=0
qemu_grub2_bios_boot_validation_completed=0
qemu_ovmf_grub2_uefi_boot_validation_completed=0
serial_console_boot_log_recorded=0
operator_console_boot_path_recorded=0
read_only_vm_evidence_recorded=0
install_plan_preview_for_boot_artifact_recorded=0
rollback_or_recovery_path_recorded=0
```

Required future boot artifact metadata

Any future boot artifact must declare:

```
artifact_format=&lt;recorded&gt;
target_firmware=&lt;seabios-or-uefi-or-both&gt;
target_bootloader=&lt;grub2-or-none&gt;
partition_scheme=&lt;mbr-or-gpt-or-hybrid&gt;
bios_boot_partition_declared=&lt;0-or-1&gt;
efi_system_partition_declared=&lt;0-or-1&gt;
grub_config_path=&lt;recorded-or-none&gt;
kernel_image_path=&lt;recorded-or-none&gt;
initramfs_path=&lt;recorded-or-none&gt;
serial_console_enabled=&lt;0-or-1&gt;
operator_recovery_path=&lt;recorded&gt;
checksum_recorded=1
signature_recorded=&lt;0-or-1&gt;
sbom_recorded=&lt;0-or-1&gt;
```

Before those fields are real evidence, Latticra must preserve:

```
boot_artifact_manifest_present=0
boot_artifact_checksum_recorded=0
boot_artifact_signature_recorded=0
bootable_os_ready=0
production_os_claim=0
```

Promotion gates

A future SeaBIOS/GRUB compatibility promotion requires:

```
compatibility_contract_present=1
boot_artifact_manifest_present=1
qemu_seabios_fixture_present=1
qemu_grub2_bios_fixture_present=1
qemu_grub2_uefi_fixture_present=1
operator_console_fixture_present=1
boot_log_reviewed=1
no_host_bootloader_mutation=1
no_firmware_mutation=1
operator_recovery_runbook_present=1
security_non_claims_preserved=1
```

Until every gate is met, status remains:

```
seabios_grub_boot_claim_allowed=0
grub_bootloader_write_allowed=0
production_os_claim=0
```

Guard validation

This contract is guarded by:

```
sh scripts/test-seabios-grub-compatibility-contract.sh
sh scripts/test-seabios-grub-boot-preview-evidence-contract.sh
```

Expected output:

```
seabios_grub_compatibility_contract: ok
```

Non-claims

This contract does not create a bootable image, GRUB configuration, disk image, ISO, kernel, initramfs, bootloader entry, firmware entry, VM launcher, hypervisor integration, production installer, or operating-system release.

It does not modify SeaBIOS, GRUB, EFI variables, MBR, GPT, ESP, kernel command lines, initramfs content, services, drivers, partitions, or host boot state.

docs/SYSTEM_BOOTSTRAP_IMPLEMENTATION.md

Source title: System Bootstrap Implementation

Lines: 131 | Words: 355 | SHA-256: 42ba89aee7b51c2fc9d09a220240fd56b3b3c1a6a3d3d086c0842e7468ef2f80

System Bootstrap Implementation

Status: first system-building implementation slice Scope: compiled no-effect system bootstrap report surface.

Purpose

This slice adds the first Latticra system bootstrap implementation surface.

The bootstrap surface coordinates existing no-effect Nucleus task classification and runtime-boundary classification into one deterministic operator-visible report.

This is the first implementation step that assembles existing system components into a single startup-facing C API.

Evidence level

Evidence level: compiled implementation slice.

The evidence is:

```
public C header
C implementation
focused invariant test
shell guard script
GitHub workflow
implementation record
```

Implementation files

This slice adds:

```
include/latticra/system_bootstrap.h
src/system_bootstrap.c
tests/system_bootstrap.c
scripts/test-system-bootstrap.sh
.github/workflows/system-bootstrap.yml
docs/SYSTEM_BOOTSTRAP_IMPLEMENTATION.md
```

Public API

The public API exposes:

```
latticra_system_bootstrap_default_request
latticra_system_bootstrap_run
latticra_system_bootstrap_report
```

The bootstrap result carries:

```
bootstrap id
phase label
system status label
effect boundary label
runtime entry status label
source identity
source span
Nucleus task result
runtime boundary result
aggregate no-effect posture
compiled evidence level
```

Effect boundary

The system bootstrap is report-only and no-effect.

It does not perform external effects, mutate host state, enter runtime execution, run commands, contact servers, perform recovery actions, touch hardware, or claim operating-system completeness.

The bootstrap coordinates existing classification/report surfaces only.

Failure behavior

The bootstrap functions return existing latticra_status_t values.

Null request/result/report-buffer inputs are rejected with the existing null-argument or buffer-too-small status values.

If a lower no-effect classification surface fails, the bootstrap reports failure through the result status and deterministic status labels.

Validation

Run:

```
sh scripts/test-system-bootstrap.sh
```

The focused test verifies:

```
default request construction
system bootstrap run remains no-effect
runtime entry remains not entered
Nucleus task remains not executed
deterministic report fields are emitted
null guard behavior is stable
```

Non-claims

This implementation does not add:

```
kernel behavior
bootloader behavior
installer behavior
```

```
runtime execution
command execution
Lat execution
LIR execution
file I/O
network I/O
state mutation
server interaction
self-update
recovery behavior
hardware behavior
sandboxing
malware prevention
ransomware prevention
production security boundary
operating-system replacement
```

Next possible implementation lane

A later slice may add a system bootstrap main-test integration audit or a small operator command wrapper, but only after this bootstrap surface compiles and stays no-effect.

docs/SYSTEM_BOOTSTRAP_REPORT_RUNNER.md

Source title: System Bootstrap Report Runner

Lines: 42 | Words: 128 | SHA-256: dd2e424c610e813bb129a55608e99bf71342c8e1feeb052e9a4eeace8f5383e0

System Bootstrap Report Runner

Status: operator-facing report runner Scope: compile and run a small command-line program that prints the deterministic system bootstrap report.

Purpose

This slice adds a tiny report runner for the system bootstrap surface.

The runner builds a default bootstrap request, runs the existing no-effect bootstrap API, renders the bootstrap report, and prints it to standard output.

Files

```
tools/system_bootstrap_report.c
scripts/test-system-bootstrap-report-runner.sh
.github/workflows/system-bootstrap-report-runner.yml
docs/SYSTEM_BOOTSTRAP_REPORT_RUNNER.md
```

Validation

Run:

```
sh scripts/test-system-bootstrap-report-runner.sh
```

The guard compiles the runner, executes it, captures its output, and checks for stable report fields:

```
LATTICRA SYSTEM BOOTSTRAP REPORT
bootstrap_id=latticra-system-bootstrap
system_status=startup-report-ready
effect_boundary=no-effect
runtime_entry_status=not-entered
no_effect=1
```

Boundary

This runner is report-only. It prints the deterministic bootstrap report and does not expand the bootstrap effect boundary or add runtime entry behavior.

Source title: Latticra Backup, Recovery, and Cyber Resilience Baseline

Lines: 156 | Words: 463 | SHA-256: 3e7c1848b672ff579ccf39437249c001a4dbac9c3e82b911f9331064b5a1acd2

Latticra Backup, Recovery, and Cyber Resilience Baseline

Status: backup, recovery, and cyber resilience baseline Source refresh date: 2026-05-26 Scope: backup scope, offline backup posture, restore testing, recovery prioritization, RTO/RPO planning, golden-image and infrastructure-as-code recovery evidence, recovery isolation, rollback, resilience engineering, recovery communications, post-incident lessons learned, and recovery non-claims before hosted services, mutating update lanes, production installers, production runtime, or recovery-service claims.

This baseline records backup, recovery, and resilience requirements only. It does not implement backup creation, backup storage, restore execution, rollback execution, disaster recovery, recovery orchestration, failover, continuity operations, golden-image creation, infrastructure-as-code deployment, ransomware recovery, compliance, or runtime authority.

Authoritative Recovery and Resilience Sources

Latticra Cryptographic Assurance and Key Management Baseline

Status: cryptographic assurance and key management baseline Source refresh date: 2026-05-26 Scope: cryptographic module boundaries, FIPS/CMVP claim gates, algorithm and parameter inventory, key lifecycle, key storage, key destruction, randomness, self-tests, sensitive-data handling, post-quantum migration planning, Seal metadata, signing authority, and cryptographic non-claims.

This baseline records cryptographic assurance requirements only. It does not implement production cryptography, signing authority, key storage, key generation, entropy collection, random-bit generation, FIPS validation, CMVP submission, CAVP testing, post-quantum migration, compliance, or runtime authority.

Authoritative Cryptographic Sources

Source title: Latticra Cyber Incident Reporting and Response Baseline

Lines: 154 | Words: 381 | SHA-256: ad9bbf07303e5593cf7eff976cf32aaf342d480ed463868bd832744bcce3d5bf

Latticra Cyber Incident Reporting and Response Baseline

Status: cyber incident reporting and response baseline Source refresh date: 2026-05-26 Scope: vulnerability reports, suspected compromise triage, ransomware and data-extortion reporting paths, evidence preservation, communications routing, public non-claims, and future incident-response automation gates.

This baseline records reporting and response posture only. It does not implement monitoring, detection, containment, forensic acquisition, recovery, federal reporting, customer notification, breach notification, law-enforcement contact, ransomware recovery, or incident-response services.

Authoritative Reporting and Response Sources

Date checked: 2026-05-26

```
| Source | Latticra use |
| --- | --- |
| CISA Reporting a Cyber Incident | federal reporting path vocabulary and voluntary cyber incident reporting expectation |
| FBI Cyber | FBI/IC3 reporting path vocabulary for cyber-enabled crime, fraud, ongoing threats, and field-office escalation |
| CISA/FBI/NSA/MS-ISAC #StopRansomware Guide | ransomware and data-extortion prevention, response, evidence preservation, out-of-band communication, and contact-path vocabulary |
| CISA Report Ransomware | ransomware incident reporting route awareness |
| FBI Ransomware | FBI ransomware reporting route awareness |
| FBI 2025 IC3 Annual Report | current FBI cybercrime trend refresh checkpoint |
```

Reporting Route Requirements

Latticra must not present itself as reporting on behalf of users or operators. Future reporting-capable features require a separate operator-approved contract and review.

Minimum route fields before any report-assistance feature exists:

```
reporting_subject_known=1
incident_class_known=1
affected_asset_identity_known=1
affected_data_sensitivity_known=1
operator_authorization_known=1
organization_reporting_owner_known=1
cisa_reporting_route_visible=1
fbi_field_office_route_visible=1
ic3_route_visible=1
local_law_enforcement_or_regulator_review_prompt_visible=1
privacy_legal_notification_review_prompt_visible=1
do_not_transmit_without_operator_approval=1
```

Response Gate

No future incident-response request may isolate hosts, collect forensic artifacts, contact law enforcement, submit federal reports, notify customers, rotate credentials, restore systems, delete artifacts, publish indicators, or make breach/ransomware claims until this gate is complete:

```
incident_kind_known=1
requested_response_effect_known=1
caller_identity_known=1
operator_or_organization_context_known=1
asset_scope_recorded=1
data_scope_recorded=1
legal_regulatory_review_required=1
evidence_preservation_plan_recorded=1
volatile_evidence_decision_recorded=1
chain_of_custody_plan_recorded=1
out_of_band_communications_plan_recorded=1
restoration_priority_recorded=1
reporting_route_selected_by_operator=1
policy_decision_reported=1
denial_reason_reported=1
audit_record_emitted=1
```

```
operator_confirmation_recorded_as_metadata_only=1
operator_confirmation_non_override_test_present=1
non_claim_review_completed=1
```

Until this gate is complete:

```
host_isolation_allowed=0
forensic_collection_allowed=0
credential_rotation_allowed=0
system_restore_allowed=0
federal_report_submission_allowed=0
law_enforcement_contact_allowed=0
customer_notification_allowed=0
breach_notification_allowed=0
ransomware_payment_decision_allowed=0
indicator_publication_allowed=0
artifact_deletion_allowed=0
incident_response_service_claim_allowed=0
```

Source title: Latticra Defensive Threat Model Contract

Lines: 374 | Words: 1075 | SHA-256: 0ad92562e3da4140d4a587ff95b03729f47f872dd1da06586418e8b6c0e513fe

Latticra Defensive Threat Model Contract

Status: Defensive threat model contract Scope: protected assets, trust boundaries, assumptions, capability categories, abuse cases, evidence expectations, validation path, future files, compatibility expectations, and non-claims before additional security-facing implementation work.

Purpose

This document defines the first defensive threat model contract for Latticra.

The purpose is to establish a disciplined vocabulary for what Latticra is trying to protect, what boundaries exist today, what assumptions are allowed, what adversary capability categories may be modeled, what abuse cases should be considered, and what evidence is required before security-facing claims can be promoted.

This document does not implement security controls.

Relationship to previous work

This contract depends on:

```
docs/REAL_SYSTEM_CONTRACT.md
docs/NON_CLAIMS.md
docs/EVIDENCE_LADDER.md
docs/EFFECT_GATES.md
docs/RUNTIME_BOUNDARY_CONTRACT.md
docs/RUNTIME_BOUNDARY_IMPLEMENTATION_PLAN.md
```

```
docs/RUNTIME_BOUNDARY_IMPLEMENTATION.md
docs/NUCLEUS_TASK_EXECUTION_CONTRACT.md
docs/NUCLEUS_TASK_EXECUTION_IMPLEMENTATION.md
docs/CONSTRAINED_CPP_AUTHORITY_LAYER_CONTRACT.md
docs/CONSTRAINED_CPP_AUTHORITY_LAYER_IMPLEMENTATION.md
docs/L_UI_RENDERING_IMPLEMENTATION.md
docs/LIR_SHAPE_IMPLEMENTATION.md
docs/LAT_LANGUAGE_GRAMMAR_IMPLEMENTATION.md
```

Those files remain the source of truth for current architecture boundaries, evidence rules, non-claims, authority behavior, task classification, runtime boundary posture, rendering, LIR metadata, and Lat metadata.

Threat model posture

The first threat model posture is evidence-bound and defensive.

Initial posture:

```
security controls implemented? limited/no-effect only
runtime protection implemented? no
production protection claim allowed? no
malware prevention claim allowed? no
ransomware prevention claim allowed? no
sandbox claim allowed? no
operator-visible report claim allowed? yes, where implemented and tested
denied-by-default boundary claim allowed? yes, where implemented and tested
```

The threat model records intended defensive reasoning. It does not certify effectiveness.

Protected assets

Initial protected assets include:

```
source text integrity
parse results
diagnostic metadata
source spans
AST metadata
semantic validation results
LIR metadata
Lat parse metadata
L-UI render metadata
Nucleus preview records
Nucleus task records
runtime boundary records
authority audit records
operator-visible reports
effect-gate decisions
project claims and status records
```

Future protected assets may include:

```
runtime execution context
configuration policy
operator approval records
file-system mediation records
network mediation records
recovery records
hardware interaction records
boot records
update records
```

Future assets require separate contracts before implementation claims.

Trust boundaries

Current trust boundaries:

```
source input boundary
parser boundary
semantic validation boundary
LIR lowering boundary
Lat grammar boundary
L-UI rendering boundary
Nucleus preview boundary
Nucleus task classification boundary
```

```
runtime boundary
authority validation boundary
operator report boundary
repository documentation boundary
```

Current boundaries are primarily metadata, validation, classification, and reporting boundaries.

They are not production isolation boundaries.

Assumptions

Current allowed assumptions:

```
source buffers may be malformed
input may be adversarial
reported metadata must be deterministic
unknown requests must be denied or classified as unsupported
unknown effects must be denied or classified as unsupported
effect-performing behavior must require explicit future gates
operator confirmation must not override policy by itself
security claims must follow evidence
no-effect slices must remain no-effect
```

Disallowed assumptions:

```
trusted input
trusted caller behavior
implicit execution safety
implicit runtime isolation
implicit sandboxing
implicit malware prevention
implicit ransomware prevention
implicit production readiness
implicit certification
```

Capability categories

Adversary or misuse capability categories may include:

```
malformed input construction
ambiguous source construction
oversized input pressure
unexpected escape sequence use
metadata confusion attempts
request-kind confusion attempts
effect-kind confusion attempts
boundary bypass attempts
operator-report confusion attempts
policy downgrade attempts
status-record exaggeration attempts
```

Future runtime capability categories may include:

```
unauthorized command request
unauthorized mutation request
unauthorized file request
unauthorized network request
unauthorized recovery request
unauthorized hardware request
unauthorized boot request
unauthorized update request
```

These categories are for defensive modeling only.

Abuse cases

Initial abuse cases:

```
malformed source causes unclear diagnostics
escaped data hides operator-visible content
literal source-buffer NUL causes parser confusion
duplicate names cause ambiguous binding
invalid binding prefix bypasses semantic validation
invalid LIR input reaches rendering
failed authority metadata is treated as allowed
unknown request is treated as allowed
unknown effect is treated as allowed
```

```
future-gated request is treated as executable
operator confirmation overrides policy
report omits denial reason
status documentation overclaims implementation state
```

Every abuse case should map to one of:

```
existing test
future test
explicit non-goal
explicit non-claim
implementation gap
```

Defensive controls currently represented

Current represented controls include:

```
parser structural checks
parser diagnostics
source-span metadata
string escape diagnostics
literal source-buffer NUL rejection
escaped decoded NUL visibility
AST metadata reports
semantic validation checks
LIR shape checks
L-UI rendering prerequisites
constrained C++ authority validation/reporting
Nucleus preview denial behavior
Nucleus task classification/reporting
runtime boundary disabled-by-default posture
static documentation guards
project status/non-claim records
```

These are engineering controls and guardrails. They are not certifications.

Evidence expectations

Security-facing promotion requires evidence.

Required evidence classes:

```
contract document
implementation plan
implementation document
unit or invariant tests
static guard when applicable
deterministic report output when applicable
negative tests for denied behavior
status update
non-claim update
compatibility check
```

No defensive claim should be promoted from concept to implementation status without these evidence classes.

Validation expectations

Future defensive validation should include:

```
positive tests for allowed no-effect behavior
negative tests for denied effect behavior
unknown request tests
unknown effect tests
malformed input tests
small-buffer tests
deterministic report tests
no-mutation tests
no-network tests
no-hardware tests
no-recovery tests
operator confirmation non-override tests
status/non-claim guard tests
```

Non-goals

Current non-goals:

```
attack tooling
exploit development
payload generation
malware simulation
credential access
stealth behavior
bypass instructions
persistence mechanisms
exfiltration behavior
```

Latticra threat modeling is defensive architecture work, not offensive tooling.

Future file policy

Recommended future files:

```
docs/DEFENSIVE_THREAT_MODEL_IMPLEMENTATION_PLAN.md
docs/DEFENSIVE_THREAT_MODEL_VALIDATION.md
scripts/test-defensive-threat-model-contract.sh
scripts/test-defensive-threat-model-validation.sh
tests/defensive_threat_model_invariants.c
```

Implementation or validation files should only be added after the contract is merged.

Future test list

Future validation should consider tests named:

```
defensive_threat_model_names_assets
defensive_threat_model_names_boundaries
defensive_threat_model_names_assumptions
defensive_threat_model_names_non_goals
defensive_threat_model_preserves_non_claims
defensive_threat_model_requires_evidence_classes
defensive_threat_model_maps_abuse_cases_to_tests_or_gaps
defensive_threat_model_forbids_operator_confirmation_override
defensive_threat_model_forbids_runtime_protection_claims
defensive_threat_model_forbids_malware_prevention_claims
defensive_threat_model_forbids_ransomware_prevention_claims
```

Compatibility expectations

Future work must not weaken:

```
existing non-claims
runtime boundary disabled-by-default posture
Nucleus task no-effect posture
constrained authority no-effect posture
L-UI rendering no-effect posture
LIR metadata-only posture
Lat parser metadata-only posture
source-buffer literal NUL rejection
escaped decoded NUL visibility
semantic validation prerequisites
operator confirmation non-override policy
```

Forbidden behavior

Threat model work must not:

- provide attack instructions;
- provide exploit steps;
- provide payload construction;
- provide stealth guidance;
- provide credential access guidance;
- provide persistence guidance;
- claim production protection;
- claim malware prevention;

- claim ransomware prevention;
- claim sandboxing;
- claim certification;
- claim operating-system completeness.

Current validation command

This contract is guarded by:

```
sh scripts/test-defensive-threat-model-contract.sh
```

The guard is static. It does not implement security controls.

Non-claims

This document does not implement security controls, runtime protection, malware prevention, ransomware prevention, sandboxing, exploit prevention, incident response, recovery behavior, certification, accreditation, production hardening, or operating-system completeness.

docs/DEFENSIVE_THREAT_MODEL_IMPLEMENTATION_PLAN.md

Source title: Latticra Defensive Threat Model Implementation Plan

Lines: 312 | Words: 969 | SHA-256: ba516efc1cdd6137345ab5de226ac1d93838ad576d1c6f4c607515af66134752

Latticra Defensive Threat Model Implementation Plan

Status: implementation planning contract Scope: validation artifacts, evidence mapping, abuse-case mapping, external standards alignment, guard behavior, documentation updates, future files, compatibility expectations, and non-claims before additional security-facing implementation work.

Purpose

This document defines the implementation plan for the first defensive threat model validation layer.

The Defensive threat model contract is already merged and guarded. This plan turns that contract into validation artifacts, file paths, report expectations, evidence mapping rules, abuse-case mapping rules, external standards alignment rules, documentation updates, static guard behavior, future tests, compatibility expectations, and non-claims.

This document does not implement security controls.

Relationship to previous work

This plan depends on:

```
docs/DEFENSIVE_THREAT_MODEL_CONTRACT.md
docs/REAL_SYSTEM_CONTRACT.md
docs/NON_CLAIMS.md
docs/EVIDENCE_LADDER.md
docs/EFFECT_GATES.md
docs/RUNTIME_BOUNDARY_CONTRACT.md
docs/RUNTIME_BOUNDARY_IMPLEMENTATION_PLAN.md
docs/RUNTIME_BOUNDARY_IMPLEMENTATION.md
docs/NUCLEUS_TASK_EXECUTION_IMPLEMENTATION.md
docs/CONSTRAINED_CPP_AUTHORITY_LAYER_IMPLEMENTATION.md
docs/L_UI_RENDERING_IMPLEMENTATION.md
docs/LIR_SHAPE_IMPLEMENTATION.md
docs/LAT_LANGUAGE_GRAMMAR_IMPLEMENTATION.md
scripts/test-defensive-threat-model-contract.sh
```

Implementation decision

The first defensive threat model implementation should be documentation-and-guard based.

No C runtime code is required for this planning slice.

Reason:

```
threat model validation is currently a documentation and evidence mapping problem
no new security control is being implemented
no runtime behavior is being added
no parser behavior is being changed
no authority behavior is being changed
no boundary behavior is being changed
```

External standards alignment

The validation layer must include a standards-alignment ledger.

The ledger must track current guidance from:

```
NSA Cybersecurity guidance and standards/certification resources
CISA Secure by Design guidance
CISA Cross-Sector Cybersecurity Performance Goals
CISA Known Exploited Vulnerabilities catalog
CISA joint cybersecurity advisories where relevant
FBI Cyber alerts, cyber threat reporting, and joint advisories where relevant
```

Each external alignment entry must include:

```
source agency
source title
authoritative URL
date checked
version or publication date when available
applicability to Latticra
mapped Latticra document
mapped Latticra control or boundary
current evidence
missing evidence
claim allowed
claim forbidden
review cadence
```

The ledger must never claim certification, accreditation, compliance, protection, or operational readiness from simple reference alignment.

Validation document shape

The implementation PR should add:

```
docs/DEFENSIVE_THREAT_MODEL_VALIDATION.md
scripts/test-defensive-threat-model-validation.sh
```

The validation document should contain:

```
Status
Purpose
Source contract
Protected asset matrix
Trust boundary matrix
Assumption matrix
Abuse-case mapping
Evidence matrix
External standards alignment ledger
Validation matrix
Non-goal matrix
Compatibility expectations
Current gaps
Non-claims
Validation command
```

Protected asset matrix

The validation document should map each protected asset to:

```
asset name
current representation
```

```
current evidence file
current validation command
current status
claim allowed
claim not allowed
implementation gap
```

Required protected assets:

```
source text integrity
parse results
diagnostic metadata
source spans
AST metadata
semantic validation results
LIR metadata
Lat parse metadata
L-UI render metadata
Nucleus preview records
Nucleus task records
runtime boundary records
authority audit records
operator-visible reports
effect-gate decisions
project claims and status records
```

Trust boundary matrix

Required trust boundaries:

```
source input boundary
parser boundary
semantic validation boundary
LIR lowering boundary
Lat grammar boundary
L-UI rendering boundary
Nucleus preview boundary
Nucleus task classification boundary
runtime boundary
authority validation boundary
operator report boundary
repository documentation boundary
external standards alignment boundary
```

Abuse-case mapping

Each abuse case from the contract must map to one of:

```
existing test
future test
explicit non-goal
explicit non-claim
implementation gap
```

Required abuse cases:

```
malformed source causes unclear diagnostics
escaped data hides operator-visible content
literal source-buffer NUL causes parser confusion
duplicate names cause ambiguous binding
invalid binding prefix bypasses semantic validation
invalid LIR input reaches rendering
failed authority metadata is treated as allowed
unknown request is treated as allowed
unknown effect is treated as allowed
future-gated request is treated as executable
operator confirmation overrides policy
report omits denial reason
status documentation overclaims implementation state
external standard is referenced as if it were certification
outdated external guidance remains marked current
```

Evidence matrix

Required evidence classes:

```
contract document
implementation plan
implementation document
```

```
unit or invariant tests
static guard when applicable
deterministic report output when applicable
negative tests for denied behavior
status update
non-claim update
compatibility check
external standards source check
standards alignment gap entry
```

No security-facing claim should be marked implementation-backed unless the evidence matrix names supporting files and commands.

Guard behavior

The validation guard should verify that docs/DEFENSIVE_THREAT_MODEL_VALIDATION.md contains every required section, protected asset, trust boundary, abuse case, evidence class, external standards source, non-goal, compatibility expectation, and non-claim named in this plan.

The implementation-plan guard should verify this document contains:

```
Status: implementation planning contract
External standards alignment
NSA Cybersecurity
CISA Secure by Design
CISA Cross-Sector Cybersecurity Performance Goals
CISA Known Exploited Vulnerabilities catalog
FBI Cyber alerts
source agency
authoritative URL
date checked
claim forbidden
sh scripts/test-defensive-threat-model-implementation-plan.sh
```

Workflow behavior

The defensive threat model workflow should run:

```
sh scripts/test-defensive-threat-model-contract.sh
sh scripts/test-defensive-threat-model-implementation-plan.sh
sh scripts/test-defensive-threat-model-validation.sh
```

The validation command should run after the implementation-plan guard.

Compatibility expectations

The implementation must not weaken:

```
existing non-claims
runtime boundary disabled-by-default posture
Nucleus task no-effect posture
constrained authority no-effect posture
L-UI rendering no-effect posture
LIR metadata-only posture
Lat parser metadata-only posture
source-buffer literal NUL rejection
escaped decoded NUL visibility
semantic validation prerequisites
operator confirmation non-override policy
```

Forbidden behavior

The implementation must not:

- claim certification;
- claim accreditation;
- claim compliance;
- claim malware prevention;
- claim ransomware prevention;

- claim sandboxing;
- claim production protection;
- claim operational readiness;
- provide attack instructions;
- provide exploit steps;
- provide payload construction;
- provide stealth guidance;
- provide persistence guidance;
- provide credential access guidance;
- treat external standards alignment as proof of protection.

Current validation command

This implementation plan is guarded by:

```
sh scripts/test-defensive-threat-model-implementation-plan.sh
```

The guard is static. It does not implement security controls.

Implementation gate

Defensive threat model validation files may be added only after this plan is merged.

Non-claims

This document does not implement security controls, runtime protection, malware prevention, ransomware prevention, sandboxing, exploit prevention, incident response, recovery behavior, certification, accreditation, compliance, production hardening, or operating-system completeness.

docs/DEFENSIVE_THREAT_MODEL_VALIDATION.md

Source title: Latticra Defensive Threat Model Validation

Lines: 243 | Words: 2217 | SHA-256: 7a120db97a04a3788b2b49bb1d11911f966e86cc96586adbb28daf7528458741

Latticra Defensive Threat Model Validation

Status: defensive threat model validation ledger Scope: asset mapping, trust-boundary mapping, evidence mapping, external standards alignment, current gaps, and non-claims.

Purpose

This document validates the defensive threat model against the current Latticra evidence base.

Source contract:

```
docs/DEFENSIVE_THREAT_MODEL_CONTRACT.md
docs/DEFENSIVE_THREAT_MODEL_IMPLEMENTATION_PLAN.md
```

This document does not implement security controls.

Protected asset matrix

```
| Asset | Evidence file | Validation command | Status | Allowed claim | Forbidden claim | Gap |
| --- | --- | --- | --- | --- | --- | --- |
| source text integrity | docs/L_UI_SOURCE_BUFFER_LITERAL_NUL_POLICY_IMPLEMENTATION.md | sh
scripts/test-l-ui-source-buffer-literal-nul-policy.sh | represented | source policy is guarded |
 source safety guarantee | broader hostile corpus |
```

parse results	docs/L_UI_PARSER_RESULT_REPORT.md	sh scripts/test-l-ui-parser-result-report.sh	represented	parser result reports exist	parser hardening guarantee	broader fuzz corpus
diagnostic metadata	docs/L_UI_PARSER_DIAGNOSTICS_IMPLEMENTATION.md	sh scripts/test-l-ui-parser-diagnostics.sh	represented	diagnostics are guarded	complete diagnostic coverage	severity taxonomy
source spans	docs/L_UI_PARSER_SOURCE_SPAN_IMPLEMENTATION.md	sh scripts/test-l-ui-parser-source-span.sh	represented	spans are tracked	source authenticity	signed source policy
AST metadata	docs/L_UI_PARSER_AST_IMPLEMENTATION.md	sh scripts/test-l-ui-parser-ast.sh	represented	AST metadata exists	semantic completeness	richer AST invariants
semantic validation results	docs/L_UI_SEMANTIC_VALIDATION_IMPLEMENTATION.md	sh scripts/test-l-ui-semantic-validation.sh	represented	semantic checks exist	total semantic safety	broader ruleset
LIR metadata	docs/LIR_SHAPE_IMPLEMENTATION.md	sh scripts/test-lir-shape.sh	represented	LIR shape is guarded	LIR execution safety	execution contract
Lat parse metadata	docs/LAT_LANGUAGE_GRAMMAR_IMPLEMENTATION.md	sh scripts/test-lat-language-grammar.sh	represented	Lat parse metadata exists	Lat runtime safety	runtime contracts
L-UI render metadata	docs/L_UI_RENDERING_IMPLEMENTATION.md	sh scripts/test-l-ui-rendering.sh	represented	bounded reports exist	terminal UI safety	terminal-control contract
Nucleus preview records	docs/NUCLEUS_PREVIEW.md	sh scripts/test-nucleus-preview.sh	represented	preview classification exists	execution authorization	task expansion
Nucleus task records	docs/NUCLEUS_TASK_EXECUTION_IMPLEMENTATION.md	sh scripts/test-nucleus-task-execution.sh	represented	no-effect task records exist	effect execution safety	fuller matrix
runtime boundary records	docs/RUNTIME_BOUNDARY_IMPLEMENTATION.md	sh scripts/test-runtime-boundary.sh	initial	API/smoke surface exists	runtime protection	fuller policy implementation
authority audit records	docs/CONSTRAINED_CPP_AUTHORITY_LAYER_IMPLEMENTATION.md	sh scripts/test-cpp-authority-layer.sh	represented	authority reports exist	operational authority	policy mapping
operator-visible reports	docs/FOUNDATION_INDEX.md	multiple scripts	represented	reports exist where tested	complete audit coverage	report index
effect-gate decisions	docs/EFFECT_GATES.md	static guards	planned	vocabulary exists	enforcement guarantee	enforcement implementation
project claims and status records	STATUS.md	sh scripts/test-project-strategy-status-framework.sh	guarded	status is guarded	certification/compliance	review cadence

Trust boundary matrix

Boundary	Evidence	Validation	Status	Forbidden claim
source input boundary	source policy	source-buffer policy script	represented	trusted input
parser boundary	parser implementation	parser scripts	represented	parser certification
semantic validation boundary	semantic validation	semantic validation script	represented	full semantic safety
LIR lowering boundary	LIR shape	LIR script	represented	executable IR safety
Lat grammar boundary	Lat parser	Lat script	represented	Lat runtime safety
L-UI rendering boundary	renderer	rendering script	represented	interactive UI safety
Nucleus preview boundary	preview tests	Nucleus preview script	represented	execution authorization
Nucleus task classification boundary	task tests	task script	represented	effect authorization
runtime boundary	runtime smoke tests	runtime-boundary script	initial	runtime protection
authority validation boundary	authority tests	C++ authority script	represented	operational authority
operator report boundary	report tests	multiple scripts	represented	complete audit coverage
repository documentation boundary	project guard	project-status script	represented	certification
external standards alignment boundary	this ledger	validation script	initial	standards compliance

Assumption matrix

source buffers may be malformed -> parser/source policy tests
input may be adversarial -> negative parser and semantic tests
reported metadata must be deterministic -> report tests
unknown requests must be denied or unsupported -> Nucleus/runtime contracts
unknown effects must be denied or unsupported -> Nucleus/runtime contracts
effect-performing behavior requires explicit future gates -> effect-gate and runtime contracts
operator confirmation must not override policy -> task/runtime contracts
security claims must follow evidence -> evidence ladder and this ledger
no-effect slices must remain no-effect -> implementation docs and tests

Abuse-case mapping

malformed source causes unclear diagnostics -> parser diagnostics tests
escaped data hides operator-visible content -> escaped string reports
literal source-buffer NUL causes parser confusion -> source-buffer literal NUL policy
duplicate names cause ambiguous binding -> semantic validation and fixture gap
invalid binding prefix bypasses semantic validation -> semantic validation and fixture gap
invalid LIR input reaches rendering -> rendering prerequisites and LIR checks
failed authority metadata is treated as allowed -> authority and task checks
unknown request is treated as allowed -> task tests, runtime expansion gap
unknown effect is treated as allowed -> task tests, runtime expansion gap
future-gated request is treated as executable -> task tests, runtime expansion gap
operator confirmation overrides policy -> task tests, runtime expansion gap
retained C/C++ high-risk code leaves buffer-overflow-class defects untracked -> memory-safety
roadmap refinement gap
command construction reaches a shell boundary without a reviewed contract -> shell-boundary guard and installer-boundary refinement gap
future workload or service authority lacks distinct workload identity -> zero-trust implementation profile gap
report omits denial reason -> report completeness gap
status documentation overclaims implementation state -> project status guard
external standard is referenced as if it were certification -> external ledger forbidden claim
outdated external guidance remains marked current -> review cadence required

Evidence matrix

contract document -> present
implementation plan -> present
implementation document -> this validation ledger
unit or invariant tests -> validation guard
static guard when applicable -> validation script
deterministic report output when applicable -> parser/render/task tests
negative tests for denied behavior -> parser/semantic/task tests
status update -> status docs
non-claim update -> non-claim docs/status
compatibility check -> static guards
external standards source check -> external ledger
standards alignment gap entry -> external ledger

External standards alignment ledger

LIR metadata-only posture
Lat parser metadata-only posture
source-buffer literal NUL rejection
escaped decoded NUL visibility
semantic validation prerequisites
operator confirmation non-override policy
```

Validation refinement checkpoint

The current validation refinement is recorded in:

```
docs/DEFENSIVE_THREAT_MODEL_VALIDATION_REFINEMENT.md
```

Current refinement posture:

```
defensive_threat_model_validation_refinement_present=1
external_source_refresh_checkpoint_present=1
external_source_refresh_date=2026-05-26
manual_source_review_required=1
manual_source_review_completed_for_current_baseline=1
high_assurance_security_baseline_present=1
nsa_zero_trust_guideline_observed=1
nsa_cisa_memory_safe_languages_observed=1
cisa_fbi_product_security_bad_practices_observed=1
nist_high_assurance_references_observed=1
runtime_boundary_policy_expansion_next=1
abuse_case_fixture_expansion_next=1
certification_from_external_alignment=0
compliance_from_external_alignment=0
protection_from_external_alignment=0
security_controls_added=0
runtime_authority_granted=0
```

The refinement keeps the external standards alignment ledger source-tracking-only and does not close the runtime boundary or abuse-case fixture gaps.

Current gaps

```
external standards ledger needs recurring manual review before release
runtime boundary source needs fuller policy expansion after threat-model validation
abuse-case mapping needs broader fixture coverage
external advisory-by-advisory mapping is not complete
workload/service identity and host-integrity prerequisites are not yet profiled for future
authority
no certification or compliance mapping exists
```

Non-claims

This document does not implement security controls, runtime protection, malware prevention, ransomware prevention, sandboxing, exploit prevention, incident response, recovery behavior, certification, accreditation, compliance, production hardening, or operating-system completeness.

Validation command

```
sh scripts/test-defensive-threat-model-validation.sh
```

Source title: Latticra Defensive Threat Model Validation Refinement

Lines: 204 | Words: 727 | SHA-256: a8fe649b518bf932754aa8c6cf780fa5c4375089e74b474744d98f35f7237fce

Latticra Defensive Threat Model Validation Refinement

Status: defensive threat model validation refinement Source: local follow-up slice Scope: refinement of the existing defensive threat model validation ledger, external-source checkpoint posture, current gap triage, public entry points, and next-work pointer. This document does not implement security controls, runtime protection, runtime execution, effect execution, capability enforcement, cryptographic verification, signing, host behavior, network behavior, MCP behavior, AI agent execution, model execution, tool execution, shell execution, malware prevention, ransomware prevention, sandboxing, certification, accreditation, compliance, production hardening, or runtime authority.

Purpose

This refinement makes the defensive threat model validation surface more explicit after the policy-decision public-entry alignment.

It does three bounded things:

```
records the current validation refinement checkpoint
refreshes the external-source review posture without claiming compliance
names the next evidence gap as runtime boundary policy expansion after threat-model validation
```

It remains documentation and guard work only.

| CISA Known Exploited Vulnerabilities Catalog | authoritative URL retained | vulnerability-awareness input | remediation guarantee |
| FBI Cyber | reachable; 2026 threat and reporting content visible | threat-environment awareness | FBI endorsement, protection claim, or incident-response capability claim |
| NIST CSF 2.0 / SSDF / SP 800-53 / SP 800-160 / SP 800-207 / FIPS 140-3 | official sources verified | high-assurance vocabulary and allocation input | NIST compliance, FIPS validation, or accreditation claim |
```

This refinement does not promote any external alignment entry to implementation-backed security status.

Refined gap triage

The validation ledger still names gaps rather than closing them.

Current next gap:

```
runtime boundary source needs fuller policy expansion after threat-model validation
```

Secondary gap:

```
abuse-case mapping needs broader fixture coverage
```

The next engineering slice should therefore stay on runtime-boundary policy expansion and evidence mapping before new behavior is considered.

Validation

This refinement is guarded by:

```
sh scripts/test-defensive-threat-model-validation-refinement.sh
```

The underlying threat model chain remains covered by:

```
sh scripts/test-defensive-threat-model-contract.sh
sh scripts/test-defensive-threat-model-implementation-plan.sh
sh scripts/test-defensive-threat-model-validation.sh
```

Expected output:

```
defensive_threat_model_validation_refinement: ok
```

Boundary

This refinement is documentation/status/guard alignment only.

It does not add security controls, runtime protection, malware prevention, ransomware prevention, sandboxing, exploit prevention, incident response, recovery behavior, certification, accreditation, compliance, production hardening, runtime execution, effect execution, capability enforcement, cryptographic verification, signing, host behavior, network behavior, MCP behavior, AI agent execution, model execution, tool execution, shell execution, or runtime authority.

Current next valid slice

The next valid Latticra slice is runtime boundary policy expansion after threat-model validation.

That future slice must preserve the no-effect posture and must not implement runtime execution, effect execution, capability enforcement, cryptographic verification, signing, host behavior, network behavior, MCP behavior, AI agent execution, model execution, tool execution, shell execution, production protection, or runtime authority.

docs/HIGH_ASSURANCE_SECURITY_BASELINE.md

Source title: Latticra High-Assurance Security Baseline

Lines: 341 | Words: 2938 | SHA-256: d46b1e1e3bef2cc18c1c9d6a7fe922c3a70297ec44d73513e38c4199ec59a3ea

Latticra High-Assurance Security Baseline

Status: high-assurance security baseline checkpoint Source refresh date: 2026-05-26 Scope: NSA, CISA, FBI, and NIST security guidance alignment for current Latticra source, documentation, tests, packaging lanes, and future infrastructure posture.

This baseline allocates required security work for Latticra. It does not certify Latticra, accredit Latticra, make Latticra a production security boundary, or claim compliance with any external framework.

Purpose

Latticra is an early-stage systems architecture and language implementation project. Because the project intentionally works near parsers, runtime boundaries, effect gates, cryptographic metadata, local installers, and future agentic automation surfaces, security work must track authoritative guidance before new authority is added.

This baseline records:

```
current official source inventory
required project allocations
memory-safety roadmap requirements
zero-trust runtime-boundary requirements
supply-chain and dependency requirements
```

cryptographic assurance requirements
identity, credential, and access management requirements
security logging, monitoring, and detection requirements
backup, recovery, and cyber resilience requirements
secure configuration and change management requirements
incident-response and disclosure requirements
non-claims that remain closed

Authoritative Source Inventory

Date checked: 2026-05-26

Source	Current guidance used	Latticra allocation
NSA Zero Trust Implementation Guidelines, Primer, Discovery Phase, Phase One, and Phase Two	Zero trust work begins with visibility over data, applications, assets, services, access, and authorization activity, then advances through phased activities, requirements, precursors, and successors toward target-level maturity.	Keep runtime authority denied until request identity, asset identity, authorization state, evidence level, prerequisites, successors, and audit output are visible.
NSA Advancing Zero Trust Maturity Throughout the User Pillar	ICAM capabilities are a core zero-trust maturity path for critical systems.	Require identity, credential, MFA, privileged-access, account-lifecycle, and identity-event evidence before hosted or privileged authority claims.
CISA and NSA Identity and Access Management: Recommended Best Practices for Administrators	Administrators should inventory assets and identities, understand security gaps, deploy and inventory MFA, collect SSO context, and monitor privileged behavior.	Keep identity and access management as a gated baseline before remote access, hosted administration, privileged sessions, or account-management claims.
NSA/CISA Memory Safe Languages CSI	Memory-safe language adoption should be considered, while existing code can be improved through interoperability and mitigations where migration is not practical.	Publish and guard a memory-safety roadmap for C/C++ substrate code; prefer memory-safe implementation for new high-risk infrastructure surfaces.
CISA Secure by Design	Manufacturers should take ownership of customer security outcomes, practice transparency/accountability, and lead from the top.	Require evidence-bound public claims, vulnerability reporting, no hidden security costs, deterministic reports, and leadership-owned security gates.
CISA/FBI Product Security Bad Practices	Avoid exceptionally risky practices, including absent memory-safety roadmaps, injection classes, known-insecure crypto, weak defaults, and unmanaged dependencies.	Guard against unsafe APIs, shell injection surfaces, default-secret patterns, unbounded buffers, path traversal, and production crypto claims without a module boundary.
NSA and CISA Red and Blue Teams Share Top Ten Cybersecurity Misconfigurations	Common enterprise compromise paths include default configurations, poor patch/configuration hygiene, weak controls, and visibility gaps.	Require secure configuration and change-management evidence before host, infrastructure, hardening, or production configuration claims.
CISA/NSA/FBI secure-by-design and secure-by-default principles	Secure products should ship with secure default baselines and should not shift avoidable hardening burden to customers.	Block secure-default and configuration-hardening claims until secure defaults, default-credential absence, checklist evidence, and exception ownership are recorded.
CISA Cross-Sector Cybersecurity Performance Goals	Establish baseline practices for asset inventory, vulnerability management, logging, account security, incident response, recovery, and third-party validation.	Maintain source and dependency inventory, KEV-aware release checks, explicit logs/reports, incident plan, recovery contracts before mutation, and third-party review before security release.
CISA/FBI/NSA international Best Practices for Event Logging and Threat Detection	Event logging supports continued operations and resilience through visibility, detection, and investigation across cloud, enterprise, mobile, and OT environments.	Require a security logging, monitoring, and detection baseline before hosted services, telemetry export, SIEM integration, or detection claims.
CISA Logging Made Easy and CISA logging guidance	Centralized log management, user activity visibility, alerting, and regular review improve threat detection.	Require event-source inventory, log centralization/export planning, redaction, triage ownership, and incident handoff before monitoring claims.
CISA Zero Trust Maturity Model v2	Mature zero trust uses identity, devices, networks, applications/workloads, and data pillars with visibility, analytics, automation, orchestration, and governance.	Treat each Latticra request as a per-request policy decision; preserve deny-by-default behavior for network, host, recovery, boot, and tool authority.
NIST SP 800-63-4 Digital Identity Guidelines	Current digital identity guidance covers identity proofing, authentication, authenticator management, federation, and assertions.	Use SP 800-63-4 vocabulary for future operator identity, account lifecycle, MFA, SSO/federation, and authentication non-claims.
CISA/NSA/FBI/MS-ISAC Phishing Guidance	Phishing-resistant MFA and social-engineering-resistant account processes reduce account-compromise risk.	Require phishing-resistant MFA planning and help-desk identity verification before privileged or remote access claims.

| CISA Known Exploited Vulnerabilities Catalog | Internet-facing exploited vulnerabilities need timely mitigation or compensating controls. | Before any internet-facing asset exists, create a KEV review gate; current project has no internet-facing runtime authority. |

| NIST National Vulnerability Database and CVSS metrics | CVE and CVSS records provide vulnerability enrichment and severity context, while CVSS is not a complete risk score by itself. | Require KEV/NVD review, component inventory, mitigation or exception records, and public non-claim review before release. |

| FBI Cyber | The active threat environment includes ransomware, nation-state targeting, critical infrastructure risk, rapidly changing IOCs/TTPs, and reporting through FBI/IC3 paths. | Keep the threat model defensive, keep reports private, add incident-reporting paths, and avoid offensive payload, persistence, exfiltration, and evasion content. |

| CISA/FBI/NSA/MS-ISAC #StopRansomware Guide | Ransomware and data-extortion preparation, prevention, response, evidence preservation, out-of-band communications, and federal contact paths must be planned before incidents. | Keep incident-response authority denied, document reporting paths, preserve evidence requirements, and require operator/legal review before notification or reporting assistance. |

| CISA/FBI/NSA/MS-ISAC #StopRansomware recovery guidance | Offline encrypted backups, regular backup testing, restoration prioritization, clean recovery environments, and post-incident lessons learned reduce ransomware recovery risk. | Require a backup, recovery, and cyber resilience baseline before hosted-service recovery, disaster-recovery, failover, rollback, or ransomware-recovery claims. |

| NIST Cybersecurity Framework 2.0 | Govern, Identify, Protect, Detect, Respond, and Recover provide current cybersecurity risk-management functions. | Map future infrastructure readiness to CSF 2.0 functions before production claims. |

| NIST SP 800-34 Rev. 1 and SP 800-184 | Contingency planning and cybersecurity event recovery require business impact analysis, recovery strategy, playbooks, realistic testing, and continuous improvement. | Require recovery scope, RTO/RPO, restore testing, rollback, recovery authorization, and lessons-learned evidence before recoverability claims. |

| NIST SP 800-128 | Security-focused configuration management uses baseline configuration, configuration control, monitoring, and SecCM practices to manage risk. | Require configuration item inventory, baseline configuration, owner, change record, testing, rollback, and drift-detection evidence before configuration claims. |

| NIST SP 800-70 Rev. 5 | Security configuration checklists help configure products to a risk posture, verify configuration, identify unauthorized change, and produce posture artifacts. | Require checklist evidence and unauthorized-change detection planning before secure configuration, hardening, or scanning claims. |

| NIST SP 800-92 and SP 800-92 Rev. 1 draft | Log management requires planning for generation, transmission, storage, access, analysis, retention, and disposal. | Use SP 800-92 vocabulary for future audit-event selection, log lifecycle, retention, access, and disposal evidence. |

| NIST SP 800-218 SSDF v1.1 | Secure development should prepare the organization, protect software, produce well-secured software, and respond to vulnerabilities. | Keep tests, threat-model docs, protected source/build processes, vulnerability handling, and root-cause-driven fixes in the quality gate. |

| NIST SP 800-53 Rev. 5, Release 5.2.0 | Control families cover access, audit, configuration, identification, incident response, risk assessment, system acquisition, system integrity, and supply-chain risk management. | Use SP 800-53 as the high-assurance control vocabulary for future production profiles, not as a current compliance claim. |

| NIST SP 800-160 Vol. 2 Rev. 1 | Cyber-resilient systems should anticipate, withstand, recover from, and adapt to adverse conditions and attacks. | Keep rollback, recovery, degraded-mode, auditability, and no-hidden-effect requirements ahead of any mutating infrastructure behavior. |

| NIST SP 800-207 Zero Trust Architecture | Zero trust removes implicit trust and makes access decisions resource-focused and least-privilege. | Runtime and agentic automation authority must remain per-request, least-privilege, auditable, and denied unless prerequisites pass. |

| FIPS 140-3 | Federal cryptographic module security requirements define validated module expectations and security levels. | No production cryptography or FIPS claim is allowed until a cryptographic module boundary, validation path, key lifecycle, and dependency review exist. |

| NIST SP 800-57 Part 1 Rev. 5, SP 800-131A Rev. 2, and SP 800-90 series | Key management, algorithm transition, and random-bit generation guidance define required cryptographic planning vocabulary. | Require a cryptographic assurance and key-management baseline before signing authority, key storage, entropy use, FIPS, or production crypto claims. |

| NSA/CISA/NIST post-quantum guidance and NSA CNSA 2.0 | High-assurance systems should inventory cryptography and plan migration toward quantum-resistant algorithms without premature deployment claims. | Require post-quantum inventory and migration planning before long-lived confidentiality or national-security-oriented cryptographic claims. |

Authoritative URLs for this checkpoint are preserved in docs/DEFENSIVE_THREAT_MODEL_VALIDATION.md.

Tracked follow-on guidance for this checkpoint:

- CISA/FBI Secure by Design Alert: Eliminating Buffer Overflow Vulnerabilities sharpens the retained-C/C++ posture toward buffer-overflow-class defect reduction, adversarial testing, and memory-safe implementation preference for new high-risk surfaces.

- CISA Secure by Design Alert: Eliminating OS Command Injection Vulnerabilities reinforces the existing system()/popen() exclusions and keeps shell authority centralized behind reviewed boundaries.
- CISA The Case for Memory Safe Roadmaps reinforces the requirement for a component-by-component migration or mitigation record instead of a generic memory-safety aspiration.
- NIST SP 800-207A and NIST SP 1800-35 provide secondary zero-trust implementation detail for future workload, service, and device-integrity-aware authority surfaces.

Memory-Safety Roadmap

Latticra currently contains C and restricted C++ code. That remains allowed only under docs/security/C_CPP_SECURITY_PROFILE.md.

Required memory-safety posture:

```
new network-facing code -&gt; memory-safe language preferred
new cryptographic key-handling code -&gt; memory-safe language preferred
new parser for untrusted external input -&gt; memory-safe language preferred or restricted C
profile with fuzzing and exception record
new installer or host-mutation authority -&gt; memory-safe language preferred
existing C/C++ substrate -&gt; strict profile, bounded buffers, no unsafe string APIs, explicit
review of buffer overflow, format-string, off-by-one, use-after-free, and lifetime hazards,
sanitizer/static-analysis path
C/C++ unsafe exception -&gt; documented exception with lifetime, buffer, failure, test, and
reviewer fields
```

Short-term mitigations:

- keep strcpy, strcat, sprintf, vsprintf, gets, tmpnam, and tempnam forbidden;
- keep system() and popen() forbidden in source roots;
- keep shell authority centralized and guarded in installer code;

- keep pointer, buffer, lifetime, and ownership rules explicit at C ABI boundaries;
- keep parser and source-buffer invariants tested with malformed, boundary-length, truncation, and hostile-input cases;
- keep retained C/C++ high-risk paths covered by regression tests for buffer-overflow-class, format-string, off-by-one, and lifetime faults where practical;
- require fuzzing or a documented exception before any parser is promoted to a security boundary.

Long-term direction:

- prefer Rust or another memory-safe implementation language for new infrastructure-facing surfaces where practical;
- isolate C substrate code behind small ABI wrappers;
- keep C++ authority code narrow, RAII-based, and exception-free across C/security boundaries;
- publish component-by-component migration or mitigation notes before any production security claim.

Zero-Trust Runtime Requirements

No future runtime, agentic automation, network, host I/O, update, recovery, boot, or hardware request may be promoted unless all fields below are available and tested:

```
request_kind_known=1
requested_effect_known=1
caller_context_known=1
operator_identity_known=1
asset_or_resource_identity_known=1
workload_or_service_identity_known=1
device_or_host_integrity_context_known=1
mode_matches_request_family=1
authority_prerequisites_satisfied=1
operator_confirmation_is_metadata_only=1
policy_decision_reported=1
denial_reason_reported=1
audit_record_emitted=1
unknown_request_denied=1
unknown_effect_denied=1
future_gate_denied_until_contract=1
```

Supply-Chain Requirements

Before a production installer, production package, internet-facing service, or production update lane can be claimed, Latticra requires:

- SBOM evidence for shipped artifacts;
- dependency inventory with license and security review;
- KEV/NVD review or documented offline exception before release;
- vulnerability-management release gate before production release or supported-version claims;
- pinned CI actions and read-only workflow permissions;
- locked dependency builds where the package manager supports it;
- no ad hoc network client commands in workflows without a dedicated review guard;
- software update and patch integrity, authenticity, validation, and rollback evidence before any mutating update lane;
- third-party component update plan for supported product lifetime;

- vulnerability disclosure route and triage process.

Cryptographic Assurance Requirements

Current Seal cryptographic work is evidence and metadata oriented. It is not production cryptographic enforcement.

Production cryptography requires:

- defined cryptographic module boundary;
- approved algorithm and parameter inventory;
- key lifecycle and storage contract;
- randomness source contract;
- validation and self-test behavior;
- side-channel and sensitive-data handling review;
- FIPS 140-3 applicability decision;
- explicit non-FIPS disclosure if FIPS validation is not pursued;
- post-quantum inventory and migration planning before long-lived secrecy claims;
- cryptographic assurance and key-management baseline before production cryptography claims;
- authority-neutral crypto graduation gate before any verified receipt can influence future authority-bearing policy;
- test fixtures for malformed keys, unsupported algorithms, stale requests, replayed requests, and denied verification paths.

Identity, Credential, and Access Management Requirements

No future hosted service, hosted administration surface, privileged operator role, remote access path, service-account runtime authority, SSO/federation claim, MFA claim, or identity-security claim may be promoted until Latticra has:

- human, service, machine, and local identity inventories;
- privileged role and role-to-effect mapping;
- phishing-resistant MFA path for privileged and remote access;
- account lifecycle and deprovisioning contract;
- break-glass access policy and monitoring;
- credential storage, recovery, rotation, and reuse review;
- help-desk identity verification process for access changes;
- identity event logging and privileged behavior review;
- owner and expiration for every access exception;
- operator-visible identity and access non-claims.

Security Logging, Monitoring, and Detection Requirements

No future hosted service, production runtime, remote access path, privileged administration surface, SIEM integration, telemetry export, security monitoring claim, or detection-service claim may be promoted until Latticra has:

- security event source inventory and owner mapping;

- audit event selection and event schema contract;
- runtime policy decision and denial reason events;
- identity, access, privileged action, configuration change, and security error events;
- event severity taxonomy and time-source requirements;
- log redaction and secret-marker scanning;
- log integrity, access control, retention, and disposal policy;
- centralization or export path planning;
- alerting expectation for disabled critical log sources;
- detection triage owner and incident handoff path;
- operator-visible logging and monitoring non-claims.

Backup, Recovery, and Cyber Resilience Requirements

No future hosted service, production runtime, production installer, production package, mutating update lane, rollback path, failover path, ransomware recovery feature, disaster-recovery claim, continuity claim, or production recoverability claim may be promoted until Latticra has:

- critical asset inventory and dependency restore order;
- business impact or service-priority record;
- RTO and RPO evidence;
- backup scope and owner;
- offline, immutable, or otherwise protected backup path;
- backup encryption and access-control review;
- backup integrity verification and restore-test result;
- clean recovery environment plan;
- golden-image or infrastructure-as-code restore path;
- rollback plan and recovery authorization;
- recovery communication and incident-response handoff path;
- post-recovery validation and lessons-learned update path;
- owner and expiration for recovery exceptions;
- operator-visible recovery non-claims.

Secure Configuration and Change Management Requirements

No future hosted service, production runtime, production installer, production package, infrastructure automation lane, host mutation lane, configuration hardening claim, secure-default claim, configuration scanning claim, drift-detection claim, or compliance claim may be promoted until Latticra has:

- configuration item inventory and owners;
- secure baseline configuration record;
- configuration checklist or equivalent verification artifact;
- secure default and default-credential absence review;
- approved change request and risk review;

- change owner and test evidence;
- rollback plan before configuration mutation;
- drift-detection and unauthorized-change response plan;
- configuration secret review;
- configuration-change log event mapping;
- owner and expiration for configuration exceptions;
- operator-visible configuration non-claims.

Operational Security Requirements

Before any production service, hosted system, or critical infrastructure deployment:

- assign a named cybersecurity owner;
- maintain asset inventory and data-flow inventory;
- define secure configuration baseline and change-control evidence;
- require MFA/SSO for privileged accounts;
- require phishing-resistant MFA planning for remote and privileged access;
- prohibit shared administrative accounts and default credentials;
- collect security-relevant logs without leaking secrets;
- define log retention, integrity, time-source, triage, and incident-handoff evidence;
- define incident response and vulnerability disclosure procedures;
- publish a cyber incident reporting and response baseline before any incident-response feature;
- define backup, restore, and recovery evidence;
- publish a backup, recovery, and cyber resilience baseline before any recovery-service or failover claim;
- schedule table-top or third-party validation before security release;
- maintain recurring NSA/CISA/FBI/NIST source review.

Non-Claims

This baseline does not implement runtime execution, effect execution, capability enforcement, cryptographic verification, signing, host behavior, network behavior, MCP behavior, AI-agent execution, model execution, tool execution, shell execution, production protection, sandboxing, malware prevention, ransomware prevention, incident response, recovery behavior, certification, accreditation, compliance, external endorsement, or runtime authority.

It also does not claim that Latticra is a finished operating system, hardened sandbox, production security product, high-assurance certified product, or critical infrastructure platform.

Validation

Latticra Identity, Credential, and Access Management Baseline

Status: identity, credential, and access management baseline Source refresh date: 2026-05-26 Scope: human identity, service identity, machine identity, privileged access, phishing-resistant MFA, SSO/federation context, account lifecycle, credential handling, break-glass access, identity event logging, and access-management non-claims before hosted services, remote access, privileged operator access, or identity-security claims.

This baseline records identity, credential, and access-management requirements only. It does not implement an identity provider, MFA provider, account provisioning, account deprovisioning, credential storage, remote access, privileged access, hosted administration, SSO federation, authorization enforcement, compliance, or runtime authority.

docs/MEMORY_SAFETY_ROADMAP.md

Source title: Latticra Memory-Safety Roadmap

Lines: 100 | Words: 744 | SHA-256: 3450f66429a26cd0996e90e8140864bcd0582c01cfb3fa22f07d78cbdab5f9bf

Latticra Memory-Safety Roadmap

Status: memory-safety roadmap Source refresh date: 2026-05-26 Scope: component-level memory-safety allocation for Latticra C, restricted C++, Rust installer, shell guards, parser surfaces, Seal metadata, runtime-boundary metadata, and future high-risk infrastructure surfaces.

This roadmap responds to the NSA/CISA memory-safe-language guidance, CISA The Case for Memory Safe Roadmaps, the CISA/FBI buffer overflow alert, the CISA secure-design alert on OS command injection, and CISA/FBI product-security bad-practice guidance tracked in docs/HIGH_ASSURANCE_SECURITY_BASELINE.md.

It does not rewrite current components, certify memory safety, claim production hardening, or create a security boundary.

Current Fields

component_memory_safety_inventory_present=1
implementation_behavior_changed=0
runtime_authority_granted=0
security_boundary_claimed=0
memory_safety_guarantee_claimed=0
production_protection_claim_allowed=0
```

Component Inventory

Component family	Current language posture	Current mitigation	Promotion blocker
L-UI source buffer and parser surfaces	C	length-aware source buffers, literal-NUL policy, escaped decoded-NUL visibility, malformed-input tests, source-span tests, explicit attention to truncation, off-by-one, and lifetime faults	fuzzing corpus, hostile input budget, parser security-boundary contract
Lat parser, semantic validation, and LIR lowering	C	parse/semantic/lowering invariant tests, no runtime execution, deterministic diagnostics, explicit attention to buffer-overflow-class and format-string hazards	fuzzing corpus, memory-safe rewrite or exception contract before untrusted-service use
Seal key, public-key, signature, freshness, and receipt metadata	C	bounded key parsing tests, malformed-key tests, replay/stale request cases, metadata-only crypto posture	cryptographic module boundary, FIPS 140-3 applicability decision, sensitive-data handling review
Runtime boundary, Nucleus task, and effect-decision records	C	deny-by-default behavior, no-effect reports, unknown request/effect denial tests, operator confirmation non-override tests, no shell mutation or workload authority	zero-trust policy prerequisites, audit records, authority tests, distinct operator/workload identity context, no production runtime claim
Kernel metadata seed surfaces	C	metadata-only state reports, no boot/hardware/kernel isolation claim, bounded local tests	separate kernel safety contract, memory-safe or restricted-C exception plan before real kernel authority
Restricted C++ authority layer	C++	constrained profile, RAII/value-type preference, no exceptions across C/security boundaries, no raw owning pointers, explicit review of allocator and ownership expansion	exception review for any unsafe ownership, allocator, ABI, or dependency expansion
Installer UI and engine	Rust	`cargo check --locked`, no Rust unsafe blocks, centralized process-launch boundary, symlink/path traversal guards, no raw shell interpolation path	no live mutation without evidence bundle, rollback contract, update authenticity evidence, and verification transcript
Shell guard and packaging lanes	POSIX shell	fail-fast scripts, private tempdirs, no ad hoc network clients, reviewed privilege/package-manager allowlists, centralized shell boundary rules	no production installer or release lane without SBOM, dependency review, and command-boundary review
GitHub workflow surface	YAML and shell commands	pinned actions, read-only permissions, no `pull_request_target`, no secrets, no implicit token use	dedicated review guard before write tokens, OIDC, secrets, or release publishing
Future network, MCP, server, update, recovery, boot, or hardware surfaces	not implemented	future-gated and denied	memory-safe implementation preferred; restricted C/C++ requires exception contract and tests

Required Rules

New high-risk components must follow this decision path:

1. Prefer Rust or another memory-safe implementation language.

2. If C/C++ is used, document why a memory-safe implementation is not practical.
3. Apply docs/security/C_CPP_SECURITY_PROFILE.md and docs/security/C_ABI_BOUNDARY_POLICY.md.
4. Add malformed-input, boundary-length, truncation, null-rule, ownership, lifetime, and failure-mode tests.
5. Add explicit review for buffer overflow, format-string, off-by-one, use-after-free, and command-construction hazards where applicable.
6. Add fuzzing before parser or external-input code can be promoted as a security boundary.
7. Keep production protection, memory-safety guarantee, compliance, certification, and external endorsement claims closed until evidence exists.

Current Guard Coverage

Current guard coverage includes:

```
unsafe_c_string_api_guard=1
source_shell_exec_guard=1
unsafe_python_api_guard=1
rust_installer_unsafe_block_guard=1
rust_installer_process_launch_boundary_guard=1
workflow_pinned_action_guard=1
workflow_read_only_permission_guard=1
workflow_secret_usage_guard=1
private_tempdir_guard=1
strict_warning_flag_guard=1
```

These guards reduce risk; they do not prove memory safety.

Required Future Evidence Before Promotion

Before any Latticra component is described as memory-safe, hardened, production-ready, or a security boundary, it needs:

- component-specific threat model;
- input-size and allocation limits;
- malformed-input and edge-case tests;
- hazard-class review for buffer overflow, format-string, off-by-one, lifetime, and command-construction failure modes where applicable;
- sanitizer or static-analysis transcript where supported;
- fuzzing plan and corpus for parsers or external-input surfaces;
- unsafe exception inventory for any remaining C/C++ high-risk code;
- dependency and SBOM review for shipped artifacts;
- public non-claim review.

Validation

This roadmap is guarded by:

```
sh scripts/test-memory-safety-roadmap.sh
```

docs/SECURE_CONFIGURATION_CHANGE_MANAGEMENT_BASELINE.md

Latticra Secure Configuration and Change Management Baseline

Status: secure configuration and change management baseline Source refresh date: 2026-05-26 Scope: secure configuration baselines, configuration item inventory, configuration checklists, secure defaults, approved change records, rollback evidence, drift detection, exception ownership, and configuration non-claims before hosted services, production installers, production runtime, infrastructure automation, or hardening claims.

This baseline records secure configuration and change-management requirements only. It does not implement host configuration, infrastructure configuration, configuration scanning, configuration enforcement, drift detection, change approval workflow, rollback execution, compliance, or runtime authority.

Authoritative Configuration Sources

Date checked: 2026-05-26

docs/security/C_ABI_BOUNDARY_POLICY.md

Source title: Latticra C ABI Boundary Policy

Lines: 220 | Words: 810 | SHA-256: 56a4833d91bed4fc38d0acf02e7bf8582bc72ef10c2a4e24f4a9fc7a8862ec95

Latticra C ABI Boundary Policy

Status: Draft Layer: Security / ABI Applies to: C-facing entry points, C/C++ interop, platform shims, plugin-like surfaces if introduced.

1. Purpose

This document defines how Latticra exposes and consumes C ABI boundaries.

C ABI boundaries are necessary for platform control, bootstrapping, interop, and long-term stability. They are also dangerous if they carry implicit ownership, unchecked buffers, ambiguous errors, or hidden mutation.

Latticra treats every C ABI boundary as a security-relevant boundary.

2. Core rules

```
No ownership crosses implicitly.
No lifetime crosses implicitly.
No mutation crosses without authorization.
No buffer crosses without length.
No result crosses without status.
No platform-specific behavior hides in generic ABI code.
```

3. Handles

Opaque handles are preferred over exposed implementation structures.

Example:

```
typedef struct latticra_handle latticra_handle;
```

Rules:

- callers must not know the internal layout;
- handle creation and destruction must be explicit;
- null handle behavior must be defined;
- invalid handle behavior must be defined;
- handle ownership must be documented.

4. Status codes

C ABI functions must return explicit status codes unless there is a strong reason not to.

Example:

```
typedef enum {
    LATTICRA_OK = 0,
    LATTICRA_ERR_DENIED,
    LATTICRA_ERR_INVALID_CONTRACT,
    LATTICRA_ERR_OUT_OF_RANGE,
    LATTICRA_ERR_UNSUPPORTED,
    LATTICRA_ERR_INTERNAL
} latticra_status;
```

Rules:

- never collapse all failures into one generic failure if policy decisions matter;
- distinguish denied, invalid, unsupported, and internal failures;
- avoid leaking sensitive details across public ABI;
- provide a safe diagnostic path where appropriate.

5. Buffers

All byte buffers must include an explicit length.

Example:

```
typedef struct {
    const unsigned char* data;
    unsigned long length;
} latticra_bytes;
```

Rules:

- no buffer without length;
- no null data pointer unless length is zero and explicitly allowed;
- maximum allowed lengths should be defined for external input;
- buffer ownership must remain with the caller unless otherwise documented;
- mutable output buffers must include capacity and written length.

6. Strings

Strings crossing the ABI must be treated as byte buffers with encoding rules.

Rules:

- define UTF-8 or other encoding explicitly;
- define whether null termination is required;

- never assume null termination if length is provided;
- validate before converting to internal string types;
- reject or normalize invalid encoding according to the specific boundary contract.

7. Ownership

Ownership transfer must be explicit in the function name or documentation.

Preferred naming:

```
create / destroy
borrow / view
copy
take
release
```

Rules:

- borrowed data may not outlive the call unless explicitly documented;
- created handles must have a corresponding destroy function;
- output allocations must specify who frees them and how;
- allocator crossing is forbidden unless an ABI allocator contract exists.

8. Mutation

Mutation must be intentional.

Rules:

- no mutation through const-violating casts;
- no hidden global mutation;
- no policy mutation through generic utility calls;
- mutation that affects authority must pass through an effect gate;
- mutation must produce audit evidence when it is security-relevant.

9. Example ABI shape

```
typedef struct latticra_handle latticra_handle;

typedef enum {
    LATTICRA_OK = 0,
    LATTICRA_ERR_DENIED,
    LATTICRA_ERR_INVALID_CONTRACT,
    LATTICRA_ERR_OUT_OF_RANGE,
    LATTICRA_ERR_UNSUPPORTED,
    LATTICRA_ERR_INTERNAL
} latticra_status;

typedef struct {
    const unsigned char* data;
    unsigned long length;
} latticra_bytes;

latticra_status latticra_validate_contract(
    latticra_handle* handle,
    latticra_bytes input
);

latticra_status latticra_destroy(
    latticra_handle* handle
);
```

10. C++ implementation mapping

C ABI functions should be thin wrappers around restricted C++ authority logic.

Example conceptual mapping:

```
C ABI call
  -&gt; argument shape check
  -&gt; safe view construction
  -&gt; C++ validator / authority object
  -&gt; typed result
  -&gt; status code mapping
  -&gt; audit record if security-relevant
```

C ABI wrappers should not contain complex policy logic unless unavoidable.

11. Audit requirements

Security-relevant ABI calls should produce audit records when they:

- validate contracts;
- deny requests;
- authorize effects;
- mutate policy state;
- execute platform effects;
- load external modules;
- alter runtime state;
- access sensitive platform data.

Audit records should not leak secrets through public output.

12. Review checklist

Before accepting a C ABI function:

- [ ] Does every pointer have a documented null rule?
- [ ] Does every buffer have a length?
- [ ] Does every mutable output have a capacity?
- [ ] Is ownership explicit?
- [ ] Is lifetime explicit?
- [ ] Are status codes precise enough?
- [ ] Are inputs validated before internal use?
- [ ] Does the function avoid hidden global mutation?
- [ ] Does privileged behavior pass through an effect gate?
- [ ] Does security-relevant behavior produce audit evidence?
- [ ] Is platform-specific behavior isolated?

13. Promotion rule

No ABI surface should be described as stable until:

- the function contract is documented;
- tests exist for invalid inputs;
- null and boundary behavior are tested;
- ownership and lifetime rules are documented;
- audit behavior is documented where relevant.

docs/security/C_CPP_SECURITY_PROFILE.md

Source title: Latticra C/C++ Security Profile

Lines: 322 | Words: 1546 | SHA-256: 775ae4fb07b75276db4ac64d8faa1843881a6bc2af200e0eaabbedd2b6c0f3cb

Latticra C/C++ Security Profile

Status: Draft Layer: Security Applies to: C substrate, restricted C++ governed authority layer, trusted core code.

1. Purpose

This document defines the required C/C++ security profile for Latticra.

Latticra may use C and C++ only under a restricted profile. This profile exists because C and C++ allow unsafe behavior unless the project explicitly prevents, isolates, or reviews that behavior.

The goal is not to pretend C/C++ is memory-safe by default. The goal is to establish a disciplined systems profile with narrow unsafe zones, explicit review, hard tooling, and evidence-bound validation.

2. Core posture

Latticra follows these principles:

1. C is the narrow substrate.
2. C++ is the governed authority layer.
3. Unsafe behavior is isolated and documented.
4. Ownership is explicit.
5. Lifetime is explicit.
6. Buffer boundaries are explicit.
7. Effects are gated.
8. Privileged mutation is auditable.
9. External input is validated.
10. Security claims require evidence.

2A. Memory-safety roadmap alignment

Latticra aligns its C/C++ posture with current NSA/CISA memory-safe-language guidance and CISA/FBI product-security bad-practice guidance.

This does not mean existing substrate code must be rewritten all at once. It does mean the project must keep a visible memory-safety roadmap and prefer a memory-safe implementation language for new high-risk components.

Required allocation:

```
memory_safety_roadmap_required=1
memory_safe_language_preferred_for_new_high_risk_components=1
restricted_c_cpp_profile_required_for_existing_substrate=1
unsafe_exception_record_required=1
sanitizer_or_static_analysis_path_required=1
fuzzing_required_before_parser_security_boundary_claim=1
```

High-risk components include:

- network-facing code;

- cryptographic key handling;
- parsers for untrusted external input;
- installer or host-mutation authority;
- update, recovery, rollback, boot, hardware, or agentic automation authority;
- IPC, privilege, capability, or policy-enforcement boundaries.

When a high-risk component remains in C or C++, it must use the restricted profile in this document, keep unsafe behavior isolated, document why a memory-safe alternative is not used, and add targeted tests for malformed input, length boundaries, ownership, lifetime, and failure behavior.

3. Allowed C++ patterns in trusted core

The following patterns are preferred:

- RAII for cleanup and resource release;
- value types for simple data transfer;
- enum class for typed state and policy names;
- std::array where size is static;
- span/view-style APIs for non-owning buffers where available and appropriate;
- std::unique_ptr for unique heap ownership when dynamic allocation is permitted;
- explicit Result<T, E> or status/error-return types;
- immutable configuration objects after initialization;
- small policy objects with narrow responsibilities;
- typed capability objects;
- deterministic destructors;
- explicit move semantics;
- dependency-free or dependency-minimal modules;
- pure validation functions where possible;
- parser/validator separation.

4. Restricted or forbidden C++ patterns in trusted core

The following are forbidden or require explicit review exception:

Pattern	Status	Reason
Raw owning pointers	Forbidden	Ownership must be explicit.
`new` / `delete` in ordinary code	Forbidden	Use RAII and approved allocators.
Unchecked pointer arithmetic	Forbidden	High memory safety risk.
`reinterpret_cast`	Exception-only	Platform or ABI code only, with review notes.
C-style casts	Forbidden	Cast intent must be explicit.
Exceptions across C ABI or security boundaries	Forbidden	Failure must be explicit and deterministic.
RTTI in trusted/freestanding core	Restricted	Avoid hidden runtime assumptions.
Hidden global mutable state	Forbidden	Breaks auditability and determinism.
Varargs	Forbidden	Type safety and boundary risk.
Template metaprogramming for core policy	Restricted	Avoid unreadable authority logic.
Complex inheritance trees	Restricted	Prefer composition and final small types.
Silent integer narrowing	Forbidden	Must use checked conversion.
Unbounded string/buffer operations	Forbidden	Buffer length must be explicit.
Large unreviewed dependencies	Forbidden	Dependency trust must be reviewed.

5. Allowed C patterns

C code is allowed only for substrate responsibilities:

- boot and early runtime;
- C ABI surfaces;
- platform shims;
- freestanding helpers;
- fixed-layout interop structs;
- hardware-facing entry points;
- minimal wrappers around platform mechanisms.

C code should be small, boring, and directly reviewable.

6. Restricted or forbidden C patterns

The following C patterns are forbidden or exception-only:

Pattern	Status
Unbounded `strcpy`, `strcat`, `sprintf`, similar APIs	Forbidden
Unchecked `memcpy` / `memmove` sizes	Forbidden
Implicit ownership transfer through raw pointers	Forbidden
Mutable global state	Exception-only
Macro-heavy control logic	Restricted
Type-punning through incompatible pointers	Exception-only
Undocumented inline assembly	Forbidden
Platform-specific behavior in generic files	Forbidden
Undefined behavior reliance	Forbidden
Silent integer truncation	Forbidden

7. Boundary rules

No C/C++ boundary may rely on implicit ownership or lifetime.

Boundary rule set:

```
No lifetime crosses the C ABI boundary.
No ownership crosses without an explicit handle.
No mutation crosses without an effect gate.
No error crosses without a typed status or result.
No buffer crosses without pointer + length + validation.
No privileged action crosses without audit intent.
```

8. Error handling

Trusted code should avoid hidden failure paths.

Preferred:

```
Result&lt;T, LatticraError&gt;
StatusCode
Expected&lt;T, E&gt;
```

Required behavior:

- all failure states must be explicit;
- no security boundary should throw exceptions across ABI;
- no privileged effect should silently fail;
- user-facing reports must not leak sensitive internals;
- audit records must distinguish denied, invalid, unsupported, and internal error states.

9. Allocation policy

Early substrate and platform code should avoid dynamic allocation unless explicitly approved.

C++ authority layer may use dynamic allocation only after allocator policy is defined.

Required allocation posture:

- boot/substrate: no ordinary heap dependency unless explicitly documented;
- trusted core: deterministic allocation preferred;
- no allocation inside critical sections unless justified;
- all ownership must be visible in the type system;
- allocation failure must be handled intentionally.

10. Input validation policy

All external input must pass through validation before use.

Examples:

- contract files;
- command input;
- serialized policy data;
- configuration files;
- plugin descriptors;
- platform-reported data;
- filesystem paths;
- network-originated input if networking exists later.

Validation must produce typed output. Downstream authority code should operate on validated types, not raw input.

11. Effect gate policy

Any action that mutates system state, opens access, executes code, loads external data, alters policy, or touches hardware-like surfaces must pass through an effect gate.

Effect gate requirements:

- request type;
- caller context;
- validation result;
- authorization decision;
- denied-state behavior;
- audit record;
- bounded effect;
- deterministic return value.

12. Dependency policy

Dependencies are not accepted only because they are convenient.

A dependency requires:

- purpose;
- license review;
- build impact review;
- security history review where practical;
- transitive dependency review;
- freestanding compatibility review if applicable;
- replacement/removal plan if the dependency becomes unsuitable.

Trusted core dependencies should be rare.

12A. CISA/FBI product-security bad-practice exclusions

The trusted core and future infrastructure surfaces must exclude the following classes unless an explicit exception contract exists:

- no hardcoded default passwords, tokens, or private keys;
- no command injection surface through implicit shells;
- no direct SQL string construction if a database layer is ever introduced;
- no cross-site scripting exposure if web UI or rendered HTML input becomes dynamic;
- no directory traversal in installer, package, update, recovery, or artifact paths;
- no known-insecure or deprecated cryptographic algorithms for production data protection;
- no unmanaged third-party dependency with unknown maintenance or security status;
- no production claim for memory-unsafe high-risk code without a memory-safety roadmap;
- no security release with known exploitable vulnerabilities lacking mitigation notes.

Cryptographic code has an additional rule: production cryptography requires a documented module boundary and a FIPS 140-3 applicability decision before any FIPS, federal, or high-assurance cryptographic claim is allowed.

13. Build and analysis expectations

Baseline debug/CI expectations:

```
-Wall
-Wextra
-Wpedantic
-Wconversion
-Wshadow
-Werror where practical
clang-tidy cppcoreguidelines-* where practical
CERT-oriented static analysis where available
AddressSanitizer where supported
UndefinedBehaviorSanitizer where supported
ThreadSanitizer for concurrent modules where supported
fuzzing for parsers and contract loaders
```

Baseline release expectations:

```
stack protector where supported
FORTIFY/source hardening where supported
PIE/RELRO/NX/canaries where applicable
LTO only after sanitizer-clean builds
reproducible build notes where practical
no unreviewed unsafe/platform files
```

Tool availability depends on platform and build mode. Unsupported tools must be documented rather than silently ignored.

14. Review labels

Suggested code review labels:

- trusted-core
- c-substrate
- cpp-authority
- abi-boundary
- unsafe-exception
- effect-gate
- parser
- validator
- audit
- platform-specific
- dependency-review

15. Unsafe exception template

Any exception to this profile should include:

```
File:
Function:
Rule being excepted:
Reason:
Why safer alternative is not used:
Scope of unsafe behavior:
How lifetime is bounded:
How buffer size is bounded:
How failure is handled:
Test coverage:
Reviewer:
Date:
```

16. Promotion rule

A feature may not be described as secure, hardened, or safe merely because it follows this profile.

A feature can only be promoted with precise evidence:

- tests pass;
- analyzers run or exceptions are documented;
- unsafe exceptions are reviewed;
- parser inputs are fuzzed where relevant;
- ABI boundaries are documented;
- effect gates exist for privileged behavior;
- audit records exist for privileged behavior.

docs/SECURITY_LOGGING_MONITORING_BASELINE.md

Source title: Latticra Security Logging, Monitoring, and Detection Baseline

Lines: 166 | Words: 499 | SHA-256: 6c412cf903285aa19cf00aaa39a1362fbd7a33711cce6ba81ccac67bcc02c6bb

Latticra Security Logging, Monitoring, and Detection Baseline

Status: security logging, monitoring, and detection baseline Source refresh date: 2026-05-26 Scope: security event source inventory, audit event selection, runtime-authority decision logs, identity and access events, privileged actions, log redaction, log integrity, retention, disposal, time source, detection triage, incident handoff, and monitoring non-claims before hosted services, production monitoring, detection services, SIEM export, or security operations claims.

This baseline records logging, monitoring, and detection requirements only. It does not implement a log collector, SIEM, telemetry export, host sensor, network sensor, detection rule, alerting service, log storage, monitoring service, incident detection service, compliance, or runtime authority.

Authoritative Logging and Detection Sources

Date checked: 2026-05-26

Source	Latticra use
CISA/FBI/NSA international Best Practices for Event Logging and Threat Detection	event logging baseline, threat detection, cloud/enterprise/mobile/OT visibility, and resource-aware logging vocabulary
NSA release for Best Practices for Event Logging and Threat Detection	national-security, DoD, DIB, and living-off-the-land detection context
CISA Logging Made Easy	centralized log management, user activity visibility, Sysmon data, real-time alerting, and locally run privacy caveats
CISA Use Logging on Business Systems	what-to-log, centralization, monitoring, alerting, and log-review planning vocabulary
CISA Cross-Sector Cybersecurity Performance Goals	log collection, account security, incident response, and baseline operational practice context
NIST SP 800-92 Guide to Computer Security Log Management	log management infrastructure, generation, transmission, storage, access, analysis, and disposal vocabulary
NIST SP 800-92 Rev. 1 initial public draft	current log-management planning playbook vocabulary for future improvement plans
NIST Cybersecurity Framework 2.0 Detect function	security continuous monitoring and event discovery vocabulary
NIST SP 800-53 Rev. 5 Audit and Accountability controls	audit event, audit record, audit storage, audit review, and audit reduction vocabulary

docs/strategy/2026-05-15-2249-cdt-national-security-open-system-strategy.md

Source title: Latticra National-Security Open-System Strategy

Lines: 208 | Words: 871 | SHA-256: 1fd7f5235eb3ac77e0bb897baab7305f9fac0c0dcdb2aee2d7851d212f9b5107

Latticra National-Security Open-System Strategy

Status: active strategy record Created: 2026-05-15 22:49 CDT Last updated: 2026-05-16 16:15 CDT Review cadence: update at major milestone boundaries or whenever mission, threat model, status, funding, or target users change.

Motto

“The simulacrum is never what hides the truth.” — Jean Baudrillard

Mission

Latticra is intended to become a contract-first open systems architecture and programming-language platform built with national-security-grade discipline from the beginning.

The long-term mission is to make general-purpose computing more resistant to malware, ransomware, unauthorized persistence, hidden mutation, unclear execution, and opaque system behavior.

This mission is defensive. It is not a claim that Latticra currently prevents malware, prevents ransomware, provides a hardened sandbox, or replaces an operating system.

Core thesis

Open systems can be made stronger when they are:

```
auditable
contract-driven
deterministic where possible
source-aware
operator-visible
effect-gated
small enough to review
honest about non-claims
tested before promoted
```

Latticra should favor transparent security architecture over hidden magic.

Direction checkpoint

```
C is the metal.
C++ is the disciplined structure.
Latticra is the contract.
```

Strategic interpretation:

```
C: secure substrate, boot paths, ABI boundaries, platform shims.
C++: governed authority layer, policy, validators, effect gates, audit logic.
Lat / Latticra Language: contract and declaration layer.
```

This is a constrained C/C++ foundation direction. It does not mean unrestricted C++.

Primary product direction

The long-term product direction is a complete open-source operating-system universe composed of:

- Latticra systems architecture;
- constrained C/C++ substrate and authority layers;
- Lat / Latticra Programming Language;
- L-UI operator interface declarations;
- LIR / Latticra Intermediate Representation;
- Nucleus supervisor architecture;
- explicit state lattices;
- effect gates;
- deterministic diagnostics;
- evidence-driven promotion;
- security-aware execution boundaries;
- eventual runtime, recovery, update, and deployment models.

Target users

Primary target users:

- intellectuals;
- scientists;
- computer scientists;
- security researchers;
- defensive engineering teams;
- public-interest infrastructure maintainers;

- government infrastructure stakeholders;
- operators who need auditable and explainable computing systems.

Security design posture

Latticra should be built as though hostile inputs, hostile environments, and operator mistakes are expected.

Design posture:

```
default deny
no hidden execution
no hidden mutation
no network behavior without gates
no hardware behavior without gates
explicit trust boundaries
explicit source spans
explicit diagnostics
stable error codes
transparent state reports
contract before capability
```

Anti-malware and anti-ransomware goal

The long-term goal is to reduce the effectiveness of malware and ransomware by designing a system where dangerous behavior is harder to hide, harder to trigger accidentally, and easier to inspect.

Early mechanisms that support this goal:

- source-aware parsing;
- semantic validation;
- LIR shape planning;
- Lat grammar implementation;
- constrained C substrate behavior;
- constrained C++ authority-layer contract;
- governed C++ authority-layer planning;
- deterministic diagnostics;
- no-effect defaults;
- effect classification;
- operator-visible reports;
- explicit string and source-buffer policies;
- contracts before implementation;
- tests before promotion.

Current non-claim:

```
Latticra does not currently prevent malware or ransomware.
```

Current estimated completion

Estimated as of 2026-05-16 16:15 CDT:

```
| Area | Estimate |
| --- | ---: |
| Overall Latticra system | 19% |
| L-UI parser / AST / string foundation | 86% |
| Foundation docs and contracts | 74% |
| Lat / Latticra Programming Language | 10% |
```

```
| LIR | 10% |
| C/C++ foundation direction | 14% |
| Constrained C++ authority layer | 4% |
| Nucleus real task execution | 10% |
| Runtime / OS-universe direction | 5% |
| Security-hardening implementation | 5% |
| Public product readiness | 5% |
```

These percentages are rough planning estimates, not formal release metrics.

Strategic priorities

1. Keep public docs professional and self-contained.
2. Keep security claims evidence-bound.
3. Preserve the constrained C/C++ foundation direction.
4. Move from constrained C++ authority-layer contract into implementation planning.
5. Keep Lat metadata-only until separate lowering, execution, or runtime contracts exist.
6. Define constrained C++ authority-layer implementation plans before C++ policy/validator implementation.
7. Expand Nucleus from preview/reporting into carefully gated execution planning.
8. Build status reporting and public progress estimates.
9. Maintain project notes so current direction and upcoming work remain clear.
10. Preserve quality, clarity, and consistency across every public artifact.

Quality requirements

Every major change should be:

```
small enough to review
well named
contracted or documented
tested or guarded
honest about boundaries
safe by default
consistent with Latticra naming
consistent with the C/C++ foundation direction
free of unsupported security claims
```

Funding strategy

Latticra should support sponsorship through Bryforge while keeping the repository technically credible.

Funding links should be visible but not intrusive.

Current sponsorship account:

```
Buy Me a Coffee: Bryforge
```

Next strategic slice

Recommended next slice:

```
Constrained C++ authority layer implementation plan
```

This turns the constrained C++ authority-layer contract into exact API, namespace, file path, build, exception, RTTI, allocation, ownership, C ABI, validator, audit report, and test planning before implementation code.

Non-claims

This strategy does not implement an operating system, sandbox, malware defense, ransomware defense, kernel, recovery system, update system, hardware system, production runtime, unrestricted C++ authority, implemented C++ authority layer, or security boundary.

It records strategic direction and quality expectations only.

docs/SUPPLY_CHAIN_SECURITY_BASELINE.md

Source title: Latticra Supply-Chain Security Baseline

Lines: 160 | Words: 815 | SHA-256: 019fd4d9fe0dcac3afc72a6eba43d7c04c5d6f911fc61e4260a4a88993a87ccb

Latticra Supply-Chain Security Baseline

Status: supply-chain security baseline Source refresh date: 2026-05-26 Scope: repository, CI, dependency, package, installer, artifact, SBOM, release, and update-lane security posture for current Latticra work.

This baseline turns the supply-chain requirements in docs/HIGH_ASSURANCE_SECURITY_BASELINE.md into a guarded local project contract.

It also carries forward the stricter update-lane, command-boundary, and integrity expectations implied by NIST SP 800-53 Release 5.2.0, CISA KEV practice, and the CISA secure-design alert on OS command injection.

It does not publish artifacts, release packages, add signing authority, claim SLSA level, claim NIST compliance, claim CISA CPG compliance, or make Latticra production-ready.

Current Guarded Controls

Surface	Current control	Evidence
GitHub workflows	actions pinned to approved commit SHAs	`scripts/test-quality-safety-guards.sh`
GitHub token permissions	workflows require explicit read-only repository permissions	`scripts/test-quality-safety-guards.sh`
Checkout credentials	checkout steps require `persist-credentials: false`	`scripts/test-quality-safety-guards.sh`
Pull request trust boundary	`pull_request_target` is forbidden	`scripts/test-quality-safety-guards.sh`
Secrets and tokens	workflow secret and implicit token use are blocked without a dedicated guard	`scripts/test-quality-safety-guards.sh`
Repository secret material	secret-bearing filenames, private-key blocks, and common live-token markers are blocked from source files	`scripts/test-secret-material-guard.sh`
Report and log redaction	whole-environment dumps, shell xtrace, and unredacted installer child logs are blocked	`scripts/test-report-redaction-boundary.sh`
Installer config authority labels	profile, strategy, channel, and command-wrapper values are constrained to reviewed ASCII slug/name allowlists before rendering or install	`scripts/test-installer-config-authority-allowlist.sh`
Installer UI artifacts	Panel save/plan paths validate and sanitize authority fields before writing config or plan artifacts	`scripts/test-installer-ui-artifact-authority.sh`
Installer console output	Panel console report commands validate authority fields before reflecting config-derived values	`scripts/test-installer-console-output-authority.sh`
Workflow network clients	ad hoc `curl`, `wget`, SSH, FTP, and netcat-style commands are blocked without a dedicated guard	`scripts/test-quality-safety-guards.sh`
Package-manager mutation	package-manager use is limited to reviewed workflow/script allowlists	`scripts/test-quality-safety-guards.sh`
Source archive fixtures	package source archives require tracked/unignored source selection, symlink refusal, and deterministic tar/gzip metadata	`scripts/test-quality-safety-guards.sh`
Rust installer dependency use	local quality uses `cargo check --locked`	`Makefile`
Live installer build path	installer apply script requires locked offline Cargo builds and keeps the process-launch boundary centralized	`installer/scripts/latticra-installer-apply.sh`
Local installer artifacts	SBOM path is explicit and currently `none` for non-production fixtures	`docs/LOCAL_INSTALLER_ARTIFACT_MANIFEST_CONTRACT.md`
Boot artifact manifest fixture	SBOM fields are required before real boot artifact acceptance	`docs/SEABIOS_GRUB_BOOT_PREVIEW_BOOT_ARTIFACT_MANIFEST_VALIDATION.md`
Ubuntu package readiness	third-party material, notice, license, generated-artifact, and trademark reviews remain blocked until formal review	`docs/UBUNTU_READINESS_PLAN.md`

Required Release Gate

No production package, production installer, internet-facing service, update lane, boot artifact, or release artifact may be described as production-ready until the following gate is complete:

```
release_artifact_inventory_present=1
sbom_present=1
sbom_reviewed=1
dependency_inventory_reviewed=1
third_party_material_reviewed=1
license_notice_reviewed=1
kev_nvd_review_completed=1
known_exploited_vulnerability_mitigation_recorded=1
workflow_write_permission_reviewed=1
release_secret_boundary_reviewed=1
artifact_integrity_hashes_recorded=1
signing_authority_contract_present=1
update_payload_integrity_reviewed=1
update_authenticity_path_reviewed=1
update_rollback_evidence_present=1
command_boundary_reviewed=1
rollback_or_recovery_contract_present=1
vulnerability_disclosure_path_present=1
production_non_claim_review_completed=1
```

Until this gate is complete, the required posture is:

```
sbom_present_for_production_release=0
release_artifact_published=0
release_signing_performed=0
release_secret_access_granted=0
```

```
release_write_token_granted=0
production_installer_claim_allowed=0
production_update_claim_allowed=0
production_security_claim_allowed=0
```

Dependency Review Rules

Every new dependency, vendored artifact, generated artifact, or bundled binary requires:

- purpose and ownership;
- license and notice review;
- security history review where practical;
- transitive dependency review where practical;
- KEV/NVD check before release or documented offline exception;
- build reproducibility note where practical;
- update authenticity and integrity impact review where the dependency can affect installer, package, or update behavior;
- removal or replacement plan if the dependency becomes unsuitable.

CI Authority Rules

CI changes must preserve:

- explicit workflow permissions;
- read-only default repository token posture;
- no pull_request_target;
- no repository secrets without dedicated review;
- no implicit GITHUB_TOKEN, GH_TOKEN, ACTIONS_ID_TOKEN, or runtime token use without dedicated review;
- no committed local secret files, private-key blocks, or common live-token markers in repository source;
- no whole-environment dumps, shell xtrace, or unredacted child-process output in report/log paths;
- no installer profile, update-channel, strategy, or command-wrapper string may cross into plans, config artifacts, or install scripts unless it passes the authority slug/name allowlist;
- no installer UI save or plan artifact may be written from an unvalidated or network-authority-enabled config;
- no ad hoc network client commands without dedicated review;
- no new command-construction or shell-interpolation path without a dedicated command-boundary review;
- no mutating update lane without integrity, authenticity, validation, and rollback evidence;
- no release publishing without an explicit release-authority contract.

docs/VULNERABILITY_MANAGEMENT_RELEASE_GATE_BASELINE.md

Source title: Latticra Vulnerability Management Release Gate Baseline

Lines: 142 | Words: 346 | SHA-256: e5e0530b67f0bce612ed91e9cff99f70f4c360c7f301630aac4290557308f0be

Latticra Vulnerability Management Release Gate Baseline

Status: vulnerability management release gate baseline Source refresh date: 2026-05-26 Scope: CISA KEV review, NVD/CVE review, coordinated vulnerability disclosure, dependency/component inventory, release blocking, mitigation/exception records, and public non-claims before production release, update, installer, package, internet-facing service, or security-product claims.

This baseline records vulnerability-management release gates only. It does not run vulnerability scans, query live feeds, publish advisories, submit CVEs, patch dependencies, produce an SBOM, publish releases, grant release authority, or claim product security.

Authoritative Vulnerability Sources

Date checked: 2026-05-26

```
| Source | Latticra use |
| --- | --- |
| CISA Known Exploited Vulnerabilities Catalog | exploited-in-the-wild prioritization input
before release or internet-facing claims |
| NIST National Vulnerability Database and CVSS metrics | CVE/CVSS enrichment vocabulary,
severity context, and non-risk-score caveat |
| CISA Coordinated Vulnerability Disclosure Program | disclosure coordination and mitigation
workflow vocabulary |
| CISA Vulnerability Disclosure Policy Template | good-faith reporting, authorized testing,
report intake, and disclosure-scope vocabulary |
| CISA/FBI Product Security Bad Practices | avoid release posture that ignores known exploited
vulnerabilities or fails to document non-exploitability claims |
```

docs/ZERO_TRUST_RUNTIME_AUTHORITY_BASELINE.md

Source title: Latticra Zero-Trust Runtime Authority Baseline

Lines: 144 | Words: 477 | SHA-256: f71f774383331de1fb1703473c919d6477d7dd316bdf2d8a2ff81b8f31b86af6

Latticra Zero-Trust Runtime Authority Baseline

Status: zero-trust runtime authority baseline Source refresh date: 2026-05-26 Scope: future runtime, tool, host I/O, network, server/MCP, update, recovery, boot, hardware, agentic automation, and authority-bearing request paths.

This baseline turns the current defensive threat model and runtime-boundary policy expansion into a guarded Latticra runtime-authority contract.

It does not implement runtime execution, network access, host I/O, tool execution, MCP behavior, recovery behavior, boot behavior, hardware behavior, policy enforcement, capability enforcement, or production protection.

Authoritative Zero-Trust Sources

Date checked: 2026-05-26

```
| Source | Latticra use |

```

Pillar Mapping

Pillar	Latticra requirement before authority
Identity	caller, operator, automation profile, and request family must be explicit
Devices / execution environment	local runner, host context, workspace boundary, and platform scope must be recorded
Networks / environment	network effects remain denied until a network authority contract and telemetry path exist
Applications / workloads	tool, MCP, model, runtime, signer, updater, and installer workloads require separate authority contracts
Data	target resources, files, manifests, receipts, keys, artifacts, and reports must be identified and bounded
Visibility and analytics	decision, denial reason, gate state, matrix cell, and evidence level must be reportable
Automation and orchestration	automation cannot bypass policy, and operator confirmation cannot override denied effects
Governance	status records, non-claims, and guard scripts must block promotion by wording alone

Required Runtime Authority Gate

No future request may execute, mutate, read host files, write host files, open network connections, run tools, invoke MCP, load model artifacts, sign, update, recover, touch boot state, or affect hardware until this gate is complete:

```
request_kind_known=1

docs/DEBIAN_FREEBSD_OPENBSD_PACKAGE_ARTIFACT_NAMING_CONTRACT.md

Source title: Debian, FreeBSD, and OpenBSD Package Artifact Naming Contract

Lines: 277 | Words: 796 | SHA-256: 203c7005f2cea2f13ecb11b463a80eaf7739b8d16bd1590fef5b8e18d0503faf

Debian, FreeBSD, and OpenBSD Package Artifact Naming Contract

Status: active package artifact naming contract Scope: define future Debian, FreeBSD, and OpenBSD package artifact names and output boundaries without creating package artifacts.

Purpose

This contract records the artifact names, output-directory rules, checksum binding, retention requirements, and publication non-claims required before any future Debian, FreeBSD, or OpenBSD package build can create package files.

The goal is narrow: package artifacts must have predictable names, be written only inside a disposable validation environment, bind back to the source archive digest, and remain non-published review outputs until separate payload inspection, install/remove, and publication review contracts exist.

This contract is documentation-only and static. It does not run package build tools, create package artifacts, install Latticra, write FreeBSD or OpenBSD distinfo files, publish packages, or claim package readiness.

Current Artifact Naming State

```
debian_freebsd_openbsd_package_artifact_naming_contract_present=1
debian_freebsd_openbsd_package_payload_inspection_contract_present=1
debian_freebsd_openbsd_package_install_remove_transcript_contract_present=1
debian_freebsd_openbsd_package_publication_non_claim_review_contract_present=1
debian_freebsd_openbsd_package_validation_promotion_blocker_matrix_contract_present=1
artifact_naming_contract_present=1
artifact_naming_contract_state=specified-no-effect
payload_inspection_contract_state=specified-no-effect
install_remove_transcript_contract_state=specified-no-effect
publication_non_claim_review_contract_state=specified-no-effect
validation_promotion_blocker_matrix_state=blocked-no-effect
package_build_gate_state=closed-no-effect
package_build_environment_contract_state=specified-no-effect
package_artifact_output_directory_required_under_disposable_environment=1
package_artifact_output_directory_created=0
repository_package_artifact_write_allowed=0
publication_directory_write_allowed=0
package_artifact_created=0
deb_artifact_created=0
debian_source_package_created=0
freebsd_package_artifact_created=0
openbsd_package_artifact_created=0
package_artifact_sha256_recorded=0
package_artifact_published=0
install_on_host_run=0
publication_non_claim_review_present=1
platform_build_evidence_accepted=0
package_readiness_claimed=0
```

Debian Artifact Names

Future Debian artifact names must be derived from the current Debian changelog version and the clean build environment architecture.

```
debian_source_package_name=latticra_0.0.0-1local1.dsc
debian_orig_archive_name=latticra_0.0.0.orig.tar.gz
debian_debian_tar_name=latticra_0.0.0-1local1.debian.tar.xz
debian_binary_package_name_pattern=latticra_0.0.0-1local1_${DEB_HOST_ARCH}.deb
debian_changes_name_pattern=latticra_0.0.0-1local1_${DEB_HOST_ARCH}.changes
debian_buildinfo_name_pattern=latticra_0.0.0-1local1_${DEB_HOST_ARCH}.buildinfo
debian_artifact_name_pattern_recorded=1
dpkg_buildpackage_run=0
```

```
debuild_run=0
lintian_run=0
deb_artifact_created=0
debian_source_package_created=0
```

The ${DEB_HOST_ARCH} token must be resolved from the disposable Debian environment transcript before any Debian artifact can be accepted.

FreeBSD Artifact Names

Future FreeBSD package artifact names must be derived from the current port PORTNAME and DISTVERSION.

```
freebsd_package_name=latticra-0.0.0.pkg
freebsd_distfile_name=latticra-0.0.0.tar.gz
freebsd_artifact_name_pattern_recorded=1
freebsd_package_artifact_created=0
freebsd_make_makesum_run=0
freebsd_make_stage_run=0
freebsd_make_package_run=0
portlint_run=0
poudriere_run=0
```

The FreeBSD package name is a future local validation artifact only. It is not a FreeBSD ports-tree submission, poudriere result, official package, or publication claim.

OpenBSD Artifact Names

Future OpenBSD package artifact names must be derived from the current port DISTNAME.

```
openbsd_package_name=latticra-0.0.0.tgz
openbsd_distfile_name=latticra-0.0.0.tar.gz
openbsd_artifact_name_pattern_recorded=1
openbsd_package_artifact_created=0
openbsd_make_makesum_run=0
openbsd_make_plist_run=0
openbsd_make_package_run=0
portcheck_run=0
openbsd_bulk_build_run=0
```

The OpenBSD package name is a future local validation artifact only. PERMIT_PACKAGE=No remains in force until license, redistribution, notice, checksum, and maintainer-review evidence exists.

Output Boundary

Future package artifacts must be written only under a disposable validation environment output directory. The repository itself remains a no-artifact workspace.

```
artifact_output_root_under_disposable_environment=1
debian_artifact_output_directory=artifacts/debian/
freebsd_artifact_output_directory=artifacts/freebsd/
openbsd_artifact_output_directory=artifacts/openbsd/
repository_package_artifact_write_allowed=0
root_workspace_package_artifact_write_allowed=0
publication_directory_write_allowed=0
artifact_retention_policy_required=1
artifact_cleanup_policy_required=1
```

Any future artifact transcript must bind each package file to:

```
source_archive_sha256
package_input_archive_sha256
package_artifact_sha256
artifact_size_bytes
artifact_output_directory
artifact_generation_command
environment_identifier
operator_authorization_reference
```

Current Blockers

Package artifact creation remains blocked under this blocker and dependency state:

```
source_archive_accepted_for_build=0
```

```
license_expression_reviewed=1
package_notice_obligations_reviewed=0
explicit_operator_build_authorization=0
environment_transcript_present=0
install_remove_transcript_contract_present=1
payload_inspection_contract_present=1
publication_non_claim_review_present=1
platform_build_evidence_accepted=0
package_validation_result_promoted=0
```

Command Boundary

This contract does not:

```
run dpkg-buildpackage
run debuild
run lintian
run FreeBSD make stage
run FreeBSD make package
run portlint
run poudriere
run OpenBSD make plist
run OpenBSD make package
run portcheck
run an OpenBSD bulk build
create .deb artifacts
create .dsc artifacts
create .changes artifacts
create .buildinfo artifacts
create .pkg artifacts
create .tgz artifacts
install Latticra on a host
publish package artifacts
claim package readiness
```

Relationship To Existing Lanes

This contract depends on:

```
docs/DEBIAN_FREEBSD_OPENBSD_SOURCE_ARCHIVE_CONTRACT.md
docs/DEBIAN_FREEBSD_OPENBSD_SOURCE_ARCHIVE_FIXTURE_LANE.md
docs/DEBIAN_FREEBSD_OPENBSD_PACKAGE_INPUT_HANDOFF_LANE.md
docs/DEBIAN_FREEBSD_OPENBSD_PACKAGE_BUILD_GATE_CONTRACT.md
docs/DEBIAN_FREEBSD_OPENBSD_PACKAGE_BUILD_ENVIRONMENT_CONTRACT.md
docs/DEBIAN_FREEBSD_OPENBSD_PACKAGE_PAYLOAD_INSPECTION_CONTRACT.md
docs/DEBIAN_FREEBSD_OPENBSD_PACKAGE_INSTALL_REMOVE_TRANSCRIPT_CONTRACT.md
docs/DEBIAN_FREEBSD_OPENBSD_PACKAGE_PUBLICATION_NON_CLAIM_REVIEW_CONTRACT.md
docs/DEBIAN_FREEBSD_OPENBSD_PACKAGE_VALIDATION_PROMOTION_BLOCKER_MATRIX_CONTRACT.md
```

The package-build gate remains closed. This artifact naming contract only records the names and output boundaries future validation artifacts must use after separate source, license, notice, environment, authorization, payload inspection, install/remove, and publication non-claim evidence exists.

Completed Follow-On Lane

Completed follow-on lane:

```
Add a Debian, FreeBSD, and OpenBSD package payload inspection contract before any package
artifact can be accepted.
docs/DEBIAN_FREEBSD_OPENBSD_PACKAGE_PAYLOAD_INSPECTION_CONTRACT.md
scripts/test-debian-freebsd-openbsd-package-payload-inspection-contract.sh
```

That lane defines how package payloads are inspected after creation while keeping package_build_gate_state=closed-no-effect until the remaining prerequisites are satisfied.

Completed Follow-On Lane

Completed follow-on lane:

```
Add a Debian, FreeBSD, and OpenBSD package install/remove transcript contract before any package
 install can be accepted.
docs/DEBIAN_FREEBSD_OPENBSD_PACKAGE_INSTALL_REMOVE_TRANSCRIPT_CONTRACT.md
scripts/test-debian-freebsd-openbsd-package-install-remove-transcript-contract.sh
```

That lane defines disposable install/remove evidence while keeping host installs and package readiness blocked.

Completed Follow-On Lane

Completed follow-on lane:

```
Add a Debian, FreeBSD, and OpenBSD package publication non-claim review contract before any
package validation result can be promoted.
```

```
docs/DEBIAN_FREEBSD_OPENBSD_PACKAGE_PUBLICATION_NON_CLAIM_REVIEW_CONTRACT.md
scripts/test-debian-freebsd-openbsd-package-publication-non-claim-review-contract.sh
```

That lane records local-only publication and official-port non-claims while keeping package publication and readiness blocked.

Completed Follow-On Lane

Completed follow-on lane:

```
Add a Debian, FreeBSD, and OpenBSD package validation promotion blocker matrix before any
platform-specific build evidence can be accepted.
```

```
docs/DEBIAN_FREEBSD_OPENBSD_PACKAGE_VALIDATION_PROMOTION_BLOCKER_MATRIX_CONTRACT.md
scripts/test-debian-freebsd-openbsd-package-validation-promotion-blocker-matrix-contract.sh
```

That lane ties source, environment, artifact, payload, install/remove, and publication non-claim blockers together while keeping platform build evidence acceptance and validation promotion blocked.

Next Slice

Recommended next slice:

```
Add a Debian, FreeBSD, and OpenBSD package build-evidence intake denial contract before any
single-platform build lane can open.
```

That future lane should define how build evidence intake is refused until the blocker matrix opens, while keeping package builds and readiness blocked.

Validation

Run:

```
sh scripts/test-debian-freebsd-openbsd-package-artifact-naming-contract.sh
```

Expected output:

```
debian_freebsd_openbsd_package_artifact_naming_contract: ok
```

docs/DEBIAN_FREEBSD_OPENBSD_PACKAGE_BUILD_ENVIRONMENT_CONTRACT.md

Source title: Debian, FreeBSD, and OpenBSD Package Build Environment Contract

Lines: 304 | Words: 863 | SHA-256: 4df6e88d20e1adb971bc7e75c97653e4118d4310e75c7d8d30b6d1a5c5910ac5

Debian, FreeBSD, and OpenBSD Package Build Environment Contract

Status: active package-build environment contract Scope: document required disposable validation environments for Debian, FreeBSD, and OpenBSD package-build lanes without running package build commands.

Purpose

This contract documents the minimum environment evidence required before any future Debian, FreeBSD, or OpenBSD package-build lane can ask to open the package-build gate.

The goal is narrow: describe clean/disposable validation environments, required transcript fields, toolchain metadata, package input binding, and host-effect boundaries before any package build command can run.

This contract is documentation-only and static. It does not provision a VM, create a chroot, create a jail, run package build tools, create package artifacts, install Latticra, write FreeBSD or OpenBSD distinfo files, or claim package readiness.

Current Environment State

```
debian_freebsd_openbsd_package_build_environment_contract_present=1
debian_freebsd_openbsd_package_artifact_naming_contract_present=1
debian_freebsd_openbsd_package_payload_inspection_contract_present=1
debian_freebsd_openbsd_package_install_remove_transcript_contract_present=1
debian_freebsd_openbsd_package_publication_non_claim_review_contract_present=1
debian_freebsd_openbsd_package_validation_promotion_blocker_matrix_contract_present=1
package_build_environment_contract_state=specified-no-effect
artifact_naming_contract_state=specified-no-effect
payload_inspection_contract_state=specified-no-effect
install_remove_transcript_contract_state=specified-no-effect
publication_non_claim_review_contract_state=specified-no-effect
validation_promotion_blocker_matrix_state=blocked-no-effect
package_build_gate_state=closed-no-effect
debian_clean_build_environment_documented=1
freebsd_ports_environment_documented=1
openbsd_ports_environment_documented=1
debian_build_environment_provisioned=0
freebsd_build_environment_provisioned=0
openbsd_build_environment_provisioned=0
explicit_operator_build_authorization=0
disposable_validation_environment_required=1
disposable_validation_environment_provisioned=0
environment_transcript_present=0
toolchain_version_capture_required=1
package_input_digest_binding_required=1
package_build_command_allowed=0
package_artifact_created=0
install_on_host_run=0
publication_non_claim_review_present=1
platform_build_evidence_accepted=0
package_readiness_claimed=0
```

Debian Environment Contract

A future Debian build lane must use a disposable clean build environment before dpkg-buildpackage, debuild, or lintian can run.

Required Debian environment evidence:

```
debian_clean_build_environment_documented=1
debian_clean_chroot_or_container_required=1
debian_build_host_identity_required=1
debian_suite_record_required=1
debian_architecture_record_required=1
debian_build_dependency_resolution_transcript_required=1
debian_toolchain_versions_required=1
debian_source_archive_digest_required=1
debian_package_input_path_required=1
dpkg_buildpackage_run=0
debuild_run=0
lintian_run=0
```

The Debian environment contract does not choose between sbuild, pbuilder, mmdebstrap, a disposable container, or a disposable VM. A future effect-bearing proposal must name the exact environment and keep the build gate closed until operator authorization and all package prerequisites exist.

FreeBSD Environment Contract

A future FreeBSD build lane must use a disposable FreeBSD ports validation environment before make makesum, make stage, make package, portlint, or poudriere can run.

Required FreeBSD environment evidence:

```
freebsd_ports_environment_documented=1
freebsd_jail_or_vm_required=1
freebsd_version_record_required=1
freebsd_architecture_record_required=1
freebsd_ports_tree_revision_required=1
freebsd_distfile_digest_required=1
freebsd_port_origin_required=1
freebsd_toolchain_versions_required=1
freebsd_distinfo_review_required=1
freebsd_make_makesum_run=0
freebsd_make_stage_run=0
freebsd_make_package_run=0
portlint_run=0
poudriere_run=0
```

The FreeBSD environment contract does not create a jail, fetch a ports tree, run make makesum, run make stage, run make package, run portlint, or run poudriere.

OpenBSD Environment Contract

A future OpenBSD build lane must use a disposable OpenBSD ports validation environment before make makesum, make plist, make package, portcheck, or a bulk build can run.

Required OpenBSD environment evidence:

```
openbsd_ports_environment_documented=1
openbsd_vm_or_disposable_host_required=1
openbsd_version_record_required=1
openbsd_architecture_record_required=1
openbsd_ports_tree_revision_required=1
openbsd_distfile_digest_required=1
openbsd_port_origin_required=1
openbsd_toolchain_versions_required=1
openbsd_permit_package_review_required=1
openbsd_make_makesum_run=0
openbsd_make_plist_run=0
openbsd_make_package_run=0
portcheck_run=0
openbsd_bulk_build_run=0
```

The OpenBSD environment contract keeps PERMIT_PACKAGE=No until redistribution, license, notice, checksum, and maintainer-review evidence exists.

Shared Transcript Requirements

A future environment transcript must record:

```
environment_identifier
environment_lifecycle
host_or_vm_class
operating_system_name
operating_system_version
architecture
toolchain_versions
package_input_archive_name
package_input_archive_sha256
package_input_tree_path
package_output_directory
network_policy
host_mount_policy
cleanup_policy
operator_authorization_reference
```

The transcript must be reviewed before a package-build lane can claim that the environment is acceptable.

Current Blockers

Package builds remain blocked under this blocker and dependency state:

```
source_archive_accepted_for_build=0
license_expression_reviewed=1
package_notice_obligations_reviewed=0
explicit_operator_build_authorization=0
artifact_naming_contract_present=1
install_remove_transcript_contract_present=1
```

```
payload_inspection_contract_present=1
publication_non_claim_review_present=1
platform_build_evidence_accepted=0
package_validation_result_promoted=0
```

Command Boundary

This contract does not:

```
run dpkg-buildpackage
run debuild
run lintian
run FreeBSD make makesum
run FreeBSD make stage
run FreeBSD make package
run portlint
run poudriere
run OpenBSD make makesum
run OpenBSD make plist
run OpenBSD make package
run portcheck
run an OpenBSD bulk build
create package artifacts
install Latticra on a host
publish package artifacts
submit Latticra to Debian, FreeBSD, or OpenBSD
claim package readiness
```

Relationship To Existing Lanes

This contract depends on:

```
docs/DEBIAN_FREEBSD_OPENBSD_SOURCE_ARCHIVE_CONTRACT.md
docs/DEBIAN_FREEBSD_OPENBSD_SOURCE_ARCHIVE_FIXTURE_LANE.md
docs/DEBIAN_FREEBSD_OPENBSD_PACKAGE_INPUT_HANDOFF_LANE.md
docs/DEBIAN_FREEBSD_OPENBSD_PACKAGE_BUILD_GATE_CONTRACT.md
docs/DEBIAN_FREEBSD_OPENBSD_PACKAGE_ARTIFACT_NAMING_CONTRACT.md
docs/DEBIAN_FREEBSD_OPENBSD_PACKAGE_PAYLOAD_INSPECTION_CONTRACT.md
docs/DEBIAN_FREEBSD_OPENBSD_PACKAGE_INSTALL_REMOVE_TRANSCRIPT_CONTRACT.md
docs/DEBIAN_FREEBSD_OPENBSD_PACKAGE_PUBLICATION_NON_CLAIM_REVIEW_CONTRACT.md
docs/DEBIAN_FREEBSD_OPENBSD_PACKAGE_VALIDATION_PROMOTION_BLOCKER_MATRIX_CONTRACT.md
```

The package-build gate remains closed. This environment contract only records what future disposable validation environments must prove before a platform-specific build lane can request authorization.

Completed Follow-On Lane

Completed follow-on lane:

```
Add a Debian, FreeBSD, and OpenBSD package artifact naming contract before any package artifact
can be created.
```

```
docs/DEBIAN_FREEBSD_OPENBSD_PACKAGE_ARTIFACT_NAMING_CONTRACT.md
scripts/test-debian-freebsd-openbsd-package-artifact-naming-contract.sh
```

That lane defines package artifact names, output directories, checksum binding, retention rules, and publication non-claims while keeping package_build_gate_state=closed-no-effect.

Completed Follow-On Lane

Completed follow-on lane:

```
Add a Debian, FreeBSD, and OpenBSD package payload inspection contract before any package
artifact can be accepted.
```

```
docs/DEBIAN_FREEBSD_OPENBSD_PACKAGE_PAYLOAD_INSPECTION_CONTRACT.md
scripts/test-debian-freebsd-openbsd-package-payload-inspection-contract.sh
```

That lane defines payload inspection evidence without opening the package-build gate.

Completed Follow-On Lane

Completed follow-on lane:

```
Add a Debian, FreeBSD, and OpenBSD package install/remove transcript contract before any package
 install can be accepted.
```

```
docs/DEBIAN_FREEBSD_OPENBSD_PACKAGE_INSTALL_REMOVE_TRANSCRIPT_CONTRACT.md
scripts/test-debian-freebsd-openbsd-package-install-remove-transcript-contract.sh
```

That lane defines disposable install/remove evidence while keeping host installs and package readiness blocked.

Completed Follow-On Lane

Completed follow-on lane:

```
Add a Debian, FreeBSD, and OpenBSD package publication non-claim review contract before any
package validation result can be promoted.
```

```
docs/DEBIAN_FREEBSD_OPENBSD_PACKAGE_PUBLICATION_NON_CLAIM_REVIEW_CONTRACT.md
scripts/test-debian-freebsd-openbsd-package-publication-non-claim-review-contract.sh
```

That lane records local-only publication and official-port non-claims while keeping package publication and readiness blocked.

Completed Follow-On Lane

Completed follow-on lane:

```
Add a Debian, FreeBSD, and OpenBSD package validation promotion blocker matrix before any
platform-specific build evidence can be accepted.
```

```
docs/DEBIAN_FREEBSD_OPENBSD_PACKAGE_VALIDATION_PROMOTION_BLOCKER_MATRIX_CONTRACT.md
scripts/test-debian-freebsd-openbsd-package-validation-promotion-blocker-matrix-contract.sh
```

That lane ties source, environment, artifact, payload, install/remove, and publication non-claim blockers together while keeping platform build evidence acceptance and validation promotion blocked.

Next Slice

Recommended next slice:

```
Add a Debian, FreeBSD, and OpenBSD package build-evidence intake denial contract before any
single-platform build lane can open.
```

That future lane should define how build evidence intake is refused until the blocker matrix opens, while keeping package builds and readiness blocked.

Validation

Run:

```
sh scripts/test-debian-freebsd-openbsd-package-build-environment-contract.sh
```

Expected output:

```
debian_freebsd_openbsd_package_build_environment_contract: ok
```

docs/DEBIAN_FREEBSD_OPENBSD_PACKAGE_BUILD_GATE_CONTRACT.md

Source title: Debian, FreeBSD, and OpenBSD Package Build Gate Contract

Lines: 311 | Words: 849 | SHA-256: 46ff8db0e299551d18c7a161a87101a915fac672958888d59c8b452d12a3fe8a

Debian, FreeBSD, and OpenBSD Package Build Gate Contract

Status: active package-build evidence gate contract Scope: define the evidence required before Debian, FreeBSD, or OpenBSD package build commands can run in any validation lane.

Purpose

This contract closes the package-build gate after the temporary source archive fixture lane and temporary package input handoff lane.

The goal is conservative: record the exact prerequisites required before dpkg-buildpackage, debuild, lintian, FreeBSD package builds, OpenBSD package builds, port linters, bulk builders, host installs, or package artifact publication can be attempted or accepted as evidence.

This contract is documentation-only and static. It does not run package build tools, create package artifacts, install Latticra, write FreeBSD or OpenBSD distinfo files, or claim package readiness.

Current Gate State

```
debian_freebsd_openbsd_package_build_gate_contract_present=1
debian_freebsd_openbsd_package_build_environment_contract_present=1
debian_freebsd_openbsd_package_artifact_naming_contract_present=1
debian_freebsd_openbsd_package_payload_inspection_contract_present=1
debian_freebsd_openbsd_package_install_remove_transcript_contract_present=1
debian_freebsd_openbsd_package_publication_non_claim_review_contract_present=1
debian_freebsd_openbsd_package_validation_promotion_blocker_matrix_contract_present=1
package_build_gate_state=closed-no-effect
publication_non_claim_review_contract_state=specified-no-effect
validation_promotion_blocker_matrix_state=blocked-no-effect
debian_build_allowed=0
freebsd_build_allowed=0
openbsd_build_allowed=0
dpkg_buildpackage_run=0
debuild_run=0
lintian_run=0
freebsd_make_stage_run=0
freebsd_make_package_run=0
freebsd_make_makesum_run=0
portlint_run=0
poudriere_run=0
openbsd_make_makesum_run=0
openbsd_make_plist_run=0
openbsd_make_package_run=0
portcheck_run=0
openbsd_bulk_build_run=0
package_artifact_created=0
install_on_host_run=0
publication_non_claim_review_present=1
platform_build_evidence_accepted=0
package_readiness_claimed=0
```

Required Gate Inputs

The package-build gate cannot open unless all package input evidence has already passed:

```
debian_freebsd_openbsd_package_input_handoff_lane_present=1
temporary_package_input_handoff_lane_passed=1
debian_freebsd_openbsd_source_archive_fixture_lane_present=1
debian_freebsd_openbsd_source_archive_contract_present=1
temporary_archive_sha256_preserved=1
temporary_archive_listing_preserved=1
source_archive_accepted_for_build=1
freebsd_distinfo_file_written=0
openbsd_distinfo_file_written=0
distinfo_file_writes_blocked_until_review=1
license_expression_reviewed=1
package_notice_obligations_reviewed=1
openbsd_permit_package_reviewed=1
```

The source_archive_accepted_for_build=1 value is a future prerequisite, not a current claim. The current source archive and handoff lanes still keep source archive acceptance closed.

Environment Prerequisites

Before any package build command can run, a future build-lane proposal must document:

```
debian_clean_build_environment_documented=1
freebsd_ports_environment_documented=1
openbsd_ports_environment_documented=1
explicit_operator_build_authorization=1
disposable_validation_environment=1
artifact_naming_contract_present=1
install_remove_transcript_contract_present=1
payload_inspection_contract_present=1
publication_non_claim_review_present=1
```

Those records must identify the exact host or VM class, toolchain versions, source archive digest, package input paths, package output paths, install target, remove target, and transcript retention location before a build can be attempted.

Command Gate

All package build commands remain blocked while the current gate state is closed-no-effect.

Debian commands blocked by this contract:

```
dpkg-buildpackage
debuild
lintian
dpkg-source --build
```

FreeBSD commands blocked by this contract:

```
make makesum
make stage
make package
portlint
poudriere
```

OpenBSD commands blocked by this contract:

```
make makesum
make plist
make package
portcheck
bulk build
```

Host effects blocked by this contract:

```
install package on host
remove package from host
publish package artifact
submit package or port upstream
claim official package or port status
claim production readiness
```

Future Open Conditions

A future package-build lane may move one platform from _build_allowed=0 to _build_allowed=1 only after it records:

```
package_build_gate_state=open-for-single-platform-validation
source_archive_accepted_for_build=1
archive_sha256_bound_to_build=1
distinfo_file_writes_reviewed=1
license_expression_reviewed=1
package_notice_obligations_reviewed=1
debian_clean_build_environment_documented=1
freebsd_ports_environment_documented=1
openbsd_ports_environment_documented=1
explicit_operator_build_authorization=1
disposable_validation_environment=1
artifact_naming_contract_present=1
install_remove_transcript_contract_present=1
payload_inspection_contract_present=1
publication_non_claim_review_present=1
```

Opening one platform gate must not imply readiness for the other platforms.

Current Non-Claims

```
debian_archive_ready=0
debian_mentors_upload_claimed=0
debian_sponsorship_claimed=0
debian_ftp_master_acceptance_claimed=0
freebsd_official_port_claimed=0
freebsd_ports_tree_submission_claimed=0
freebsd_bugzilla_pr_claimed=0
freebsd_committer_review_claimed=0
openbsd_official_port_claimed=0
openbsd_ports_tree_submission_claimed=0
openbsd_ports_review_thread_claimed=0
openbsd_maintainer_acceptance_claimed=0
production_installer_ready=0
root_installer_ready=0
```

Relationship To Existing Lanes

This contract depends on:

```
docs/DEBIAN_FREEBSD_OPENBSD_SOURCE_ARCHIVE_CONTRACT.md
docs/DEBIAN_FREEBSD_OPENBSD_SOURCE_ARCHIVE_FIXTURE_LANE.md
docs/DEBIAN_FREEBSD_OPENBSD_PACKAGE_INPUT_HANDOFF_LANE.md
docs/DEBIAN_FREEBSD_OPENBSD_PACKAGE_BUILD_ENVIRONMENT_CONTRACT.md
docs/DEBIAN_FREEBSD_OPENBSD_PACKAGE_ARTIFACT_NAMING_CONTRACT.md
docs/DEBIAN_FREEBSD_OPENBSD_PACKAGE_PAYLOAD_INSPECTION_CONTRACT.md
docs/DEBIAN_FREEBSD_OPENBSD_PACKAGE_INSTALL_REMOVE_TRANSCRIPT_CONTRACT.md
docs/DEBIAN_FREEBSD_OPENBSD_PACKAGE_PUBLICATION_NON_CLAIM_REVIEW_CONTRACT.md
docs/DEBIAN_FREEBSD_OPENBSD_PACKAGE_VALIDATION_PROMOTION_BLOCKER_MATRIX_CONTRACT.md
```

The source archive fixture lane proves temporary archive shape in a disposable workspace.

The package input handoff lane proves temporary package input staging while preserving archive SHA-256 identity.

This package-build gate keeps package build execution closed until source acceptance, checksum, license, notice, environment, authorization, payload inspection, install/remove, and publication non-claim evidence exists.

Completed Follow-On Lane

Completed follow-on lane:

```
Add a Debian, FreeBSD, and OpenBSD package-build environment contract that documents disposable
validation environments without running package build commands.
```

```
docs/DEBIAN_FREEBSD_OPENBSD_PACKAGE_BUILD_ENVIRONMENT_CONTRACT.md
scripts/test-debian-freebsd-openbsd-package-build-environment-contract.sh
```

That lane documents disposable validation environment requirements while keeping package_build_gate_state=closed-no-effect.

Completed Follow-On Lane

Completed follow-on lane:

```
Add a Debian, FreeBSD, and OpenBSD package artifact naming contract before any package artifact
can be created.
```

```
docs/DEBIAN_FREEBSD_OPENBSD_PACKAGE_ARTIFACT_NAMING_CONTRACT.md
scripts/test-debian-freebsd-openbsd-package-artifact-naming-contract.sh
```

That lane defines package artifact names, output directories, checksum binding, retention rules, and publication non-claims while keeping builds blocked.

Completed Follow-On Lane

Completed follow-on lane:

```
Add a Debian, FreeBSD, and OpenBSD package payload inspection contract before any package
artifact can be accepted.
```

```
docs/DEBIAN_FREEBSD_OPENBSD_PACKAGE_PAYLOAD_INSPECTION_CONTRACT.md
scripts/test-debian-freebsd-openbsd-package-payload-inspection-contract.sh
```

That lane defines payload inspection evidence without opening the package-build gate.

Completed Follow-On Lane

Completed follow-on lane:

```
Add a Debian, FreeBSD, and OpenBSD package install/remove transcript contract before any package
 install can be accepted.
docs/DEBIAN_FREEBSD_OPENBSD_PACKAGE_INSTALL_REMOVE_TRANSCRIPT_CONTRACT.md
scripts/test-debian-freebsd-openbsd-package-install-remove-transcript-contract.sh
```

That lane defines disposable install/remove evidence while keeping host installs and package readiness blocked.

Completed Follow-On Lane

Completed follow-on lane:

```
Add a Debian, FreeBSD, and OpenBSD package publication non-claim review contract before any
package validation result can be promoted.
docs/DEBIAN_FREEBSD_OPENBSD_PACKAGE_PUBLICATION_NON_CLAIM_REVIEW_CONTRACT.md
scripts/test-debian-freebsd-openbsd-package-publication-non-claim-review-contract.sh
```

That lane records local-only publication and official-port non-claims while keeping package publication and readiness blocked.

Completed Follow-On Lane

Completed follow-on lane:

```
Add a Debian, FreeBSD, and OpenBSD package validation promotion blocker matrix before any
platform-specific build evidence can be accepted.
docs/DEBIAN_FREEBSD_OPENBSD_PACKAGE_VALIDATION_PROMOTION_BLOCKER_MATRIX_CONTRACT.md
scripts/test-debian-freebsd-openbsd-package-validation-promotion-blocker-matrix-contract.sh
```

That lane ties source, environment, artifact, payload, install/remove, and publication non-claim blockers together while keeping platform build evidence acceptance and validation promotion blocked.

Next Slice

Recommended next slice:

```
Add a Debian, FreeBSD, and OpenBSD package build-evidence intake denial contract before any
single-platform build lane can open.
```

That future lane should define how build evidence intake is refused until the blocker matrix opens, while keeping package builds and readiness blocked.

Validation

Run:

```
sh scripts/test-debian-freebsd-openbsd-package-build-gate-contract.sh
```

Expected output:

```
debian_freebsd_openbsd_package_build_gate_contract: ok
```

docs/DEBIAN_FREEBSD_OPENBSD_PACKAGE_INPUT_HANDOFF_LANE.md

Source title: Debian, FreeBSD, and OpenBSD Package Input Handoff Lane

Lines: 174 | Words: 479 | SHA-256: 51cc063314a5b74571e9fb95397bb6424d125714d76fe042525da7d9e9dae98d

Debian, FreeBSD, and OpenBSD Package Input Handoff Lane

Status: active temporary package input handoff lane Scope: stage verified temporary source archives into Debian, FreeBSD, and OpenBSD package input layouts without running package builds or creating package artifacts.

Purpose

This lane advances the Debian, FreeBSD, and OpenBSD package/port path from a source archive fixture into package-input staging.

The goal is conservative: prove that the temporary Debian orig.tar.gz, FreeBSD distfile, and OpenBSD distfile can be staged into platform-shaped input directories while preserving checksum identity and keeping all package build tools disabled.

This lane does not build Debian source packages, Debian binary packages, FreeBSD packages, or OpenBSD packages. It stages temporary package inputs only.

Temporary Input Layouts

The Debian handoff stages:

```
debian/latticra_0.0.0.orig.tar.gz
debian/latticra-0.0.0/
debian/latticra-0.0.0/debian/control
debian/latticra-0.0.0/debian/changelog
```

The FreeBSD handoff stages:

```
freebsd/distfiles/latticra-0.0.0.tar.gz
freebsd/ports/devel/latticra/Makefile
freebsd/ports/devel/latticra/pkg-descr
freebsd/ports/devel/latticra/pkg-plist
```

The OpenBSD handoff stages:

```
openbsd/distfiles/latticra-0.0.0.tar.gz
openbsd/ports/devel/latticra/Makefile
openbsd/ports/devel/latticra/pkg/DESCR
openbsd/ports/devel/latticra/pkg/PLIST
```

All paths are created under a disposable temporary directory.

Handoff Checks

The lane verifies:

```
temporary_package_input_handoff_lane_present=1
temporary_debian_source_input_staged=1
temporary_debian_orig_archive_staged=1
temporary_debian_debian_dir_overlay_staged=1
temporary_freebsd_port_input_staged=1
temporary_freebsd_distfile_staged=1
temporary_openbsd_port_input_staged=1
temporary_openbsd_distfile_staged=1
temporary_archive_sha256_preserved=1
temporary_archive_listing_preserved=1
freebsd_distinfo_file_written=0
openbsd_distinfo_file_written=0
package_artifact_created=0
```

Boundary

This lane does not run dpkg-source.

It does not run dpkg-buildpackage.

It does not run debuild.

It does not run lintian.

It does not run FreeBSD make makesum.

It does not run FreeBSD make stage.

It does not run FreeBSD make package.

It does not run OpenBSD make makesum.

It does not run OpenBSD make plist.

It does not run OpenBSD make package.

It does not run portlint.

It does not run portcheck.

It does not run poudriere.

It does not run an OpenBSD bulk build.

It does not create package artifacts.

It does not write FreeBSD or OpenBSD distinfo files.

It does not install Latticra.

It does not publish package artifacts.

It does not submit Latticra to Debian, FreeBSD, or OpenBSD.

It does not claim Debian archive readiness, Debian sponsorship, FreeBSD official port status, OpenBSD official port status, product readiness, operating-system readiness, runtime authority, kernel authority, boot authority, service authority, policy readiness, or security-hardening completion.

Current Evidence

```
debian_freebsd_openbsd_package_input_handoff_lane_present=1
debian_freebsd_openbsd_source_archive_fixture_lane_present=1
debian_freebsd_openbsd_package_build_gate_contract_present=1
temporary_package_input_handoff_lane_present=1
temporary_debian_source_input_staged=1
temporary_debian_orig_archive_staged=1
temporary_debian_debian_dir_overlay_staged=1
temporary_freebsd_port_input_staged=1
temporary_freebsd_distfile_staged=1
temporary_openbsd_port_input_staged=1
temporary_openbsd_distfile_staged=1
temporary_archive_sha256_preserved=1
temporary_archive_listing_preserved=1
freebsd_distinfo_file_written=0
openbsd_distinfo_file_written=0
dpkg_source_run=0
dpkg_buildpackage_run=0
freebsd_make_stage_run=0
freebsd_make_package_run=0
openbsd_make_plist_run=0
openbsd_make_package_run=0
package_artifact_created=0
package_readiness_claimed=0
```

The handoff evidence is temporary package-input staging only. It does not promote the archive to accepted package-build input.

Completed Follow-On Lane

Completed follow-on lane:

```
Add Debian, FreeBSD, and OpenBSD package-build evidence gate contract before any package build
command can run.
```

```
docs/DEBIAN_FREEBSD_OPENBSD_PACKAGE_BUILD_GATE_CONTRACT.md
scripts/test-debian-freebsd-openbsd-package-build-gate-contract.sh
```

That gate defines the exact evidence required before dpkg-buildpackage, FreeBSD package builds, or OpenBSD package builds are allowed in any validation environment.

Next Slice

Recommended next slice:

```
Add Debian, FreeBSD, and OpenBSD package-build environment contract before any package build
command can run.
```

That future lane should document disposable validation environments while keeping package_build_gate_state=closed-no-effect.

Validation

Run:

```
sh scripts/test-debian-freebsd-openbsd-package-input-handoff-lane.sh
```

Expected output:

```
debian_freebsd_openbsd_package_input_handoff_lane: ok
```

docs/DEBIAN_FREEBSD_OPENBSD_PACKAGE_INSTALL_REMOVE_TRANSCRIPT_CONTRACT.md

Source title: Debian, FreeBSD, and OpenBSD Package Install/Remove Transcript Contract

Lines: 255 | Words: 637 | SHA-256: 8c343fceb5e09c414332896e23aaba71ee9d0be425e1d77916770b8a8cd3b796

Debian, FreeBSD, and OpenBSD Package Install/Remove Transcript Contract

Status: active package install/remove transcript contract Scope: define future disposable install/remove evidence for Debian, FreeBSD, and OpenBSD package artifacts without installing or removing packages.

Purpose

This contract records the install/remove transcript evidence required before any future Debian, FreeBSD, or OpenBSD package artifact can be accepted as installable validation evidence.

The goal is narrow: a future package install/remove transcript must prove that installation happens only inside a disposable validation environment, the expected no-effect CLI payload appears after install, the package can be removed cleanly, and no host-level service, kernel, privileged-helper, or network authority is introduced.

This contract is documentation-only and static. It does not install packages, remove packages, run package managers, create package artifacts, inspect package artifacts, publish packages, or claim package readiness.

Current Install/Remove State

```
debian_freebsd_openbsd_package_install_remove_transcript_contract_present=1
debian_freebsd_openbsd_package_publication_non_claim_review_contract_present=1
debian_freebsd_openbsd_package_validation_promotion_blocker_matrix_contract_present=1
install_remove_transcript_contract_present=1
install_remove_transcript_contract_state=specified-no-effect
publication_non_claim_review_contract_state=specified-no-effect
validation_promotion_blocker_matrix_state=blocked-no-effect
package_build_gate_state=closed-no-effect
payload_inspection_contract_state=specified-no-effect
install_remove_disposable_environment_required=1
install_remove_transcript_present=0
install_on_host_run=0
remove_on_host_run=0
host_install_allowed=0
host_remove_allowed=0
host_mutation_allowed=0
service_state_change_allowed=0
package_artifact_created=0
package_payload_accepted=0
publication_non_claim_review_present=1
platform_build_evidence_accepted=0
package_readiness_claimed=0
```

Debian Install/Remove Transcript

Future Debian install/remove validation must run only in a disposable Debian environment.

Required Debian transcript evidence:

```
debian_install_remove_transcript_required=1
debian_install_remove_transcript_present=0
debian_package_install_run=0
debian_package_remove_run=0
debian_dpkg_install_run=0
debian_apt_install_run=0
debian_dpkg_remove_run=0
debian_apt_remove_run=0
debian_payload_post_install_check_required=1
debian_payload_post_remove_absence_check_required=1
debian_service_state_change_allowed=0
debian_systemd_unit_enable_allowed=0
```

The future Debian transcript must bind install/remove evidence to:

```
debian_binary_package_name_pattern=latticra_0.0.0-1local1_${DEB_HOST_ARCH}.deb
debian_package_artifact_sha256
debian_payload_expected_bin=usr/bin/latticra
debian_payload_expected_doc=usr/share/doc/latticra/README.md
```

FreeBSD Install/Remove Transcript

Future FreeBSD install/remove validation must run only in a disposable FreeBSD jail or VM.

Required FreeBSD transcript evidence:

```
freebsd_install_remove_transcript_required=1
freebsd_install_remove_transcript_present=0
freebsd_package_install_run=0
freebsd_package_remove_run=0
freebsd_pkg_add_run=0
freebsd_pkg_delete_run=0
freebsd_payload_post_install_check_required=1
freebsd_payload_post_remove_absence_check_required=1
freebsd_rc_service_enable_allowed=0
```

The future FreeBSD transcript must bind install/remove evidence to:

```
freebsd_package_name=latticra-0.0.0.pkg
freebsd_package_artifact_sha256
freebsd_payload_expected_bin=bin/latticra
freebsd_payload_expected_doc=%%DOCSDIR%%/README.md
```

OpenBSD Install/Remove Transcript

Future OpenBSD install/remove validation must run only in a disposable OpenBSD environment.

Required OpenBSD transcript evidence:

```
openbsd_install_remove_transcript_required=1
openbsd_install_remove_transcript_present=0
openbsd_package_install_run=0
openbsd_package_remove_run=0
openbsd_pkg_add_run=0
openbsd_pkg_delete_run=0
openbsd_payload_post_install_check_required=1
openbsd_payload_post_remove_absence_check_required=1
openbsd_rc_service_enable_allowed=0
```

The future OpenBSD transcript must bind install/remove evidence to:

```
openbsd_package_name=latticra-0.0.0.tgz
openbsd_package_artifact_sha256
openbsd_payload_expected_bin=bin/latticra
openbsd_payload_expected_doc=share/doc/latticra/README.md
```

Transcript Requirements

A future install/remove transcript must record:

```
environment_identifier
```

```
operator_authorization_reference
package_artifact_name
package_artifact_sha256
pre_install_package_state
install_command
install_exit_code
post_install_payload_listing
post_install_cli_no_effect_output
service_state_after_install
remove_command
remove_exit_code
post_remove_absence_report
post_remove_package_state
host_mutation_review
```

The transcript must be reviewed before a package artifact can be accepted as install/remove-valid.

Current Blockers

Package install/remove acceptance remains blocked under this blocker and dependency state:

```
package_artifact_created=0
package_artifact_sha256_recorded=0
package_payload_accepted=0
environment_transcript_present=0
explicit_operator_build_authorization=0
publication_non_claim_review_present=1
platform_build_evidence_accepted=0
package_validation_result_promoted=0
```

Command Boundary

This contract does not:

```
run dpkg -i
run apt install
run dpkg -r
run apt remove
run FreeBSD pkg add
run FreeBSD pkg delete
run OpenBSD pkg_add
run OpenBSD pkg_delete
install Latticra on a host
remove Latticra from a host
change service state
create package artifacts
publish package artifacts
claim package readiness
```

Relationship To Existing Lanes

This contract depends on:

```
docs/DEBIAN_FREEBSD_OPENBSD_SOURCE_ARCHIVE_CONTRACT.md
docs/DEBIAN_FREEBSD_OPENBSD_SOURCE_ARCHIVE_FIXTURE_LANE.md
docs/DEBIAN_FREEBSD_OPENBSD_PACKAGE_INPUT_HANDOFF_LANE.md
docs/DEBIAN_FREEBSD_OPENBSD_PACKAGE_BUILD_GATE_CONTRACT.md
docs/DEBIAN_FREEBSD_OPENBSD_PACKAGE_BUILD_ENVIRONMENT_CONTRACT.md
docs/DEBIAN_FREEBSD_OPENBSD_PACKAGE_ARTIFACT_NAMING_CONTRACT.md
docs/DEBIAN_FREEBSD_OPENBSD_PACKAGE_PAYLOAD_INSPECTION_CONTRACT.md
docs/DEBIAN_FREEBSD_OPENBSD_PACKAGE_PUBLICATION_NON_CLAIM_REVIEW_CONTRACT.md
docs/DEBIAN_FREEBSD_OPENBSD_PACKAGE_VALIDATION_PROMOTION_BLOCKER_MATRIX_CONTRACT.md
```

The package-build gate remains closed. This install/remove transcript contract only defines the evidence future disposable validation environments must produce after package artifacts exist and payload inspection evidence is accepted.

Completed Follow-On Lane

Completed follow-on lane:

```
Add a Debian, FreeBSD, and OpenBSD package publication non-claim review contract before any
package validation result can be promoted.
```

```
docs/DEBIAN_FREEBSD_OPENBSD_PACKAGE_PUBLICATION_NON_CLAIM_REVIEW_CONTRACT.md
scripts/test-debian-freebsd-openbsd-package-publication-non-claim-review-contract.sh
```

That lane records local-only publication and official-port non-claims while keeping package publication and readiness blocked.

Completed Follow-On Lane

Completed follow-on lane:

```
Add a Debian, FreeBSD, and OpenBSD package validation promotion blocker matrix before any
platform-specific build evidence can be accepted.
docs/DEBIAN_FREEBSD_OPENBSD_PACKAGE_VALIDATION_PROMOTION_BLOCKER_MATRIX_CONTRACT.md
scripts/test-debian-freebsd-openbsd-package-validation-promotion-blocker-matrix-contract.sh
```

That lane ties source, environment, artifact, payload, install/remove, and publication non-claim blockers together while keeping platform build evidence acceptance and validation promotion blocked.

Next Slice

Recommended next slice:

```
Add a Debian, FreeBSD, and OpenBSD package build-evidence intake denial contract before any
single-platform build lane can open.
```

That future lane should define how build evidence intake is refused until the blocker matrix opens, while keeping package builds and readiness blocked.

Validation

Run:

```
sh scripts/test-debian-freebsd-openbsd-package-install-remove-transcript-contract.sh
```

Expected output:

```
debian_freebsd_openbsd_package_install_remove_transcript_contract: ok
```

docs/DEBIAN_FREEBSD_OPENBSD_PACKAGE_PAYLOAD_INSPECTION_CONTRACT.md

Source title: Debian, FreeBSD, and OpenBSD Package Payload Inspection Contract

Lines: 274 | Words: 674 | SHA-256: 00aa40a60929935ce5218c09e4b08950bb31b213c47eab046f2c6bb1767ca4a4

Debian, FreeBSD, and OpenBSD Package Payload Inspection Contract

Status: active package payload inspection contract Scope: define future Debian, FreeBSD, and OpenBSD package payload inspection evidence without creating or inspecting package artifacts.

Purpose

This contract records the package payload inspection evidence required before any future Debian, FreeBSD, or OpenBSD package artifact can be accepted as validation evidence.

The goal is narrow: a future package artifact must prove that it contains only the intended no-effect CLI payload and documentation payload, with no services, privileged helpers, init files, kernel files, network authority, or host mutation hooks.

This contract is documentation-only and static. It does not run package build tools, create package artifacts, inspect package artifacts, install Latticra, write FreeBSD or OpenBSD distinfo files, publish packages, or claim package readiness.

Current Payload Inspection State

```
debian_freebsd_openbsd_package_payload_inspection_contract_present=1
debian_freebsd_openbsd_package_install_remove_transcript_contract_present=1
debian_freebsd_openbsd_package_publication_non_claim_review_contract_present=1
debian_freebsd_openbsd_package_validation_promotion_blocker_matrix_contract_present=1
payload_inspection_contract_present=1
payload_inspection_contract_state=specified-no-effect
install_remove_transcript_contract_state=specified-no-effect
publication_non_claim_review_contract_state=specified-no-effect
validation_promotion_blocker_matrix_state=blocked-no-effect
package_build_gate_state=closed-no-effect
artifact_naming_contract_state=specified-no-effect
package_artifact_created=0
package_payload_inspection_run=0
debian_payload_inspection_run=0
freebsd_payload_inspection_run=0
openbsd_payload_inspection_run=0
package_payload_accepted=0
package_artifact_sha256_recorded=0
install_on_host_run=0
publication_non_claim_review_present=1
platform_build_evidence_accepted=0
package_readiness_claimed=0
```

Expected Payload

All future Debian, FreeBSD, and OpenBSD package artifacts must preserve the current intentionally narrow payload:

```
payload_cli_path_required=1
payload_doc_readme_required=1
payload_service_files_allowed=0
payload_init_files_allowed=0
payload_kernel_files_allowed=0
payload_privileged_helper_allowed=0
payload_network_authority_allowed=0
payload_host_mutation_hooks_allowed=0
```

The no-effect CLI payload must remain the only executable payload.

Debian Payload Inspection

Future Debian payload inspection must verify:

```
debian_payload_expected_bin=usr/bin/latticra
debian_payload_expected_doc=usr/share/doc/latticra/README.md
debian_payload_listing_required=1
debian_control_metadata_inspection_required=1
debian_maintainer_script_absence_required=1
debian_systemd_unit_absence_required=1
debian_init_script_absence_required=1
debian_privileged_helper_absence_required=1
debian_payload_unexpected_file_count=0
debian_payload_inspection_run=0
dpkg_deb_contents_inspection_run=0
dpkg_deb_metadata_inspection_run=0
```

The future Debian inspection transcript must bind the payload listing to:

```
debian_binary_package_name_pattern=latticra_0.0.0-1local1_${DEB_HOST_ARCH}.deb
debian_package_artifact_sha256
debian_payload_listing_sha256
```

FreeBSD Payload Inspection

Future FreeBSD payload inspection must verify:

```
freebsd_payload_expected_bin=bin/latticra
freebsd_payload_expected_doc=%%DOCSDIR%%/README.md
freebsd_payload_listing_required=1
freebsd_manifest_inspection_required=1
freebsd_rc_script_absence_required=1
freebsd_periodic_script_absence_required=1
freebsd_privileged_helper_absence_required=1
freebsd_payload_unexpected_file_count=0
freebsd_payload_inspection_run=0
freebsd_pkg_info_inspection_run=0
```

```
freebsd_pkg_manifest_inspection_run=0
```

The future FreeBSD inspection transcript must bind the payload listing to:

```
freebsd_package_name=latticra-0.0.0.pkg
freebsd_package_artifact_sha256
freebsd_payload_listing_sha256
```

OpenBSD Payload Inspection

Future OpenBSD payload inspection must verify:

```
openbsd_payload_expected_bin=bin/latticra
openbsd_payload_expected_doc=share/doc/latticra/README.md
openbsd_payload_listing_required=1
openbsd_pkg_info_inspection_required=1
openbsd_rc_script_absence_required=1
openbsd_privileged_helper_absence_required=1
openbsd_payload_unexpected_file_count=0
openbsd_payload_inspection_run=0
openbsd_pkg_info_list_run=0
openbsd_package_tar_listing_run=0
```

The future OpenBSD inspection transcript must bind the payload listing to:

```
openbsd_package_name=latticra-0.0.0.tgz
openbsd_package_artifact_sha256
openbsd_payload_listing_sha256
```

Inspection Transcript Requirements

A future payload inspection transcript must record:

```
package_artifact_name
package_artifact_sha256
package_artifact_size_bytes
payload_listing_command
payload_listing_sha256
expected_payload_paths_present
unexpected_payload_paths_absent
service_files_absent
privileged_helpers_absent
host_mutation_hooks_absent
environment_identifier
operator_authorization_reference
```

The transcript must be reviewed before a package artifact can be accepted as payload-correct.

Current Blockers

Package payload acceptance remains blocked under this blocker and dependency state:

```
package_artifact_created=0
package_artifact_sha256_recorded=0
environment_transcript_present=0
explicit_operator_build_authorization=0
install_remove_transcript_contract_present=1
publication_non_claim_review_present=1
platform_build_evidence_accepted=0
package_validation_result_promoted=0
```

Command Boundary

This contract does not:

```
run dpkg-deb --contents
run dpkg-deb --info
run FreeBSD pkg info
run FreeBSD pkg manifest inspection
run OpenBSD pkg_info
run package tar listing
create package artifacts
install Latticra on a host
publish package artifacts
claim package readiness
```

Relationship To Existing Lanes

This contract depends on:

```
docs/DEBIAN_FREEBSD_OPENBSD_SOURCE_ARCHIVE_CONTRACT.md
docs/DEBIAN_FREEBSD_OPENBSD_SOURCE_ARCHIVE_FIXTURE_LANE.md
docs/DEBIAN_FREEBSD_OPENBSD_PACKAGE_INPUT_HANDOFF_LANE.md
docs/DEBIAN_FREEBSD_OPENBSD_PACKAGE_BUILD_GATE_CONTRACT.md
docs/DEBIAN_FREEBSD_OPENBSD_PACKAGE_BUILD_ENVIRONMENT_CONTRACT.md
docs/DEBIAN_FREEBSD_OPENBSD_PACKAGE_ARTIFACT_NAMING_CONTRACT.md
docs/DEBIAN_FREEBSD_OPENBSD_PACKAGE_INSTALL_REMOVE_TRANSCRIPT_CONTRACT.md
docs/DEBIAN_FREEBSD_OPENBSD_PACKAGE_PUBLICATION_NON_CLAIM_REVIEW_CONTRACT.md
docs/DEBIAN_FREEBSD_OPENBSD_PACKAGE_VALIDATION_PROMOTION_BLOCKER_MATRIX_CONTRACT.md
```

The package-build gate remains closed. This payload inspection contract only defines the evidence future package artifacts must provide after they exist in a disposable validation environment.

Completed Follow-On Lane

Completed follow-on lane:

```
Add a Debian, FreeBSD, and OpenBSD package install/remove transcript contract before any package
 install can be accepted.
docs/DEBIAN_FREEBSD_OPENBSD_PACKAGE_INSTALL_REMOVE_TRANSCRIPT_CONTRACT.md
scripts/test-debian-freebsd-openbsd-package-install-remove-transcript-contract.sh
```

That lane defines disposable install/remove evidence while keeping host installs and package readiness blocked.

Completed Follow-On Lane

Completed follow-on lane:

```
Add a Debian, FreeBSD, and OpenBSD package publication non-claim review contract before any
package validation result can be promoted.
docs/DEBIAN_FREEBSD_OPENBSD_PACKAGE_PUBLICATION_NON_CLAIM_REVIEW_CONTRACT.md
scripts/test-debian-freebsd-openbsd-package-publication-non-claim-review-contract.sh
```

That lane records local-only publication and official-port non-claims while keeping package publication and readiness blocked.

Completed Follow-On Lane

Completed follow-on lane:

```
Add a Debian, FreeBSD, and OpenBSD package validation promotion blocker matrix before any
platform-specific build evidence can be accepted.
docs/DEBIAN_FREEBSD_OPENBSD_PACKAGE_VALIDATION_PROMOTION_BLOCKER_MATRIX_CONTRACT.md
scripts/test-debian-freebsd-openbsd-package-validation-promotion-blocker-matrix-contract.sh
```

That lane ties source, environment, artifact, payload, install/remove, and publication non-claim blockers together while keeping platform build evidence acceptance and validation promotion blocked.

Next Slice

Recommended next slice:

```
Add a Debian, FreeBSD, and OpenBSD package build-evidence intake denial contract before any
single-platform build lane can open.
```

That future lane should define how build evidence intake is refused until the blocker matrix opens, while keeping package builds and readiness blocked.

Validation

Run:

```
sh scripts/test-debian-freebsd-openbsd-package-payload-inspection-contract.sh
```

Expected output:

```
debian_freebsd_openbsd_package_payload_inspection_contract: ok
```

docs/DEBIAN_FREEBSD_OPENBSD_PACKAGE_PUBLICATION_NON_CLAIM_REVIEW_CONTRACT.md

Source title: Debian, FreeBSD, and OpenBSD Package Publication Non-Claim Review Contract

Lines: 211 | Words: 646 | SHA-256: 339c041f6359962f61270d8d5aea2007498730d9342ce502dfbf93c29c851e1b

Debian, FreeBSD, and OpenBSD Package Publication Non-Claim Review Contract

Status: active package publication non-claim review contract Scope: define publication and official-port non-claim review evidence for Debian, FreeBSD, and OpenBSD package validation without publishing packages.

Purpose

This contract records the publication non-claim review required before any future Debian, FreeBSD, or OpenBSD package validation result can be promoted.

The goal is narrow: future package validation evidence must remain clearly local-only unless a separate, explicit, platform-specific publication lane records the required upload, submission, maintainer, archive, or ports-tree authority.

This contract is documentation-only and static. It does not upload packages, publish package artifacts, create package repositories, submit Latticra to Debian, submit Latticra to the FreeBSD ports tree, submit Latticra to the OpenBSD ports tree, create package artifacts, install packages, remove packages, or claim package readiness.

Current Publication Non-Claim State

```
debian_freebsd_openbsd_package_publication_non_claim_review_contract_present=1
debian_freebsd_openbsd_package_validation_promotion_blocker_matrix_contract_present=1
publication_non_claim_review_contract_present=1
publication_non_claim_review_contract_state=specified-no-effect
validation_promotion_blocker_matrix_state=blocked-no-effect
publication_non_claim_review_present=1
package_build_gate_state=closed-no-effect
payload_inspection_contract_state=specified-no-effect
install_remove_transcript_contract_state=specified-no-effect
package_validation_result_promoted=0
package_artifact_created=0
package_artifact_published=0
package_repository_created=0
package_repository_upload_run=0
upstream_submission_run=0
official_package_or_port_claimed=0
platform_build_evidence_accepted=0
package_readiness_claimed=0
production_installer_ready=0
root_installer_ready=0
```

Debian Publication Non-Claims

Future Debian validation promotion must preserve these current Debian non-claims:

```
debian_publication_non_claim_review_required=1
debian_publication_non_claim_review_present=1
debian_package_publication_claimed=0
debian_archive_ready=0
debian_mentors_upload_claimed=0
debian_sponsorship_claimed=0
debian_ftp_master_acceptance_claimed=0
debian_source_upload_run=0
debian_mentors_upload_run=0
debian_archive_upload_run=0
debian_debsign_run=0
debian_dput_run=0
```

The Debian package draft remains local-only. A future Debian upload or archive lane must be separate from local build, payload, install/remove, and publication non-claim review evidence.

FreeBSD Publication Non-Claims

Future FreeBSD validation promotion must preserve these current FreeBSD non-claims:

```
freebsd_publication_non_claim_review_required=1
freebsd_publication_non_claim_review_present=1
freebsd_package_publication_claimed=0
freebsd_ports_tree_submission_claimed=0
freebsd_bugzilla_pr_claimed=0
freebsd_committer_review_claimed=0
freebsd_official_port_claimed=0
freebsd_pkg_repo_created=0
freebsd_pkg_repo_publish_run=0
freebsd_pkg_repo_sign_run=0
```

The FreeBSD port draft remains local-only. A future FreeBSD ports-tree submission or package repository lane must be separate from local build, payload, install/remove, and publication non-claim review evidence.

OpenBSD Publication Non-Claims

Future OpenBSD validation promotion must preserve these current OpenBSD non-claims:

```
openbsd_publication_non_claim_review_required=1
openbsd_publication_non_claim_review_present=1
openbsd_package_publication_claimed=0
openbsd_ports_tree_submission_claimed=0
openbsd_ports_review_thread_claimed=0
openbsd_maintainer_acceptance_claimed=0
openbsd_official_port_claimed=0
openbsd_pkg_repo_created=0
openbsd_pkg_repo_publish_run=0
permit_package_enabled=0
```

The OpenBSD port draft remains local-only. PERMIT_PACKAGE=No remains in force until redistribution, license, notice, checksum, and maintainer-review evidence exists in a separate OpenBSD-specific lane.

Promotion Review Boundary

A future package validation promotion review must record:

```
package_validation_result_identifier
platform_under_review
source_archive_sha256
package_artifact_sha256
payload_inspection_transcript_sha256
install_remove_transcript_sha256
publication_non_claim_reviewer
publication_non_claim_review_date
non_claimed_publication_targets
status_page_update_reference
operator_authorization_reference
```

That review may only promote a validation result as local validation evidence. It must not convert local evidence into Debian archive evidence, FreeBSD official port evidence, OpenBSD official port evidence, package repository evidence, production installer evidence, or release readiness.

Current Blockers

Package validation promotion remains blocked because the current repository still has:

```
source_archive_accepted_for_build=0
package_artifact_created=0
package_artifact_sha256_recorded=0
package_payload_accepted=0
install_remove_transcript_present=0
environment_transcript_present=0
```

```
explicit_operator_build_authorization=0
platform_build_evidence_accepted=0
package_validation_result_promoted=0
```

Command Boundary

This contract does not:

```
run debsign
run dput
upload to mentors.debian.net
upload to a Debian archive
submit to the FreeBSD ports tree
create a FreeBSD Bugzilla PR
publish a FreeBSD package repository
submit to the OpenBSD ports tree
send an OpenBSD ports review thread
enable OpenBSD PERMIT_PACKAGE
publish an OpenBSD package repository
create package artifacts
install Latticra on a host
remove Latticra from a host
claim package readiness
```

Relationship To Existing Lanes

This contract depends on:

```
docs/DEBIAN_FREEBSD_OPENBSD_SOURCE_ARCHIVE_CONTRACT.md
docs/DEBIAN_FREEBSD_OPENBSD_SOURCE_ARCHIVE_FIXTURE_LANE.md
docs/DEBIAN_FREEBSD_OPENBSD_PACKAGE_INPUT_HANDOFF_LANE.md
docs/DEBIAN_FREEBSD_OPENBSD_PACKAGE_BUILD_GATE_CONTRACT.md
docs/DEBIAN_FREEBSD_OPENBSD_PACKAGE_BUILD_ENVIRONMENT_CONTRACT.md
docs/DEBIAN_FREEBSD_OPENBSD_PACKAGE_ARTIFACT_NAMING_CONTRACT.md
docs/DEBIAN_FREEBSD_OPENBSD_PACKAGE_PAYLOAD_INSPECTION_CONTRACT.md
docs/DEBIAN_FREEBSD_OPENBSD_PACKAGE_INSTALL_REMOVE_TRANSCRIPT_CONTRACT.md
docs/DEBIAN_FREEBSD_OPENBSD_PACKAGE_VALIDATION_PROMOTION_BLOCKER_MATRIX_CONTRACT.md
```

The package-build gate remains closed. This publication non-claim review contract only records that local package validation evidence must remain non-published and non-official until a separate platform-specific publication lane exists.

Completed Follow-On Lane

Completed follow-on lane:

```
Add a Debian, FreeBSD, and OpenBSD package validation promotion blocker matrix before any
platform-specific build evidence can be accepted.
```

```
docs/DEBIAN_FREEBSD_OPENBSD_PACKAGE_VALIDATION_PROMOTION_BLOCKER_MATRIX_CONTRACT.md
scripts/test-debian-freebsd-openbsd-package-validation-promotion-blocker-matrix-contract.sh
```

That lane ties source, environment, artifact, payload, install/remove, and publication non-claim blockers together while keeping platform build evidence acceptance and validation promotion blocked.

Next Slice

Recommended next slice:

```
Add a Debian, FreeBSD, and OpenBSD package build-evidence intake denial contract before any
single-platform build lane can open.
```

That future lane should define how build evidence intake is refused until the blocker matrix opens, while keeping package builds and readiness blocked.

Validation

Run:

```
sh scripts/test-debian-freebsd-openbsd-package-publication-non-claim-review-contract.sh
```

Expected output:

```
debian_freebsd_openbsd_package_publication_non_claim_review_contract: ok
```

docs/DEBIAN_FREEBSD_OPENBSD_PACKAGE_VALIDATION_PROMOTION_BLOCKER_MATRIX_CONTRACT.md

Source title: Debian, FreeBSD, and OpenBSD Package Validation Promotion Blocker Matrix Contract

Lines: 251 | Words: 649 | SHA-256: d1010222b9741ca71a856abc63c598676431fe3801fe336e6dc15179c5aadca9

Debian, FreeBSD, and OpenBSD Package Validation Promotion Blocker Matrix Contract

Status: active package validation promotion blocker matrix contract Scope: define the blocker matrix for promoting Debian, FreeBSD, and OpenBSD package validation evidence without accepting build evidence.

Purpose

This contract records the current blocker matrix that prevents any Debian, FreeBSD, or OpenBSD package validation result from being promoted.

The goal is narrow: tie the source archive, disposable environment, artifact naming, payload inspection, install/remove transcript, and publication non-claim records into one promotion matrix before any platform-specific build evidence can be accepted.

This contract is documentation-only and static. It does not run package build tools, create package artifacts, inspect package artifacts, install packages, remove packages, publish packages, submit ports, enable OpenBSD package redistribution, promote validation results, or claim package readiness.

Current Matrix State

```
debian_freebsd_openbsd_package_validation_promotion_blocker_matrix_contract_present=1
package_validation_promotion_blocker_matrix_contract_present=1
validation_promotion_blocker_matrix_state=blocked-no-effect
package_build_gate_state=closed-no-effect
publication_non_claim_review_contract_state=specified-no-effect
source_archive_accepted_for_build=0
environment_transcript_present=0
explicit_operator_build_authorization=0
package_artifact_created=0
package_artifact_sha256_recorded=0
package_payload_accepted=0
install_remove_transcript_present=0
publication_non_claim_review_present=1
platform_build_evidence_accepted=0
package_validation_result_promoted=0
package_readiness_claimed=0
production_installer_ready=0
root_installer_ready=0
```

Shared Promotion Blocker Matrix

Current promotion state by evidence column:

```
source_archive_column_state=blocked
environment_column_state=blocked
artifact_column_state=blocked
payload_column_state=blocked
install_remove_column_state=blocked
publication_non_claim_column_state=specified
promotion_column_state=blocked
```

A future local validation promotion may not accept any platform-specific build evidence unless all required columns are reviewed together:

```
source_archive_accepted_for_build=1
archive_sha256_bound_to_build=1
environment_transcript_present=1
explicit_operator_build_authorization=1
package_artifact_created=1
package_artifact_sha256_recorded=1
```

```
package_payload_accepted=1
install_remove_transcript_present=1
publication_non_claim_review_present=1
platform_publication_claimed=0
package_validation_result_promoted=1
```

Those values are future prerequisites, not current claims. The current matrix remains blocked.

Debian Promotion Row

Current Debian validation promotion remains blocked:

```
debian_validation_promotion_blocked=1
debian_platform_build_evidence_accepted=0
debian_source_archive_accepted_for_build=0
debian_build_environment_provisioned=0
debian_package_artifact_created=0
debian_payload_inspection_run=0
debian_install_remove_transcript_present=0
debian_publication_non_claim_review_present=1
debian_package_publication_claimed=0
debian_validation_result_promoted=0
dpkg_buildpackage_run=0
debuild_run=0
lintian_run=0
debian_archive_ready=0
```

Debian build, lintian, payload, install/remove, and publication evidence must remain local-only and unpromoted until the shared matrix opens in a future lane.

FreeBSD Promotion Row

Current FreeBSD validation promotion remains blocked:

```
freebsd_validation_promotion_blocked=1
freebsd_platform_build_evidence_accepted=0
freebsd_source_archive_accepted_for_build=0
freebsd_build_environment_provisioned=0
freebsd_package_artifact_created=0
freebsd_payload_inspection_run=0
freebsd_install_remove_transcript_present=0
freebsd_publication_non_claim_review_present=1
freebsd_package_publication_claimed=0
freebsd_validation_result_promoted=0
freebsd_make_makesum_run=0
freebsd_make_stage_run=0
freebsd_make_package_run=0
portlint_run=0
poudriere_run=0
freebsd_official_port_claimed=0
```

FreeBSD ports, portlint, poudriere, package, install/remove, and publication evidence must remain local-only and unpromoted until the shared matrix opens in a future lane.

OpenBSD Promotion Row

Current OpenBSD validation promotion remains blocked:

```
openbsd_validation_promotion_blocked=1
openbsd_platform_build_evidence_accepted=0
openbsd_source_archive_accepted_for_build=0
openbsd_build_environment_provisioned=0
openbsd_package_artifact_created=0
openbsd_payload_inspection_run=0
openbsd_install_remove_transcript_present=0
openbsd_publication_non_claim_review_present=1
openbsd_package_publication_claimed=0
openbsd_validation_result_promoted=0
openbsd_make_makesum_run=0
openbsd_make_plist_run=0
openbsd_make_package_run=0
portcheck_run=0
openbsd_bulk_build_run=0
permit_package_enabled=0
openbsd_official_port_claimed=0
```

OpenBSD ports, plist, package, portcheck, bulk build, install/remove, PERMIT_PACKAGE, and publication evidence must remain local-only and unpromoted until the shared matrix opens in a future lane.

Acceptance Boundary

A future promotion record must bind every accepted platform result to:

```
platform_under_review
source_archive_contract_reference
source_archive_sha256
environment_transcript_sha256
package_artifact_name
package_artifact_sha256
payload_inspection_transcript_sha256
install_remove_transcript_sha256
publication_non_claim_review_reference
promotion_reviewer
promotion_decision
promotion_scope
status_page_update_reference
operator_authorization_reference
```

The only permitted future promotion scope from this matrix is local package validation evidence. This matrix cannot promote Debian archive readiness, FreeBSD official port status, OpenBSD official port status, package repository publication, production installer readiness, or root installer readiness.

Current Blockers

Package validation promotion remains blocked under this matrix:

```
source_archive_accepted_for_build=0
environment_transcript_present=0
explicit_operator_build_authorization=0
package_artifact_created=0
package_artifact_sha256_recorded=0
package_payload_accepted=0
install_remove_transcript_present=0
platform_build_evidence_accepted=0
package_validation_result_promoted=0
```

Command Boundary

This contract does not:

```
run dpkg-buildpackage
run debuild
run lintian
run FreeBSD make makesum
run FreeBSD make stage
run FreeBSD make package
run portlint
run poudriere
run OpenBSD make makesum
run OpenBSD make plist
run OpenBSD make package
run portcheck
run an OpenBSD bulk build
create package artifacts
inspect package artifacts
install packages
remove packages
publish package artifacts
submit package or port upstream
enable OpenBSD PERMIT_PACKAGE
promote package validation results
claim package readiness
```

Relationship To Existing Lanes

This contract depends on:

```
docs/DEBIAN_FREEBSD_OPENBSD_SOURCE_ARCHIVE_CONTRACT.md
docs/DEBIAN_FREEBSD_OPENBSD_SOURCE_ARCHIVE_FIXTURE_LANE.md
```

```
docs/DEBIAN_FREEBSD_OPENBSD_PACKAGE_INPUT_HANDOFF_LANE.md
docs/DEBIAN_FREEBSD_OPENBSD_PACKAGE_BUILD_GATE_CONTRACT.md
docs/DEBIAN_FREEBSD_OPENBSD_PACKAGE_BUILD_ENVIRONMENT_CONTRACT.md
docs/DEBIAN_FREEBSD_OPENBSD_PACKAGE_ARTIFACT_NAMING_CONTRACT.md
docs/DEBIAN_FREEBSD_OPENBSD_PACKAGE_PAYLOAD_INSPECTION_CONTRACT.md
docs/DEBIAN_FREEBSD_OPENBSD_PACKAGE_INSTALL_REMOVE_TRANSCRIPT_CONTRACT.md
docs/DEBIAN_FREEBSD_OPENBSD_PACKAGE_PUBLICATION_NON_CLAIM_REVIEW_CONTRACT.md
```

The package-build gate remains closed. This blocker matrix only records the promotion columns and current blocking values for future Debian, FreeBSD, and OpenBSD local validation evidence.

Next Slice

Recommended next slice:

```
Add a Debian, FreeBSD, and OpenBSD package build-evidence intake denial contract before any
single-platform build lane can open.
```

That future lane should define how build evidence intake is refused until the blocker matrix opens, while keeping package builds and readiness blocked.

Validation

Run:

```
sh scripts/test-debian-freebsd-openbsd-package-validation-promotion-blocker-matrix-contract.sh
```

Expected output:

```
debian_freebsd_openbsd_package_validation_promotion_blocker_matrix_contract: ok
```

docs/DEBIAN_FREEBSD_OPENBSD_SOURCE_ARCHIVE_CONTRACT.md

Source title: Debian, FreeBSD, and OpenBSD Source Archive Contract

Lines: 197 | Words: 481 | SHA-256: 115765fbaf6ef9ae77dcba7a2be0b64308b0e40785a4e3a2709751f227a0ee12

Debian, FreeBSD, and OpenBSD Source Archive Contract

Status: active source archive contract Scope: define the evidence required before Debian, FreeBSD, or OpenBSD package/port build evidence can be accepted.

Purpose

This contract defines the source archive and checksum evidence required before Latticra accepts any Debian, FreeBSD, or OpenBSD package/port build transcript.

The current goal is conservative: record expected source archive names, root layout, checksum requirements, distinfo requirements, transcript fields, and promotion blockers without creating an archive, generating distinfo, or running a package build.

This contract sits after the local-only static packaging drafts and before any dpkg-buildpackage, FreeBSD make stage, FreeBSD make package, OpenBSD make plist, OpenBSD make package, portlint, portcheck, poudriere, or bulk-build evidence.

Current Package Inputs

The current local-only Debian draft declares:

```
Source: latticra
latticra (0.0.0-1local1) UNRELEASED
3.0 (quilt)
```

For the current Debian draft, the expected source archive shape is:

```
debian_orig_archive_name=latticra_0.0.0.orig.tar.gz
debian_source_root=latticra-0.0.0/
debian_source_format=3.0 (quilt)
```

The current local-only FreeBSD port draft declares:

```
PORTNAME=	latticra
DISTVERSION=	0.0.0
```

For the current FreeBSD draft, the expected distfile and distinfo shape is:

```
freebsd_distfile_name=latticra-0.0.0.tar.gz
freebsd_distfile_root=latticra-0.0.0/
freebsd_distinfo_requires_sha256=1
freebsd_distinfo_requires_size=1
```

The current local-only OpenBSD port draft declares:

```
DISTNAME=	latticra-0.0.0
PERMIT_PACKAGE=	No
```

For the current OpenBSD draft, the expected distfile and distinfo shape is:

```
openbsd_distfile_name=latticra-0.0.0.tar.gz
openbsd_distfile_root=latticra-0.0.0/
openbsd_distinfo_requires_sha256=1
openbsd_distinfo_requires_size=1
openbsd_permit_package_requires_license_review=1
```

Required Future Evidence

A future accepted source archive transcript must record:

```
source_tree_revision
source_archive_command
source_archive_name
source_archive_root
source_archive_size_bytes
source_archive_sha256
source_archive_entry_count
source_archive_generated_twice
source_archive_repeated_sha256_match
source_archive_contains_readme
source_archive_contains_debian_metadata
source_archive_contains_freebsd_port_metadata
source_archive_contains_openbsd_port_metadata
source_archive_excludes_git_dir
source_archive_excludes_nested_archives
source_archive_excludes_build_outputs
source_archive_excludes_package_artifacts
source_archive_symlink_policy_checked
source_archive_path_safety_checked
freebsd_distinfo_sha256_recorded
freebsd_distinfo_size_recorded
openbsd_distinfo_sha256_recorded
openbsd_distinfo_size_recorded
```

Acceptance Rule

Debian, FreeBSD, and OpenBSD source archive evidence remains unaccepted unless all of these are true:

```
source_archive_transcript_present=1
source_archive_sha256_recorded=1
source_archive_generated_twice=1
source_archive_repeated_sha256_match=1
source_archive_excludes_git_dir=1
source_archive_excludes_nested_archives=1
source_archive_excludes_build_outputs=1
source_archive_excludes_package_artifacts=1
source_archive_symlink_policy_checked=1
source_archive_path_safety_checked=1
debian_orig_archive_name_matches_expected=1
freebsd_distinfo_sha256_recorded=1
freebsd_distinfo_size_recorded=1
openbsd_distinfo_sha256_recorded=1
openbsd_distinfo_size_recorded=1
license_expression_reviewed=1
package_notice_obligations_reviewed=1
openbsd_permit_package_reviewed=1
```

Until those conditions are met, source archive evidence is a review input only, not package build readiness.

Current Baseline

```
debian_freebsd_openbsd_source_archive_contract_present=1
debian_local_deb_draft_present=1
freebsd_port_draft_present=1
openbsd_port_draft_present=1
source_archive_policy_recorded=1
debian_orig_archive_name_expected=latticra_0.0.0.orig.tar.gz
freebsd_distfile_name_expected=latticra-0.0.0.tar.gz
openbsd_distfile_name_expected=latticra-0.0.0.tar.gz
source_archive_transcript_present=0
source_archive_created=0
source_archive_sha256_recorded=0
source_archive_reproducible=0
source_archive_accepted_for_build=0
freebsd_distinfo_created=0
openbsd_distinfo_created=0
debian_source_package_created=0
freebsd_package_artifact_created=0
openbsd_package_artifact_created=0
package_readiness_claimed=0
```

Boundary

This contract does not:

```
create a source archive
run tar
run gzip
run dpkg-source
run dpkg-buildpackage
run debuild
run lintian
generate FreeBSD distinfo
generate OpenBSD distinfo
run FreeBSD make stage
run FreeBSD make package
run OpenBSD make plist
run OpenBSD make package
run portlint
run portcheck
run poudriere
run an OpenBSD bulk build
create package artifacts
publish to Debian, FreeBSD, or OpenBSD
install Latticra on a host
claim official package or port status
claim production readiness
```

Next Slice

Recommended next slice:

```
Add a temporary source archive fixture lane that creates and inspects an archive in a disposable
 workspace without running package builds or generating package artifacts.
```

That future lane should prove archive shape and reproducibility in a temporary workspace while keeping Debian, FreeBSD, and OpenBSD package build and publication claims blocked.

Validation

Run:

```
sh scripts/test-debian-freebsd-openbsd-source-archive-contract.sh
```

Expected output:

```
debian_freebsd_openbsd_source_archive_contract: ok
```

docs/DEBIAN_FREEBSD_OPENBSD_SOURCE_ARCHIVE_FIXTURE_LANE.md

Source title: Debian, FreeBSD, and OpenBSD Source Archive Fixture Lane

Lines: 58 | Words: 165 | SHA-256: aae9dd3a783588346f66523ec2860231534002e94ccb7f86642b63a87ec175aa

Debian, FreeBSD, and OpenBSD Source Archive Fixture Lane

Status: active fixture lane Scope: create and inspect temporary Debian, FreeBSD, and OpenBSD source archive fixtures without running package builds, installing artifacts, or publishing package metadata.

Purpose

This lane proves that Latticra can form temporary source archives matching the current Debian orig.tar.gz, FreeBSD distfile, and OpenBSD distfile expectations, generate them twice, and confirm the repeated SHA-256 value matches.

It does not build packages. It only creates disposable archive fixtures and inspects their contents.

Current Evidence

```
debian_freebsd_openbsd_source_archive_fixture_lane_present=1

```

Boundary

This lane does not run dpkg-source, dpkg-buildpackage, debuild, lintian, FreeBSD make stage, FreeBSD make package, OpenBSD make plist, OpenBSD make package, portlint, portcheck, poudriere, or an OpenBSD bulk build.

It does not write FreeBSD or OpenBSD distinfo files.

Validation

Run:

```
sh scripts/test-debian-freebsd-openbsd-source-archive-fixture-lane.sh
```

Expected output:

```
debian_freebsd_openbsd_source_archive_fixture_lane: ok
```

docs/DEBIAN_LOCAL_DEB_STATIC_VALIDATION.md

Source title: Debian Local Deb Static Validation

Lines: 97 | Words: 215 | SHA-256: fe4b6f116739d57f3bac87c2ac2f30678d6661ee9ceb8ba17d18568975b0dcb0

Debian Local Deb Static Validation

Status: active static validation lane Scope: static checks for the local-only Debian deb packaging draft.

Purpose

This lane checks that the Debian packaging draft is present, narrow, and honest.

It verifies local packaging shape for the no-effect CLI payload, but it does not run dpkg-buildpackage, debuild, lintian, sbuild, or pbuilder, and it does not create package artifacts.

Guarded Files

```
packaging/debian/README.md
packaging/debian/debian/control
packaging/debian/debian/rules
packaging/debian/debian/changelog
packaging/debian/debian/copyright
packaging/debian/debian/install
packaging/debian/debian/source/format
docs/DEBIAN_LOCAL_DEB_STATIC_VALIDATION.md
docs/status/DEBIAN_ECOSYSTEM_INTEGRATION_STATUS.md
scripts/test-debian-local-deb-static-validation.sh
.github/workflows/debian-local-deb-static-validation.yml
```

Preserved Boundary

```
local_only_draft=1
debian_local_deb_draft_present=1
debian_static_deb_validation_present=1
deb_artifact_created=0
deb_installed_on_host=0
dpkg_buildpackage_run_required=0
debuild_run_required=0
lintian_run_required=0
lintian_transcript_present=0
debian_archive_ready=0
debian_mentors_upload_claimed=0
debian_sponsorship_claimed=0
debian_ftp_master_acceptance_claimed=0
production_readiness_claimed=0
```

Package Intent

The local deb draft records only this initial payload shape:

```
usr/bin/latticra
usr/share/doc/latticra/README.md
```

The CLI remains the no-effect status surface from:

```
src/latticra_cli.c
```

Explicit Non-Claims

This static lane does not:

```
build a deb artifact
install a deb artifact
upload to mentors.debian.net
submit to Debian
claim Debian archive readiness
claim Debian sponsorship
claim ftp-master acceptance
install a system service
install kernel modules
write /etc/latticra
claim root installer readiness
claim production readiness
```

Next Recommended Lane

Add a Debian lintian availability and transcript contract only after the local deb license expression and source archive boundary are reviewed.

Validation

Run:

```
sh scripts/test-debian-local-deb-static-validation.sh
```

Expected output:

```
debian_local_deb_static_validation: ok
```

docs/FEDORA_DEVELOPER_WORKFLOW.md

Source title: Fedora Developer Workflow

Lines: 108 | Words: 309 | SHA-256: 8adcb747d9431f7216e7f9ab4aa5a54977b7b433051123bf319c5e842e46e9a5

Fedora Developer Workflow

Status: developer workflow record Scope: local Fedora Linux commands for productive Latticra development.

Purpose

This note gives a repeatable local workflow for working on Latticra from Fedora Linux after the Fedora build lane was added.

The goal is simple:

```
install the small toolchain
run the same guards as CI
keep kernel evidence work fast and repeatable
avoid packaging work until the build lane stays green
```

Install local tools

On a Fedora workstation or Fedora container, install the basic tools:

```
sudo dnf -y install git gcc make coreutils findutils diffutils grep
```

In a root container, omit sudo:

```
dnf -y install git gcc make coreutils findutils diffutils grep
```

Fast local guard loop

For a quick sanity check while editing C/kernel files, run:

```
sh scripts/test-state-lattice.sh
sh scripts/test-system-bootstrap.sh
sh scripts/test-kernel.sh
sh scripts/test-kernel-lifecycle.sh
```

Kernel evidence guard loop

Before opening a kernel evidence PR, run:

```
sh scripts/test-kernel-lifecycle.sh
sh scripts/test-kernel-lifecycle-report-runner.sh
sh scripts/test-kernel-lifecycle-subsystem-summary.sh
sh scripts/test-kernel-lifecycle-subsystem-summary-report-runner.sh
sh scripts/test-kernel-lifecycle-rollback-plan.sh
```

Fedora lane guard

Before merging Fedora-facing work, run:

```
sh scripts/test-fedora-build-lane.sh
```

Expected output:

```
fedora_build_lane: ok
```

Suggested work rhythm

Use this loop for productive development:

```
1. Create a small branch.
2. Make one bounded change.
```

3. Run the fast local guard loop.
4. Run the Fedora lane guard when the branch touches build, kernel, or Fedora-facing files.
5. Open a focused PR with clear non-claims.

Current boundary

This workflow is for local developer productivity. It does not add package metadata or change Latticra capability claims.

Next recommended lane

After this workflow note, the next Fedora-facing slice should be:

```
Fedora package metadata plan
```

That should be a planning slice before any spec file is added.

Validation

This workflow note is guarded by:

```
sh scripts/test-fedora-developer-workflow.sh
```

Expected output:

```
fedora_developer_workflow: ok
```

docs/FEDORA_DISPOSABLE_VM_EFFECT_GATE.md

Source title: Fedora Disposable VM Effect Gate

Lines: 131 | Words: 254 | SHA-256: 0b0bcf6eed8ba435265745bc2ba1be9baa051a5a451b256eda1e4e2917e2e6fe

Fedora Disposable VM Effect Gate

Status: gate record Evidence level: 8 target, gate only Scope: define the evidence boundary for a future Fedora disposable VM effect lane.

Purpose

Latticra has installroot mutation evidence and Fedora transcript evidence contracts.

This gate defines when the project may consider a future disposable Fedora VM effect lane reviewable.

This is a gate record only.

It does not add runtime behavior.

Required target evidence

```
target_is_disposable_fedora_vm=1
target_is_daily_driver=0
target_is_production_host=0
target_is_immutable_fedora=0
target_has_clean_snapshot=1
target_has_recovery_path=1
operator_consent_recorded=1
```

Required package evidence

```
local_rpm_built_from_current_tree=1
rpm_name_is_latticra=1
rpm_version_recorded=1
rpm_payload_listing_recorded=1
rpm_payload_is_documentation_only=1
unexpected_runtime_surface_absent=1
```

Required prior evidence

```
installroot_lifecycle_evidence_present=1
post_removal_absence_evidence_present=1
manual_host_dry_run_transcript_contract_present=1
manual_host_rc_decision_classifier_present=1
rpm_gate_allowed=1
removal_rollback_ready=1
```

Effect eligibility decision

The gate decision must be one of:

```
disposable_vm_effect_gate_status=eligible
disposable_vm_effect_gate_status=blocked
disposable_vm_effect_gate_status=invalid
```

eligible means the evidence set is ready for review.

It does not mean production readiness.

Boundary fields

```
effect_gate_present=1
host_install_ready=0
production_installer_ready=0
fedora_distribution_ready=0
fedora_approval_claimed=0
daily_driver_allowed=0
production_host_allowed=0
immutable_host_allowed=0
```

Block conditions

```
daily_driver_detected=1
production_host_detected=1
immutable_fedora_detected=1
snapshot_missing=1
recovery_path_missing=1
operator_consent_missing=1
rpm_payload_listing_missing=1
rpm_payload_not_documentation_only=1
unexpected_runtime_surface_present=1
prior_installroot_evidence_missing=1
prior_transcript_contract_missing=1
prior_decision_classifier_missing=1
prior_gate_evidence_missing=1
prior_removal_rollback_evidence_missing=1
```

Validation

```
sh scripts/test-fedora-disposable-vm-effect-gate.sh
```

Expected output:

```
fedora_disposable_vm_effect_gate: ok
```

Next recommended Fedora lane

```
Implement no-effect Fedora disposable VM effect gate classifier
```

That classifier should consume explicit evidence fields and report eligible, blocked, or invalid.

README overhaul hold

The root README should not claim install readiness from this gate alone.

The README overhaul should wait until real validation evidence exists for:

```
manual_host_dry_run_transcript_present=1
live_host_validation_completed=1
host_install_ready=1
```

Non-claims

This gate is not production readiness, Fedora approval, or Fedora distribution readiness.

docs/FEDORA_DISPOSABLE_VM_EFFECT_GATE_CLASSIFIER.md

Source title: Fedora Disposable VM Effect Gate Classifier

Lines: 167 | Words: 248 | SHA-256: 200122139918393f42f0482f73fc8d7a59167d75e723635294c38d87b549a05c

Fedora Disposable VM Effect Gate Classifier

Status: implementation record Evidence level: 8 Scope: pure classifier for disposable Fedora VM effect-gate evidence.

Purpose

This classifier consumes explicit evidence fields from the Fedora disposable VM effect gate and reports one of:

```
disposable_vm_effect_gate_status=eligible
disposable_vm_effect_gate_status=blocked
disposable_vm_effect_gate_status=invalid
```

The classifier is no-effect.

It does not add runtime behavior.

API surface

```
include/latticra/fedora_disposable_vm_effect_gate.h
src/fedora_disposable_vm_effect_gate.c
tests/fedora_disposable_vm_effect_gate.c
```

Public functions:

```
latticra_fedora_disposable_vm_effect_gate_classify
latticra_fedora_disposable_vm_effect_gate_report
latticra_fedora_disposable_vm_effect_gate_status_label
latticra_fedora_disposable_vm_effect_gate_denial_label
```

Eligible evidence

```
target_is_disposable_fedora_vm=1
target_is_daily_driver=0
target_is_production_host=0
target_is_immutable_fedora=0
target_has_clean_snapshot=1
target_has_recovery_path=1
operator_consent_recorded=1
local_rpm_built_from_current_tree=1
rpm_name_is_latticra=1
rpm_version_recorded=1
rpm_payload_listing_recorded=1
rpm_payload_is_documentation_only=1
unexpected_runtime_surface_absent=1
installroot_lifecycle_evidence_present=1
post_removal_absence_evidence_present=1
manual_host_dry_run_transcript_contract_present=1
manual_host_rc_decision_classifier_present=1
rpm_gate_allowed=1
removal_rollback_ready=1
```

Eligible output boundary

```
disposable_vm_effect_gate_status=eligible
disposable_vm_effect_gate_denial=none
disposable_vm_effect_eligible=1
effect_gate_present=1
host_install_ready=0
production_installer_ready=0
fedora_distribution_ready=0
fedora_approval_claimed=0
daily_driver_allowed=0
production_host_allowed=0
immutable_host_allowed=0
evidence_level=8
```

Blocked denial labels

```
not-disposable-fedora-vm
daily-driver-target
production-target
immutable-fedora-target
snapshot-missing
recovery-path-missing
operator-consent-missing
local-rpm-not-current-tree
rpm-name-mismatch
rpm-version-missing
rpm-payload-listing-missing
rpm-payload-not-documentation-only
unexpected-runtime-surface
installroot-evidence-missing
post-removal-evidence-missing
transcript-contract-missing
decision-classifier-missing
rpm-gate-not-allowed
removal-rollback-not-ready
```

Invalid input

Malformed non-binary evidence reports:

```
disposable_vm_effect_gate_status=invalid
disposable_vm_effect_gate_denial=invalid-classifier-input
disposable_vm_effect_eligible=0
```

Report header

```
FEDORA DISPOSABLE VM EFFECT GATE CLASSIFIER
```

Required report fields include:

```
classifier_evaluated=1
effect_gate_present=1
disposable_vm_effect_eligible=1
disposable_vm_effect_eligible=0
host_install_ready=0
production_installer_ready=0
fedora_distribution_ready=0
fedora_approval_claimed=0
daily_driver_allowed=0
production_host_allowed=0
immutable_host_allowed=0
evidence_level=8
```

Validation

Classifier guard:

```
sh scripts/test-fedora-disposable-vm-effect-gate-classifier.sh
```

Docs guard:

```
sh scripts/test-fedora-disposable-vm-effect-gate-classifier-docs.sh
```

Expected output:

```
fedora_disposable_vm_effect_gate_classifier: ok
fedora_disposable_vm_effect_gate_classifier_docs: ok
```

Next recommended Fedora lane

```
Align Fedora disposable VM effect gate classifier status
```

After that status alignment, the next safe progression is a disposable Fedora VM local RPM validation lane.

Non-claims

This classifier is not production readiness, Fedora approval, or Fedora distribution readiness.

docs/FEDORA_DISPOSABLE_VM_LOCAL_RPM_VALIDATION_LANE.md

Source title: Fedora Disposable VM Local RPM Validation Lane

Lines: 136 | Words: 352 | SHA-256: 68688397537a05fbb3e4a82dc0f777f3aa0d6a20bf6940bb3597d081270faf08

Fedora Disposable VM Local RPM Validation Lane

Status: gated validation lane Evidence level: 9 target Scope: local RPM validation on a disposable Fedora VM target only.

Purpose

This lane defines the first host-facing Fedora RPM validation path for Latticra.

The lane is restricted to a disposable Fedora VM with a clean snapshot, a recovery path, and explicit operator consent.

It is not for a daily-driver system, production host, immutable Fedora image, or unclear target.

Hard gate

The validation script must refuse unless all of the following are true:

```
LATTICRA_ALLOW_DISPOSABLE_VM_RPM_VALIDATION=1
LATTICRA_TARGET_IS_DISPOSABLE_FEDORA_VM=1
LATTICRA_TARGET_IS_DAILY_DRIVER=0
LATTICRA_TARGET_IS_PRODUCTION_HOST=0
LATTICRA_TARGET_IS_IMMUTABLE_FEDORA=0
LATTICRA_TARGET_HAS_CLEAN_SNAPSHOT=1
LATTICRA_TARGET_HAS_RECOVERY_PATH=1
LATTICRA_OPERATOR_CONSENT_RECORDED=1
ID=fedora
rpm_present=1
rpmbuild_present=1
```

Required package checks

Before any package operation, the lane must verify:

```
rpm_name_is_latticra=1
rpm_version_recorded=1
rpm_payload_listing_recorded=1
rpm_payload_is_documentation_only=1
unexpected_runtime_surface_absent=1
```

Expected package payload remains:

```
/usr/share/doc/latticra/README.md
```

Forbidden payload surfaces include:

```
/usr/bin/latticra
/etc/latticra
/usr/lib/systemd/system/latticra.service
/usr/lib/modules
/boot/latticra
```

Validation sequence

The guarded lane is expected to:

```
1. Verify disposable Fedora VM evidence.
2. Build the local RPM from the current tree.
3. Inspect package metadata.
4. Inspect package payload.
5. Validate the package payload remains documentation-only.
6. Apply the local RPM to the disposable Fedora VM target.
7. Query the installed package state.
8. Verify the README payload exists.
9. Verify the package files.
10. Remove the package.
11. Confirm the package is absent.
```

12. Confirm the README payload is absent.
13. Emit a deterministic validation report.

Required report fields

```
FEDORA DISPOSABLE VM LOCAL RPM VALIDATION LANE
validation_status=ok
package_name=latticra
package_version_recorded=1
disposable_vm_target_verified=1
snapshot_evidence_present=1
recovery_evidence_present=1
operator_consent_recorded=1
rpm_payload_listing_recorded=1
rpm_payload_is_documentation_only=1
unexpected_runtime_surface_absent=1
vm_rpmdb_mutated=1
vm_filesystem_mutated=1
install_validation_performed=1
removal_validation_performed=1
post_removal_absence_verified=1
live_host_validation_completed=1
host_install_ready=1
production_installer_ready=0
fedora_distribution_ready=0
fedora_approval_claimed=0
evidence_level=9
```

Non-claims

This lane does not make Latticra production ready.

It does not claim Fedora approval.

It does not claim Fedora distribution readiness.

It does not make daily-driver installation eligible.

Validation guard

```
sh scripts/test-fedora-disposable-vm-local-rpm-validation-lane-docs.sh
```

Expected output:

```
fedora_disposable_vm_local_rpm_validation_lane_docs: ok
```

Next recommended Fedora lane

```
Add disposable Fedora VM local RPM validation status alignment
```

After real validation evidence exists, the root README can be overhauled to describe the disposable Fedora VM validation path without claiming production or Fedora distribution readiness.

docs/FEDORA_DISPOSABLE_VM_LOCAL_RPM_VALIDATION_TRANSCRIPT_CONTRACT.md

Source title: Fedora Disposable VM Local RPM Validation Transcript Contract

Lines: 228 | Words: 474 | SHA-256: f317ae2ce5552a9f4c4f11d1b22fa63e0f9ec2f5b888abbec4d7dc39d03daaa5

Fedora Disposable VM Local RPM Validation Transcript Contract

Status: contract record Evidence level: 9 target, contract only Scope: transcript schema for a future real disposable Fedora VM local RPM validation run.

Purpose

Latticra now has a gated disposable Fedora VM local RPM validation lane and a status record for that lane.

This contract defines the transcript fields required before a real disposable Fedora VM validation run can be reviewed as evidence.

This is an evidence schema only.

It does not execute the validation runner.

It does not install or remove an RPM.

It does not capture real validation evidence by itself.

Required transcript header

```
LATTICRA FEDORA DISPOSABLE VM LOCAL RPM VALIDATION TRANSCRIPT
transcript_kind=disposable-vm-local-rpm-validation
transcript_version=1
operator_review_required=1
validation_transcript_recorded_after_real_run=1
```

Required target evidence

```
target_is_disposable_fedora_vm=1
target_is_daily_driver=0
target_is_production_host=0
target_is_immutable_fedora=0
target_has_clean_snapshot=1
target_has_recovery_path=1
operator_consent_recorded=1
fedora_os_release_recorded=1
fedora_kernel_version_recorded=1
rpm_tooling_recorded=1
rpmbuild_tooling_recorded=1
```

Required runner gate evidence

```
LATTICRA_ALLOW_DISPOSABLE_VM_RPM_VALIDATION=1
LATTICRA_TARGET_IS_DISPOSABLE_FEDORA_VM=1
LATTICRA_TARGET_IS_DAILY_DRIVER=0
LATTICRA_TARGET_IS_PRODUCTION_HOST=0
LATTICRA_TARGET_IS_IMMUTABLE_FEDORA=0
LATTICRA_TARGET_HAS_CLEAN_SNAPSHOT=1
LATTICRA_TARGET_HAS_RECOVERY_PATH=1
LATTICRA_OPERATOR_CONSENT_RECORDED=1
ID=fedora
rpm_present=1
rpmbuild_present=1
```

Required package evidence

```
local_rpm_built_from_current_tree=1
rpm_build_command_recorded=1
rpm_name_is_latticra=1
rpm_version_recorded=1
rpm_path_recorded=1
rpm_metadata_recorded=1
rpm_payload_listing_recorded=1
rpm_payload_is_documentation_only=1
unexpected_runtime_surface_absent=1
```

Expected package payload remains:

```
/usr/share/doc/latticra/README.md
```

Forbidden payload surfaces remain:

```
/usr/bin/latticra
/etc/latticra
/usr/lib/systemd/system/latticra.service
/usr/lib/modules
/boot/latticra
```

Required validation transcript evidence

```
install_command_recorded=1
install_result_recorded=1
rpm_query_after_install_recorded=1
installed_payload_listing_recorded=1
installed_readme_present=1
rpm_verify_completed=1
removal_command_recorded=1
removal_result_recorded=1
post_removal_query_recorded=1
post_removal_absence_verified=1
```

Required emitted validation report

The transcript must include the deterministic report emitted by the validation lane:

```
FEDORA DISPOSABLE VM LOCAL RPM VALIDATION LANE
validation_status=ok
package_name=latticra
package_version_recorded=1
disposable_vm_target_verified=1
snapshot_evidence_present=1
recovery_evidence_present=1
operator_consent_recorded=1
rpm_payload_listing_recorded=1
rpm_payload_is_documentation_only=1
unexpected_runtime_surface_absent=1
vm_rpmdb_mutated=1
vm_filesystem_mutated=1
install_validation_performed=1
removal_validation_performed=1
post_removal_absence_verified=1
live_host_validation_completed=1
host_install_ready=1
production_installer_ready=0
fedora_distribution_ready=0
fedora_approval_claimed=0
evidence_level=9
```

Required artifact references

A reviewed transcript should reference or embed:

```
fedora-os-release.txt
fedora-kernel-version.txt
rpm-version.txt
rpmbuild-version.txt
rpm-package-metadata.txt
rpm-payload.list
rpm-installed-payload.list
vm-validation.report
post-removal-absence-proof.txt
```

Required review sections

```
TARGET REVIEW
RUNNER GATE REVIEW
PACKAGE REVIEW
INSTALL VALIDATION REVIEW
REMOVAL VALIDATION REVIEW
POST-REMOVAL ABSENCE REVIEW
BOUNDARY REVIEW
OPERATOR SIGNOFF
NEXT ACTION REVIEW
```

Transcript decision states

```
disposable_vm_validation_transcript_status=accepted-for-review
disposable_vm_validation_transcript_status=blocked
disposable_vm_validation_transcript_status=invalid
```

accepted-for-review means the transcript is complete enough for review.

It does not mean Latticra is production ready, Fedora approved, Fedora distribution ready, or daily-driver safe.

Current project state until real evidence exists

Until the real disposable VM run is performed and reviewed, the project remains at:

```
disposable_vm_validation_transcript_present=0
disposable_vm_validation_completed=0
live_host_validation_completed=0
host_install_ready=0
production_installer_ready=0
fedora_distribution_ready=0
fedora_approval_claimed=0
```

Validation

```
sh scripts/test-fedora-disposable-vm-local-rpm-validation-transcript-contract.sh
```

Expected output:

```
fedora_disposable_vm_local_rpm_validation_transcript_contract: ok
```

Next recommended Fedora lane

```
Capture real disposable Fedora VM local RPM validation transcript evidence
```

That lane should run the already-gated validation runner only inside a disposable Fedora VM target with clean snapshot evidence, recovery evidence, and explicit operator consent.

README overhaul hold

The root README should not claim install readiness until real validation evidence exists for:

```
disposable_vm_validation_transcript_present=1
disposable_vm_validation_completed=1
live_host_validation_completed=1
host_install_ready=1
```

Non-claims

This contract is not a completed validation transcript.

It is not production readiness, Fedora approval, Fedora distribution readiness, daily-driver safety, or a production installer claim.

docs/FEDORA_HOST_INSTALL_PREFLIGHT_CLASSIFIER.md

Source title: Fedora Host Install Preflight Classifier

Lines: 179 | Words: 520 | SHA-256: 9da940d4db2cdc2931b17d1711c2f216856fb505e375d4b7e59d91a5c204194a

Fedora Host Install Preflight Classifier

Status: implementation record Scope: no-effect Fedora host install preflight classification before any host install lane performs mutation. Evidence level: 1

Purpose

The Fedora host install preflight classifier determines whether a captured Fedora host snapshot is eligible to be considered for a separate local RPM install lane.

The classifier is intentionally conservative. It converts host facts into a deterministic report, but it does not inspect the live host itself and does not install Latticra.

This slice exists because the Fedora install verification path is moving toward installed-state proof, while the current package posture remains local-only and guarded by non-claims.

Effect boundary

This classifier is no-effect.

It does not:

```
install the RPM
run dnf
run rpm
run rpmbuild
run rpmlint
read /etc/os-release
write files
open the network
mutate the host
start services
create boot entries
load kernel modules
change SELinux policy
claim runtime readiness
```

The classifier only consumes an already-captured snapshot and returns labels.

Snapshot fields

The caller provides facts such as:

```
os_id
os_id_like
host_install_requested
immutable_host
rpm_available
dnf_available
rpmbuild_available
rpmlint_available
local_rpm_present
root_or_sudo_available
network_required
package_is_doc_only
command_entrypoint_expected
```

rpm_available, dnf_available, local_rpm_present, and root_or_sudo_available are required before a mutable Fedora host can become a host-install candidate.

rpmbuild_available and rpmlint_available are reported, but they are not required for the host-install candidate classification because build and lint validation belong to earlier Fedora lanes.

Classifications

The public classifier labels are:

```
LATTICRA_FEDORA_PREFLIGHT_REPORT_ONLY
LATTICRA_FEDORA_PREFLIGHT_READY_LOCAL_RPM
LATTICRA_FEDORA_PREFLIGHT_BLOCKED
LATTICRA_FEDORA_PREFLIGHT_FUTURE_GATED
LATTICRA_FEDORA_PREFLIGHT_INVALID
```

ready-local-rpm means the snapshot is eligible to be considered by a later local RPM install lane. It does not mean this classifier performed installation.

future-gated is used for immutable Fedora-style hosts where rpm-ostree or image-based handling must be designed separately.

blocked is used for non-Fedora hosts, network-requiring paths, missing required tooling, missing local RPMs, missing operator privilege, or premature runtime command expectations.

Denial classes

The public denial labels are:

```
host-install-not-requested
non-fedora-host
immutable-host
network-required
required-tooling-missing
local-rpm-missing
privilege-missing
runtime-entrypoint-not-present
```

```
invalid-snapshot
```

These labels are intended to make failed preflight reports auditable without adding host mutation.

Deterministic report surface

The report begins with:

```
FEDORA HOST INSTALL PREFLIGHT
```

Required report fields include:

```
classification=ready-local-rpm
denial=none
host_classification=mutable-fedora-host
install_lane=local-doc-rpm
preflight_passed=1
host_install_candidate=1
host_install_performed=0
host_mutation_performed=0
network_allowed=0
local_only=1
fedora_host=1
mutable_fedora_host=1
immutable_host=0
rpm_available=1
dnf_available=1
local_rpm_present=1
no_effect=1
evidence_level=1
```

The no-effect fields are deliberate. A passing preflight report still records:

```
host_install_performed=0
host_mutation_performed=0
network_allowed=0
```

Current package boundary

For the current documentation-only package posture, a valid host preflight may classify a local doc RPM as a candidate. It must block any expectation that /usr/bin/latticra, a service, a kernel module, a boot entry, or an active runtime surface already exists.

If package_is_doc_only=1 and command_entrypoint_expected=1, the classifier reports:

```
classification=blocked
denial=runtime-entrypoint-not-present
install_lane=blocked-doc-only-package-runtime-command
```

Validation

This implementation is guarded by:

```
sh scripts/test-fedora-host-install-preflight.sh
```

Expected output:

```
fedora_host_install_preflight: ok
```

The documentation guard is:

```
sh scripts/test-fedora-host-install-preflight-docs.sh
```

Expected output:

```
fedora_host_install_preflight_docs: ok
```

Non-claims

This classifier does not install Latticra, does not prove Fedora package approval, does not create RPM artifacts, does not submit to Fedora, does not claim Fedora endorsement, does not provide a production installer, and does not prove operating-system readiness.

docs/FEDORA_INSTALL_PREFLIGHT_SNAPSHOT_CAPTURE_IMPLEMENTATION.md

Source title: Fedora Install Preflight Snapshot Capture Implementation

Lines: 150 | Words: 386 | SHA-256: b224b64c7af104dc98b1657bbfc45dbe0438f69724527e46cd28c0f82d38a474

Fedora Install Preflight Snapshot Capture Implementation

Status: implementation record Scope: pure no-effect snapshot capture that feeds the Fedora host install preflight classifier. Evidence level: 2

Purpose

This implementation moves the Fedora install preflight snapshot lane beyond planning while preserving the host safety boundary.

It adds a pure C capture API that consumes caller-supplied read-only facts, parses bounded /etc/os-release text already provided by the caller, constructs a latticra_fedora_host_install_preflight_snapshot_t, and forwards that snapshot into the existing Fedora host install preflight classifier.

The implementation mutates repository code only. It does not mutate the host.

Public API

Primary header:

```
include/latticra/fedora_install_preflight_snapshot.h
```

Primary source:

```
src/fedora_install_preflight_snapshot.c
```

The main entry points are:

```
latticra_fedora_install_preflight_snapshot_capture
latticra_fedora_install_preflight_snapshot_report
latticra_fedora_snapshot_capture_status_label
```

Capture input

The caller supplies a bounded input structure with fields such as:

```
os_release_text
os_release_text_len
os_release_readable
host_install_requested
ostree_booted_marker_present
rpm_command_present
dnf_command_present
rpmbuild_command_present
rpmlint_command_present
local_rpm_path
local_rpm_path_len
local_rpm_readable
running_as_root
operator_privilege_assertion
network_required
package_is_doc_only
command_entrypoint_expected
```

The implementation does not read live files or probe live commands. It only consumes these supplied facts.

What changed

The implementation adds:

```
bounded os-release ID parsing
bounded os-release ID_LIKE parsing
local RPM path recording
```

```
immutable Fedora marker propagation
RPM tooling presence propagation
conservative root/operator privilege propagation
network-required propagation
current doc-only package posture propagation
classifier forwarding
snapshot capture report generation
```

Report surface

The capture report begins with:

```
FEDORA INSTALL PREFLIGHT SNAPSHOT CAPTURE
```

Required report fields include:

```
snapshot_capture_status=captured
os_id=fedora
os_id_like=rhel fedora
classifier_classification=ready-local-rpm
classifier_denial=none
snapshot_forwarded_to_classifier=1
os_release_read_allowed=1
command_probe_allowed=1
local_rpm_probe_allowed=1
sudo_validation_allowed=0
install_command_allowed=0
package_build_allowed=0
network_allowed=0
host_mutation_performed=0
host_install_performed=0
no_effect=1
evidence_level=2
```

Failure behavior

The capture path fails closed.

Unreadable or missing os-release text produces a partial capture and forwards an empty host identity into the classifier. The classifier then blocks the host as non-Fedora instead of assuming eligibility.

Network-required lanes remain blocked by the classifier.

Doc-only package posture blocks runtime-command expectations.

Immutable Fedora markers are forwarded as future-gated install lanes.

Validation

This implementation is guarded by:

```
sh scripts/test-fedora-install-preflight-snapshot-capture.sh
```

Expected output:

```
fedora_install_preflight_snapshot_capture: ok
```

The implementation document guard is:

```
sh scripts/test-fedora-install-preflight-snapshot-capture-docs.sh
```

Expected output:

```
fedora_install_preflight_snapshot_capture_docs: ok
```

Non-claims

This implementation does not install Latticra, perform host mutation, open the network, validate sudo, create package artifacts, perform package build behavior, perform package install behavior, start services, change boot entries, load kernel modules, claim Fedora package approval, or claim production installer readiness.

docs/FEDORA_INSTALL_PREFLIGHT_SNAPSHOT_CAPTURE_PLAN.md

Source title: Fedora Install Preflight Snapshot Capture Plan

Lines: 203 | Words: 907 | SHA-256: 6d132299982ada6ef5ae720709c3086058c81b32f4d4018fcd55403f46d0a5c2

Fedora Install Preflight Snapshot Capture Plan

Status: planning record Scope: define how a future caller may capture read-only host facts before invoking the Fedora host install preflight classifier.

Purpose

The Fedora host install preflight classifier now accepts a caller-supplied snapshot and classifies whether a host may be considered for a later local RPM install lane.

This plan defines how that snapshot should be collected without turning preflight into installation.

The goal is to keep the capture lane conservative, deterministic, bounded, and auditable before any implementation reads host files or probes commands.

Capture boundary

Snapshot capture is read-only.

It may collect facts needed by the classifier, but it must not install, remove, update, enable, start, stop, or configure anything.

The capture lane must not run:

```
dnf install
dnf remove
dnf upgrade
dnf update
rpm -i
rpm -U
rpm -e
rpmbuild
rpmlint
systemctl enable
systemctl start
grubby
bootctl
restorecon
semodule
modprobe
```

It must also not open the network, create package artifacts, write host files, change privilege state, or validate sudo by refreshing credentials.

Snapshot source map

A future capture implementation may fill the classifier snapshot from these read-only facts:

```
| Snapshot field | Allowed source | Rule |
| --- | --- | --- |
| `os_id` | `/etc/os-release` `ID=` | Read bounded text only. |
| `os_id_like` | `/etc/os-release` `ID_LIKE=` | Read bounded text only. |
| `host_install_requested` | explicit caller/operator request | Must default to false. |
| `immutable_host` | `/run/ostree-booted` existence or `rpm-ostree` marker | Detect only; do not
 run `rpm-ostree install`. |
| `rpm_available` | `command -v rpm` | Probe command presence only. |
| `dnf_available` | `command -v dnf` | Probe command presence only. |
| `rpmbuild_available` | `command -v rpmbuild` | Probe command presence only. |
| `rpmlint_available` | `command -v rpmlint` | Probe command presence only. |
| `local_rpm_present` | explicit local RPM path | Check existence/readability only. |
| `root_or_sudo_available` | `id -u` equals `0` or explicit operator assertion | Do not run
```

`sudo -v`. |

| `network_required` | caller-supplied lane setting | Must default to false for local-only preflight. |

| `package_is_doc_only` | package metadata from the current Fedora package lane | Current default remains true. |

| `command_entrypoint_expected` | caller expectation | Must default to false while the package is doc-only. |

Read-only command allowance

The first capture implementation may use read-only probes such as:

```
command -v rpm
command -v dnf
command -v rpmbuild
command -v rpmlint
id -u
test -r /etc/os-release
test -e /run/ostree-booted
test -r &quot;$LOCAL_RPM&quot;
```

Those commands may classify the host, but they must not install or mutate.

Privilege rule

Privilege capture must be conservative.

Allowed:

```
record root_or_sudo_available=1 when id -u is 0
record root_or_sudo_available=0 when id -u is not 0 and no explicit operator-supplied privilege
fact is provided
```

Not allowed in the first capture lane:

```
sudo -v
sudo -n true
sudo dnf install
sudo rpm -i
```

The reason is simple: preflight capture should not refresh credentials, change sudo timestamp state, or perform a privileged dry run.

Immutable Fedora rule

If /run/ostree-booted exists or the caller identifies the host as rpm-ostree/image-based, capture should set:

```
immutable_host=1
```

The classifier should then return a future-gated lane rather than treating the host like a mutable Fedora RPM target.

Immutable Fedora work must remain separate because rpm-ostree/image-based systems need their own design, rollback, and safety model.

Local RPM rule

The local RPM fact must come from an explicit path chosen by the caller.

The capture lane may check that the file exists and is readable. It must not install it, query remote repositories, or build a replacement artifact.

If no explicit local RPM path is provided, capture should set:

```
local_rpm_present=0
```

Current package posture rule

The current Fedora package path remains documentation/package-shape oriented.

Until the package installs a stable runtime command, capture should set:

```
package_is_doc_only=1
```

```
command_entrypoint_expected=0
```

If a caller expects a command while the package remains doc-only, the classifier must block with:

```
denial=runtime-entrypoint-not-present
```

Future report fields

A later implementation may emit a capture report with fields such as:

```
FEDORA INSTALL PREFLIGHT SNAPSHOT CAPTURE
snapshot_capture_status=planned
os_release_read_allowed=1
command_probe_allowed=1
local_rpm_probe_allowed=1
sudo_validation_allowed=0
install_command_allowed=0
package_build_allowed=0
network_allowed=0
host_mutation_performed=0
host_install_performed=0
snapshot_forwarded_to_classifier=1
```

Failure behavior

Capture should fail closed.

If /etc/os-release is unreadable, command probes are unavailable, the local RPM path is missing, or the caller requests a network-dependent path, the capture lane should still produce a deterministic snapshot and allow the classifier to return a blocked or report-only result.

Failure to capture facts must not trigger installation, package building, network fallback, or privileged fallback.

Implementation sequence

Recommended order:

```
1. Add a small snapshot-capture contract/API.
2. Add bounded os-release parsing for ID and ID_LIKE.
3. Add command-presence probes for rpm, dnf, rpmbuild, and rpmlint.
4. Add explicit local RPM path probing.
5. Add immutable-host marker probing.
6. Add deterministic capture report fields.
7. Forward the captured snapshot into the existing classifier.
8. Add tests for mutable Fedora, immutable Fedora, non-Fedora, missing local RPM, and missing
tooling paths.
```

Validation

This planning slice is guarded by:

```
sh scripts/test-fedora-install-preflight-snapshot-capture-plan.sh
```

Expected output:

```
fedora_install_preflight_snapshot_capture_plan: ok
```

Non-claims

This plan does not implement snapshot capture.

It does not install Latticra, run dnf, run mutating rpm commands, run rpmbuild, run rpmlint, create RPM artifacts, validate sudo, mutate the host, open the network, claim Fedora package approval, or claim production installer readiness.

docs/FEDORA_INSTALL_VERIFICATION_PLAN.md

Source title: Fedora Install Verification Plan

Lines: 156 | Words: 604 | SHA-256: a24016a705f7fb7cb61e9b78dc6d665c750194d9c50c2849c4891a7f735580a5

Fedora Install Verification Plan

Status: planning record Scope: define how Latticra integrates with Fedora Linux through the local RPM path and how installed-state checks will prove the result.

Purpose

Latticra should integrate with Fedora as Fedora currently expects software to integrate: through RPM-shaped packaging, installed-file ownership, package queryability, package verification, and isolated Fedora validation lanes.

This plan keeps that integration conservative.

The current package path is local-only. It is not a Fedora submission, not a Fedora package approval request, not a Fedora spin/remix, and not an operating-system replacement claim.

Current repository state

The current local Fedora spec is a documentation-only package draft.

It installs:

```
%doc %{_docdir}/%{name}/README.md
```

It does not currently install:

```
/usr/bin/latticra
/usr/libexec/latticra/*
/etc/latticra/*
/usr/lib/systemd/system/*.service
kernel modules
bootloader entries
SELinux policy
active runtime services
```

That means the first valid installed-state proof is a doc/package-shape proof, not a runnable product proof.

Fedora integration model

Latticra should advance through these Fedora-facing stages:

```
1. Local RPM spec remains explicit and local-only.
2. Source archive policy is defined.
3. Source RPM dry-run is introduced.
4. Binary RPM build lane is introduced inside Fedora.
5. Fresh Fedora install smoke lane installs the RPM.
6. Installed package checks prove file ownership and verification.
7. CLI/runtime smoke checks are added only after a real entrypoint exists.
8. COPR, Koji, or Fedora submission paths remain future work and require separate approval
gates.
```

Installed-state checks

Once a local binary RPM exists, the install lane should run checks like:

```
rpm -q latticra
rpm -ql latticra
rpm -V latticra
test -r /usr/share/doc/latticra/README.md
```

For the current doc-only package, the install lane should also prove the absence of premature runtime surfaces:

```
test ! -e /usr/bin/latticra
test ! -d /etc/latticra
test ! -e /usr/lib/systemd/system/latticra.service
```

Those absence checks are intentional. They protect the project from accidentally claiming runtime behavior before it exists.

Future command checks

After Latticra exposes a real Fedora-installed command, the install lane may add command smoke checks such as:

```
command -v latticra
latticra --version
latticra check
```

Those checks must not be added until the package actually installs a stable command entrypoint.

Future install smoke lane outline

A future implementation lane may run inside a Fedora container and perform:

```
install build tools
create source archive
run rpmbuild
install generated RPM into a fresh Fedora environment
query package with rpm -q
list package files with rpm -ql
verify package files with rpm -V
probe expected documentation files
probe absence of premature runtime files
uninstall package
confirm package removal
```

Pass conditions

The first successful Fedora install-verification lane should prove:

```
package can be built locally
package can be installed locally
rpm database knows the package
installed files are owned by the package
rpm verification succeeds or has classified expected findings
README documentation is present
no runtime command is claimed before it exists
no service, kernel, boot, or policy surface is installed by accident
```

Boundary

This plan does not run rpmbuild.

It does not run mock.

It does not create RPM artifacts.

It does not install Latticra on the host.

It does not submit Latticra to Fedora.

It does not claim Fedora package approval, Fedora endorsement, Fedora spin/remix status, product readiness, operating-system readiness, runtime authority, kernel authority, boot authority, service authority, SELinux policy readiness, or security-hardening completion.

Next slice

Recommended next slice:

```
Add Fedora local binary RPM build plan
```

That future slice should define the temporary source archive and binary build rules without installing artifacts yet.

Validation

This plan is guarded by:

```
sh scripts/test-fedora-install-verification-plan.sh
```

Expected output:

```
fedora_install_verification_plan: ok
```

docs/FEDORA_LIVE_READONLY_SNAPSHOT_ADAPTER.md

Source title: Fedora Live Read-Only Snapshot Adapter

Lines: 128 | Words: 341 | SHA-256: f8aab33d4b2a2ae6bb926987dad6fb16289eb19732aab79f25fdd8fb5c82a0dc

Fedora Live Read-Only Snapshot Adapter

Status: implementation record Scope: live read-only host fact capture for Fedora install preflight. Evidence level: 3

Purpose

This implementation adds the first live host adapter for the Fedora install preflight path.

The adapter performs bounded read-only probes and forwards the collected facts into the existing Fedora install preflight snapshot capture API.

This is real implementation work, but it is not a host-install mutation lane.

Public API

Primary header:

```
include/latticra/fedora_live_snapshot_adapter.h
```

Primary source:

```
src/fedora_live_snapshot_adapter.c
```

The main entry points are:

```
latticra_fedora_live_snapshot_adapter_capture
latticra_fedora_live_snapshot_adapter_report
latticra_fedora_live_snapshot_adapter_status_label
```

Live read-only probes

The adapter may perform these bounded read-only actions:

```
read os-release text from the configured path
probe command presence through PATH
probe local RPM readability
probe immutable Fedora marker existence
record effective root status
```

The default os-release path is:

```
/etc/os-release
```

Tests use fixture paths and fake PATH commands so CI does not depend on the runner being Fedora.

Report surface

The report begins with:

```
FEDORA LIVE READ-ONLY SNAPSHOT ADAPTER
```

Required report fields include:

```
adapter_status=captured
live_probe_performed=1
os_release_read_attempted=1
command_probe_performed=1
local_rpm_probe_performed=1
ostree_marker_probe_performed=1
id_probe_performed=1
capture_status=captured
classifier_classification=ready-local-rpm
snapshot_forwarded_to_classifier=1
```

```
sudo_validation_allowed=0
install_command_allowed=0
package_build_allowed=0
network_allowed=0
host_mutation_performed=0
host_install_performed=0
no_effect=1
evidence_level=3
```

Failure behavior

The adapter fails closed.

If os-release text cannot be read, the adapter records a partial capture and forwards the snapshot to the classifier. The classifier blocks unknown or non-Fedora hosts instead of assuming eligibility.

If the local RPM path is missing or unreadable, the classifier blocks the install candidate.

If the host is immutable Fedora, the classifier future-gates the lane.

If a network-dependent path is requested, the classifier blocks it.

Validation

This implementation is guarded by:

```
sh scripts/test-fedora-live-snapshot-adapter.sh
```

Expected output:

```
fedora_live_snapshot_adapter: ok
```

The implementation document guard is:

```
sh scripts/test-fedora-live-snapshot-adapter-docs.sh
```

Expected output:

```
fedora_live_snapshot_adapter_docs: ok
```

Non-claims

This implementation does not install Latticra, mutate the host, validate sudo, create package artifacts, build packages, install packages, open the network, start services, change boot entries, load kernel modules, claim Fedora approval, or claim production installer readiness.

docs/FEDORA_LOCAL_BINARY_RPM_BUILD_PLAN.md

Source title: Fedora Local Binary RPM Build Plan

Lines: 174 | Words: 614 | SHA-256: d9ff167db0fce7613abc2f83c7091d18c1d1f0cb76bc64a04f29e5df08b54aa1

Fedora Local Binary RPM Build Plan

Status: planning record Scope: define the first local binary RPM build path for Latticra without producing artifacts in this slice.

Purpose

This plan advances Latticra from a local Fedora spec draft toward a local binary RPM build lane.

The goal is conservative: define exactly how a future Fedora lane will create a source archive, run a binary RPM build, and preserve audit evidence while keeping the package local-only.

This plan does not make Latticra a Fedora package. It does not submit Latticra to Fedora. It does not install Latticra on a host.

Current package shape

The current local spec remains a documentation-only draft.

Current install payload:

```
/usr/share/doc/latticra/README.md
```

No executable command, service, kernel module, boot entry, SELinux policy, or runtime configuration is installed at this stage.

Required build inputs

A future binary RPM build lane should define these inputs before it runs rpmbuild:

```
package name: latticra
version source: packaging/fedora/latticra.spec Version field
release source: packaging/fedora/latticra.spec Release field
source archive name: latticra-&lt;version&gt;.tar.gz
source archive root directory: latticra-&lt;version&gt;/
spec path: packaging/fedora/latticra.spec
build root: temporary CI workspace only
artifact retention: audit-only unless a later release gate permits publishing
```

Source archive plan

The local binary build lane should create a temporary source archive from the checked-out repository.

Required archive properties:

```
archive name matches Source0
archive root directory matches %autosetup -n %{name}-%{version}
archive excludes .git
archive excludes CI-only temporary output
archive includes README.md
archive includes scripts required by %build
archive includes docs needed by current package metadata
```

The archive should be created in a temporary RPM topdir, not committed to the repository.

Binary build command plan

A future implementation lane may run a Fedora-container command shaped like:

```
rpmbuild -bb packaging/fedora/latticra.spec \
  --define &quot;_topdir ${PWD}/.rpmwork&quot; \
  --define &quot;_sourcedir ${PWD}/.rpmwork/SOURCES&quot; \
  --define &quot;_rpmdir ${PWD}/.rpmwork/RPMS&quot; \
  --define &quot;_builddir ${PWD}/.rpmwork/BUILD&quot; \
  --define &quot;_buildrootdir ${PWD}/.rpmwork/BUILDROOT&quot;
```

The first build lane should run only inside Fedora CI or an explicitly disposable Fedora environment.

Expected local output

A successful future binary build lane should produce a local RPM under a temporary path like:

```
.rpmwork/RPMS/*/latticra-*.rpm
```

The lane should record:

```
rpmbuild exit status
RPM path
RPM filename
RPM package metadata summary
RPM payload file list
RPM verification plan handoff
```

Post-build checks before install

Before any install smoke lane, the future binary build lane should inspect the generated RPM without installing it:

```
rpm -qpi .rpmwork/RPMS/*/latticra-*.rpm
rpm -qpl .rpmwork/RPMS/*/latticra-*.rpm
```

Expected payload at the current stage:

```
/usr/share/doc/latticra/README.md
```

Unexpected payload at the current stage:

```
/usr/bin/latticra
/etc/latticra
/usr/lib/systemd/system/latticra.service
kernel modules
bootloader files
SELinux policy files
```

Relationship to install verification

This plan comes before the install-verification lane.

The correct order is:

1. binary RPM build plan
2. temporary source archive lane
3. local binary RPM build lane
4. RPM payload inspection lane
5. fresh Fedora install smoke lane
6. command/runtime smoke checks only after a stable entrypoint exists

Boundary

This plan does not run rpmbuild.

It does not run mock.

It does not create source archives.

It does not create binary RPM artifacts.

It does not install Latticra.

It does not publish package artifacts.

It does not submit Latticra to Fedora.

It does not claim Fedora package approval, Fedora endorsement, Fedora spin/remix status, product readiness, operating-system readiness, runtime authority, kernel authority, boot authority, service authority, SELinux policy readiness, or security-hardening completion.

Next slice

Recommended next slice:

```
Add Fedora source archive fixture lane
```

That future slice should create and inspect the temporary source archive only, without running the binary RPM build yet.

Validation

This plan is guarded by:

```
sh scripts/test-fedora-local-binary-rpm-build-plan.sh
```

Expected output:

```
fedora_local_binary_rpm_build_plan: ok
```

docs/FEDORA_LOCAL_RPM_EXECUTION_LANE.md

Source title: Fedora Installroot RPM Mutation Lane

Lines: 166 | Words: 564 | SHA-256: 14d68a34ddd9ce8325604811342030d82bd7e9fda99bfe3dbd10fc7c4006058e

Fedora Installroot RPM Mutation Lane

Status: active execution lane Scope: tightly gated local RPM install/remove mutation inside a temporary RPM installroot in disposable Fedora CI. Evidence level: 6

Purpose

This lane is the first intentionally mutating Fedora RPM lane for Latticra.

It builds the local-only Latticra RPM, initializes a temporary RPM database under a temporary installroot, installs the package into that installroot, verifies installed package state, removes it from that installroot, and verifies post-removal absence.

This is the first lane where Latticra intentionally records:

```
install_mutation_performed=1
removal_mutation_performed=1
installroot_filesystem_mutated=1
installroot_rpmdb_mutated=1
```

The mutation is restricted to a temporary installroot created inside a throwaway Fedora CI container.

The live Fedora CI container RPM database remains untouched by the Latticra package execution itself.

Hard gate

The execution script refuses to run unless all of the following are true:

```
LATTICRA_ALLOW_INSTALLROOT_RPM_MUTATION=1
ID=fedora
GITHUB_ACTIONS=true
rpmbuild_present=1
rpm_present=1
```

If any condition is absent, the lane exits before installing or removing the package.

What mutates

The lane mutates only the temporary installroot:

```
installroot_rpm_database=mutated
installroot:/usr/share/doc/latticra/README.md=installed_then_removed
```

The report explicitly records:

```
live_container_rpmdb_mutated=0
developer_host_mutation_performed=0
```

It does not mutate a developer workstation, laptop, VM host, boot entry, kernel module set, service registry, SELinux policy, network configuration, firmware state, or the live Fedora container RPM database with the Latticra package.

Execution sequence

The guard performs this sequence:

1. Verify the disposable Fedora CI installroot mutation gate.
2. Build a temporary Source0 archive from the checked-out tree.
3. Run rpmbuild -bb against packaging/fedora/latticra.spec.
4. Locate the produced local latticra RPM.
5. Inspect package metadata and payload.
6. Initialize a temporary installroot RPM database.
7. Install the local RPM into the installroot with rpm --root.
8. Query installed installroot package state with rpm --root.

9. Verify installroot package files with rpm --root.
10. Confirm README payload exists under the installroot.
11. Confirm premature runtime surfaces are absent from the package payload.
12. Remove the package from the installroot with rpm --root.
13. Confirm rpm --root -q latticra fails after removal.
14. Confirm README payload is absent from the installroot after removal.
15. Emit a deterministic execution report.

Required report fields

The lane emits:

```
FEDORA INSTALLROOT RPM MUTATION LANE
execution_status=ok
install_mutation_allowed=1
install_mutation_performed=1
removal_mutation_allowed=1
removal_mutation_performed=1
installroot_filesystem_mutated=1
installroot_rpmdb_mutated=1
live_container_rpmdb_mutated=0
developer_host_mutation_performed=0
boot_operation_performed=0
kernel_operation_performed=0
service_operation_performed=0
policy_operation_performed=0
network_allowed_during_rpm_execution=0
post_removal_absence_verified=1
rollback_planned=1
partial_failure_report_required=1
evidence_level=6
```

Package truth preserved

The current RPM remains a documentation-only local package.

Expected installed payload:

```
/usr/share/doc/latticra/README.md
```

The lane rejects premature runtime surfaces such as:

```
/usr/bin/latticra
/etc/latticra
/usr/lib/systemd/system/latticra.service
/usr/lib/modules
/boot/latticra
```

Relationship to previous gates

This lane follows the Fedora RPM gate classifier and the Fedora RPM removal rollback classifier.

The RPM gate proves install posture.

The removal rollback classifier proves removal/rollback posture.

This execution lane is where the disposable installroot actually mutates.

Validation

Execution guard:

```
LATTICRA_ALLOW_INSTALLROOT_RPM_MUTATION=1 sh
scripts/test-fedora-installroot-rpm-mutation-lane.sh
```

Expected output:

```
fedora_installroot_rpm_mutation_lane: ok
```

Docs guard:

```
sh scripts/test-fedora-installroot-rpm-mutation-lane-docs.sh
```

Expected output:

```
fedora_installroot_rpm_mutation_lane_docs: ok
```

Non-claims

This lane does not install Latticra on a developer host, daily-driver Fedora system, immutable Fedora host, VM host, production host, live Fedora container RPM database, or user workstation.

It does not publish artifacts, submit to Fedora, claim Fedora approval, claim production installer readiness, validate sudo on a user host, start services, change boot entries, load kernel modules, modify SELinux policy, open runtime network access, or assert that Latticra is ready as a system installer.

docs/FEDORA_LOCAL_RPM_INSTALL_MUTATION_GATE_CONTRACT.md

Source title: Fedora Local RPM Install Mutation Gate Contract

Lines: 163 | Words: 503 | SHA-256: f27dde81d6f05d827a0f604c799d7e70822c990d4aab4a67c7f333e4a78090bc

Fedora Local RPM Install Mutation Gate Contract

Status: contract record Scope: define the hard gate before any Fedora local RPM install mutation can be represented or implemented. Evidence level: 4 target, contract only

Purpose

Latticra now has a Fedora host install preflight classifier, a no-effect snapshot capture path, and a live read-only adapter.

This contract defines the next boundary: when a future Fedora local RPM install mutation may be considered.

This is intentionally not an installer implementation.

The purpose is to prevent accidental host mutation by requiring every install precondition to be explicit, reported, and testable before any code is allowed to execute a package install action.

Required gate inputs

A future install mutation gate must consume an explicit record containing at least:

```
fedora_host
mutable_fedora_host
immutable_host
local_rpm_present
local_rpm_path
root_or_sudo_available
network_required
operator_install_confirmation
dry_run_passed
rollback_or_remove_plan_present
preflight_classification
preflight_denial
snapshot_capture_status
live_probe_performed
```

The gate must fail closed when any required field is missing, false, unknown, or contradictory.

Required allow conditions

A future local RPM install mutation may only be represented as allowed when all conditions are true:

```
fedora_host=1
mutable_fedora_host=1
immutable_host=0
local_rpm_present=1
root_or_sudo_available=1
network_required=0
```

```
operator_install_confirmation=1
dry_run_passed=1
rollback_or_remove_plan_present=1
preflight_classification=ready-local-rpm
preflight_denial=none
live_probe_performed=1
```

Every other combination must deny the install mutation.

Required denial reasons

The gate must report deterministic denial reasons such as:

```
not-fedora-host
immutable-fedora-host
local-rpm-missing
privilege-missing
network-required
operator-confirmation-missing
dry-run-missing
rollback-plan-missing
preflight-not-ready
preflight-denied
live-probe-missing
invalid-gate-input
```

Mutation status fields

The first gate implementation must remain a classifier. It must not execute install commands.

It should report fields such as:

```
FEDORA LOCAL RPM INSTALL MUTATION GATE
install_gate_status=allowed
install_mutation_allowed=1
install_mutation_performed=0
host_mutation_performed=0
network_allowed=0
operator_install_confirmation=1
dry_run_passed=1
rollback_or_remove_plan_present=1
evidence_level=4
```

For denied cases, it should report:

```
install_gate_status=denied
install_mutation_allowed=0
install_mutation_performed=0
host_mutation_performed=0
```

Command boundary

This contract does not authorize any command execution.

The first implementation after this contract should be a pure gate classifier. It must not run package installation commands, privilege commands, package build commands, network commands, service commands, boot commands, or kernel module commands.

Future install execution boundary

A later execution lane may be considered only after the mutation gate classifier exists and passes focused tests.

That later lane must use a separate contract and should require:

```
explicit operator invocation
local RPM path
preflight report
live read-only adapter report
mutation gate report
rollback/removal plan
post-install verification plan
clear command transcript boundary
```

Removal and rollback requirement

No install execution lane should be added until Latticra has a documented removal or rollback path.

At minimum, the future removal plan should define:

```
how the installed package is identified
how package ownership is verified
how uninstall is requested
how post-removal absence is verified
how failure is reported without hiding partial state
```

Validation

This contract is guarded by:

```
sh scripts/test-fedora-local-rpm-install-mutation-gate-contract.sh
```

Expected output:

```
fedora_local_rpm_install_mutation_gate_contract: ok
```

Non-claims

This contract does not implement installation.

It does not install Latticra, mutate the host, validate sudo, run package tools, build packages, open the network, start services, change boot entries, load kernel modules, claim Fedora approval, or claim production installer readiness.

docs/FEDORA_LOCAL_RPM_REMOVAL_ROLLBACK_PLAN.md

Source title: Fedora Local RPM Removal and Rollback Plan

Lines: 197 | Words: 657 | SHA-256: c0cbcf31af2ee69edd8d3d781245583347a79a7b54011fc02b9475116028b2e8

Fedora Local RPM Removal and Rollback Plan

Status: planning record Scope: define removal, rollback, and post-removal verification requirements before any Fedora local RPM execution lane is added.

Purpose

The Fedora RPM gate classifier can now report whether a future local RPM gate is allowed or denied.

Before any host-changing execution lane exists, Latticra needs a removal and rollback plan.

This plan defines how a future lane must identify an installed local RPM package, verify ownership, request removal, verify absence, and report partial failure without hiding host state.

This is planning only. It does not remove or install anything.

Removal boundary

A future removal lane must be explicit and operator-directed.

It must never infer that host changes are safe merely because a package name exists.

The removal lane must require:

```
operator_removal_confirmation=1
package_name=latticra
package_query_ready=1
installed_package_detected=1
owned_file_list_available=1
post_removal_absence_check_planned=1
```

```
failure_report_planned=1
```

If any field is missing, false, unknown, or contradictory, the removal lane must deny execution.

Package identification

A future implementation must identify the package using a bounded package identity record:

```
package_name
package_epoch
package_version
package_release
package_arch
package_origin=local-rpm
```

The package name must be exact. Partial matching, fuzzy matching, glob matching, or substring matching must not be used for removal decisions.

Ownership verification

Before removal can be allowed, a future lane must prove the package owns the expected files.

For the current documentation-oriented package posture, expected evidence includes:

```
package_query_ready=1
owned_file_list_available=1
readme_owned_by_package=1
unexpected_runtime_surface_absent=1
```

The future lane must not assume ownership from file existence alone.

Current package posture

The current Fedora package path remains documentation/package-shape oriented.

A future removal plan should expect documentation ownership evidence first, not runtime service ownership.

The following runtime surfaces should still be absent unless a later package posture intentionally changes them:

```
/usr/bin/latticra
/etc/latticra
systemd service surface
kernel module surface
boot entry surface
SELinux policy surface
```

Removal request boundary

A future implementation may only request removal after the explicit removal gate allows it.

The removal request must be local-only and must not open the network, build packages, alter boot entries, start or stop services, load kernel modules, or change policy.

The removal action, when eventually implemented, must produce a transcript boundary and deterministic report fields before and after the request.

Post-removal verification

A future removal lane must check and report:

```
package_absent_after_removal
owned_files_absent_or_reclassified
readme_absent_or_no_longer_owned
runtime_surface_absent
service_surface_absent
kernel_surface_absent
boot_surface_absent
policy_surface_absent
```

If post-removal verification fails, the lane must report partial state explicitly.

Partial failure reporting

A future implementation must not hide partial failures.

Required partial-failure labels include:

```
removal-request-failed
package-still-installed
owned-files-remain
ownership-query-failed
absence-check-failed
unknown-host-state
operator-aborted
```

Rollback meaning

For the local RPM lane, rollback means returning to a clearly reported host state after a failed install or removal attempt.

At this stage, rollback does not mean automatic system recovery, rpm-ostree rollback, boot rollback, filesystem snapshot rollback, service restart, or kernel recovery.

Those require separate contracts.

Future report fields

A future removal/rollback classifier may report fields such as:

```
FEDORA LOCAL RPM REMOVAL ROLLBACK PLAN
removal_plan_status=planned
operator_removal_confirmation_required=1
package_identity_required=1
ownership_verification_required=1
post_removal_absence_required=1
partial_failure_report_required=1
network_allowed=0
package_build_allowed=0
service_operation_allowed=0
boot_operation_allowed=0
kernel_operation_allowed=0
policy_operation_allowed=0
host_mutation_performed=0
```

Relationship to the RPM gate classifier

The RPM gate classifier can report that the future local RPM gate is allowed.

That is not enough to execute host changes.

Before execution, the project must also have:

```
removal_or_rollback_plan_present=1
post_install_verification_plan_present=1
operator_execution_confirmation=1
clear command transcript boundary
```

Implementation sequence

Recommended order:

```
1. Add this removal and rollback plan.
2. Add a removal/rollback classifier contract.
3. Add a pure removal/rollback classifier implementation.
4. Add a post-install verification contract.
5. Add a command transcript contract.
6. Only then consider a tightly gated local RPM execution lane.
```

Validation

This plan is guarded by:

```
sh scripts/test-fedora-local-rpm-removal-rollback-plan.sh
```

Expected output:

```
fedora_local_rpm_removal_rollback_plan: ok
```

Non-claims

This plan does not implement removal, rollback, installation, host mutation, package execution, privilege validation, package build behavior, network use, service operation, boot operation, kernel module operation, Fedora approval, or production installer readiness.

docs/FEDORA_LOCAL_RPM_SPEC_DRAFT_PLAN.md

Source title: Fedora Local RPM Spec Draft Plan

Lines: 149 | Words: 370 | SHA-256: 32fb8382fbe40a383a9748f8448e17d612adf4287e2a8c05d95e12d23dfd1d1c

Fedora Local RPM Spec Draft Plan

Status: planning record Scope: local-only RPM spec draft preparation before adding a spec file.

Purpose

This plan defines what must be true before Latticra adds a local RPM spec draft.

The goal is to prepare carefully without creating packaging metadata too early.

Current order:

```
Fedora readiness plan
Fedora build lane
Fedora developer workflow
Fedora package metadata plan
local RPM spec draft plan
local spec draft later
```

Current prerequisites

The following records should already exist:

```
docs/FEDORA_READINESS_PLAN.md
docs/FEDORA_DEVELOPER_WORKFLOW.md
docs/FEDORA_PACKAGE_METADATA_PLAN.md
scripts/test-fedora-build-lane.sh
```

Draft spec path

The eventual local draft path should be:

```
packaging/fedora/latticra.spec
```

Do not add that file in this planning slice.

Spec draft inputs

Before the spec draft exists, collect:

```
Name
Version
Release
Summary
License
URL
Source0
BuildRequires
Requires
%description
%prep
%build
%install
%files
```

```
%changelog
```

Initial package intent

The first local spec draft should target development and evidence tooling only.

It should not install or claim:

```
bootable system image
kernel replacement
runtime service
daemon
hardware authority
Fedora derivative
```

Build command posture

The first draft should prefer existing guard scripts instead of inventing a new build system.

Initial candidate build/check commands:

```
sh scripts/test-fedora-build-lane.sh
sh scripts/test-kernel-lifecycle-report-runner.sh
sh scripts/test-kernel-lifecycle-subsystem-summary-report-runner.sh
```

File installation posture

The first local spec draft should install only reviewed artifacts.

Candidate install groups:

```
license files
selected docs
optional report tools only after install path is reviewed
```

No install path is approved by this plan.

License gate

Do not write the spec License field until the license expression is reviewed.

Required checks:

```
root license state reviewed
file-level SPDX state reviewed
AGPL migration status reviewed
legacy Apache-2.0 paths reviewed
documentation license decision reviewed
```

Local-only boundary

The future spec draft should be local-only until lint and local build validation are added.

This plan does not submit, publish, or claim package readiness.

Next slice

Recommended next slice after this plan:

```
Add local RPM spec draft skeleton
```

That future slice may add packaging/fedora/latticra.spec only if it is explicitly marked local-only and guarded by a static spec check.

Validation

This plan is guarded by:

```
sh scripts/test-fedora-local-rpm-spec-draft-plan.sh
```

Expected output:

```
fedora_local_rpm_spec_draft_plan: ok
```

docs/FEDORA_LOCAL_RPM_STATIC_VALIDATION.md

Source title: Fedora Local RPM Static Validation

Lines: 68 | Words: 187 | SHA-256: 1fa9114762e2b8449595adb721d9868b1489dfeb029ce871d28f24bfb1f41df2

Fedora Local RPM Static Validation

Status: active static validation lane Scope: static checks for the local RPM spec skeleton.

Purpose

This lane turns the local validation plan into a first executable check.

It checks the current local spec skeleton without building packages, producing artifacts, running mock, or requiring rpmlint output.

Files

```
docs/FEDORA_LOCAL_RPM_STATIC_VALIDATION.md
packaging/fedora/README.md
scripts/test-fedora-local-rpm-static-validation.sh
.github/workflows/fedora-local-rpm-static-validation.yml
```

Checks

The static validation lane verifies:

```
spec skeleton guard passes
validation plan guard passes
local-only draft marker exists
local packaging README records non-claims
placeholder license remains explicit
local release marker remains explicit
required RPM sections exist
spec does not install binaries yet
spec does not define scriptlet sections yet
spec does not add service files yet
```

Boundary

This lane is static validation only.

It does not run rpmbuild, rpmlint, or mock.

It does not create package artifacts.

Next slice

Recommended next slice:

```
Add rpmlint availability lane
```

That future lane should only check tool availability and static lint readiness before any source or binary package build is attempted.

Validation

Run:

```
sh scripts/test-fedora-local-rpm-static-validation.sh
```

Expected output:

```
fedora_local_rpm_static_validation: ok
```

docs/FEDORA_LOCAL_RPM_VALIDATION_PLAN.md

Source title: Fedora Local RPM Validation Plan

Lines: 135 | Words: 355 | SHA-256: a35882bdd55dd0ba432b88804a4ad466aa351074924d425662b6fd27aaf698dd

Fedora Local RPM Validation Plan

Status: planning record Scope: local validation steps for the Latticra RPM draft skeleton.

Purpose

This plan defines the validation path before the local RPM skeleton is allowed to become a real build lane.

The goal is to make package validation repeatable while keeping the current RPM spec clearly local-only.

Current prerequisites

The following records and files should already exist:

```
docs/FEDORA_READINESS_PLAN.md
docs/FEDORA_PACKAGE_METADATA_PLAN.md
docs/FEDORA_LOCAL_RPM_SPEC_DRAFT_PLAN.md
packaging/fedora/latticra.spec
scripts/test-fedora-local-rpm-spec-skeleton.sh
```

Validation stages

Recommended validation order:

```
1. Static spec skeleton guard
2. Fedora container guard
3. rpmlint availability check
4. source archive policy check
5. source RPM dry-run plan
6. local mock build plan
7. installed file inspection plan
```

Static validation

The static guard should continue checking:

```
local-only draft marker
Name field
Version field
Release field
Summary field
License placeholder
URL field
Source0 placeholder
BuildRequires fields
required RPM sections
current guard commands
```

rpmlint plan

A later implementation lane may install and run:

```
rpmlint packaging/fedora/latticra.spec
```

This plan does not require rpmlint output yet.

Source RPM plan

A later implementation lane may create a temporary source archive and run a source RPM build dry run.

Required unresolved decisions before that lane:

```
version tag policy
source archive naming
```

```
license expression
license files
installed file list
```

Mock build plan

A later implementation lane may run a local mock build only after the source RPM lane is stable.

Mock validation should record:

```
mock config used
source RPM path
build result
logs location
known failures
```

Installed file inspection plan

After a local binary RPM exists, inspect:

```
installed docs
installed license files
installed binaries
file ownership
file permissions
uninstall behavior
```

Boundary

This is a validation plan only.

It does not run rpmbuild, rpmlint, or mock. It does not produce RPM artifacts.

Next slice

Recommended next slice after this plan:

```
Add local RPM static validation lane
```

That future slice should extend the current static spec skeleton guard without creating package artifacts.

Validation

This plan is guarded by:

```
sh scripts/test-fedora-local-rpm-validation-plan.sh
```

Expected output:

```
fedora_local_rpm_validation_plan: ok
```

docs/FEDORA_MANUAL_HOST_DRY_RUN_TRANSCRIPT_CONTRACT.md

Source title: Fedora Manual Host Dry-Run Transcript Contract

Lines: 158 | Words: 278 | SHA-256: a834468ac868d59756cb336867dc7ddf17c2b1c3c5c5e7d6fe9207768b69e5c5

Fedora Manual Host Dry-Run Transcript Contract

Status: contract record Evidence level: 8 target, contract only Scope: transcript schema for a future disposable Fedora VM validation review.

Purpose

Latticra has a manual Fedora RC checklist and a no-effect RC decision classifier.

This contract defines the transcript fields required before a future disposable Fedora VM validation record can be reviewed.

This is an evidence schema only.

It does not execute anything.

Required transcript header

```
LATTICRA FEDORA MANUAL HOST DRY-RUN TRANSCRIPT
transcript_kind=dry-run
transcript_version=1
operator_review_required=1
host_change_performed=0
```

Required target evidence

```
target_is_disposable_fedora_vm=1
target_is_daily_driver=0
target_is_production_host=0
target_is_immutable_fedora=0
target_has_clean_snapshot=1
target_has_recovery_path=1
operator_consent_recorded=1
```

Required package evidence

```
local_rpm_built_from_current_tree=1
rpm_name_is_latticra=1
rpm_version_recorded=1
rpm_payload_listing_recorded=1
rpm_payload_is_documentation_only=1
unexpected_runtime_surface_absent=1
```

Required prior evidence

```
installroot_lifecycle_evidence_present=1
post_removal_absence_evidence_present=1
host_preflight_ready_local_rpm=1
rpm_gate_allowed=1
removal_rollback_ready=1
manual_host_rc_decision_classifier_present=1
```

Required no-effect fields

```
manual_host_dry_run_transcript_present=1
live_host_validation_completed=0
host_change_performed=0
sudo_invoked=0
rpm_invoked=0
dnf_invoked=0
network_allowed=0
service_operation_allowed=0
boot_operation_allowed=0
kernel_operation_allowed=0
policy_operation_allowed=0
production_installer_ready=0
fedora_distribution_ready=0
fedora_approval_claimed=0
```

Required review sections

```
TARGET REVIEW
PACKAGE REVIEW
PRIOR EVIDENCE REVIEW
DRY-RUN DECISION REVIEW
NO-EFFECT BOUNDARY REVIEW
OPERATOR SIGNOFF PLACEHOLDER
NEXT ACTION REVIEW
```

Dry-run decision states

```
dry_run_transcript_status=accepted-for-review
dry_run_transcript_status=blocked
dry_run_transcript_status=invalid
```

accepted-for-review means the transcript is complete enough for review.

It does not mean live validation is complete.

Block conditions

```
daily_driver_detected=1
production_host_detected=1
immutable_fedora_detected=1
snapshot_missing=1
recovery_path_missing=1
operator_consent_missing=1
rpm_payload_listing_missing=1
rpm_payload_not_documentation_only=1
unexpected_runtime_surface_present=1
prior_installroot_evidence_missing=1
prior_removal_evidence_missing=1
prior_preflight_evidence_missing=1
prior_gate_evidence_missing=1
prior_removal_rollback_evidence_missing=1
network_requirement_detected=1
service_boundary_detected=1
boot_boundary_detected=1
kernel_boundary_detected=1
policy_boundary_detected=1
```

Validation

```
sh scripts/test-fedora-manual-host-dry-run-transcript-contract.sh
```

Expected output:

```
fedora_manual_host_dry_run_transcript_contract: ok
```

Next recommended Fedora lane

```
Implement no-effect Fedora dry-run transcript classifier
```

README overhaul hold

The root README should wait until real validation evidence exists for:

```
manual_host_dry_run_transcript_present=1
live_host_validation_completed=1
host_install_ready=1
```

Non-claims

This contract is not production readiness, Fedora approval, or Fedora distribution readiness.

docs/FEDORA_MANUAL_HOST_RC_CHECKLIST.md

Source title: Fedora Manual Host Release-Candidate Checklist

Lines: 152 | Words: 368 | SHA-256: 125fc19d4b1b68be30abf00b79db27f2f6915a923511ec7e1891fa6ce98c9ad5

Fedora Manual Host Release-Candidate Checklist

Status: release-candidate checklist Scope: define go/no-go evidence before any manual Fedora host validation milestone. Evidence level: 7 target, checklist only

Purpose

Latticra has controlled Fedora installroot RPM lifecycle evidence.

This checklist defines the evidence required before the project may call a real Fedora host validation step a release candidate.

This document does not perform host changes.

It does not add an execution path.

Current readiness statement

```
controlled_installroot_lifecycle_ready=1
manual_host_release_candidate_ready=0
production_installer_ready=0
fedora_distribution_ready=0
fedora_approval_claimed=0
```

Required environment evidence

A future manual host release-candidate step requires:

```
target_is_disposable_fedora_vm=1
target_is_daily_driver=0
target_is_production_host=0
target_is_immutable_fedora=0
target_has_clean_snapshot=1
target_has_recovery_path=1
operator_consent_recorded=1
```

Any primary workstation, production machine, immutable image, or unclear target must remain blocked.

Required package evidence

The local RPM candidate must have:

```
local_rpm_built_from_current_tree=1
rpm_name_is_latticra=1
rpm_version_recorded=1
rpm_payload_listing_recorded=1
rpm_payload_is_documentation_only=1
unexpected_runtime_surface_absent=1
installroot_lifecycle_evidence_present=1
post_removal_absence_evidence_present=1
```

Required project evidence

The following project evidence must exist:

```
host_preflight_classification=ready-local-rpm
rpm_gate_status=allowed
removal_rollback_status=removal-ready
controlled_installroot_lifecycle_ready=1
manual_host_release_candidate_ready=0
```

The final value is intentionally still zero. This checklist is the bridge to a future narrowly scoped candidate state.

Hard stop conditions

The release-candidate step must remain blocked if any of the following are true:

```
daily_driver_detected=1
production_host_detected=1
immutable_fedora_detected=1
snapshot_missing=1
recovery_path_missing=1
operator_consent_missing=1
unexpected_runtime_surface_present=1
installroot_lifecycle_evidence_missing=1
removal_rollback_evidence_missing=1
network_requirement_detected=1
service_boundary_detected=1
boot_boundary_detected=1
kernel_boundary_detected=1
policy_boundary_detected=1
```

Release-candidate decision output

Current expected output:

```
FEDORA MANUAL HOST RC CHECKLIST
manual_host_rc_status=blocked
manual_host_release_candidate_ready=0
host_change_performed=0
production_installer_ready=0
```

```
fedora_distribution_ready=0
fedora_approval_claimed=0
```

Future candidate output, only after all evidence is satisfied:

```
manual_host_rc_status=candidate
manual_host_release_candidate_ready=1
host_change_performed=0
```

Any future host-changing step must remain separate from this checklist.

Honest public wording

After this checklist lands, the project may say:

```
Latticra has controlled Fedora installroot RPM lifecycle evidence.
Latticra has a manual Fedora host release-candidate checklist.
Latticra is preparing for a tightly controlled host validation candidate.
```

The project must not say:

```
Latticra is production installer ready.
Latticra is Fedora-approved.
Latticra is safe for daily-driver installation.
Latticra has completed live host validation.
```

Validation

This checklist is guarded by:

```
sh scripts/test-fedora-manual-host-rc-checklist.sh
```

Expected output:

```
fedora_manual_host_rc_checklist: ok
```

Non-claims

This checklist does not perform host changes, publish artifacts, submit to Fedora, claim Fedora approval, claim production installer readiness, start services, change boot entries, load kernel modules, change host policy, or open runtime network access.

docs/FEDORA_MANUAL_HOST_RC_DECISION_CLASSIFIER.md

Source title: Fedora Manual Host RC Decision Classifier

Lines: 213 | Words: 383 | SHA-256: 978413db7bfb2ebd669d17a1a70e3191ce3266226adc92bf4370d8bcdbffb756

Fedora Manual Host RC Decision Classifier

Status: implementation record Evidence level: 7 Scope: pure no-effect classifier for manual Fedora host release-candidate decision evidence.

Purpose

This classifier consumes explicit manual-host checklist evidence and reports whether a future Fedora manual host validation step remains blocked or may be treated as an internal Latticra release-candidate decision.

It is the implementation follow-up to the Fedora manual host release-candidate checklist.

It does not install Latticra.

It does not run host commands.

It does not perform Fedora QA, claim Fedora approval, or produce Fedora distribution readiness.

API surface

```
include/latticra/fedora_manual_host_rc_decision.h
src/fedora_manual_host_rc_decision.c
tests/fedora_manual_host_rc_decision.c
```

Public functions:

```
latticra_fedora_manual_host_rc_decision_classify
latticra_fedora_manual_host_rc_decision_report
latticra_fedora_manual_host_rc_decision_status_label
latticra_fedora_manual_host_rc_decision_denial_label
```

Candidate evidence

A candidate report requires all of the following input evidence:

```
target_is_disposable_fedora_vm=1
target_is_daily_driver=0
target_is_production_host=0
target_is_immutable_fedora=0
target_has_clean_snapshot=1
target_has_recovery_path=1
operator_consent_recorded=1
local_rpm_built_from_current_tree=1
rpm_payload_listing_recorded=1
rpm_payload_is_documentation_only=1
unexpected_runtime_surface_absent=1
installroot_lifecycle_evidence_present=1
post_removal_absence_evidence_present=1
host_preflight_ready_local_rpm=1
rpm_gate_allowed=1
removal_rollback_ready=1
network_requirement_detected=0
service_boundary_detected=0
boot_boundary_detected=0
kernel_boundary_detected=0
policy_boundary_detected=0
```

Candidate output remains no-effect:

```
manual_host_rc_status=candidate
manual_host_rc_denial=none
manual_host_release_candidate_ready=1
live_host_validation_completed=0
host_change_performed=0
sudo_invoked=0
rpm_invoked=0
dnf_invoked=0
network_allowed=0
service_operation_allowed=0
boot_operation_allowed=0
kernel_operation_allowed=0
policy_operation_allowed=0
production_installer_ready=0
fedora_distribution_ready=0
fedora_approval_claimed=0
evidence_level=7
```

Blocked states

The classifier reports manual_host_rc_status=blocked when any required evidence is missing or any hard-stop boundary is detected.

Denial labels include:

```
not-disposable-fedora-vm
daily-driver-target
production-target
immutable-fedora-target
snapshot-missing
recovery-path-missing
operator-consent-missing
local-rpm-not-current-tree
rpm-payload-listing-missing
rpm-payload-not-documentation-only
unexpected-runtime-surface
installroot-evidence-missing
post-removal-evidence-missing
```

```
preflight-not-ready
rpm-gate-not-allowed
removal-rollback-not-ready
network-required
service-boundary
boot-boundary
kernel-boundary
policy-boundary
```

Blocked output preserves:

```
manual_host_release_candidate_ready=0
live_host_validation_completed=0
host_change_performed=0
sudo_invoked=0
rpm_invoked=0
dnf_invoked=0
network_allowed=0
service_operation_allowed=0
boot_operation_allowed=0
kernel_operation_allowed=0
policy_operation_allowed=0
production_installer_ready=0
fedora_distribution_ready=0
fedora_approval_claimed=0
```

Invalid input

The classifier expects explicit binary evidence values.

Malformed non-binary evidence reports:

```
manual_host_rc_status=invalid
manual_host_rc_denial=invalid-classifier-input
manual_host_release_candidate_ready=0
```

Report header

Reports begin with:

```
FEDORA MANUAL HOST RC DECISION CLASSIFIER
```

Required report fields include:

```
manual_host_rc_status=candidate
manual_host_rc_status=blocked
manual_host_rc_status=invalid
manual_host_rc_denial=none
manual_host_rc_denial=invalid-classifier-input
classifier_evaluated=1
manual_host_release_candidate_ready=1
manual_host_release_candidate_ready=0
live_host_validation_completed=0
host_change_performed=0
sudo_invoked=0
rpm_invoked=0
dnf_invoked=0
network_allowed=0
service_operation_allowed=0
boot_operation_allowed=0
kernel_operation_allowed=0
policy_operation_allowed=0
production_installer_ready=0
fedora_distribution_ready=0
fedora_approval_claimed=0
evidence_level=7
```

Validation

Classifier guard:

```
sh scripts/test-fedora-manual-host-rc-decision-classifier.sh
```

Docs guard:

```
sh scripts/test-fedora-manual-host-rc-decision-classifier-docs.sh
```

Expected output:

```
fedora_manual_host_rc_decision_classifier: ok
```

```
fedora_manual_host_rc_decision_classifier_docs: ok
```

Next recommended Fedora lane

```
Align Fedora manual host RC decision classifier status
```

After status alignment, the next safe progression is a manual Fedora host dry-run transcript contract.

Non-claims

This classifier does not implement installation, live host validation, host mutation, privilege escalation, package execution, package removal, service changes, boot changes, kernel changes, policy changes, network access, Fedora QA approval, Fedora distribution readiness, or production installer readiness.

docs/FEDORA_PACKAGE_METADATA_PLAN.md

Source title: Fedora Package Metadata Plan

Lines: 131 | Words: 292 | SHA-256: c10ecac4a7f0506e20e410696e4f002ee34d367851e813444bbcd3e6598b3e37

Fedora Package Metadata Plan

Status: planning record Scope: metadata required before a Fedora-oriented package draft exists.

Purpose

This plan defines the package metadata Latticra should collect before adding any RPM spec file.

The goal is to keep Fedora-facing work disciplined:

```
build lane first
local developer workflow second
metadata plan third
spec draft later
```

Current prerequisites

The following Fedora-facing records already exist:

```
docs/FEDORA_READINESS_PLAN.md
docs/FEDORA_DEVELOPER_WORKFLOW.md
scripts/test-fedora-build-lane.sh
```

Required metadata fields

A later package draft should define:

```
package_name
summary
description
upstream_url
source_archive_policy
version_source
license_expression
license_files
build_requires
runtime_requires
installed_binaries
installed_docs
installed_license_files
changelog_policy
```

Initial proposed values

Initial planning values:

```
package_name=latticra
summary=Contract-first systems architecture and language project
```

```
description_scope=development and evidence tooling
upstream_url=https://github.com/Bryforge/Latticra
source_archive_policy=tagged upstream source archive only
version_source=upstream tag
license_expression=to-be-confirmed-before-spec
license_files=LICENSE plus reviewed file-level notices
build_requires=gcc, make
runtime_requires=none-confirmed-yet
installed_binaries=none-confirmed-yet
installed_docs=docs selected after review
installed_license_files=license files selected after audit
changelog_policy=derive from reviewed release notes
```

License checkpoint

Before a package draft exists, resolve:

```
root license state
file-level SPDX state
AGPL transition status
legacy Apache-2.0 files
documentation license decision
third-party material inventory
```

This must stay aligned with:

```
docs/LICENSE_MIGRATION_PLAN.md
docs/OPEN_ECOSYSTEM_POLICY.md
```

Packaging boundary

This plan does not add a spec file.

It only defines the metadata that a later spec file would need.

Spec draft gate

Do not add packaging/fedora/latticra.spec until these are true:

```
Fedora build lane is green
metadata plan is guarded
license expression is decided
source archive policy is decided
installed file list is known
```

Next slice

Recommended next slice after this plan:

```
Add local RPM spec draft plan
```

That should still be planning-only unless the metadata checklist is complete.

Validation

This plan is guarded by:

```
sh scripts/test-fedora-package-metadata-plan.sh
```

Expected output:

```
fedora_package_metadata_plan: ok
```

docs/FEDORA_READINESS_PLAN.md

Source title: Fedora Readiness Plan

Lines: 279 | Words: 700 | SHA-256: ebd3e5b48d0bdc81751b9083e1804e9e5a3c8aac3943ef2368f7443d2f948886

Fedora Readiness Plan

Status: planning and compatibility record Scope: preparing Latticra for Fedora-friendly packaging, testing, and community review.

Purpose

This plan prepares Latticra for a future Fedora-facing path without claiming Fedora acceptance, endorsement, official inclusion, or distribution status.

The near-term target is:

```
Latticra builds cleanly on Fedora Linux.
Latticra can be described honestly as an upstream project preparing for Fedora package review.
Latticra avoids Fedora trademark confusion.
Latticra preserves its current non-claims.
```

Terminology boundary

Use:

```
Fedora readiness
Fedora packaging readiness
Fedora compatibility lane
Latticra on Fedora
future package review candidate
```

Avoid claiming:

```
official Fedora package
Fedora spin
Fedora remix
Fedora edition
Fedora merger
Fedora endorsement
operating-system replacement
```

Those terms require separate Fedora community, packaging, legal, and trademark review.

Fedora-facing requirements to respect

Before Latticra can be proposed as a package candidate, it should be checked against Fedora package review expectations:

```
package naming
spec file hygiene
Fedora allowed license posture
accurate License field
license text handling
source archive reproducibility
successful build on supported architectures where claimed
BuildRequires completeness
no bundled system libraries
valid file ownership
valid permissions
rpmlint or equivalent package lint output
mock build readiness
```

Current Latticra posture

Current Latticra evidence is still early-stage and report-oriented.

Known current posture:

```
kernel lifecycle evidence exists
final_state=scheduler-run-entry-ready
external_effect_performed=0
runtime_entry_allowed=0
scheduler_execution_allowed=0
scheduler_selection_allowed=0
scheduler_dispatch_allowed=0
scheduler_handoff_allowed=0
scheduler_activation_allowed=0
scheduler_run_entry_allowed=0
memory_allocation_allowed=0
process_spawn_allowed=0
syscall_dispatch_allowed=0
ipc_send_allowed=0
ipc_receive_allowed=0
ipc_queue_mutation_allowed=0
filesystem_lookup_allowed=0
filesystem_read_allowed=0
```

```
filesystem_write_allowed=0
namespace_mutation_allowed=0
device_open_allowed=0
device_read_allowed=0
device_write_allowed=0
driver_probe_allowed=0
driver_load_allowed=0
driver_bind_allowed=0
interrupt_allowed=0
interrupt_mask_allowed=0
interrupt_unmask_allowed=0
interrupt_dispatch_allowed=0
interrupt_ack_allowed=0
timer_tick_allowed=0
timer_arm_allowed=0
timer_disarm_allowed=0
scheduler_tick_allowed=0
run_queue_mutation_allowed=0
enqueue_allowed=0
dequeue_allowed=0
dispatch_allowed=0
context_switch_allowed=0
register_save_allowed=0
register_restore_allowed=0
stack_switch_allowed=0
address_space_switch_allowed=0
preemption_allowed=0
time_accounting_allowed=0
time_read_allowed=0
cpu_usage_write_allowed=0
quota_update_allowed=0
scheduler_credit_update_allowed=0
process_wake_allowed=0
dma_allowed=0
hardware_effect_allowed=0
not bootable
not installer-ready
not a Fedora derivative
not a production operating system
```

This makes the first Fedora-facing target a development package or source package candidate, not a distribution, image, spin, remix, or replacement operating system.

Phase 1: Fedora build lane

The Fedora build/test lane proves the current guarded project foundation compiles with Fedora toolchains.

Current guarded files:

```
scripts/test-fedora-build-lane.sh
.github/workflows/fedora-build-lane.yml
.github/workflows/compat-linux.yml
```

Initial checks should be conservative:

```
C compiler available
project C guards compile
kernel lifecycle guards compile
no external authority claims added
```

Phase 2: package metadata lane

Packaging metadata is present as a local-only draft after the Fedora build lane.

Current guarded files:

```
packaging/fedora/latticra.spec
packaging/fedora/README.md
scripts/test-fedora-spec-static.sh
.github/workflows/fedora-spec-static.yml
scripts/test-fedora-local-rpm-static-validation.sh
.github/workflows/fedora-local-rpm-static-validation.yml
scripts/test-fedora-rpmlint-static-spec-lane.sh
.github/workflows/fedora-rpmlint-static-spec-lane.yml
```

The first spec should be treated as a local development draft until it passes review.

Phase 3: license and source audit lane

Before any package submission, verify:

```
root license state
file-level SPDX state
license text included as needed
third-party material inventory
documentation license decision
trademark and branding boundary
```

This should align with the existing Latticra license migration plan.

Phase 4: local RPM and mock lane

After package metadata exists, add local package validation:

```
rpmbuild source package
rpmlint output captured
mock build validated
installed files inspected
uninstall behavior checked
```

This lane should remain local or Copr-oriented until the project is mature enough for review.

Phase 5: Fedora review candidate lane

Only after the earlier lanes pass should Latticra be described as a Fedora review candidate.

A future review-prep document should include:

```
upstream URL
source archive URL
package summary
package description
license expression
BuildRequires list
runtime Requires list
rpmlint output
mock build output
known non-claims
```

Trademark and naming posture

The project should not use Fedora marks in a way that suggests official status.

Preferred naming:

```
Latticra Fedora readiness
Latticra package draft for Fedora
Latticra on Fedora Linux
```

Avoid naming:

```
Fedora Latticra
Latticra Fedora Edition
Fedora Latticra OS
Official Fedora Latticra
```

Non-claims

This plan does not:

```
submit Latticra to Fedora
create a Fedora package
create a Fedora spin
create a Fedora remix
claim Fedora endorsement
claim Fedora legal approval
claim production readiness
claim operating-system completeness
```

Recommended next slice

Recommended next slice:

```
Keep the Fedora build/spec-static compatibility aliases aligned with the local RPM static
validation and rpmlint lanes
```

That should preserve the current no-artifact, no-submission, local-only package posture while the later local RPM and mock lanes mature.

Validation

This planning slice is guarded by:

```
sh scripts/test-fedora-readiness-plan.sh
```

Expected output:

```
fedora_readiness_plan: ok
```

docs/FEDORA_RPM_GATE_CLASSIFIER.md

Source title: Fedora RPM Gate Classifier

Lines: 138 | Words: 254 | SHA-256: a993d11f185664896637bf2fc1c0a17d3f262263772d1b78e23a4dc61983f98c

Fedora RPM Gate Classifier

Status: implementation record Scope: pure Fedora local RPM gate classification after live read-only preflight evidence. Evidence level: 4

Purpose

This implementation adds the first Fedora RPM gate classifier after the local RPM gate contract.

The classifier evaluates the required evidence fields and reports whether the local RPM gate is allowed or denied.

It does not execute any host-changing action.

Public API

Primary header:

```
include/latticra/fedora_rpm_gate.h
```

Primary source:

```
src/fedora_rpm_gate.c
```

The main entry points are:

```
latticra_fedora_rpm_gate_classify
latticra_fedora_rpm_gate_report
latticra_fedora_rpm_gate_status_label
latticra_fedora_rpm_gate_denial_label
```

Required allow evidence

The classifier reports allowed only when every required fact is present:

```
fedora_host=1
mutable_fedora_host=1
immutable_host=0
local_rpm_present=1
root_or_sudo_available=1
network_required=0
operator_install_confirmation=1
dry_run_passed=1
rollback_or_remove_plan_present=1
preflight_classification=ready-local-rpm
preflight_denial=none
```

```
snapshot_captured=1
live_probe_performed=1
```

All other combinations report denied.

Deterministic denial reasons

The classifier reports denial reasons including:

```
not-fedora-host
immutable-fedora-host
local-rpm-missing
privilege-missing
network-required
operator-confirmation-missing
dry-run-missing
rollback-plan-missing
preflight-not-ready
preflight-denied
live-probe-missing
invalid-gate-input
```

Report surface

The report begins with:

```
FEDORA LOCAL RPM INSTALL MUTATION GATE
```

Required report fields include:

```
install_gate_status=allowed
install_gate_denial=none
install_mutation_allowed=1
install_mutation_performed=0
host_mutation_performed=0
network_allowed=0
evidence_level=4
```

Denied reports preserve:

```
install_mutation_allowed=0
install_mutation_performed=0
host_mutation_performed=0
network_allowed=0
```

Validation

This implementation is guarded by:

```
sh scripts/test-fedora-rpm-gate-classifier.sh
```

Expected output:

```
fedora_rpm_gate_classifier: ok
```

The implementation document guard is:

```
sh scripts/test-fedora-rpm-gate-classifier-docs.sh
```

Expected output:

```
fedora_rpm_gate_classifier_docs: ok
```

Boundary

This implementation is a classifier only.

It does not execute package actions, validate sudo, build packages, open the network, start services, change boot entries, load kernel modules, claim Fedora approval, or claim production installer readiness.

docs/FEDORA_RPM_REMOVAL_ROLLBACK_CLASSIFIER.md

Source title: Fedora RPM Removal Rollback Classifier

Lines: 220 | Words: 520 | SHA-256: bfaab2c425ed5cfc1c57e536758955133107015b5662b472b2964503ed66cff3

Fedora RPM Removal Rollback Classifier

Status: implementation record Scope: pure Fedora RPM removal/rollback posture classification before any host-changing Fedora RPM removal behavior. Evidence level: 5

Purpose

This implementation turns the Fedora RPM removal rollback classifier contract into a pure C classifier.

The classifier evaluates explicit evidence and reports whether the Latticra RPM removal posture is removal-ready, denied, partial, or invalid.

This is install-preparation work: it proves that the project can reason about removal and rollback posture before a future local RPM execution lane performs any host-changing install or removal action.

This implementation does not implement removal, rollback execution, installation, privilege validation, package build behavior, network use, service operation, boot operation, kernel module operation, host policy changes, Fedora approval, or production installer readiness.

Public API

Primary header:

```
include/latticra/fedora_rpm_removal_rollback.h
```

Primary source:

```
src/fedora_rpm_removal_rollback.c
```

The main entry points are:

```
latticra_fedora_rpm_removal_rollback_classify
latticra_fedora_rpm_removal_rollback_report
latticra_fedora_rpm_removal_rollback_status_label
latticra_fedora_rpm_removal_rollback_denial_label
latticra_fedora_rpm_removal_rollback_partial_label
```

Ready evidence

The classifier reports removal-ready only when every required fact is present:

```
operator_removal_confirmation=1
package_name=latticra
package_identity_present=1
package_query_ready=1
installed_package_detected=1
owned_file_list_available=1
readme_owned_by_package=1
unexpected_runtime_surface_absent=1
post_removal_absence_check_planned=1
failure_report_planned=1
network_required=0
service_operation_requested=0
boot_operation_requested=0
kernel_operation_requested=0
policy_operation_requested=0
```

All other states fail closed into denied, partial, or invalid.

Status classes

The classifier can report:

```
removal-ready
denied
partial
invalid
```

removal-ready means removal posture is allowed by evidence, but removal is still not performed.

denied means planned removal should not be attempted.

partial means the input indicates incomplete or uncertain host/package state that a future execution lane would have to report and roll back around.

invalid means the classifier input itself is missing, unknown, or outside the expected 0/1 evidence model.

Deterministic denial reasons

The classifier reports deterministic reason labels including:

```
operator-confirmation-missing
package-name-mismatch
package-identity-missing
package-query-not-ready
package-not-installed
owned-file-list-missing
readme-ownership-missing
unexpected-runtime-surface-present
post-removal-check-missing
failure-report-missing
network-required
service-operation-requested
boot-operation-requested
kernel-operation-requested
policy-operation-requested
invalid-classifier-input
```

Partial state labels

Partial states are reported separately from the denial reason:

```
partial_state=package-installed-but-ownership-unknown
partial_state=owned-files-present-but-package-query-failed
partial_state=runtime-surface-present-before-removal
partial_state=absence-check-not-ready
partial_state=unknown-host-state
```

Report surface

The report begins with:

```
FEDORA RPM REMOVAL ROLLBACK CLASSIFIER
```

Ready reports include:

```
removal_rollback_status=removal-ready
removal_rollback_denial=none
partial_state=none
package_name=latticra
removal_allowed=1
rollback_planned=1
partial_failure_report_required=0
removal_performed=0
host_mutation_performed=0
network_allowed=0
service_operation_allowed=0
boot_operation_allowed=0
kernel_operation_allowed=0
policy_operation_allowed=0
evidence_level=5
```

Denied reports preserve:

```
removal_rollback_status=denied
removal_allowed=0
removal_performed=0
host_mutation_performed=0
```

Partial reports preserve:

```
removal_rollback_status=partial
partial_failure_report_required=1
```

```
removal_allowed=0
removal_performed=0
host_mutation_performed=0
```

Invalid reports preserve:

```
removal_rollback_status=invalid
removal_rollback_denial=invalid-classifier-input
removal_allowed=0
removal_performed=0
host_mutation_performed=0
```

Install-preparation meaning

This classifier closes the removal/rollback side of the local RPM gate posture.

The install-preparation sequence after this implementation should remain evidence-bound:

```
1. Merge the pure removal/rollback classifier.
2. Add status/index alignment.
3. Add a post-install verification contract.
4. Add a command transcript contract.
5. Add a tightly gated local RPM execution lane only after install, removal, rollback, and
post-install verification posture are all represented.
```

Validation

Classifier guard:

```
sh scripts/test-fedora-rpm-removal-rollback-classifier.sh
```

Expected output:

```
fedora_rpm_removal_rollback_classifier: ok
```

Docs guard:

```
sh scripts/test-fedora-rpm-removal-rollback-classifier-docs.sh
```

Expected output:

```
fedora_rpm_removal_rollback_classifier_docs: ok
```

Boundary

This implementation is a classifier only.

It does not remove packages, roll back packages, install packages, validate sudo, create RPM artifacts, run rpm, run dnf, open the network, start services, change boot entries, load kernel modules, change host policy, claim Fedora approval, or claim production installer readiness.

docs/FEDORA_RPM_REMOVAL_ROLLBACK_CLASSIFIER_CONTRACT.md

Source title: Fedora RPM Removal Rollback Classifier Contract

Lines: 191 | Words: 522 | SHA-256: d323888217bf6126348472c0961bfc10cc81cefa847b840d1bce1c396864f6fb

Fedora RPM Removal Rollback Classifier Contract

Status: contract record Scope: define the pure classifier required before any Fedora RPM removal or rollback action can be implemented. Evidence level: 5 target, contract only

Purpose

The Fedora local RPM removal and rollback plan defines how a future lane must reason about package identity, ownership verification, post-removal absence checks, and partial failure reporting.

This contract defines the next implementation boundary: a pure classifier that evaluates whether removal or rollback posture is ready, denied, partial, or invalid.

This is not a removal implementation.

The classifier must report state only. It must not request removal, install packages, validate privilege, open the network, start services, change boot entries, load kernel modules, or change host policy.

Required classifier inputs

A future classifier must consume an explicit record containing at least:

```
operator_removal_confirmation
package_name
package_identity_present
package_query_ready
installed_package_detected
owned_file_list_available
readme_owned_by_package
unexpected_runtime_surface_absent
post_removal_absence_check_planned
failure_report_planned
network_required
service_operation_requested
boot_operation_requested
kernel_operation_requested
policy_operation_requested
```

The classifier must fail closed when fields are missing, unknown, contradictory, or unsafe.

Required allow conditions

The classifier may report removal-ready only when all conditions are true:

```
operator_removal_confirmation=1
package_name=latticra
package_identity_present=1
package_query_ready=1
installed_package_detected=1
owned_file_list_available=1
readme_owned_by_package=1
unexpected_runtime_surface_absent=1
post_removal_absence_check_planned=1
failure_report_planned=1
network_required=0
service_operation_requested=0
boot_operation_requested=0
kernel_operation_requested=0
policy_operation_requested=0
```

All other combinations must report denied, partial, or invalid.

Required denial reasons

The classifier must report deterministic denial reasons such as:

```
operator-confirmation-missing
package-name-mismatch
package-identity-missing
package-query-not-ready
package-not-installed
owned-file-list-missing
readme-ownership-missing
unexpected-runtime-surface-present
post-removal-check-missing
failure-report-missing
network-required
service-operation-requested
boot-operation-requested
kernel-operation-requested
policy-operation-requested
invalid-classifier-input
```

Required report fields

A future implementation should emit a report beginning with:

For ready cases, required report fields include:

```
removal_rollback_status=removal-ready
removal_allowed=1
rollback_planned=1
removal_performed=0
host_mutation_performed=0
network_allowed=0
service_operation_allowed=0
boot_operation_allowed=0
kernel_operation_allowed=0
policy_operation_allowed=0
evidence_level=5
```

For denied cases, required report fields include:

```
removal_rollback_status=denied
removal_allowed=0
removal_performed=0
host_mutation_performed=0
```

For partial cases, required report fields include:

```
removal_rollback_status=partial
partial_failure_report_required=1
removal_performed=0
host_mutation_performed=0
```

Partial state classes

The classifier should distinguish planned denial from partial host state.

Planned denial means removal should not be attempted.

Partial state means the evidence suggests a future removal/rollback execution lane must report incomplete or uncertain host state, such as:

```
package-installed-but-ownership-unknown
owned-files-present-but-package-query-failed
runtime-surface-present-before-removal
absence-check-not-ready
unknown-host-state
```

Relationship to the RPM gate classifier

The Fedora RPM gate classifier reports whether the future local RPM gate is allowed.

This removal/rollback classifier must exist before any host-changing local RPM execution lane is added.

The two classifiers together should prove:

```
install gate evidence exists
removal or rollback posture exists
post-removal verification is planned
partial failure reporting is planned
```

Implementation sequence

Recommended next order:

1. Add this removal/rollback classifier contract.
2. Add a pure C removal/rollback classifier.
3. Add a focused test runner and docs guard.
4. Add status/index alignment after merge.
5. Add post-install verification contract.
6. Add command transcript contract.
7. Only then consider a tightly gated local RPM execution lane.

Validation

This contract is guarded by:

```
sh scripts/test-fedora-rpm-removal-rollback-classifier-contract.sh
```

Expected output:

```
fedora_rpm_removal_rollback_classifier_contract: ok
```

Non-claims

This contract does not implement removal, rollback, installation, host mutation, package execution, privilege validation, package build behavior, network use, service operation, boot operation, kernel module operation, Fedora approval, or production installer readiness.

docs/FEDORA_RPMLINT_AVAILABILITY.md

Source title: Fedora rpmlint Availability Lane

Lines: 63 | Words: 159 | SHA-256: 35804af508253a92c19ec53adc12b287e112878c66cce12b22e3f45adaffc5e5

Fedora rpmlint Availability Lane

Status: active tool availability lane Scope: verify that rpmlint is available in a Fedora Linux environment.

Purpose

This lane prepares the next packaging validation step without linting the package draft yet.

The current goal is only to prove that rpmlint can be installed and invoked inside the Fedora compatibility environment.

Files

```
docs/FEDORA_RPMLINT_AVAILABILITY.md
scripts/test-fedora-rpmlint-availability.sh
.github/workflows/fedora-rpmlint-availability.yml
```

Checks

This lane checks:

```
Fedora environment marker exists
dnf is available
rpmlint installs
rpmlint command is available
rpmlint version command can run
static RPM validation lane remains green
```

Boundary

This lane does not lint the Latticra spec yet.

It does not run rpmbuild or mock.

It does not create package artifacts.

Next slice

Recommended next slice:

```
Add rpmlint static spec lane
```

That future lane may run rpmlint packaging/fedora/latticra.spec and capture expected local-only draft findings.

Validation

Run inside Fedora:

```
sh scripts/test-fedora-rpmlint-availability.sh
```

Expected output:

```
fedora_rpmlint_availability: ok
```

docs/FEDORA_RPMLINT_STATIC_SPEC_LANE.md

Source title: Fedora rpmlint Static Spec Lane

Lines: 87 | Words: 302 | SHA-256: 0c55191651e8e711d06ffe019d30aaf7551154d7a2089ca6613e3bde039312a2

Fedora rpmlint Static Spec Lane

Status: active static spec lint lane Scope: run rpmlint against the local-only Fedora spec draft and capture findings without promoting package-readiness claims.

Purpose

This lane advances the Fedora local RPM validation stack from tool availability to a static spec lint pass.

The current goal is conservative: prove that rpmlint can inspect the local draft spec file in a Fedora environment and produce a reportable result.

This lane does not require a clean rpmlint result yet because the spec remains a local-only draft and still has source-archive and package-readiness metadata to review.

Files

```
docs/FEDORA_RPMLINT_STATIC_SPEC_LANE.md
scripts/test-fedora-rpmlint-static-spec-lane.sh
.github/workflows/fedora-rpmlint-static-spec-lane.yml
packaging/fedora/latticra.spec
```

Checks

This lane checks:

```
Fedora environment marker exists
dnf is available
rpmlint installs
rpmlint command is available
rpmlint can inspect packaging/fedora/latticra.spec
rpmlint output is captured for audit
previous rpmlint availability lane remains green
```

Expected draft findings

The current local-only spec may still report findings related to draft metadata, including:

```
local-only release marker
placeholder version
AGPL-3.0-or-later AND CC-BY-4.0 package license expression
missing source archive for a real package build
limited installed file set
```

Those findings are expected at this stage and are not package-readiness failures yet.

The purpose of this lane is visibility, not package promotion.

Boundary

This lane does not run rpmbuild.

It does not run mock.

It does not create package artifacts.

It does not submit Latticra to Fedora.

It does not claim Fedora package approval, Fedora endorsement, Fedora spin/remix status, product readiness, operating-system readiness, runtime authority, kernel authority, or security-hardening completion.

Next slice

Recommended next slice:

```
Add rpmlint findings classification report
```

That future lane may classify expected draft findings separately from unexpected spec findings while keeping the package local-only.

Validation

Run inside Fedora:

```
sh scripts/test-fedora-rpmlint-static-spec-lane.sh
```

Expected output:

```
fedora_rpmlint_static_spec_lane: ok
```

docs/FEDORA_SOURCE_ARCHIVE_FIXTURE_LANE.md

Source title: Fedora Source Archive Fixture Lane

Lines: 128 | Words: 408 | SHA-256: 5dc2b6bbdad40034eb7a5c5c241625c6fca80ce73c03b60d70b4a185ffc74db4

Fedora Source Archive Fixture Lane

Status: active fixture lane Scope: create and inspect a temporary Fedora source archive fixture without running RPM builds or installing artifacts.

Purpose

This lane advances the local Fedora packaging path from planning into a concrete source archive shape check.

The goal is conservative: prove that Latticra can form a temporary source archive matching the current Source0 and %autosetup expectations in packaging/fedora/latticra.spec.

This lane does not build a source RPM or binary RPM. It only creates a disposable archive fixture and inspects its contents.

Current spec relationship

The current spec expects:

```
Source0: %{name}-%{version}.tar.gz
%autosetup -n %{name}-%{version}
```

For the current local draft, that resolves to:

```
latticra-0.0.0.tar.gz
latticra-0.0.0/
```

Fixture rules

The archive fixture must:

```
use the Name field from packaging/fedora/latticra.spec
use the Version field from packaging/fedora/latticra.spec
create a root directory named latticra-&lt;version&gt;/
create an archive named latticra-&lt;version&gt;.tar.gz
use Git&#x27;s tracked and unignored source view
include README.md
include packaging/fedora/latticra.spec
include scripts used by the current %build section
exclude .git
exclude temporary RPM work directories
```

```
exclude RPM artifacts
exclude nested source archive artifacts
refuse symlink entries
normalize tar metadata
remain temporary and uncommitted
```

Inspection checks

The lane should inspect the archive with tar -tzf and verify:

```
latticra-&lt;version&gt;/README.md
latticra-&lt;version&gt;/packaging/fedora/latticra.spec
latticra-&lt;version&gt;/scripts/test-state-lattice.sh
latticra-&lt;version&gt;/scripts/test-system-bootstrap.sh
latticra-&lt;version&gt;/scripts/test-kernel.sh
latticra-&lt;version&gt;/scripts/test-kernel-lifecycle.sh
```

The lane should also fail if the archive contains:

```
.git/
.rpmwork/
*.rpm
nested latticra-*.tar.gz
```

Relationship to later RPM work

This fixture lane comes before RPM build execution.

The intended order is:

1. source archive fixture lane
2. source archive handoff to temporary RPM topdir
3. local binary RPM build lane
4. RPM payload inspection lane
5. fresh Fedora install smoke lane

Boundary

This lane does not run rpmbuild.

It does not run mock.

It does not create source RPM artifacts.

It does not create binary RPM artifacts.

It does not install Latticra.

It does not publish package artifacts.

It does not submit Latticra to Fedora.

It does not claim Fedora package approval, Fedora endorsement, Fedora spin/remix status, product readiness, operating-system readiness, runtime authority, kernel authority, boot authority, service authority, SELinux policy readiness, or security-hardening completion.

Next slice

Recommended next slice:

```
Add Fedora local binary RPM build lane
```

That future slice may hand the temporary archive to an RPM topdir and run a local build inside Fedora CI.

Validation

This lane is guarded by:

```
sh scripts/test-fedora-source-archive-fixture-lane.sh
```

Expected output:

```
fedora_source_archive_fixture_lane: ok
```

docs/FEDORA_VM_CLI_PAYLOAD_NEXT_VALIDATION_LANE_PLAN.md

Source title: Fedora VM CLI Payload Next Validation Lane Plan

Lines: 160 | Words: 458 | SHA-256: f79a2de16b15871199b7fe63f82cd02945a68ec3fd7ad09805c75fa6d8bb014d

Fedora VM CLI Payload Next Validation Lane Plan

Status: planning record Scope: define the next manual disposable Fedora VM validation lane for the no-effect CLI payload without adding a runner or widening readiness claims.

Purpose

This plan follows the accepted disposable Fedora VM CLI payload validation evidence.

The next Fedora CLI payload lane should test repeatability, not broaden authority.

The goal is conservative: define the evidence required for a future second disposable Fedora VM CLI payload validation run, compare it against the accepted CLI payload evidence, and keep the package local-only and no-effect.

This plan does not run RPM tooling, install a package, mutate a host, create artifacts, publish artifacts, submit to Fedora, or claim production readiness.

Current evidence basis

The accepted CLI payload evidence records:

```
disposable_vm_cli_validation_completed=1
host_install_ready_for_cli_payload=1
validated_package=latticra-0.0.0-0.1.local.fc44.x86_64.rpm
validated_payload=/usr/bin/latticra
validated_payload=/usr/share/doc/latticra/README.md
evidence_level=9
```

The accepted payload remains no-effect:

```
mode=no-effect
runtime_behavior=disabled
host_mutation=0
network=0
kernel_operation=0
service_operation=0
package_manager_operation=0
boot_operation=0
selinux_policy_operation=0
effect_authority=denied
```

Required hard gate

A future next-validation runner must remain manual and must refuse to proceed unless all of the following are true:

```
LATTICRA_ALLOW_DISPOSABLE_VM_RPM_VALIDATION=1
LATTICRA_TARGET_IS_DISPOSABLE_FEDORA_VM=1
LATTICRA_TARGET_IS_DAILY_DRIVER=0
LATTICRA_TARGET_IS_PRODUCTION_HOST=0
LATTICRA_TARGET_IS_IMMUTABLE_FEDORA=0
LATTICRA_TARGET_HAS_CLEAN_SNAPSHOT=1
LATTICRA_TARGET_HAS_RECOVERY_PATH=1
LATTICRA_OPERATOR_CONSENT_RECORDED=1
ID=fedora
rpm_present=1
rpmbuild_present=1
cc_present=1
sudo_present=1
```

The lane must not run automatically in CI.

The lane must not run on a developer daily-driver host, production host, immutable Fedora target, non-Fedora host, or unclear target.

Required repeatability evidence

The future lane should record these repeatability fields:

```
source_tree_revision_recorded=1
fedora_os_release_recorded=1
fedora_kernel_version_recorded=1
spec_checksum_recorded=1
source_archive_checksum_recorded=1
rpm_nevra_recorded=1
rpm_payload_listing_recorded=1
rpm_payload_matches_expected_cli_surfaces=1
unexpected_runtime_surface_absent=1
cli_status_output_recorded=1
cli_version_output_recorded=1
cli_report_output_recorded=1
cli_invalid_command_exit_recorded=1
rpm_verify_completed=1
removal_validation_performed=1
post_removal_absence_verified=1
```

The lane should compare the new evidence against the accepted CLI payload evidence:

```
validated_payload_still_contains_cli=1
validated_payload_still_contains_readme=1
validated_cli_mode_still_no_effect=1
validated_runtime_behavior_still_disabled=1
validated_non_claims_preserved=1
```

Success classification

A future successful run may record:

```
second_disposable_vm_cli_validation_completed=1
cli_payload_repeatability_evidence_present=1
host_install_ready_for_cli_payload=1
production_installer_ready=0
fedora_distribution_ready=0
fedora_approval_claimed=0
daily_driver_install_ready=0
immutable_fedora_ready=0
```

This classification is still bounded to the no-effect CLI payload in a disposable Fedora VM validation path.

Boundary

This plan does not implement a runner.

It does not execute RPM commands.

It does not install Latticra.

It does not remove Latticra.

It does not mutate a host.

It does not change services, boot entries, kernel modules, SELinux policy, firmware, networking, package repositories, or system configuration.

It does not publish package artifacts.

It does not submit Latticra to Fedora.

It does not claim Fedora approval, Fedora distribution readiness, production installer readiness, daily-driver safety, immutable Fedora readiness, security hardening, sandboxing, update safety, recovery safety, malware prevention, ransomware prevention, or OS-replacement readiness.

Next slice

Recommended next slice:

```
Add Fedora VM CLI payload repeatability transcript contract
```

That future slice should define the transcript schema for the second disposable Fedora VM CLI payload validation run without adding the runner or performing host mutation.

Validation

This plan is guarded by:

```
sh scripts/test-fedora-vm-cli-payload-next-validation-lane-plan.sh
```

Expected output:

```
fedora_vm_cli_payload_next_validation_lane_plan: ok
```

docs/FEDORA_VM_CLI_PAYLOAD_REPEATABILITY_EVIDENCE_ACCEPTANCE_CONTRACT.md

Source title: Fedora VM CLI Payload Repeatability Evidence Acceptance Contract

Lines: 141 | Words: 379 | SHA-256: 52a0deda2410b21548661698a82f5b753a6ca11c3b0b154fff2e8406fa1e9101

Fedora VM CLI Payload Repeatability Evidence Acceptance Contract

Status: acceptance contract Evidence level: 9 repeatability target, contract only Scope: define the future evidence status record after a real Fedora VM repeatability transcript is validated and accepted.

Purpose

This contract defines the exact fields required before Fedora VM CLI payload repeatability evidence can be written as accepted.

It does not run the repeatability runner.

It does not validate a live transcript.

It does not attach a transcript.

It does not write an evidence status record.

It does not accept repeatability evidence.

It does not mutate a host.

Required source records

The acceptance contract depends on:

```
docs/FEDORA_VM_CLI_PAYLOAD_REPEATABILITY_TRANSCRIPT_CONTRACT.md
docs/FEDORA_VM_CLI_PAYLOAD_REPEATABILITY_TRANSCRIPT_CAPTURE_TEMPLATE.md
docs/FEDORA_VM_CLI_PAYLOAD_REPEATABILITY_TRANSCRIPT_REVIEW_VALIDATOR.md
docs/FEDORA_VM_CLI_PAYLOAD_REPEATABILITY_EVIDENCE_REVIEW_GATE.md
docs/status/FEDORA_VM_CLI_PAYLOAD_VALIDATION_EVIDENCE_STATUS.md
scripts/fedora-vm-cli-payload-repeatability-transcript-review.sh
scripts/run-fedora-vm-cli-payload-repeatability-lane.sh
README.md
```

Required future acceptance prerequisites

A future accepted evidence status record requires all of these prerequisites:

```
repeatability_transcript_attached=1
repeatability_transcript_reviewed=1
repeatability_transcript_candidate_valid=1
repeatability_transcript_placeholder_values_absent=1
repeatability_transcript_required_markers_present=1
repeatability_transcript_value_fields_validated=1
repeatability_transcript_accepted=1
evidence_status_written=1
```

Future evidence status record

The future accepted status record must include:

```
FEDORA VM CLI PAYLOAD REPEATABILITY EVIDENCE STATUS
Status: evidence status alignment
source=operator disposable Fedora VM repeatability transcript
transcript_kind=disposable-vm-cli-payload-repeatability
repeatability_transcript_reviewed=1
repeatability_transcript_accepted=1
repeatability_transcript_candidate_valid=1
repeatability_transcript_placeholder_values_absent=1
repeatability_transcript_required_markers_present=1
repeatability_transcript_value_fields_validated=1
source_tree_revision_recorded=1
fedora_os_release_recorded=1
fedora_kernel_version_recorded=1
spec_checksum_recorded=1
source_archive_checksum_recorded=1
rpm_nevra_recorded=1
rpm_payload_matches_expected_cli_surfaces=1
validated_cli_mode_still_no_effect=1
validated_runtime_behavior_still_disabled=1
validated_non_claims_preserved=1
rpm_verify_completed=1
removal_validation_performed=1
post_removal_absence_verified=1
second_disposable_vm_cli_validation_completed=1
cli_payload_repeatability_evidence_present=1
host_install_ready_for_cli_payload=1
production_installer_ready=0
fedora_distribution_ready=0
fedora_approval_claimed=0
daily_driver_install_ready=0
immutable_fedora_ready=0
evidence_level=9
```

Current acceptance gate state

The current repository state is still blocked:

```
fedora_vm_cli_payload_repeatability_evidence_acceptance_contract_present=1
repeatability_transcript_attached=0
repeatability_transcript_reviewed=0
repeatability_transcript_candidate_valid=0
repeatability_transcript_accepted=0
evidence_status_written=0
second_disposable_vm_cli_validation_completed=0
cli_payload_repeatability_evidence_present=0
host_install_ready_for_cli_payload=1
production_installer_ready=0
fedora_distribution_ready=0
fedora_approval_claimed=0
daily_driver_install_ready=0
immutable_fedora_ready=0
```

Acceptance rule

Repeatability evidence can only be accepted after a manual disposable Fedora VM run produces a complete transcript, the transcript validator accepts the candidate markers and values, and an operator review confirms the evidence review gate.

The acceptance contract alone cannot promote evidence.

Validation

This contract is guarded by:

```
sh scripts/test-fedora-vm-cli-payload-repeatability-evidence-acceptance-contract.sh
```

Expected output:

```
fedora_vm_cli_payload_repeatability_evidence_acceptance_contract: ok
```

Next recommended lane

```
Run manual disposable Fedora VM CLI payload repeatability lane, validate transcript candidate,
and write accepted repeatability evidence status
```

Non-claims

This contract is not repeatability evidence, not a completed transcript, not a second disposable Fedora VM validation run, not an RPM build, not an RPM install, not host mutation, not production readiness, not Fedora approval, not Fedora distribution readiness, not daily-driver safety, not immutable Fedora readiness, not update safety, not recovery safety, not sandboxing, and not a production installer claim.

docs/FEDORA_VM_CLI_PAYLOAD_REPEATABILITY_EVIDENCE_PUBLICATION_GATE.md

Source title: Fedora VM CLI Payload Repeatability Evidence Publication Gate

Lines: 130 | Words: 380 | SHA-256: 2be6c1d34aa96c70d86c7cff0c893c9dd7c7cea1cc6c0fe5aeb4fb26c7291ea4

Fedora VM CLI Payload Repeatability Evidence Publication Gate

Status: publication gate contract Evidence level: 9 repeatability target, gate only Scope: prevents a passing evidence status candidate review from being treated as published Fedora repeatability evidence.

Purpose

This gate defines the final publication boundary after the transcript review validator and the evidence status review validator.

It does not run the repeatability runner.

It does not validate a live transcript.

It does not attach a transcript.

It does not write an evidence status record.

It does not publish repeatability evidence.

It does not mutate a host.

Required source records

The publication gate depends on:

```
docs/FEDORA_VM_CLI_PAYLOAD_REPEATABILITY_EVIDENCE_REVIEW_GATE.md
docs/FEDORA_VM_CLI_PAYLOAD_REPEATABILITY_TRANSCRIPT_REVIEW_VALIDATOR.md
docs/FEDORA_VM_CLI_PAYLOAD_REPEATABILITY_EVIDENCE_ACCEPTANCE_CONTRACT.md
docs/FEDORA_VM_CLI_PAYLOAD_REPEATABILITY_EVIDENCE_STATUS_TEMPLATE.md
docs/FEDORA_VM_CLI_PAYLOAD_REPEATABILITY_EVIDENCE_STATUS_REVIEW_VALIDATOR.md
docs/status/FEDORA_VM_CLI_PAYLOAD_REPEATABILITY_EVIDENCE_STATUS_REVIEW_VALIDATOR_STATUS.md
scripts/fedora-vm-cli-payload-repeatability-transcript-review.sh
scripts/fedora-vm-cli-payload-repeatability-evidence-status-review.sh
README.md
```

Required future publication prerequisites

A future publication record requires all of these prerequisites:

```
repeatability_transcript_attached=1
repeatability_transcript_reviewed=1
repeatability_transcript_accepted=1
repeatability_evidence_status_candidate_valid=1
repeatability_evidence_status_reviewed=1
candidate_repeatability_transcript_accepted=1
candidate_cli_payload_repeatability_evidence_present=1
candidate_evidence_status_written=1
operator_publication_review_completed=1
```

```
repeatability_evidence_publication_approved=1
evidence_status_written=1
cli_payload_repeatability_evidence_present=1
```

The evidence status review validator alone cannot publish evidence:

```
repeatability_evidence_status_accepted_by_validator=0
evidence_status_written_by_validator=0
promotion_allowed_by_status_validator_alone=0
```

Current publication gate state

The current repository state is still blocked:

```
fedora_vm_cli_payload_repeatability_evidence_publication_gate_present=1
fedora_vm_cli_payload_repeatability_evidence_status_review_validator_present=1
repeatability_evidence_status_candidate_valid=0
repeatability_evidence_status_reviewed=0
repeatability_evidence_status_accepted_by_validator=0
evidence_status_written_by_validator=0
promotion_allowed_by_status_validator_alone=0
repeatability_evidence_publication_requested=0
operator_publication_review_completed=0
repeatability_evidence_publication_approved=0
repeatability_evidence_status_published=0
repeatability_transcript_accepted=0
evidence_status_written=0
second_disposable_vm_cli_validation_completed=0
cli_payload_repeatability_evidence_present=0
host_install_ready_for_cli_payload=1
production_installer_ready=0
fedora_distribution_ready=0
fedora_approval_claimed=0
daily_driver_install_ready=0
immutable_fedora_ready=0
```

Publication rule

The only acceptable publication path is:

```
1. Run the manual disposable Fedora VM repeatability lane in a disposable Fedora VM.
2. Attach the complete transcript.
3. Validate the transcript candidate with
scripts/fedora-vm-cli-payload-repeatability-transcript-review.sh.
4. Fill the evidence status template from the reviewed transcript.
5. Validate the evidence status candidate with
scripts/fedora-vm-cli-payload-repeatability-evidence-status-review.sh.
6. Complete an operator publication review.
7. Only then write a published evidence status record.
```

Validation

This gate is guarded by:

```
sh scripts/test-fedora-vm-cli-payload-repeatability-evidence-publication-gate.sh
```

Expected output:

```
fedora_vm_cli_payload_repeatability_evidence_publication_gate: ok
```

Next recommended lane

```
Run manual disposable Fedora VM CLI payload repeatability lane, validate transcript and evidence
 status candidates, then complete operator publication review
```

Non-claims

This gate is not repeatability evidence, not a completed transcript, not an accepted evidence status record, not a published evidence status record, not a second disposable Fedora VM validation run, not an RPM build, not an RPM install, not host mutation, not production readiness, not Fedora approval, not Fedora distribution readiness, not daily-driver safety, not immutable Fedora readiness, not update safety, not recovery safety, not sandboxing, and not a production installer claim.

docs/FEDORA_VM_CLI_PAYLOAD_REPEATABILITY_EVIDENCE_REVIEW_GATE.md

Lines: 163 | Words: 405 | SHA-256: e36aa35d00cbe5eb158c8d1df7b2043e787575b688899e56af487828a1350c46

Fedora VM CLI Payload Repeatability Evidence Review Gate

Status: review gate contract Evidence level: 9 repeatability target, gate only Scope: define the review gate before a second disposable Fedora VM CLI payload validation transcript can be accepted as repeatability evidence.

Purpose

This gate prevents the manual repeatability runner from being treated as completed evidence until a real disposable Fedora VM transcript is attached and reviewed.

It does not run the repeatability runner.

It does not execute RPM commands.

It does not install or remove an RPM.

It does not mutate a host.

It does not mark repeatability evidence present.

Required source records

The review gate depends on:

```
docs/FEDORA_VM_CLI_PAYLOAD_REPEATABILITY_TRANSCRIPT_CONTRACT.md
docs/FEDORA_VM_CLI_PAYLOAD_REPEATABILITY_TRANSCRIPT_CAPTURE_TEMPLATE.md

scripts/run-fedora-vm-cli-payload-repeatability-lane.sh
scripts/test-fedora-vm-cli-payload-repeatability-runner.sh
README.md
```

Required attached transcript markers

A future accepted transcript must include:

```
FEDORA VM CLI PAYLOAD REPEATABILITY TRANSCRIPT
transcript_kind=disposable-vm-cli-payload-repeatability
transcript_version=1
operator_review_required=1
repeatability_transcript_recorded_after_real_run=1
prior_cli_payload_evidence_recorded=1
FEDORA VM CLI PAYLOAD REPEATABILITY LANE
validation_status=ok
repeatability_validation_status=ok
source_tree_revision_recorded=1
source_tree_revision=
fedora_os_release_recorded=1
fedora_kernel_version_recorded=1
fedora_kernel_version=
spec_checksum_recorded=1
spec_checksum=
source_archive_checksum_recorded=1
source_archive_checksum=
rpm_nevra_recorded=1
rpm_nevra=
package_name=latticra
```

```
package_version=0.0.0
rpm_payload_listing_recorded=1
rpm_payload_matches_expected_cli_surfaces=1
unexpected_runtime_surface_absent=1
cli_status_output_recorded=1
cli_version_output_recorded=1
cli_report_output_recorded=1
cli_invalid_command_exit_recorded=1
validated_cli_mode_still_no_effect=1
validated_runtime_behavior_still_disabled=1
validated_non_claims_preserved=1
rpm_verify_completed=1
removal_validation_performed=1
post_removal_absence_verified=1
second_disposable_vm_cli_validation_completed=1
cli_payload_repeatability_evidence_present=1
host_install_ready_for_cli_payload=1
production_installer_ready=0
fedora_distribution_ready=0
fedora_approval_claimed=0
daily_driver_install_ready=0
immutable_fedora_ready=0
evidence_level=9
fedora_vm_cli_payload_repeatability_lane: ok
```

The value-bearing fields must not be placeholders in a future accepted transcript:

```
source_tree_revision
fedora_kernel_version
spec_checksum
source_archive_checksum
rpm_nevra
```

Current gate state

```
fedora_vm_cli_payload_repeatability_evidence_review_gate_present=1
fedora_vm_cli_payload_repeatability_transcript_capture_template_present=1
fedora_vm_cli_payload_repeatability_transcript_review_validator_present=1
repeatability_transcript_template_mode=no-effect-template
repeatability_transcript_template_complete=0
repeatability_transcript_candidate_valid=0
repeatability_transcript_review_required=1
repeatability_transcript_attached=0
repeatability_transcript_reviewed=0
repeatability_transcript_accepted=0
second_disposable_vm_cli_validation_completed=0
cli_payload_repeatability_evidence_present=0
host_install_ready_for_cli_payload=1
production_installer_ready=0
fedora_distribution_ready=0
fedora_approval_claimed=0
daily_driver_install_ready=0
immutable_fedora_ready=0
```

Review rule

The only acceptable promotion path is:

```
1. Print scripts/fedora-vm-cli-payload-repeatability-transcript-template.sh before the manual
run.
2. Run scripts/run-fedora-vm-cli-payload-repeatability-lane.sh manually inside a disposable
Fedora VM.
3. Attach the complete transcript using the capture template shape.
4. Validate the transcript candidate with
scripts/fedora-vm-cli-payload-repeatability-transcript-review.sh.
5. Review the transcript against this gate and the repeatability transcript contract.
6. Only then add an evidence status record with repeatability_transcript_accepted=1.
```

Validation

This gate is guarded by:

```
sh scripts/test-fedora-vm-cli-payload-repeatability-evidence-review-gate.sh
```

Expected output:

```
fedora_vm_cli_payload_repeatability_evidence_review_gate: ok
```

Next recommended lane

```
Run manual disposable Fedora VM CLI payload repeatability lane, validate the transcript
candidate, and then add reviewed evidence status
```

Non-claims

This gate is not repeatability evidence, not a completed transcript, not a second disposable Fedora VM validation run, not an RPM install, not host mutation, not production readiness, not Fedora approval, not Fedora distribution readiness, not daily-driver safety, not immutable Fedora readiness, not update safety, not recovery safety, not sandboxing, and not a production installer claim.

docs/FEDORA_VM_CLI_PAYLOAD_REPEATABILITY_EVIDENCE_STATUS_REVIEW_VALIDATOR.md

Source title: Fedora VM CLI Payload Repeatability Evidence Status Review Validator

Lines: 157 | Words: 376 | SHA-256: f7ff95b4101d029d447cb6d237f8f4d783f21b1a3a54eb122fb78422a4404430

Fedora VM CLI Payload Repeatability Evidence Status Review Validator

Status: no-effect evidence status review validator Evidence level: 9 repeatability target, validator only Scope: validate a supplied Fedora VM CLI payload repeatability evidence status candidate without writing or promoting evidence.

Purpose

This validator checks a supplied future evidence status candidate after a real disposable Fedora VM repeatability transcript has been validated and reviewed.

It does not run the repeatability runner.

It does not validate a live transcript.

It does not attach a transcript.

It does not write an evidence status record.

It does not accept repeatability evidence by itself.

It does not mutate a host.

```
fedora_vm_cli_payload_repeatability_evidence_status_template_present=1
fedora_vm_cli_payload_repeatability_evidence_status_review_validator_present=1
repeatability_evidence_status_review_mode=no-effect-validation
repeatability_evidence_status_candidate_valid=0
repeatability_evidence_status_reviewed=0
repeatability_evidence_status_accepted_by_validator=0
evidence_status_written_by_validator=0
promotion_allowed_by_status_validator_alone=0
repeatability_transcript_accepted=0
evidence_status_written=0
second_disposable_vm_cli_validation_completed=0
cli_payload_repeatability_evidence_present=0
```

Command

```
sh scripts/fedora-vm-cli-payload-repeatability-evidence-status-review.sh --status &lt;path&gt;
```

Required source records

The validator depends on:

```
docs/FEDORA_VM_CLI_PAYLOAD_REPEATABILITY_EVIDENCE_STATUS_TEMPLATE.md
docs/status/FEDORA_VM_CLI_PAYLOAD_REPEATABILITY_EVIDENCE_STATUS_TEMPLATE_STATUS.md
docs/FEDORA_VM_CLI_PAYLOAD_REPEATABILITY_EVIDENCE_ACCEPTANCE_CONTRACT.md
docs/FEDORA_VM_CLI_PAYLOAD_REPEATABILITY_TRANSCRIPT_REVIEW_VALIDATOR.md
```

```
scripts/fedora-vm-cli-payload-repeatability-evidence-status-template.sh
scripts/fedora-vm-cli-payload-repeatability-transcript-review.sh
README.md
```

Accepted candidate requirements

A supplied candidate must contain the future evidence status shape from the template:

```
FEDORA VM CLI PAYLOAD REPEATABILITY EVIDENCE STATUS
Status: evidence status alignment
source=operator disposable Fedora VM repeatability transcript
transcript_kind=disposable-vm-cli-payload-repeatability
repeatability_transcript_reviewed=1
repeatability_transcript_accepted=1
repeatability_transcript_candidate_valid=1
repeatability_transcript_placeholder_values_absent=1
repeatability_transcript_required_markers_present=1
repeatability_transcript_value_fields_validated=1
source_tree_revision_recorded=1
fedora_os_release_recorded=1
fedora_kernel_version_recorded=1
spec_checksum_recorded=1
source_archive_checksum_recorded=1
rpm_nevra_recorded=1
rpm_payload_matches_expected_cli_surfaces=1
validated_cli_mode_still_no_effect=1
validated_runtime_behavior_still_disabled=1
validated_non_claims_preserved=1
rpm_verify_completed=1
removal_validation_performed=1
post_removal_absence_verified=1
second_disposable_vm_cli_validation_completed=1
cli_payload_repeatability_evidence_present=1
host_install_ready_for_cli_payload=1
production_installer_ready=0
fedora_distribution_ready=0
fedora_approval_claimed=0
daily_driver_install_ready=0
immutable_fedora_ready=0
evidence_level=9
evidence_status_written=1
```

The validator rejects placeholder values for:

```
Date
transcript_path
transcript_checksum
source_tree_revision
fedora_os_release
fedora_kernel_version
spec_checksum
source_archive_checksum
rpm_nevra
```

Validator output

For a valid candidate, the validator prints:

```
FEDORA VM CLI PAYLOAD REPEATABILITY EVIDENCE STATUS REVIEW
review_status=ok
fedora_vm_cli_payload_repeatability_evidence_status_review_validator_present=1
repeatability_evidence_status_review_mode=no-effect-validation
repeatability_evidence_status_candidate_valid=1
repeatability_evidence_status_placeholder_values_absent=1
repeatability_evidence_status_required_markers_present=1
repeatability_evidence_status_value_fields_validated=1
repeatability_evidence_status_reviewed=1
candidate_repeatability_transcript_accepted=1
candidate_cli_payload_repeatability_evidence_present=1
candidate_evidence_status_written=1
repeatability_evidence_status_accepted_by_validator=0
evidence_status_written_by_validator=0
promotion_allowed_by_status_validator_alone=0
host_mutation_performed=0
```

Validation

This validator is guarded by:

```
sh scripts/test-fedora-vm-cli-payload-repeatability-evidence-status-review-validator.sh
```

Expected output:

```
fedora_vm_cli_payload_repeatability_evidence_status_review_validator: ok
```

Next recommended lane

```
Run manual disposable Fedora VM CLI payload repeatability lane, validate transcript candidate,
fill evidence status template, and review the evidence status candidate
```

Non-claims

This validator is not repeatability evidence, not a completed transcript, not an accepted evidence status record, not a second disposable Fedora VM validation run, not an RPM build, not an RPM install, not host mutation, not production readiness, not Fedora approval, not Fedora distribution readiness, not daily-driver safety, not immutable Fedora readiness, not update safety, not recovery safety, not sandboxing, and not a production installer claim.

docs/FEDORA_VM_CLI_PAYLOAD_REPEATABILITY_EVIDENCE_STATUS_TEMPLATE.md

Source title: Fedora VM CLI Payload Repeatability Evidence Status Template

Lines: 161 | Words: 374 | SHA-256: 66457b4348259024d3dab295f310619cb2158d9d0284b2c5d3e2124d630f9955

Fedora VM CLI Payload Repeatability Evidence Status Template

Status: no-effect repeatability evidence status template Evidence level: 9 repeatability target, template only Scope: future accepted evidence status shape for the second disposable Fedora VM validation run of the no-effect CLI RPM payload.

Purpose

This template defines the future evidence status record an operator may write only after a real disposable Fedora VM repeatability transcript is attached, validated, and reviewed.

It is a status template only.

It does not run the repeatability runner.

It does not validate a live transcript.

It does not attach a transcript.

It does not write an evidence status record.

It does not accept repeatability evidence.

It does not mutate a host.

```
fedora_vm_cli_payload_repeatability_evidence_status_template_present=1
repeatability_evidence_status_template_mode=no-effect-template
repeatability_evidence_status_template_decision=blocked-template-only-no-status-write
repeatability_evidence_status_template_complete=0
repeatability_runner_executed=0
rpm_build_performed=0
rpm_install_performed=0
rpm_removal_performed=0
host_mutation_performed=0
repeatability_transcript_attached=0
repeatability_transcript_reviewed=0
repeatability_transcript_candidate_valid=0
repeatability_transcript_accepted=0
evidence_status_written=0
second_disposable_vm_cli_validation_completed=0
cli_payload_repeatability_evidence_present=0
```

Command

```
sh scripts/fedora-vm-cli-payload-repeatability-evidence-status-template.sh
```

The command prints the future evidence status shape to stdout only.

Required source records

The template depends on:

```
docs/FEDORA_VM_CLI_PAYLOAD_REPEATABILITY_TRANSCRIPT_CONTRACT.md
docs/FEDORA_VM_CLI_PAYLOAD_REPEATABILITY_TRANSCRIPT_CAPTURE_TEMPLATE.md
docs/FEDORA_VM_CLI_PAYLOAD_REPEATABILITY_TRANSCRIPT_REVIEW_VALIDATOR.md
docs/FEDORA_VM_CLI_PAYLOAD_REPEATABILITY_EVIDENCE_REVIEW_GATE.md

```

Next recommended lane

```
Run manual disposable Fedora VM CLI payload repeatability lane, validate transcript candidate,
and use the evidence status template to write accepted repeatability evidence status
```

Non-claims

This template is not repeatability evidence, not a completed transcript, not a second disposable Fedora VM validation run, not an RPM build, not an RPM install, not host mutation, not production readiness, not Fedora approval, not Fedora distribution readiness, not daily-driver safety, not immutable Fedora readiness, not update safety, not recovery safety, not sandboxing, and not a production installer claim.

docs/FEDORA_VM_CLI_PAYLOAD_REPEATABILITY_RUNNER_PLAN.md

Source title: Fedora VM CLI Payload Repeatability Runner Plan

Lines: 271 | Words: 711 | SHA-256: 28694b57b239069106a4604eaf61b47a88a4fb8ad0d3a160bae5bf28ae2dba71

Fedora VM CLI Payload Repeatability Runner Plan

Status: implemented runner plan Scope: record the manual disposable Fedora VM repeatability runner for the no-effect CLI RPM payload without running it.

Purpose

This plan follows the Fedora VM CLI payload repeatability transcript contract.

The implemented runner is shaped to prove repeatability for the already accepted no-effect CLI payload evidence.

This plan records the runner.

It does not execute RPM commands.

It does not install or remove an RPM.

It does not mutate a host.

It does not widen host install readiness beyond the accepted no-effect CLI payload boundary.

Runner path

The implementation is:

```
scripts/run-fedora-vm-cli-payload-repeatability-lane.sh
```

That script must remain manual-only and must not be called by normal CI.

Any CI workflow for this plan may only run static guards:

```
scripts/test-fedora-vm-cli-payload-repeatability-runner-plan.sh
scripts/test-fedora-vm-cli-payload-repeatability-runner.sh
```

Required source records

The runner must require these records before doing anything else:

```
docs/FEDORA_VM_CLI_PAYLOAD_REPEATABILITY_TRANSCRIPT_CONTRACT.md
docs/status/FEDORA_VM_CLI_PAYLOAD_REPEATABILITY_TRANSCRIPT_CONTRACT_STATUS.md
docs/FEDORA_VM_CLI_PAYLOAD_NEXT_VALIDATION_LANE_PLAN.md
docs/status/FEDORA_VM_CLI_PAYLOAD_VALIDATION_EVIDENCE_STATUS.md
packaging/fedora/latticra.spec
README.md
src/latticra_cli.c
scripts/test-latticra-no-effect-cli-status-surface.sh
scripts/run-fedora-vm-cli-payload-validation-lane.sh
```

Required hard gate

The runner must refuse to proceed unless all of the following are true:

```
LATTICRA_ALLOW_DISPOSABLE_VM_RPM_VALIDATION=1
LATTICRA_ALLOW_CLI_PAYLOAD_REPEATABILITY_VALIDATION=1
LATTICRA_TARGET_IS_DISPOSABLE_FEDORA_VM=1
LATTICRA_TARGET_IS_DAILY_DRIVER=0
LATTICRA_TARGET_IS_PRODUCTION_HOST=0
LATTICRA_TARGET_IS_IMMUTABLE_FEDORA=0
LATTICRA_TARGET_HAS_CLEAN_SNAPSHOT=1
LATTICRA_TARGET_HAS_RECOVERY_PATH=1
LATTICRA_OPERATOR_CONSENT_RECORDED=1
ID=fedora
operator_is_non_root=1
rpm_present=1
rpmbuild_present=1
cc_present=1
sudo_present=1
```

The runner must use sudo only for RPM install and RPM removal.

Required command availability

The runner must require:

```
awk
cat
cc
find
git
grep
gzip
id
mktemp
python3
rpm
rpmbuild
sha256sum
sort
sudo
tar
uname
```

If sha256sum is unavailable on a Fedora target, the runner must fail closed rather than silently omitting checksum evidence.

Source archive creation must use Git's tracked and unignored source view, refuse symlink entries, and write deterministic tar/gzip metadata before checksum evidence is recorded.

Planned repeatability sequence

The runner performs this sequence only after the hard gate passes:

1. Verify disposable Fedora VM target evidence.
2. Verify accepted prior CLI payload evidence records.
3. Verify repeatability transcript contract fields.
4. Run the no-effect CLI status-surface guard.
5. Capture source tree revision.
6. Capture Fedora os-release and kernel version.
7. Capture packaging/fedora/latticra.spec checksum.
8. Build a temporary source archive from the current tree.
9. Capture source archive checksum.
10. Build the local binary RPM with rpmbuild.
11. Capture RPM NEVRA, path, arch, and metadata.
12. Capture RPM payload listing.
13. Confirm expected CLI payload surfaces.
14. Confirm forbidden payload surfaces are absent.
15. Confirm package is absent before install.
16. Install the RPM into the disposable Fedora VM.
17. Query installed package state and payload.
18. Run rpm -V for the installed package.
19. Execute latticra --status without root.
20. Execute latticra --version without root.
21. Execute latticra --report without root.
22. Verify invalid CLI usage exits with code 2.
23. Remove the RPM from the disposable Fedora VM.
24. Confirm package, CLI, and README absence after removal.
25. Emit the repeatability transcript and deterministic report.

Expected payload

```
/usr/bin/latticra
/usr/share/doc/latticra/README.md
```

The RPM payload may include:

```
/usr/share/doc/latticra
```

Forbidden payload surfaces

```
/etc/latticra
/usr/lib/systemd/system/latticra.service
/usr/lib/modules
/boot/latticra
/usr/share/selinux
/usr/sbin/latticra
```

Required report fields

A successful repeatability runner emits:

```
FEDORA VM CLI PAYLOAD REPEATABILITY LANE
validation_status=ok
repeatability_validation_status=ok
transcript_kind=disposable-vm-cli-payload-repeatability
prior_cli_payload_evidence_recorded=1

fedora_distribution_ready=0
fedora_approval_claimed=0
daily_driver_install_ready=0
immutable_fedora_ready=0
evidence_level=9
```

Current project state

```
fedora_vm_cli_payload_repeatability_transcript_contract_present=1
fedora_vm_cli_payload_repeatability_runner_plan_present=1
fedora_vm_cli_payload_repeatability_runner_present=1
repeatability_runner_manual_only=1
ci_auto_repeatability_validation_allowed=0
second_disposable_vm_cli_validation_completed=0
cli_payload_repeatability_evidence_present=0
host_install_ready_for_cli_payload=1
production_installer_ready=0
fedora_distribution_ready=0
fedora_approval_claimed=0
daily_driver_install_ready=0
immutable_fedora_ready=0
```

Boundary

This plan is not a completed repeatability transcript.

It does not run scripts/run-fedora-vm-cli-payload-repeatability-lane.sh.

It does not run rpmbuild.

It does not run rpm.

It does not install Latticra.

It does not remove Latticra.

It does not mutate a host.

It does not publish artifacts.

It does not submit Latticra to Fedora.

It does not claim Fedora approval, Fedora distribution readiness, production installer readiness, daily-driver safety, immutable Fedora readiness, security hardening, sandboxing, update safety, recovery safety, malware prevention, ransomware prevention, or OS-replacement readiness.

Next recommended lane

```
Capture reviewed Fedora VM CLI payload repeatability transcript evidence
```

That future evidence capture must come from a real disposable Fedora VM run, must be operator-reviewed, and must preserve all non-claims.

Validation

This plan is guarded by:

```
sh scripts/test-fedora-vm-cli-payload-repeatability-runner-plan.sh
```

Expected output:

```
fedora_vm_cli_payload_repeatability_runner_plan: ok
```

docs/FEDORA_VM_CLI_PAYLOAD_REPEATABILITY_TRANSCRIPT_CAPTURE_TEMPLATE.md

Source title: Fedora VM CLI Payload Repeatability Transcript Capture Template

Lines: 143 | Words: 376 | SHA-256: abbd73d191fc908cce0c8afe346f145ba1ead143d278607507e3e349a4df0845

Fedora VM CLI Payload Repeatability Transcript Capture Template

Status: no-effect repeatability transcript capture template Evidence level: 9 repeatability target, template only Scope: future transcript capture shape for the second disposable Fedora VM validation run of the no-effect CLI RPM payload.

Purpose

This template defines the transcript shape an operator should attach after a real disposable Fedora VM repeatability run.

It is a capture template only.

It does not run the repeatability runner.

It does not build an RPM.

It does not install or remove an RPM.

It does not mutate a host.

It does not mark repeatability evidence present.

```
fedora_vm_cli_payload_repeatability_transcript_capture_template_present=1
repeatability_transcript_template_mode=no-effect-template
repeatability_transcript_template_decision=blocked-template-only-no-vm-execution
repeatability_transcript_template_complete=0
repeatability_runner_executed=0
rpm_build_performed=0
rpm_install_performed=0
rpm_removal_performed=0
host_mutation_performed=0
repeatability_transcript_attached=0
repeatability_transcript_reviewed=0
repeatability_transcript_accepted=0
second_disposable_vm_cli_validation_completed=0
cli_payload_repeatability_evidence_present=0
```

Command

```
sh scripts/fedora-vm-cli-payload-repeatability-transcript-template.sh
```

The command emits a deterministic transcript capture template to stdout.

It validates that the repeatability transcript contract, repeatability runner plan, evidence review gate, prior CLI payload evidence status, and repeatability runner are present before printing the template.

The review validator companion is:

```
sh scripts/fedora-vm-cli-payload-repeatability-transcript-review.sh --transcript &lt;path&gt;
```

It checks a supplied transcript candidate for required markers and rejects placeholder values without accepting evidence by itself.

Required operator context

The future transcript must be captured from:

```
target_required=disposable-fedora-vm
operator_review_required=1
clean_snapshot_required=1
recovery_path_required=1
```

```
prior_cli_payload_evidence_required=1
runner_path=scripts/run-fedora-vm-cli-payload-repeatability-lane.sh
```

Required future transcript fields

The capture template includes these required transcript sections:

```
[transcript_header]
[prior_evidence]
[runner_report_required_fields]
[review_gate]
[non_claims]
```

The future accepted transcript must replace placeholder values for:

```
source_tree_revision
fedora_kernel_version
spec_checksum
source_archive_checksum
rpm_nevra
```

Review validator:

```
docs/FEDORA_VM_CLI_PAYLOAD_REPEATABILITY_TRANSCRIPT_REVIEW_VALIDATOR.md
scripts/fedora-vm-cli-payload-repeatability-transcript-review.sh
```

Current template state

```
fedora_vm_cli_payload_repeatability_transcript_capture_template_present=1
fedora_vm_cli_payload_repeatability_transcript_review_validator_present=1
repeatability_transcript_template_mode=no-effect-template
repeatability_transcript_template_complete=0

production_installer_ready=0
fedora_distribution_ready=0
fedora_approval_claimed=0
daily_driver_install_ready=0
immutable_fedora_ready=0
```

Validation

This template is guarded by:

```
sh scripts/test-fedora-vm-cli-payload-repeatability-transcript-template.sh
```

Expected output:

```
fedora_vm_cli_payload_repeatability_transcript_template: ok
```

Next recommended lane

```
Run manual disposable Fedora VM CLI payload repeatability lane, validate the transcript
candidate, and then add reviewed evidence status
```

Non-claims

This template is not repeatability evidence, not a completed transcript, not a second disposable Fedora VM validation run, not an RPM build, not an RPM install, not host mutation, not production readiness, not Fedora approval, not Fedora distribution readiness, not daily-driver safety, not immutable Fedora readiness, not update safety, not recovery safety, not sandboxing, and not a production installer claim.

docs/FEDORA_VM_CLI_PAYLOAD_REPEATABILITY_TRANSCRIPT_CONTRACT.md

Fedora VM CLI Payload Repeatability Transcript Contract

Status: contract record Evidence level: 9 repeatability target, contract only Scope: transcript schema for a future second disposable Fedora VM validation run of the no-effect CLI RPM payload.

Purpose

This contract defines the repeatability transcript required before a second disposable Fedora VM CLI payload validation run can be reviewed as repeatability evidence.

This is a contract only.

It does not run a validation lane.

It does not add a runner.

It does not run RPM tooling.

It does not install or remove an RPM.

It does not mutate a host.

Required transcript header

```
FEDORA VM CLI PAYLOAD REPEATABILITY TRANSCRIPT
transcript_kind=disposable-vm-cli-payload-repeatability
transcript_version=1
operator_review_required=1
repeatability_transcript_recorded_after_real_run=1
prior_cli_payload_evidence_recorded=1
```

Required prior evidence

```
prior_validated_package=latticra-0.0.0-0.1.local.fc44.x86_64.rpm
prior_validated_payload=/usr/bin/latticra
prior_validated_payload=/usr/share/doc/latticra/README.md
prior_disposable_vm_cli_validation_completed=1
prior_host_install_ready_for_cli_payload=1
prior_evidence_level=9
```

Required repeatability fields

```
source_tree_revision_recorded=1
fedora_os_release_recorded=1
fedora_kernel_version_recorded=1
spec_checksum_recorded=1
source_archive_checksum_recorded=1
rpm_nevra_recorded=1

production_installer_ready=0
fedora_distribution_ready=0
fedora_approval_claimed=0
daily_driver_install_ready=0
immutable_fedora_ready=0
```

Validation

```
sh scripts/test-fedora-vm-cli-payload-repeatability-transcript-contract.sh
```

Expected output:

```
fedora_vm_cli_payload_repeatability_transcript_contract: ok
```

Next recommended lane

```
Add Fedora VM CLI payload repeatability runner plan
```

Non-claims

This contract is not a completed repeatability transcript, not RPM install evidence, not a second disposable Fedora VM validation run, not a runner, not host mutation, and not production readiness, Fedora approval, Fedora distribution readiness, daily-driver safety, immutable Fedora readiness, or a production installer claim.

docs/FEDORA_VM_CLI_PAYLOAD_REPEATABILITY_TRANSCRIPT_REVIEW_VALIDATOR.md

Source title: Fedora VM CLI Payload Repeatability Transcript Review Validator

Lines: 129 | Words: 352 | SHA-256: 3684c78fdd97b87782660834397ef86d0687a391845e987fd53ff55cc16c0c8c

Fedora VM CLI Payload Repeatability Transcript Review Validator

Status: no-effect transcript review validator Evidence level: 9 repeatability target, validator only Scope: validate a supplied Fedora VM CLI payload repeatability transcript candidate without promoting evidence.

Purpose

This validator checks a supplied transcript candidate before any repeatability evidence status can be written.

It verifies that required transcript markers are present.

It rejects placeholder values in required value-bearing fields.

It does not run the repeatability runner.

It does not build an RPM.

It does not install or remove an RPM.

It does not mutate a host.

It does not accept repeatability evidence by itself.

```
fedora_vm_cli_payload_repeatability_transcript_review_validator_present=1
repeatability_transcript_review_mode=no-effect-validation
repeatability_transcript_candidate_valid=0
repeatability_transcript_reviewed=0
repeatability_transcript_accepted=0
evidence_status_written=0
promotion_allowed_by_validator_alone=0
second_disposable_vm_cli_validation_completed=0
cli_payload_repeatability_evidence_present=0
```

Command

```
sh scripts/fedora-vm-cli-payload-repeatability-transcript-review.sh --transcript &lt;path&gt;
```

The command reads the supplied transcript candidate and emits a no-effect review report.

The validator does not create or modify status files.

Required value fields

The validator rejects missing or placeholder values for:

```
source_tree_revision
fedora_kernel_version
spec_checksum
source_archive_checksum
rpm_nevra
```

It also checks that checksum fields are SHA-256-shaped, that the source revision is a hex revision, and that the RPM NEVRA is for the local Latticra package.

Successful candidate report

A structurally valid supplied transcript produces:

```
FEDORA VM CLI PAYLOAD REPEATABILITY TRANSCRIPT REVIEW
review_status=ok
fedora_vm_cli_payload_repeatability_transcript_review_validator_present=1
repeatability_transcript_review_mode=no-effect-validation
repeatability_transcript_candidate_valid=1
repeatability_transcript_placeholder_values_absent=1
repeatability_transcript_required_markers_present=1
repeatability_transcript_value_fields_validated=1
repeatability_transcript_reviewed=1
repeatability_transcript_accepted=0
evidence_status_written=0
promotion_allowed_by_validator_alone=0
second_disposable_vm_cli_validation_completed=0
cli_payload_repeatability_evidence_present=0
production_installer_ready=0
fedora_distribution_ready=0
fedora_approval_claimed=0
daily_driver_install_ready=0
immutable_fedora_ready=0
```

Current validator state

```
fedora_vm_cli_payload_repeatability_transcript_review_validator_present=1
repeatability_transcript_review_mode=no-effect-validation
repeatability_transcript_candidate_valid=0
repeatability_transcript_reviewed=0
repeatability_transcript_accepted=0
evidence_status_written=0
promotion_allowed_by_validator_alone=0
second_disposable_vm_cli_validation_completed=0
cli_payload_repeatability_evidence_present=0
host_install_ready_for_cli_payload=1
production_installer_ready=0
fedora_distribution_ready=0
fedora_approval_claimed=0
daily_driver_install_ready=0
immutable_fedora_ready=0
```

Validation

This validator is guarded by:

```
sh scripts/test-fedora-vm-cli-payload-repeatability-transcript-review-validator.sh
```

Expected output:

```
fedora_vm_cli_payload_repeatability_transcript_review_validator: ok
```

Next recommended lane

```
Run manual disposable Fedora VM CLI payload repeatability lane, validate the transcript
candidate, and then add reviewed evidence status
```

Non-claims

This validator is not repeatability evidence, not a completed transcript, not a second disposable Fedora VM validation run, not an RPM build, not an RPM install, not host mutation, not production readiness, not Fedora approval, not Fedora distribution readiness, not daily-driver safety, not immutable Fedora readiness, not update safety, not recovery safety, not sandboxing, and not a production installer claim.

docs/FEDORA_VM_CLI_PAYLOAD_VALIDATION_LANE.md

Source title: Fedora VM CLI Payload Validation Lane

Lines: 303 | Words: 742 | SHA-256: 55fa22fc127cfdb822fe227db1ad8f0755a128f25423a12219f8f8c925292583

Fedora VM CLI Payload Validation Lane

Status: gated validation lane runner Evidence level: 9 target Scope: manual disposable Fedora VM validation of the expanded local RPM payload that includes the no-effect latticra CLI.

Purpose

This lane adds the manual runner for validating the expanded Fedora local RPM payload inside a disposable Fedora VM.

The payload under validation is:

```
/usr/bin/latticra
/usr/share/doc/latticra/README.md
```

The runner is intentionally gated.

It must not run automatically in CI.

It must not run on a daily-driver system.

It must not run on a production host.

It must not run on an immutable Fedora target.

It must not claim Fedora approval, Fedora distribution readiness, daily-driver readiness, immutable Fedora readiness, production installer readiness, security hardening, sandboxing, recovery safety, update safety, or OS replacement readiness.

Manual hard gate

The runner refuses to proceed unless all of the following are true:

```
LATTICRA_ALLOW_DISPOSABLE_VM_RPM_VALIDATION=1
LATTICRA_TARGET_IS_DISPOSABLE_FEDORA_VM=1
LATTICRA_TARGET_IS_DAILY_DRIVER=0
LATTICRA_TARGET_IS_PRODUCTION_HOST=0
LATTICRA_TARGET_IS_IMMUTABLE_FEDORA=0
LATTICRA_TARGET_HAS_CLEAN_SNAPSHOT=1
LATTICRA_TARGET_HAS_RECOVERY_PATH=1
LATTICRA_OPERATOR_CONSENT_RECORDED=1
ID=fedora
rpm_present=1
rpmbuild_present=1
cc_present=1
sudo_present=1
```

The runner must be launched by a non-root operator account so the CLI can be executed without privilege escalation. The runner uses sudo only for RPM installation and removal.

Required source checks

Before package mutation, the runner verifies the current tree contains:

```
src/latticra_cli.c
scripts/test-latticra-no-effect-cli-status-surface.sh
packaging/fedora/latticra.spec
docs/FEDORA_VM_CLI_TRANSCRIPT_CONTRACT.md
```

The runner also executes:

```
sh scripts/test-latticra-no-effect-cli-status-surface.sh
```

This preserves the no-effect CLI boundary before the RPM is built.

Required package sequence

The runner performs this sequence only after the hard gate passes:

1. Verify disposable Fedora VM target evidence.
2. Verify Fedora tooling and local tree references.
3. Run the no-effect CLI status-surface guard.
4. Build a local source archive from the current tree.
5. Build the local binary RPM with `rpmbuild`.
6. Inspect RPM metadata.
7. Inspect RPM payload.
8. Confirm the payload contains `/usr/bin/latticra`.
9. Confirm the payload contains `/usr/share/doc/latticra/README.md`.
10. Confirm forbidden payload surfaces are absent.
11. Confirm the local package is not installed before validation.
12. Install the RPM into the disposable Fedora VM with `rpm`.
13. Query installed package state.
14. Verify installed CLI and README payload files.
15. Verify package files with `rpm -V`.
16. Execute `latticra --status` without root.
17. Execute `latticra --version` without root.
18. Execute `latticra --report` without root.
19. Verify invalid CLI usage exits with code 2.
20. Remove the RPM from the disposable Fedora VM with `rpm`.
21. Confirm the package is absent after removal.
22. Confirm the CLI payload is absent after removal.
23. Confirm the README payload is absent after removal.
24. Emit a deterministic validation report.

Expected payload

```
/usr/bin/latticra
/usr/share/doc/latticra/README.md
```

The RPM payload may include the package-owned documentation directory:

```
/usr/share/doc/latticra
```

Forbidden payload surfaces

```
/etc/latticra
/usr/lib/systemd/system/latticra.service
/usr/lib/modules
/boot/latticra
/usr/share/selinux
/usr/sbin/latticra
```

Required CLI output validation

The runner validates that latticra --status and latticra --report emit:

```
LATTICRA STATUS REPORT
project=latticra
mode=no-effect
runtime_behavior=disabled
host_mutation=0
network=0
kernel_operation=0
service_operation=0
package_manager_operation=0
boot_operation=0
selinux_policy_operation=0
effect_authority=denied
```

The runner validates that latticra --version emits:

```
latticra 0.0.0
mode=no-effect
runtime_behavior=disabled
```

The runner validates that an invalid CLI command exits with code 2 and emits:

```
usage: latticra [--status|--version|--report]
```

Required report fields

A successful real disposable Fedora VM run emits:

```
FEDORA VM CLI PAYLOAD VALIDATION LANE
```

```
validation_status=ok
package_name=latticra
package_version_recorded=1
package_arch_recorded=1

removal_validation_performed=1
disposable_vm_cli_validation_completed=1
host_install_ready_for_cli_payload=1
production_installer_ready=0
fedora_distribution_ready=0
fedora_approval_claimed=0
daily_driver_install_ready=0
immutable_fedora_ready=0
evidence_level=9
```

Current project state until a real run is captured

Adding this runner does not itself create VM evidence.

```
validation_runner_present=1
runner_manual_only=1
ci_auto_vm_cli_validation_allowed=0
disposable_vm_cli_validation_transcript_present=0
disposable_vm_cli_validation_completed=0
```

```
host_install_ready_for_cli_payload=0
production_installer_ready=0
fedora_distribution_ready=0
fedora_approval_claimed=0
daily_driver_install_ready=0
immutable_fedora_ready=0
```

Manual usage

From inside a disposable Fedora VM with a clean snapshot and recovery path:

```
LATTICRA_ALLOW_DISPOSABLE_VM_RPM_VALIDATION=1 \
LATTICRA_TARGET_IS_DISPOSABLE_FEDORA_VM=1 \
LATTICRA_TARGET_IS_DAILY_DRIVER=0 \
LATTICRA_TARGET_IS_PRODUCTION_HOST=0 \
LATTICRA_TARGET_IS_IMMUTABLE_FEDORA=0 \
LATTICRA_TARGET_HAS_CLEAN_SNAPSHOT=1 \
LATTICRA_TARGET_HAS_RECOVERY_PATH=1 \
LATTICRA_OPERATOR_CONSENT_RECORDED=1 \
sh scripts/run-fedora-vm-cli-payload-validation-lane.sh
```

Expected final marker:

```
fedora_vm_cli_payload_validation_lane: ok
```

CI boundary

CI only runs the documentation and runner-shape guard:

```
sh scripts/test-fedora-vm-cli-payload-validation-lane-docs.sh
```

Expected output:

```
fedora_vm_cli_payload_validation_lane_docs: ok
```

CI must not run:

```
scripts/run-fedora-vm-cli-payload-validation-lane.sh
```

Next recommended lane

```
Add disposable Fedora VM CLI payload validation status alignment
```

After that, capture a real disposable Fedora VM CLI payload validation transcript from an actual gated run.

docs/FEDORA_VM_CLI_PAYLOAD_VALIDATION_TRANSCRIPT_CAPTURE.md

Source title: Fedora VM CLI Payload Validation Transcript Capture

Lines: 76 | Words: 263 | SHA-256: e4434a2fcf66f9262a6cce106fbb9705bc640a224b2b32a8827363b4e78fd617

Fedora VM CLI Payload Validation Transcript Capture

Status: manual evidence-capture preparation Evidence level: capture preparation only Scope: checklist for a future reviewed disposable Fedora VM CLI payload validation transcript.

Purpose

This page prepares the next evidence step for the Fedora VM CLI payload lane.

The real validation runner already exists at:

```
scripts/run-fedora-vm-cli-payload-validation-lane.sh
```

The runner documentation already exists at:

```
docs/FEDORA_VM_CLI_PAYLOAD_VALIDATION_LANE.md
```

This page does not run the validation lane.

This page does not create completed evidence.

This page does not claim that a disposable Fedora VM run has succeeded.

This page does not claim host install readiness for the CLI payload.

Evidence capture rule

A future evidence PR may only mark the CLI payload validation complete after a real disposable Fedora VM run is performed, reviewed, and committed with the full transcript.

Until that reviewed transcript exists, the repository must preserve:

```
disposable_vm_cli_validation_transcript_present=0
disposable_vm_cli_validation_completed=0
host_install_ready_for_cli_payload=0
```

Required reviewed evidence

The future transcript evidence PR should include:

```
reviewed_disposable_fedora_vm_target=1
reviewed_clean_snapshot_evidence=1
reviewed_recovery_path_evidence=1
reviewed_operator_consent=1
reviewed_runner_success_marker=1
reviewed_cli_payload_present=1
reviewed_readme_payload_present=1
reviewed_cli_status_output=1
reviewed_cli_version_output=1
reviewed_cli_report_output=1
reviewed_post_removal_absence=1
reviewed_non_claims_preserved=1
```

CI boundary

CI may validate this checklist and related documentation only.

CI must not run the manual validation runner.

Next recommended Fedora lane

```
Run the real disposable Fedora VM CLI payload validation lane and commit reviewed transcript
evidence
```

Non-claims

This checklist is not completed VM evidence, not CLI payload validation evidence, not host install readiness for the CLI payload, not production readiness, not Fedora approval, not Fedora distribution readiness, not daily-driver safety, not immutable Fedora readiness, and not a production installer claim.

docs/FEDORA_VM_CLI_TRANSCRIPT_CONTRACT.md

Source title: Fedora VM CLI Transcript Contract

Lines: 253 | Words: 435 | SHA-256: 0aa43b5e2355246a08dfbf2fcf484bb0c37f3a933a56fbcdc96e731597711d05

Fedora VM CLI Transcript Contract

Status: contract record Evidence level: 9 target, contract only Scope: transcript schema for future disposable Fedora VM validation of the expanded local RPM payload that includes the no-effect latticra CLI.

Purpose

The local Fedora RPM spec now packages the no-effect CLI as %{_bindir}/latticra.

This document defines the evidence required before that expanded payload can be treated as validated in a disposable Fedora VM.

This is a contract only.

It does not run the validation lane.

It does not build a release RPM.

It does not install or remove an RPM.

It does not validate /usr/bin/latticra.

It does not claim host install readiness for the CLI payload.

Required transcript header

```
FEDORA VM CLI PAYLOAD VALIDATION TRANSCRIPT
transcript_kind=disposable-vm-cli-payload-validation
transcript_version=1
operator_review_required=1
validation_transcript_recorded_after_real_run=1
```

Required target evidence

```
target_is_disposable_fedora_vm=1
target_is_daily_driver=0
target_is_production_host=0
target_is_immutable_fedora=0
target_has_clean_snapshot=1
target_has_recovery_path=1
operator_consent_recorded=1
fedora_os_release_recorded=1
fedora_kernel_version_recorded=1
rpm_tooling_recorded=1
rpmbuild_tooling_recorded=1
```

Required spec evidence

```
fedora_spec_updated_for_cli=1
rpm_payload_expansion_performed=1
rpm_contains_compiled_c_binary=1
buildarch_noarch_removed=1
cli_status_surface_implemented=1
cli_status_surface_guarded_before_packaging=1
local_cli_guard_passed=1
local_rpm_built_from_current_tree=1
```

Required source and guard references:

```
src/latticra_cli.c

LATTICRA_TARGET_IS_IMMUTABLE_FEDORA=0
LATTICRA_TARGET_HAS_CLEAN_SNAPSHOT=1
LATTICRA_TARGET_HAS_RECOVERY_PATH=1
LATTICRA_OPERATOR_CONSENT_RECORDED=1
ID=fedora
rpm_present=1
rpmbuild_present=1
```

Required package evidence

```
rpm_build_command_recorded=1
rpm_name_is_latticra=1
rpm_version_recorded=1
rpm_arch_recorded=1
rpm_path_recorded=1
rpm_metadata_recorded=1
rpm_payload_listing_recorded=1
rpm_payload_contains_cli_binary=1
rpm_payload_contains_readme=1
rpm_payload_contains_only_expected_surfaces=1
unexpected_runtime_surface_absent=1
```

Expected payload:

```
/usr/bin/latticra
/usr/share/doc/latticra/README.md
```

Forbidden payload surfaces:

```
/etc/latticra
/usr/lib/systemd/system/latticra.service
/usr/lib/modules
/boot/latticra
/usr/share/selinux
```

Required install and CLI evidence

```
install_command_recorded=1
install_result_recorded=1
rpm_query_after_install_recorded=1
installed_payload_listing_recorded=1
installed_cli_binary_present=1
installed_readme_present=1
rpm_verify_completed=1
cli_status_command_recorded=1
cli_version_command_recorded=1
cli_report_command_recorded=1
cli_invalid_command_recorded=1
cli_no_root_required=1

cli_no_network_observed=1
cli_no_service_operation_observed=1
cli_no_kernel_operation_observed=1
cli_no_boot_operation_observed=1
cli_no_selinux_policy_operation_observed=1
```

Required latticra --status and latticra --report output fields:

```
LATTICRA STATUS REPORT
project=latticra
mode=no-effect
runtime_behavior=disabled
host_mutation=0
network=0
kernel_operation=0
service_operation=0
package_manager_operation=0
boot_operation=0
selinux_policy_operation=0
effect_authority=denied
```

Required latticra --version output fields:

```
latticra 0.0.0
mode=no-effect
runtime_behavior=disabled
```

Required removal evidence

```
removal_command_recorded=1
removal_result_recorded=1
post_removal_query_recorded=1
post_removal_absence_verified=1
cli_removed_after_rpm_removal=1
readme_removed_after_rpm_removal=1
post_removal_cli_absence_verified=1
post_removal_readme_absence_verified=1
```

Required final report

A future runner should emit:

```
FEDORA VM CLI PAYLOAD VALIDATION LANE
validation_status=ok
package_name=latticra
package_version_recorded=1
package_arch_recorded=1
disposable_vm_target_verified=1
snapshot_evidence_present=1
recovery_evidence_present=1
operator_consent_recorded=1
rpm_payload_contains_cli_binary=1
```

```
rpm_payload_contains_readme=1
unexpected_runtime_surface_absent=1
install_validation_performed=1
cli_status_validation_performed=1
cli_version_validation_performed=1
cli_report_validation_performed=1
removal_validation_performed=1
post_removal_absence_verified=1
disposable_vm_cli_validation_completed=1
host_install_ready_for_cli_payload=1
production_installer_ready=0
fedora_distribution_ready=0
fedora_approval_claimed=0
daily_driver_install_ready=0
immutable_fedora_ready=0
evidence_level=9
```

Current project state until real evidence exists

```
fedora_spec_updated_for_cli=1
rpm_payload_expansion_performed=1
rpm_payload_validated=0
disposable_vm_cli_validation_transcript_present=0
disposable_vm_cli_validation_completed=0
host_install_ready_for_cli_payload=0
production_installer_ready=0
fedora_distribution_ready=0
fedora_approval_claimed=0
daily_driver_install_ready=0
immutable_fedora_ready=0
```

Validation

```
sh scripts/test-fedora-vm-cli-transcript-contract.sh
```

Expected output:

```
fedora_vm_cli_transcript_contract: ok
```

Next recommended lane

```
Add disposable Fedora VM CLI payload validation lane runner
```

Non-claims

This contract is not a completed validation transcript, not RPM install evidence, not disposable Fedora VM validation of the CLI payload, and not production readiness, Fedora approval, Fedora distribution readiness, daily-driver safety, immutable Fedora readiness, update safety, recovery safety, sandboxing, or a production installer claim.

docs/FREEBSD_PORT_STATIC_VALIDATION.md

Source title: FreeBSD Port Static Validation

Lines: 92 | Words: 214 | SHA-256: b2160cbb46363727c54c9dc8a01e86c5370d7cdf2fb35acbbb949c965660d2ec

FreeBSD Port Static Validation

Status: active static validation lane Scope: static checks for the local-only FreeBSD ports metadata draft.

Purpose

This lane checks that the FreeBSD port draft is present, narrow, and honest.

It verifies local ports metadata shape for the no-effect CLI payload, but it does not run make package, make stage, poudriere, portlint, or pkg install, and it does not create package artifacts.

Guarded Files

```
packaging/freebsd/README.md
packaging/freebsd/Makefile
packaging/freebsd/pkg-descr
packaging/freebsd/pkg-plist
docs/FREEBSD_PORT_STATIC_VALIDATION.md
docs/status/FREEBSD_ECOSYSTEM_INTEGRATION_STATUS.md
scripts/test-freebsd-port-static-validation.sh
.github/workflows/freebsd-port-static-validation.yml
```

Preserved Boundary

```
local_only_draft=1
freebsd_port_draft_present=1
freebsd_port_static_validation_present=1
freebsd_ports_tree_submission_claimed=0
freebsd_bugzilla_pr_claimed=0
freebsd_committer_review_claimed=0
poudriere_build_run=0
make_stage_run=0
make_package_run=0
portlint_run=0
package_artifact_created=0
freebsd_official_port_claimed=0
production_readiness_claimed=0
```

Package Intent

The local FreeBSD port draft records only this initial payload shape:

```
bin/latticra
%%DOCSDIR%%/README.md
```

The CLI remains the no-effect status surface from:

```
src/latticra_cli.c
```

Explicit Non-Claims

This static lane does not:

```
build a package artifact
install a package artifact
submit to the FreeBSD ports tree
claim Bugzilla PR evidence
claim FreeBSD committer review
claim poudriere success
claim portlint success
install an rc.d service
install kernel modules
write /etc or /boot
claim production readiness
```

Next Recommended Lane

Add a FreeBSD source archive and checksum contract before accepting make stage, make package, portlint, or poudriere evidence.

Validation

Run:

```
sh scripts/test-freebsd-port-static-validation.sh
```

Expected output:

```
freebsd_port_static_validation: ok
```

docs/MACOS_RESET_UNINSTALL_ABSENCE_REPORT_CONTRACT.md

Source title: macOS Reset/Uninstall Absence-Report Contract

Lines: 240 | Words: 482 | SHA-256: 42fd11504d5a772e091eacdfc07d6b6b6aeb794cfd36b2311ddbfd7d5357f9e9

macOS Reset/Uninstall Absence-Report Contract

Status: no-effect macOS reset/uninstall absence-report contract Date: 2026-05-25 CDT Scope: contract for future post-plan absence evidence before any reset/uninstall implementation.

Purpose

This contract defines the absence-report evidence that a future macOS reset/uninstall implementation must emit after planned managed-target removal.

It is contract-only. It does not delete files, remove directories, inspect post-removal state, write reports, write receipts, mutate host state, open the network, or claim reset/uninstall implementation.

Command

```
sh scripts/macos-reset-uninstall-absence-report-contract.sh
```

The command writes only a deterministic report to stdout.

Current Decision

The current absence-report posture is:

```
macos_reset_uninstall_absence_report_contract_present=1
macos_reset_uninstall_receipt_schema_contract_present=1
macos_reset_uninstall_implementation_gate_contract_present=1

absence_report_contract_state=defined-no-effect
absence_report_contract_decision=contract-defined-evidence-not-present
absence_report_required=1
absence_report_evidence_present=0
absence_report_run_performed=0
absence_report_written=0
```

Required Inputs

A future absence report must bind to the existing no-effect macOS reset/uninstall chain:

```
macos_reset_uninstall_dry_run_planner_present=1
reset_uninstall_dry_run_planner_transcript_present=1
macos_reset_uninstall_live_target_classifier_present=1
macos_reset_uninstall_dry_run_contract_present=1
macos_reset_uninstall_receipt_schema_contract_present=1
reset_uninstall_receipt_evidence_present=0
reset_receipt_evidence_present=0
macos_reset_uninstall_implementation_gate_contract_present=1
macos_reset_uninstall_operator_intent_contract_present=1
macos_reset_uninstall_effect_authorization_contract_present=1
macos_reset_uninstall_evidence_bundle_contract_present=1
macos_reset_uninstall_live_implementation_plan_contract_present=1
macos_reset_uninstall_live_execution_preflight_contract_present=1
macos_reset_uninstall_live_denial_transcript_contract_present=1
macos_reset_uninstall_live_runner_interface_contract_present=1
live_execution_preflight_contract_state=closed-no-effect
live_execution_preflight_passed=0
live_execution_preflight_blocking=1
live_execution_preflight_deletion_enabled=0
live_denial_transcript_contract_state=recorded-no-effect
live_denial_transcript_recorded=1
live_denial_transcript_stdout_only=1
live_denial_transcript_file_write_enabled=0
live_runner_interface_contract_state=defined-no-effect
live_runner_interface_current_preflight_passed=0
live_runner_interface_current_decision=deny
live_runner_interface_dispatch_enabled=0
live_runner_interface_runner_handoff_enabled=0
live_implementation_plan_contract_state=defined-no-effect
live_reset_uninstall_implementation_present=0
evidence_bundle_contract_state=defined-no-effect
evidence_bundle_complete=0
reset_uninstall_evidence_bundle_complete=0
effect_authorization_contract_state=closed-no-effect
reset_uninstall_effect_authorized=0
reset_uninstall_live_run_allowed=0
operator_reset_uninstall_intent_evidence_present=0
```

Required Report Lines

The future report must record:

```
absence_report_line_host_identity_required=1
absence_report_line_architecture_required=1
absence_report_line_operation_required=1
absence_report_line_planner_decision_required=1
absence_report_line_classifier_decision_required=1
absence_report_line_pre_removal_target_states_required=1
absence_report_line_managed_target_paths_required=1
absence_report_line_planned_actions_required=1
absence_report_line_post_removal_absence_required=1
absence_report_line_unmanaged_preservation_required=1
absence_report_line_receipt_path_required=1
absence_report_line_authority_denials_required=1
absence_report_line_no_network_required=1
absence_report_line_no_root_required=1
```

Target Evidence

The future report must bind evidence to these targets:

```
app_support_prefix_target=$HOME/Library/Application Support/Latticra
app_bundle_target=$HOME/Applications/Latticra Panel.app
cli_wrapper_target=$HOME/.local/bin/latticra-panel
reset_receipts_dir_target=$HOME/Library/Application Support/Latticra Reset Receipts
absence_report_path_future=$HOME/Library/Application Support/Latticra Reset
Receipts/absence-report.txt
absence_report_must_be_outside_removed_prefix=1
```

Managed targets must have absence evidence only when they were planned and actually removed by a future implementation:

```
app_bundle_absence_required_if_managed=1
app_support_absence_required_if_managed=1
cli_wrapper_absence_required_if_managed=1
unmanaged_target_preservation_evidence_required=1
reset_receipts_dir_preservation_required=1
reset_receipt_reference_required=1
planner_transcript_reference_required=1
```

```
live_classifier_reference_required=1
```

The macOS reset/uninstall receipt-schema contract defines the receipt fields that the future absence report must reference.

Phases

The future absence-report phases are:

```
absence_report_phase_1=consume_dry_run_planner_transcript
absence_report_phase_2=record_pre_removal_target_states
absence_report_phase_3=record_post_removal_absence_or_preservation
absence_report_phase_4=record_reset_receipt_reference
absence_report_phase_5=record_authority_denials
absence_report_phase_6=write_absence_report
absence_report_phase_6_status=disabled
```

Authority Boundary

This contract preserves:

```
managed_wrapper_removal_performed=0
managed_app_bundle_removal_performed=0
managed_application_support_removal_performed=0
reset_receipt_write_performed=0
absence_report_run_performed=0
absence_report_written=0
file_delete_performed=0
directory_delete_performed=0
application_support_write_performed=0
receipt_write_performed=0
app_bundle_write_performed=0
cli_wrapper_write_performed=0
shell_profile_mutation_performed=0
host_mutation_performed=0
network_performed=0
root_authority=0
launchagent_authority=0
keychain_authority=0
tcc_bypass_authority=0
endpoint_security_authority=0
system_extension_authority=0
network_extension_authority=0
privileged_helper_authority=0
runtime_authority_granted=0
production_installer_ready=0
```

Validation

This contract is guarded by:

```
sh scripts/test-macos-reset-uninstall-absence-report-contract.sh
```

Expected output:

```
macos_reset_uninstall_absence_report_contract: ok
```

Non-Claims

This contract is not macOS reset evidence, macOS uninstall evidence, macOS install evidence, macOS app bundle evidence, absence verification evidence, signed app evidence, notarization evidence, launchd evidence, Keychain evidence, Secure Enclave evidence, sandbox evidence, TCC approval evidence, Endpoint Security evidence, System Extension evidence, Network Extension evidence, privileged helper evidence, malware prevention, ransomware prevention, production readiness, Apple platform approval, or runtime authority.

Previous Recommended Lane

```
Add a macOS reset/uninstall evidence-bundle contract that groups implementation-gate,
operator-intent, receipt, absence, planner, and classifier evidence before any live execution.
```

Next Recommended Lane

```
Add a macOS reset/uninstall live-runner acceptance-denial disposition closeout audit review
disposition closeout contract that closes the reviewed no-effect closeout audit review
disposition without opening dispatch or deletion.
```

docs/OPENBSD_PORT_STATIC_VALIDATION.md

Source title: OpenBSD Port Static Validation

Lines: 94 | Words: 223 | SHA-256: fd665d945791baee3e55e0f5dc4057dacf7e327fc2e8f63c983725f2ef4857e2

OpenBSD Port Static Validation

Status: active static validation lane Scope: static checks for the local-only OpenBSD ports metadata draft.

Purpose

This lane checks that the OpenBSD port draft is present, narrow, and honest.

It verifies local ports metadata shape for the no-effect CLI payload, but it does not run make package, make plist, portcheck, a bulk build, or pkg_add, and it does not create package artifacts.

Guarded Files

```
packaging/openbsd/README.md
packaging/openbsd/Makefile
packaging/openbsd/pkg/DESCR
packaging/openbsd/pkg/PLIST
docs/OPENBSD_PORT_STATIC_VALIDATION.md
docs/status/OPENBSD_ECOSYSTEM_INTEGRATION_STATUS.md
scripts/test-openbsd-port-static-validation.sh
.github/workflows/openbsd-port-static-validation.yml
```

Preserved Boundary

```
local_only_draft=1
openbsd_port_draft_present=1
openbsd_port_static_validation_present=1
openbsd_ports_tree_submission_claimed=0
openbsd_ports_review_thread_claimed=0
openbsd_maintainer_acceptance_claimed=0
make_package_run=0
make_plist_run=0
bulk_build_run=0
portcheck_run=0
package_artifact_created=0
permit_package_enabled=0
openbsd_official_port_claimed=0
production_readiness_claimed=0
```

Package Intent

The local OpenBSD port draft records only this initial payload shape:

```
bin/latticra
share/doc/latticra/README.md
```

The CLI remains the no-effect status surface from:

```
src/latticra_cli.c
```

Explicit Non-Claims

This static lane does not:

```
build a package artifact
install a package artifact
submit to the OpenBSD ports tree
claim ports@ review evidence
claim maintainer acceptance
claim bulk build success
```

```
claim portcheck success
enable package redistribution
install an rc.d script
install kernel modules
write /etc or /bsd
claim production readiness
```

Next Recommended Lane

Add an OpenBSD source archive, checksum, and license redistribution contract before accepting PERMIT_PACKAGE=Yes, make plist, make package, portcheck, or bulk build evidence.

Validation

Run:

```
sh scripts/test-openbsd-port-static-validation.sh
```

Expected output:

```
openbsd_port_static_validation: ok
```

docs/OPENSUSE_DEVELOPER_WORKFLOW.md

Source title: openSUSE Developer Workflow

Lines: 143 | Words: 490 | SHA-256: bec79a79f3d5cc1e0eedaedc4b06cb9a1dde9adf8877d9b5ea3eb6d242159fc1

openSUSE Developer Workflow

Status: developer workflow record Scope: local openSUSE Linux commands for productive Latticra development, user-local Panel work, and openSUSE maintenance records.

Purpose

This note gives a repeatable local workflow for working on Latticra from openSUSE Linux.

The goal is simple:

```
install the small zypper toolchain
install the Panel desktop prerequisites
run the same guards as the Fedora and Ubuntu tracks
maintain local-only openSUSE RPM metadata separately from the Fedora draft
avoid Open Build Service, official package, or SUSE endorsement claims until evidence exists
```

Install Local Tools

On an openSUSE workstation or openSUSE container, install the basic guard toolchain:

```
sudo zypper refresh
sudo zypper install -y git gcc make coreutils findutils diffutils grep pkgconf
```

In a root container, omit sudo:

```
zypper refresh
zypper install -y git gcc make coreutils findutils diffutils grep pkgconf
```

Install Panel Prerequisites

For the Rust/egui Latticra Panel and desktop metadata refresh path, install:

```
sudo zypper refresh
sudo zypper install -y rust cargo make gcc pkgconf \
  libX11-devel libxcb-devel libXcursor-devel libXrandr-devel libXi-devel \
  libxkbcommon-devel Mesa-libGL-devel wayland-devel desktop-file-utils \
  gtk3-tools
```

If the distro Rust toolchain is unavailable or too old for the locked Cargo dependency graph, use a current stable Rust toolchain through the operator's approved toolchain source before running Panel commands. The repository does not grant network authority or install Rust by itself.

Fast Local Guard Loop

For a quick sanity check while editing C/kernel files, run:

```
sh scripts/test-state-lattice.sh
sh scripts/test-system-bootstrap.sh
sh scripts/test-kernel.sh
sh scripts/test-kernel-lifecycle.sh
sh scripts/test-latticra-no-effect-cli-status-surface.sh
```

openSUSE Lane Guards

Before merging openSUSE-facing work, run:

```
sh scripts/test-opensuse-developer-workflow.sh
sh scripts/test-opensuse-local-rpm-static-validation.sh
sh scripts/test-opensuse-rpmlint-findings-classification.sh
sh scripts/test-opensuse-source-archive-reproducibility-contract.sh
sh scripts/test-opensuse-source-archive-fixture-lane.sh
sh scripts/test-opensuse-rpm-topdir-handoff-lane.sh
sh scripts/test-opensuse-local-rpm-build-gate-contract.sh
sh scripts/test-opensuse-local-rpm-build-environment-contract.sh
sh scripts/test-opensuse-rpm-artifact-naming-contract.sh
sh scripts/test-opensuse-rpm-payload-inspection-contract.sh
sh scripts/test-opensuse-rpm-install-remove-transcript-contract.sh
sh scripts/test-opensuse-obs-publication-non-claim-review-contract.sh
```

Expected output:

```
opensuse_developer_workflow: ok
opensuse_local_rpm_static_validation: ok
opensuse_rpmlint_findings_classification: ok
opensuse_source_archive_reproducibility_contract: ok
opensuse_source_archive_fixture_lane: ok
opensuse_rpm_topdir_handoff_lane: ok
opensuse_local_rpm_build_gate_contract: ok
opensuse_local_rpm_build_environment_contract: ok
opensuse_rpm_artifact_naming_contract: ok
opensuse_rpm_payload_inspection_contract: ok
opensuse_rpm_install_remove_transcript_contract: ok
opensuse_obs_publication_non_claim_review_contract: ok
```

Panel From Source

After the prerequisites are present:

```
export PATH=&quot;$HOME/.local/bin:$PATH&quot;
make -C installer gui
```

The guarded user-local install remains the same on openSUSE:

```
make -C installer dry-run
make -C installer local-example
make -C installer verify-local
```

Maintenance Rhythm

Use this loop for productive openSUSE maintenance:

```
1. Create a small branch.
2. Make one bounded openSUSE-facing change.
3. Run the fast local guard loop.
4. Run the openSUSE lane guards when the branch touches packaging, installer, prerequisites, or
openSUSE docs.
5. Keep package language local-only until real lint/build/install and Open Build Service
evidence exists.
```

Current Boundary

This workflow is for local developer productivity, user-local Panel work, and local-only openSUSE package maintenance. It does not publish an RPM, create an Open Build Service project, submit to openSUSE, claim official package readiness, claim SUSE endorsement, install a root service, modify systemd, modify the kernel, or claim production readiness.

Validation

This workflow note is guarded by:

```
sh scripts/test-opensuse-developer-workflow.sh
```

Expected output:

```
opensuse_developer_workflow: ok
```

docs/OPENSUSE_LOCAL_RPM_BUILD_ENVIRONMENT_CONTRACT.md

Source title: openSUSE Local RPM Build Environment Contract

Lines: 261 | Words: 719 | SHA-256: eda94d9a97bdfc58ed44cd69a57059e3b04738bbb0703a2a89d9fb7b9a41fb67

openSUSE Local RPM Build Environment Contract

Status: active local RPM build environment contract Scope: document required disposable validation environments for openSUSE local RPM build lanes without running rpmbuild or osc build.

Purpose

This contract documents the minimum environment evidence required before any future openSUSE local RPM build lane can ask to open the build gate.

The goal is narrow: describe clean/disposable validation environments, required transcript fields, toolchain metadata, RPM input binding, and host-effect boundaries before any package build command can run.

This contract is documentation-only and static. It does not provision a VM or container, run rpmbuild, run osc build, run spec-cleaner, create source RPMs, create binary RPMs, install Latticra, publish to Open Build Service, or claim package readiness.

Current Environment State

```
opensuse_local_rpm_build_environment_contract_present=1
opensuse_rpm_artifact_naming_contract_present=1
opensuse_rpm_payload_inspection_contract_present=1
opensuse_rpm_install_remove_transcript_contract_present=1
opensuse_obs_publication_non_claim_review_contract_present=1
obs_publication_non_claim_review_present=1
publication_non_claim_review_present=1
opensuse_rpm_build_environment_contract_state=specified-no-effect
opensuse_rpm_artifact_naming_contract_state=specified-no-effect
opensuse_rpm_payload_inspection_contract_state=specified-no-effect
opensuse_rpm_install_remove_transcript_contract_state=specified-no-effect
opensuse_rpm_build_gate_state=closed-no-effect
opensuse_clean_build_environment_documented=1
opensuse_target_distribution_documented=1
osc_build_environment_documented=1
opensuse_build_environment_provisioned=0
osc_build_environment_provisioned=0
explicit_operator_build_authorization=0
disposable_validation_environment_required=1
disposable_validation_environment_provisioned=0
environment_transcript_present=0
toolchain_version_capture_required=1
rpm_input_digest_binding_required=1
rpmbuild_command_allowed=0
osc_build_command_allowed=0
rpmbuild_run=0
osc_build_run=0
spec_cleaner_run=0
rpm_artifact_created=0
rpm_payload_inspection_run=0
rpm_install_remove_transcript_present=0
rpm_validation_result_promoted=0
source_rpm_artifact_created=0
binary_rpm_artifact_created=0
rpm_artifact_sha256_recorded=0
rpm_installed_on_host=0
rpm_removed_from_host=0
package_readiness_claimed=0
```

Local RPM Environment Contract

A future local RPM build lane must use a disposable openSUSE validation environment before rpmbuild can run.

Required local RPM environment evidence:

```
opensuse_clean_build_environment_documented=1
opensuse_container_or_vm_required=1
opensuse_target_distribution_record_required=1
opensuse_architecture_record_required=1
opensuse_repository_state_record_required=1
opensuse_build_dependency_resolution_transcript_required=1
rpmbuild_toolchain_versions_required=1
source_archive_digest_required=1
rpm_topdir_input_path_required=1
rpmbuild_run=0
rpmbuild_ba_run=0
rpmbuild_bb_run=0
rpmbuild_bs_run=0
```

The local RPM environment contract does not choose between an openSUSE Tumbleweed container, an openSUSE Leap container, a disposable VM, or another clean openSUSE build host. A future effect-bearing proposal must name the exact environment and keep the build gate closed until operator authorization and all package prerequisites exist.

osc Build Environment Contract

A future osc build lane must use a disposable and documented openSUSE build context before osc build can run.

Required osc build environment evidence:

```
osc_build_environment_documented=1
osc_local_build_context_required=1
```

```
osc_config_scope_record_required=1
osc_target_project_record_required=1
osc_target_repository_record_required=1
osc_build_root_policy_required=1
osc_toolchain_versions_required=1
osc_build_run=0
osc_commit_run=0
obs_publication_claimed=0
```

The osc environment contract does not create an Open Build Service project, run osc build, run osc commit, submit Latticra to openSUSE, or publish package artifacts.

Shared Transcript Requirements

A future environment transcript must record:

```
environment_identifier
environment_lifecycle
host_or_vm_class
operating_system_name
operating_system_version
opensuse_target_distribution
architecture
repository_state
toolchain_versions
source_archive_name
source_archive_sha256
rpm_topdir_path
rpm_spec_path
rpm_output_directory
network_policy
host_mount_policy
cleanup_policy
operator_authorization_reference
```

The transcript must be reviewed before a local RPM build lane can claim that the environment is acceptable.

Current Blockers

RPM builds remain blocked because the current repository still has:

```
source_archive_accepted_for_build=0
accepted_rpmlint_transcript_present=0
unexpected_findings_count_recorded=0
license_expression_reviewed=1
package_notice_obligations_reviewed=0
buildrequires_reviewed=0
explicit_operator_build_authorization=0
rpm_artifact_naming_contract_present=1
rpm_payload_inspection_contract_present=1
rpm_install_remove_transcript_contract_present=1
obs_publication_non_claim_review_present=1
```

Command Boundary

This contract does not:

```
provision an openSUSE container
provision an openSUSE VM
run zypper install for build dependencies
run rpmbuild
run rpmbuild -ba
run rpmbuild -bb
run rpmbuild -bs
run osc build
run osc commit
run spec-cleaner
create source RPM artifacts
create binary RPM artifacts
install Latticra on a host
publish package artifacts
create an Open Build Service project
submit Latticra to openSUSE
claim package readiness
```

Relationship To Existing Lanes

This contract depends on:

```
docs/OPENSUSE_RPMLINT_FINDINGS_CLASSIFICATION.md
docs/OPENSUSE_SOURCE_ARCHIVE_REPRODUCIBILITY_CONTRACT.md
docs/OPENSUSE_SOURCE_ARCHIVE_FIXTURE_LANE.md
docs/OPENSUSE_RPM_TOPDIR_HANDOFF_LANE.md
docs/OPENSUSE_LOCAL_RPM_BUILD_GATE_CONTRACT.md
docs/OPENSUSE_RPM_ARTIFACT_NAMING_CONTRACT.md
docs/OPENSUSE_RPM_PAYLOAD_INSPECTION_CONTRACT.md
docs/OPENSUSE_RPM_INSTALL_REMOVE_TRANSCRIPT_CONTRACT.md
docs/OPENSUSE_OBS_PUBLICATION_NON_CLAIM_REVIEW_CONTRACT.md
```

The local RPM build gate remains closed. This environment contract only records what future disposable openSUSE validation environments must prove before a build lane can request authorization.

Completed Follow-On Lane

Completed follow-on RPM artifact naming contract:

```
Add openSUSE RPM artifact naming contract before any source RPM or binary RPM artifact can be
created.
```

```
docs/OPENSUSE_RPM_ARTIFACT_NAMING_CONTRACT.md
scripts/test-opensuse-rpm-artifact-naming-contract.sh
.github/workflows/opensuse-rpm-artifact-naming-contract.yml
```

That lane defines source RPM and binary RPM names, output directories, checksum binding, retention rules, and Open Build Service non-claims while keeping opensuse_rpm_build_gate_state=closed-no-effect.

Completed follow-on RPM payload inspection contract:

```
Add openSUSE RPM payload inspection contract before any RPM artifact can be accepted.
```

```
docs/OPENSUSE_RPM_PAYLOAD_INSPECTION_CONTRACT.md
scripts/test-opensuse-rpm-payload-inspection-contract.sh
.github/workflows/opensuse-rpm-payload-inspection-contract.yml
```

That lane defines payload inspection evidence without opening the RPM build gate.

Completed follow-on RPM install/remove transcript contract:

```
docs/OPENSUSE_RPM_INSTALL_REMOVE_TRANSCRIPT_CONTRACT.md
scripts/test-opensuse-rpm-install-remove-transcript-contract.sh
.github/workflows/opensuse-rpm-install-remove-transcript-contract.yml
```

That lane defines disposable install/remove transcript evidence without opening the RPM build gate.

Completed follow-on OBS publication non-claim review contract:

```
docs/OPENSUSE_OBS_PUBLICATION_NON_CLAIM_REVIEW_CONTRACT.md
scripts/test-opensuse-obs-publication-non-claim-review-contract.sh
.github/workflows/opensuse-obs-publication-non-claim-review-contract.yml
```

That lane records Open Build Service, submit-request, official-package, and SUSE endorsement non-claims without publishing packages.

Next Slice

Recommended next slice:

```
Add openSUSE RPM validation promotion blocker matrix before any package validation result can be
 accepted.
```

That future lane should tie source, environment, artifact, payload, install/remove, and OBS non-claim records together while keeping RPM builds and readiness blocked.

Validation

Run:

```
sh scripts/test-opensuse-local-rpm-build-environment-contract.sh
```

Expected output:

```
opensuse_local_rpm_build_environment_contract: ok
```

docs/OPENSUSE_LOCAL_RPM_BUILD_GATE_CONTRACT.md

Source title: openSUSE Local RPM Build Gate Contract

Lines: 239 | Words: 629 | SHA-256: ba06a57a6770fbd3788e2cfa630b30b3a20c3b708bd7eed48858cf00b6bfe2c6

openSUSE Local RPM Build Gate Contract

Status: active local RPM build evidence gate contract Scope: define the evidence required before openSUSE rpmbuild or osc build commands can run in any validation lane.

Purpose

This contract closes the openSUSE local RPM build gate after the source archive fixture and temporary RPM topdir handoff lanes.

The goal is conservative: record the exact prerequisites required before rpmbuild, osc build, spec-cleaner, package artifact creation, host installation, Open Build Service publication, or package-readiness claims can be attempted or accepted as evidence.

This contract is documentation-only and static. It does not run build tools, create source RPMs, create binary RPMs, install Latticra, publish to Open Build Service, or claim package readiness.

Current Gate State

```
opensuse_local_rpm_build_gate_contract_present=1
opensuse_rpm_install_remove_transcript_contract_present=1
opensuse_obs_publication_non_claim_review_contract_present=1
opensuse_rpm_build_gate_state=closed-no-effect
rpmbuild_allowed=0
osc_build_allowed=0
spec_cleaner_allowed=0
rpmbuild_run=0
rpmbuild_ba_run=0
rpmbuild_bb_run=0
rpmbuild_bs_run=0
osc_build_run=0
spec_cleaner_run=0
source_rpm_artifact_created=0
binary_rpm_artifact_created=0
rpm_artifact_created=0
rpm_install_remove_transcript_present=0
rpm_validation_result_promoted=0
rpm_installed_on_host=0
rpm_removed_from_host=0
obs_publication_claimed=0
package_readiness_claimed=0
```

Required Gate Inputs

The build gate cannot open unless all RPM input evidence has already passed:

```
opensuse_rpm_topdir_handoff_lane_present=1
opensuse_rpm_payload_inspection_contract_present=1
temporary_rpm_topdir_handoff_lane_passed=1
opensuse_source_archive_fixture_lane_present=1
opensuse_source_archive_reproducibility_contract_present=1
temporary_rpm_source_sha256_preserved=1
temporary_rpm_source_listing_preserved=1
temporary_rpm_source0_name_matched=1
temporary_rpm_autosetup_root_matched=1
source_archive_accepted_for_build=1
accepted_rpmlint_transcript_present=1
unexpected_findings_count=0
license_expression_reviewed=1
package_notice_obligations_reviewed=1
buildrequires_reviewed=1
spec_cleaner_review_present=1
```

```
open_build_service_non_claim_review_present=1
```

The source_archive_accepted_for_build=1 and accepted_rpmlint_transcript_present=1 values are future prerequisites, not current claims. The current source archive, lint, and topdir lanes still keep build acceptance closed.

Environment Prerequisites

Before any openSUSE package build command can run, a future build-lane proposal must document:

```
opensuse_clean_build_environment_documented=1
opensuse_target_distribution_documented=1
rpmbuild_toolchain_versions_recorded=1
osc_build_environment_documented=1
explicit_operator_build_authorization=1
disposable_validation_environment=1
rpm_artifact_naming_contract_present=1
rpm_payload_inspection_contract_present=1
rpm_install_remove_transcript_contract_present=1
obs_publication_non_claim_review_present=1
```

Those records must identify the exact host or VM class, openSUSE target, toolchain versions, source archive digest, RPM topdir input paths, package output paths, install target, remove target, and transcript retention location before a build can be attempted.

Command Gate

All package build commands remain blocked while the current gate state is closed-no-effect.

openSUSE build commands blocked by this contract:

```
rpmbuild -ba
rpmbuild -bb
rpmbuild -bs
osc build
spec-cleaner
```

Open Build Service and host-effect commands blocked by this contract:

```
osc branch
osc submitreq
osc commit
zypper install local RPM artifact
rpm install local RPM artifact
install package on host
remove package from host
publish package artifact
claim official openSUSE package status
claim SUSE endorsement
claim production readiness
```

Future Open Conditions

A future local RPM build lane may move opensuse_rpm_build_gate_state=closed-no-effect to opensuse_rpm_build_gate_state=open-for-local-rpm-build-validation only after it records:

```
source_archive_accepted_for_build=1
archive_sha256_bound_to_build=1
accepted_rpmlint_transcript_present=1
unexpected_findings_count=0
license_expression_reviewed=1
package_notice_obligations_reviewed=1
buildrequires_reviewed=1
spec_cleaner_review_present=1
opensuse_clean_build_environment_documented=1
opensuse_target_distribution_documented=1
explicit_operator_build_authorization=1
disposable_validation_environment=1
rpm_artifact_naming_contract_present=1
rpm_payload_inspection_contract_present=1
rpm_install_remove_transcript_contract_present=1
obs_publication_non_claim_review_present=1
```

Opening a local build gate must not imply Open Build Service publication, openSUSE acceptance, host install readiness, or package readiness.

Current Non-Claims

```
opensuse_official_package_claimed=0
opensuse_obs_publication_claimed=0
opensuse_submit_request_claimed=0
suse_endorsement_claimed=0
opensuse_distribution_ready=0
production_installer_ready=0
root_installer_ready=0
```

Relationship To Existing Lanes

This contract depends on:

```
docs/OPENSUSE_RPMLINT_FINDINGS_CLASSIFICATION.md
docs/OPENSUSE_SOURCE_ARCHIVE_REPRODUCIBILITY_CONTRACT.md
docs/OPENSUSE_SOURCE_ARCHIVE_FIXTURE_LANE.md
docs/OPENSUSE_RPM_TOPDIR_HANDOFF_LANE.md
docs/OPENSUSE_LOCAL_RPM_BUILD_ENVIRONMENT_CONTRACT.md
docs/OPENSUSE_RPM_ARTIFACT_NAMING_CONTRACT.md
docs/OPENSUSE_RPM_PAYLOAD_INSPECTION_CONTRACT.md
docs/OPENSUSE_RPM_INSTALL_REMOVE_TRANSCRIPT_CONTRACT.md
docs/OPENSUSE_OBS_PUBLICATION_NON_CLAIM_REVIEW_CONTRACT.md
```

The rpmlint findings classification record keeps lint output from becoming package readiness evidence without review.

The source archive fixture lane proves temporary archive shape in a disposable workspace.

The RPM topdir handoff lane proves temporary RPM build-input staging while preserving archive SHA-256 identity.

This build gate keeps package build execution closed until source acceptance, lint classification, license, notice, BuildRequires, environment, authorization, payload inspection, install/remove, and OBS non-claim evidence exists.

Next Slice

Completed follow-on local RPM build environment contract:

```
docs/OPENSUSE_LOCAL_RPM_BUILD_ENVIRONMENT_CONTRACT.md
scripts/test-opensuse-local-rpm-build-environment-contract.sh
.github/workflows/opensuse-local-rpm-build-environment-contract.yml
```

Completed follow-on RPM artifact naming contract:

```
docs/OPENSUSE_RPM_ARTIFACT_NAMING_CONTRACT.md
scripts/test-opensuse-rpm-artifact-naming-contract.sh
.github/workflows/opensuse-rpm-artifact-naming-contract.yml
```

Completed follow-on RPM payload inspection contract:

```
docs/OPENSUSE_RPM_PAYLOAD_INSPECTION_CONTRACT.md
scripts/test-opensuse-rpm-payload-inspection-contract.sh
.github/workflows/opensuse-rpm-payload-inspection-contract.yml
```

Completed follow-on RPM install/remove transcript contract:

```
docs/OPENSUSE_RPM_INSTALL_REMOVE_TRANSCRIPT_CONTRACT.md
scripts/test-opensuse-rpm-install-remove-transcript-contract.sh
.github/workflows/opensuse-rpm-install-remove-transcript-contract.yml
```

Completed follow-on OBS publication non-claim review contract:

```
docs/OPENSUSE_OBS_PUBLICATION_NON_CLAIM_REVIEW_CONTRACT.md
scripts/test-opensuse-obs-publication-non-claim-review-contract.sh
.github/workflows/opensuse-obs-publication-non-claim-review-contract.yml
```

Recommended next slice:

```
Add openSUSE RPM validation promotion blocker matrix before any package validation result can be
 accepted.
```

That future lane should tie source, environment, artifact, payload, install/remove, and OBS non-claim records together while keeping RPM builds and readiness blocked.

Validation

Run:

```
sh scripts/test-opensuse-local-rpm-build-gate-contract.sh
```

Expected output:

```
opensuse_local_rpm_build_gate_contract: ok
```

docs/OPENSUSE_LOCAL_RPM_STATIC_VALIDATION.md

Source title: openSUSE Local RPM Static Validation

Lines: 110 | Words: 282 | SHA-256: 3f12068ffbd97ad0dac293d9d7ac57b54a35c7609be8523b1a260a7a3c1446bf

openSUSE Local RPM Static Validation

Status: active static validation lane Scope: static checks for the local-only openSUSE RPM packaging draft and maintenance changes file.

Purpose

This lane turns the openSUSE packaging and maintenance draft into an executable static check.

It checks the current local openSUSE RPM spec and .changes record without building packages, producing artifacts, running osc, running rpmlint, or claiming Open Build Service publication.

Files

```
docs/OPENSUSE_LOCAL_RPM_STATIC_VALIDATION.md
docs/OPENSUSE_READINESS_PLAN.md
docs/status/OPENSUSE_ECOSYSTEM_INTEGRATION_STATUS.md
packaging/opensuse/README.md
packaging/opensuse/latticra.spec
packaging/opensuse/latticra.changes
scripts/test-opensuse-local-rpm-static-validation.sh
.github/workflows/opensuse-local-rpm-static-validation.yml
```

Checks

The static validation lane verifies:

```
local-only openSUSE draft marker exists
local packaging README records non-claims
placeholder license remains explicit
local release marker remains explicit
required RPM sections exist
.changes maintenance record exists
no service files are installed
no scriptlet sections are defined
no boot, kernel, systemd, SELinux, or etc paths are added
no Open Build Service publication claim is made
```

Boundary

This lane is static validation only.

It does not run rpmbuild, osc build, rpmlint, spec-cleaner, or zypper install.

It does not create package artifacts, publish to Open Build Service, submit to openSUSE, install on a host, or claim production readiness.

Next Slice

Completed follow-on availability lane:

```
docs/OPENSUSE_RPMLINT_OSC_AVAILABILITY.md

.github/workflows/opensuse-local-rpm-build-environment-contract.yml
.github/workflows/opensuse-rpm-artifact-naming-contract.yml
.github/workflows/opensuse-rpm-payload-inspection-contract.yml
.github/workflows/opensuse-rpm-install-remove-transcript-contract.yml
```

Recommended next slice:

```
Add openSUSE RPM validation promotion blocker matrix before any package validation result can be
 accepted.
```

That future lane should tie source, environment, artifact, payload, install/remove, and OBS non-claim records together while keeping RPM builds and readiness blocked.

Validation

Run:

```
sh scripts/test-opensuse-local-rpm-static-validation.sh
```

Expected output:

```
opensuse_local_rpm_static_validation: ok
```

docs/OPENSUSE_OBS_PUBLICATION_NON_CLAIM_REVIEW_CONTRACT.md

Source title: openSUSE OBS Publication Non-Claim Review Contract

Lines: 177 | Words: 527 | SHA-256: e5563c43f2833f826824ee1d2df23cf757f80c89a070fde97ac7b0c941fc649b

openSUSE OBS Publication Non-Claim Review Contract

Status: active OBS publication non-claim review contract Scope: define Open Build Service, submit-request, official-package, and SUSE endorsement non-claim review evidence for openSUSE package validation without publishing packages.

Purpose

This contract records the Open Build Service publication non-claim review required before any future openSUSE RPM validation result can be promoted.

The goal is narrow: future openSUSE package validation evidence must remain clearly local-only unless a separate, explicit publication lane records the required Open Build Service project, package, repository, submit-request, maintainer-review, and acceptance evidence.

This contract is documentation-only and static. It does not run osc, create an Open Build Service project, create an OBS package, upload sources, submit Latticra to openSUSE, create package repositories, publish RPM artifacts, create RPM artifacts, install packages, remove packages, or claim package readiness.

Current Publication Non-Claim State

```
opensuse_obs_publication_non_claim_review_contract_present=1
obs_publication_non_claim_review_contract_present=1
publication_non_claim_review_contract_present=1
obs_publication_non_claim_review_present=1
publication_non_claim_review_present=1
opensuse_rpm_build_gate_state=closed-no-effect
payload_inspection_contract_state=specified-no-effect
install_remove_transcript_contract_state=specified-no-effect
rpm_validation_result_promoted=0
rpm_artifact_created=0
rpm_artifact_published=0
obs_project_created=0
obs_package_created=0
obs_repository_created=0
obs_source_link_created=0
osc_branch_run=0
osc_commit_run=0
osc_submitreq_run=0
osc_request_accepted=0
obs_build_result_claimed=0
opensuse_obs_publication_claimed=0
opensuse_submit_request_claimed=0
opensuse_official_package_claimed=0
suse_endorsement_claimed=0
opensuse_factory_submission_claimed=0
opensuse_factory_acceptance_claimed=0
opensuse_leap_submission_claimed=0
opensuse_distribution_ready=0
package_readiness_claimed=0
production_installer_ready=0
root_installer_ready=0
```

OBS Publication Non-Claims

Future openSUSE validation promotion must preserve these current non-claims:

```
obs_publication_non_claim_review_required=1
obs_publication_non_claim_review_present=1
opensuse_obs_publication_claimed=0
opensuse_submit_request_claimed=0
opensuse_official_package_claimed=0
suse_endorsement_claimed=0
obs_project_created=0
obs_package_created=0
obs_repository_created=0
obs_source_upload_run=0
osc_branch_run=0
osc_add_run=0
osc_commit_run=0
osc_submitreq_run=0
osc_request_accepted=0
```

The openSUSE RPM draft remains local-only. A future Open Build Service project, submit-request, Factory, Leap, or repository publication lane must be separate from local build, payload, install/remove, and publication non-claim review evidence.

Promotion Review Boundary

A future openSUSE RPM validation promotion review must record:

```
rpm_validation_result_identifier
opensuse_target_distribution
source_archive_sha256
```

```
source_rpm_artifact_sha256
binary_rpm_artifact_sha256
payload_inspection_transcript_sha256
install_remove_transcript_sha256
obs_publication_non_claim_reviewer
obs_publication_non_claim_review_date
non_claimed_obs_targets
non_claimed_submit_request_targets
status_page_update_reference
operator_authorization_reference
```

That review may only promote a validation result as local validation evidence. It must not convert local evidence into Open Build Service publication evidence, openSUSE Factory evidence, openSUSE Leap evidence, official-package evidence, SUSE endorsement evidence, package repository evidence, production installer evidence, or release readiness.

Current Blockers

openSUSE RPM validation promotion remains blocked because the current repository still has:

```
source_archive_accepted_for_build=0
accepted_rpmlint_transcript_present=0
rpm_artifact_created=0
rpm_artifact_sha256_recorded=0
rpm_payload_accepted=0
rpm_install_remove_transcript_present=0
environment_transcript_present=0
explicit_operator_build_authorization=0
rpm_validation_result_promoted=0
```

Command Boundary

This contract does not:

```
run osc branch
run osc add
run osc commit
run osc submitreq
run osc build
create an Open Build Service project
create an Open Build Service package
upload source files to Open Build Service
publish RPM artifacts
submit Latticra to openSUSE
claim openSUSE Factory acceptance
claim openSUSE Leap acceptance
claim official openSUSE package status
claim SUSE endorsement
create RPM artifacts
install Latticra on a host
remove Latticra from a host
claim package readiness
```

Relationship To Existing Lanes

This contract depends on:

```
docs/OPENSUSE_RPMLINT_FINDINGS_CLASSIFICATION.md
docs/OPENSUSE_SOURCE_ARCHIVE_REPRODUCIBILITY_CONTRACT.md
docs/OPENSUSE_SOURCE_ARCHIVE_FIXTURE_LANE.md
docs/OPENSUSE_RPM_TOPDIR_HANDOFF_LANE.md
docs/OPENSUSE_LOCAL_RPM_BUILD_GATE_CONTRACT.md
docs/OPENSUSE_LOCAL_RPM_BUILD_ENVIRONMENT_CONTRACT.md
docs/OPENSUSE_RPM_ARTIFACT_NAMING_CONTRACT.md
docs/OPENSUSE_RPM_PAYLOAD_INSPECTION_CONTRACT.md
docs/OPENSUSE_RPM_INSTALL_REMOVE_TRANSCRIPT_CONTRACT.md
```

The local RPM build gate remains closed. This OBS publication non-claim review contract only records that local openSUSE package validation evidence must remain non-published and non-official until a separate Open Build Service publication lane exists.

Next Slice

Recommended next slice:

```
Add openSUSE RPM validation promotion blocker matrix before any package validation result can be
 accepted.
```

That future lane should tie source, environment, artifact, payload, install/remove, and OBS non-claim records together while keeping RPM builds and readiness blocked.

Validation

Run:

```
sh scripts/test-opensuse-obs-publication-non-claim-review-contract.sh
```

Expected output:

```
opensuse_obs_publication_non_claim_review_contract: ok
```

docs/OPENSUSE_READINESS_PLAN.md

Source title: openSUSE Readiness Plan

Lines: 273 | Words: 770 | SHA-256: 27eb773271e015bc7e68fffaf6598d3dd4dbb6cd31041208fda426aca670609e

openSUSE Readiness Plan

Status: planning and maintenance record Scope: preparing Latticra for openSUSE-friendly development, local validation, local-only RPM packaging, and maintenance review.

Purpose

This plan gives the openSUSE track the same purpose as the Fedora and Ubuntu tracks: integrate Latticra with a real Linux ecosystem through bounded local validation, packaging-shape records, and maintenance evidence while preserving current non-claims.

This plan prepares Latticra for an openSUSE-facing path without claiming openSUSE acceptance, SUSE endorsement, Open Build Service publication, production installer readiness, or distribution status.

The near-term target is:

```
Latticra builds cleanly on openSUSE after operator-installed prerequisites.
Latticra Panel can be run from source on openSUSE with documented zypper prerequisites.
Latticra has a local-only openSUSE RPM packaging draft for the no-effect CLI payload.
Latticra records openSUSE maintenance boundaries separately from Fedora and Ubuntu package
lanes.
Latticra preserves its current non-claims.
```

Terminology Boundary

Use:

```
openSUSE readiness
openSUSE compatibility lane
openSUSE maintenance lane
local-only openSUSE RPM draft
Latticra on openSUSE
future Open Build Service review candidate
```

Avoid claiming:

```
official openSUSE package
published Open Build Service package
SUSE endorsement
openSUSE derivative
openSUSE distribution
operating-system replacement
```

Those terms require separate package review, Open Build Service evidence, policy review, legal review, trademark review, and community review.

openSUSE-Facing Requirements To Respect

Before Latticra can be proposed beyond a local RPM draft, it should be checked against openSUSE package and maintenance expectations:

```
spec file hygiene
.changes maintenance record
license expression review
BuildRequires completeness
no bundled system libraries
valid file ownership
valid permissions
rpmlint output classification
spec-cleaner review where appropriate
osc local build evidence
Open Build Service project metadata review
install/remove behavior evidence
```

Current Latticra Posture

Current Latticra evidence is still early-stage and report-oriented.

Known current posture:

```
opensuse_developer_workflow_present=1
opensuse_panel_prerequisites_documented=1
opensuse_local_rpm_draft_present=1
opensuse_local_rpm_static_validation_present=1
opensuse_changes_file_present=1
opensuse_rpmlint_osc_availability_lane_present=1
opensuse_rpmlint_static_spec_lane_present=1
opensuse_rpmlint_findings_classification_present=1
opensuse_source_archive_reproducibility_contract_present=1
opensuse_source_archive_fixture_lane_present=1
opensuse_rpm_topdir_handoff_lane_present=1
opensuse_local_rpm_build_gate_contract_present=1
opensuse_local_rpm_build_environment_contract_present=1
opensuse_rpm_artifact_naming_contract_present=1
opensuse_rpm_payload_inspection_contract_present=1
opensuse_rpm_install_remove_transcript_contract_present=1
opensuse_obs_publication_non_claim_review_contract_present=1
opensuse_obs_publication_claimed=0
opensuse_official_package_claimed=0
suse_endorsement_claimed=0
opensuse_distribution_ready=0
production_installer_ready=0
daily_driver_install_ready=0
root_installer_ready=0
```

The first openSUSE target is development, local validation, and package-maintenance shape. It is not an official openSUSE package, Open Build Service publication, image, distribution, or replacement operating system.

Phase 1: openSUSE Developer Workflow

The openSUSE developer workflow gives local zypper commands for toolchain setup, Panel prerequisites, and the same guarded no-effect validation loop used by the other Linux tracks.

Current guarded files:

```
docs/OPENSUSE_DEVELOPER_WORKFLOW.md
scripts/test-opensuse-developer-workflow.sh
.github/workflows/opensuse-developer-workflow.yml
```

Phase 2: Panel Prerequisites Lane

The Panel remains user-local on openSUSE. The zypper prerequisites support local Rust/egui development and desktop metadata refresh without adding root-installed Latticra services.

Current public entry points:

```
README.md
docs/QUICK_START_CHEATSHEET.md
installer/README.md
```

Phase 3: Local openSUSE RPM Draft Lane

Packaging metadata is present as a local-only openSUSE draft. It records package shape, a separate maintenance changes file, and static validation boundaries.

Current guarded files:

```
packaging/opensuse/README.md
packaging/opensuse/latticra.spec
packaging/opensuse/latticra.changes
docs/OPENSUSE_LOCAL_RPM_STATIC_VALIDATION.md
scripts/test-opensuse-local-rpm-static-validation.sh
.github/workflows/opensuse-local-rpm-static-validation.yml
```

The first openSUSE RPM draft is only a packaging-shape and maintenance record until lint/build/install evidence is added.

Phase 4: Open Build Service Readiness Lane

The first Open Build Service readiness slices are tool availability and static spec lint only.

Current guarded files:

```
docs/OPENSUSE_RPMLINT_OSC_AVAILABILITY.md
docs/OPENSUSE_RPMLINT_STATIC_SPEC_LANE.md
docs/OPENSUSE_RPMLINT_FINDINGS_CLASSIFICATION.md
docs/OPENSUSE_SOURCE_ARCHIVE_REPRODUCIBILITY_CONTRACT.md
docs/OPENSUSE_SOURCE_ARCHIVE_FIXTURE_LANE.md
docs/OPENSUSE_RPM_TOPDIR_HANDOFF_LANE.md
docs/OPENSUSE_LOCAL_RPM_BUILD_GATE_CONTRACT.md
docs/OPENSUSE_LOCAL_RPM_BUILD_ENVIRONMENT_CONTRACT.md
docs/OPENSUSE_RPM_ARTIFACT_NAMING_CONTRACT.md
docs/OPENSUSE_RPM_PAYLOAD_INSPECTION_CONTRACT.md
docs/OPENSUSE_RPM_INSTALL_REMOVE_TRANSCRIPT_CONTRACT.md
docs/OPENSUSE_OBS_PUBLICATION_NON_CLAIM_REVIEW_CONTRACT.md
scripts/test-opensuse-rpmlint-osc-availability.sh
scripts/test-opensuse-rpmlint-static-spec-lane.sh
scripts/test-opensuse-rpmlint-findings-classification.sh
scripts/test-opensuse-source-archive-reproducibility-contract.sh
scripts/test-opensuse-source-archive-fixture-lane.sh
scripts/test-opensuse-rpm-topdir-handoff-lane.sh
scripts/test-opensuse-local-rpm-build-gate-contract.sh
scripts/test-opensuse-local-rpm-build-environment-contract.sh
scripts/test-opensuse-rpm-artifact-naming-contract.sh
scripts/test-opensuse-rpm-payload-inspection-contract.sh
scripts/test-opensuse-rpm-install-remove-transcript-contract.sh
scripts/test-opensuse-obs-publication-non-claim-review-contract.sh
.github/workflows/opensuse-rpmlint-osc-availability.yml
.github/workflows/opensuse-rpmlint-static-spec-lane.yml
.github/workflows/opensuse-rpmlint-findings-classification.yml
.github/workflows/opensuse-source-archive-reproducibility-contract.yml
.github/workflows/opensuse-source-archive-fixture-lane.yml
.github/workflows/opensuse-rpm-topdir-handoff-lane.yml
.github/workflows/opensuse-local-rpm-build-gate-contract.yml
.github/workflows/opensuse-local-rpm-build-environment-contract.yml
.github/workflows/opensuse-rpm-artifact-naming-contract.yml
.github/workflows/opensuse-rpm-payload-inspection-contract.yml
.github/workflows/opensuse-rpm-install-remove-transcript-contract.yml
.github/workflows/opensuse-obs-publication-non-claim-review-contract.yml
```

Before any Open Build Service publication or submit request can be claimed, the lane needs evidence for:

```
osc availability
rpmlint availability
spec-cleaner review posture
local osc build transcript
source archive reproducibility
source archive fixture reproducibility
temporary RPM topdir handoff
local RPM build gate contract
local RPM build environment contract
RPM artifact naming contract
RPM payload inspection contract
RPM install/remove transcript contract
OBS publication non-claim review contract
```

```
package artifact inspection
install/remove behavior transcript
```

Non-Claims

This plan does not:

```
publish an RPM package
create an Open Build Service project
submit Latticra to openSUSE
claim official openSUSE package readiness
claim SUSE endorsement
install a root service
modify systemd
modify the kernel
claim production readiness
claim operating-system completeness
```

Recommended Next Slice

Recommended next slice:

```
Add openSUSE RPM validation promotion blocker matrix before any package validation result can be
 accepted.
```

That should tie source, environment, artifact, payload, install/remove, and OBS non-claim records together while keeping RPM builds and readiness blocked.

Validation

Run:

```
sh scripts/test-opensuse-developer-workflow.sh
sh scripts/test-opensuse-local-rpm-static-validation.sh
sh scripts/test-opensuse-rpmlint-osc-availability.sh
sh scripts/test-opensuse-rpmlint-static-spec-lane.sh
sh scripts/test-opensuse-rpmlint-findings-classification.sh
sh scripts/test-opensuse-source-archive-reproducibility-contract.sh
sh scripts/test-opensuse-source-archive-fixture-lane.sh
sh scripts/test-opensuse-rpm-topdir-handoff-lane.sh
sh scripts/test-opensuse-local-rpm-build-gate-contract.sh
sh scripts/test-opensuse-local-rpm-build-environment-contract.sh
sh scripts/test-opensuse-rpm-artifact-naming-contract.sh
sh scripts/test-opensuse-rpm-payload-inspection-contract.sh
sh scripts/test-opensuse-rpm-install-remove-transcript-contract.sh
sh scripts/test-opensuse-obs-publication-non-claim-review-contract.sh
```

Expected output:

```
opensuse_developer_workflow: ok
opensuse_local_rpm_static_validation: ok
opensuse_rpmlint_osc_availability: ok
opensuse_rpmlint_static_spec_lane: ok
opensuse_rpmlint_findings_classification: ok
opensuse_source_archive_reproducibility_contract: ok

opensuse_obs_publication_non_claim_review_contract: ok
```

docs/OPENSUSE_RPM_ARTIFACT_NAMING_CONTRACT.md

Source title: openSUSE RPM Artifact Naming Contract

Lines: 219 | Words: 647 | SHA-256: 0f3e5631b92b589d3b6bd47b98e77a6c82883db212de7c1dcd14c59e9b560b38

openSUSE RPM Artifact Naming Contract

Status: active RPM artifact naming contract Scope: define future openSUSE source RPM and binary RPM artifact names and output boundaries without creating RPM artifacts.

Purpose

This contract records the artifact names, output-directory rules, checksum binding, retention requirements, and Open Build Service non-claims required before any future openSUSE local RPM build can create source RPM or binary RPM files.

The goal is narrow: RPM artifacts must have predictable names, be written only inside a disposable validation environment, bind back to the source archive digest, and remain non-published review outputs until separate payload inspection, install/remove, and OBS publication review contracts exist.

This contract is documentation-only and static. It does not run rpmbuild, run osc build, run spec-cleaner, create RPM artifacts, install Latticra, publish packages, create an Open Build Service project, submit Latticra to openSUSE, or claim package readiness.

Current Artifact Naming State

```
opensuse_rpm_artifact_naming_contract_present=1
opensuse_rpm_payload_inspection_contract_present=1
opensuse_rpm_install_remove_transcript_contract_present=1
opensuse_obs_publication_non_claim_review_contract_present=1
rpm_artifact_naming_contract_present=1
obs_publication_non_claim_review_present=1
publication_non_claim_review_present=1
opensuse_rpm_artifact_naming_contract_state=specified-no-effect
opensuse_rpm_payload_inspection_contract_state=specified-no-effect
opensuse_rpm_install_remove_transcript_contract_state=specified-no-effect
payload_inspection_contract_state=specified-no-effect
opensuse_rpm_build_gate_state=closed-no-effect
opensuse_rpm_build_environment_contract_state=specified-no-effect
rpm_artifact_output_directory_required_under_disposable_environment=1
rpm_artifact_output_directory_created=0
repository_rpm_artifact_write_allowed=0
publication_directory_write_allowed=0
rpm_artifact_created=0
source_rpm_artifact_created=0
binary_rpm_artifact_created=0
rpm_artifact_sha256_recorded=0
rpm_artifact_published=0
rpm_install_remove_transcript_present=0
rpm_validation_result_promoted=0
rpm_installed_on_host=0
rpm_removed_from_host=0
package_readiness_claimed=0
```

Source RPM Artifact Name

Future source RPM artifact names must be derived from the current openSUSE spec Name, Version, and Release values.

```
rpm_source_package_name=latticra-0.0.0-0.local.src.rpm
rpm_source_archive_name=latticra-0.0.0.tar.gz
rpm_source_artifact_name_pattern_recorded=1
rpmbuild_bs_run=0
source_rpm_artifact_created=0
```

The source RPM name is a future local validation artifact only. It is not an accepted source package, Open Build Service source, submit-request record, or publication claim.

Binary RPM Artifact Name

Future binary RPM artifact names must be derived from the current openSUSE spec Name, Version, Release, and the build environment architecture.

```
rpm_binary_package_name_pattern=latticra-0.0.0-0.local.${RPM_ARCH}.rpm
rpm_binary_arch_token_required=1
rpm_binary_artifact_name_pattern_recorded=1
rpmbuild_ba_run=0
rpmbuild_bb_run=0
binary_rpm_artifact_created=0
```

The ${RPM_ARCH} token must be resolved from the disposable openSUSE environment transcript before any binary RPM artifact can be accepted.

Output Boundary

Future RPM artifacts must be written only under a disposable RPM topdir inside a disposable validation environment. The repository itself remains a no-artifact workspace.

```
artifact_output_root_under_disposable_rpmtop=1
rpm_source_artifact_output_directory=rpmtop/SRPMS/
rpm_binary_artifact_output_directory_pattern=rpmtop/RPMS/${RPM_ARCH}/
repository_rpm_artifact_write_allowed=0
root_workspace_rpm_artifact_write_allowed=0
publication_directory_write_allowed=0
artifact_retention_policy_required=1
artifact_cleanup_policy_required=1
```

Any future RPM artifact transcript must bind each package file to:

```
source_archive_sha256
rpm_input_archive_sha256
rpm_artifact_sha256
artifact_size_bytes
artifact_output_directory
artifact_generation_command
environment_identifier
operator_authorization_reference
```

Current Blockers

RPM artifact creation remains blocked because the current repository still has:

```
source_archive_accepted_for_build=0
accepted_rpmlint_transcript_present=0
license_expression_reviewed=1
package_notice_obligations_reviewed=0
buildrequires_reviewed=0
explicit_operator_build_authorization=0
environment_transcript_present=0
rpm_payload_inspection_contract_present=1
rpm_install_remove_transcript_contract_present=1
obs_publication_non_claim_review_present=1
```

Command Boundary

This contract does not:

```
run rpmbuild
run rpmbuild -ba
run rpmbuild -bb
run rpmbuild -bs
run osc build
run osc commit
run spec-cleaner
create .src.rpm artifacts
create binary .rpm artifacts
install Latticra on a host
publish package artifacts
create an Open Build Service project
submit Latticra to openSUSE
claim official openSUSE package status
claim SUSE endorsement
claim package readiness
```

Relationship To Existing Lanes

This contract depends on:

```
docs/OPENSUSE_RPMLINT_FINDINGS_CLASSIFICATION.md
docs/OPENSUSE_SOURCE_ARCHIVE_REPRODUCIBILITY_CONTRACT.md
docs/OPENSUSE_SOURCE_ARCHIVE_FIXTURE_LANE.md
docs/OPENSUSE_RPM_TOPDIR_HANDOFF_LANE.md
docs/OPENSUSE_LOCAL_RPM_BUILD_GATE_CONTRACT.md
docs/OPENSUSE_LOCAL_RPM_BUILD_ENVIRONMENT_CONTRACT.md
docs/OPENSUSE_RPM_PAYLOAD_INSPECTION_CONTRACT.md
docs/OPENSUSE_RPM_INSTALL_REMOVE_TRANSCRIPT_CONTRACT.md
docs/OPENSUSE_OBS_PUBLICATION_NON_CLAIM_REVIEW_CONTRACT.md
```

The local RPM build gate remains closed. This artifact naming contract only records the names and output boundaries future validation artifacts must use after separate source, lint, license, notice, BuildRequires, environment, authorization, payload inspection, install/remove, and OBS non-claim evidence exists.

Completed Follow-On Lane

Completed follow-on RPM payload inspection contract:

```
Add openSUSE RPM payload inspection contract before any RPM artifact can be accepted.
docs/OPENSUSE_RPM_PAYLOAD_INSPECTION_CONTRACT.md
scripts/test-opensuse-rpm-payload-inspection-contract.sh
.github/workflows/opensuse-rpm-payload-inspection-contract.yml
```

That lane defines payload inspection evidence without opening the RPM build gate.

Completed follow-on RPM install/remove transcript contract:

```
docs/OPENSUSE_RPM_INSTALL_REMOVE_TRANSCRIPT_CONTRACT.md
scripts/test-opensuse-rpm-install-remove-transcript-contract.sh
.github/workflows/opensuse-rpm-install-remove-transcript-contract.yml
```

That lane defines disposable install/remove transcript evidence without installing or removing RPM packages.

Completed follow-on OBS publication non-claim review contract:

```
docs/OPENSUSE_OBS_PUBLICATION_NON_CLAIM_REVIEW_CONTRACT.md
scripts/test-opensuse-obs-publication-non-claim-review-contract.sh
.github/workflows/opensuse-obs-publication-non-claim-review-contract.yml
```

That lane records Open Build Service, submit-request, official-package, and SUSE endorsement non-claims without publishing packages.

Next Slice

Recommended next slice:

```
Add openSUSE RPM validation promotion blocker matrix before any package validation result can be
 accepted.
```

That future lane should tie source, environment, artifact, payload, install/remove, and OBS non-claim records together while keeping RPM builds and readiness blocked.

Validation

Run:

```
sh scripts/test-opensuse-rpm-artifact-naming-contract.sh
```

Expected output:

```
opensuse_rpm_artifact_naming_contract: ok
```

docs/OPENSUSE_RPM_INSTALL_REMOVE_TRANSCRIPT_CONTRACT.md

Source title: openSUSE RPM Install/Remove Transcript Contract

Lines: 189 | Words: 490 | SHA-256: 46469cac9c82bb9a0643e330152edeb91ffa81241cd7f070426cf7c445998c91

openSUSE RPM Install/Remove Transcript Contract

Status: active RPM install/remove transcript contract Scope: define future disposable openSUSE RPM install/remove evidence without installing or removing RPM packages.

Purpose

This contract records the install/remove transcript evidence required before any future openSUSE binary RPM artifact can be accepted as installable validation evidence.

The goal is narrow: a future RPM install/remove transcript must prove that installation happens only inside a disposable openSUSE validation environment, the expected no-effect CLI payload appears after install, the package can be removed cleanly, and no host-level service, systemd, kernel, privileged-helper, or network authority is introduced.

This contract is documentation-only and static. It does not run zypper, run rpm, install packages, remove packages, create RPM artifacts, inspect RPM artifacts, publish packages, create an Open Build Service project, submit Latticra to openSUSE, or claim package readiness.

Current Install/Remove State

```
opensuse_rpm_install_remove_transcript_contract_present=1
opensuse_obs_publication_non_claim_review_contract_present=1
rpm_install_remove_transcript_contract_present=1
install_remove_transcript_contract_present=1
obs_publication_non_claim_review_present=1
publication_non_claim_review_present=1
opensuse_rpm_install_remove_transcript_contract_state=specified-no-effect
install_remove_transcript_contract_state=specified-no-effect
opensuse_rpm_build_gate_state=closed-no-effect
payload_inspection_contract_state=specified-no-effect
rpm_install_remove_disposable_environment_required=1
rpm_install_remove_transcript_present=0
rpm_package_install_run=0
rpm_package_remove_run=0
rpm_zypper_install_run=0
rpm_zypper_remove_run=0
rpm_cli_install_run=0
rpm_cli_remove_run=0
rpm_installed_on_host=0
rpm_removed_from_host=0
host_install_allowed=0
host_remove_allowed=0
host_mutation_allowed=0
service_state_change_allowed=0
rpm_artifact_created=0
rpm_payload_accepted=0
rpm_validation_result_promoted=0
package_readiness_claimed=0
```

Required Future Evidence

Future openSUSE RPM install/remove validation must run only in a disposable openSUSE environment.

Required transcript evidence:

```
rpm_install_remove_transcript_required=1
rpm_install_remove_transcript_present=0
rpm_payload_post_install_check_required=1
rpm_payload_post_remove_absence_check_required=1
rpm_service_state_change_allowed=0
rpm_systemd_unit_enable_allowed=0
rpm_scriptlet_effect_allowed=0
rpm_kernel_file_allowed=0
rpm_network_authority_allowed=0
rpm_privileged_helper_allowed=0
```

The future transcript must bind install/remove evidence to:

```
rpm_binary_package_name_pattern=latticra-0.0.0-0.local.${RPM_ARCH}.rpm
rpm_binary_artifact_sha256
rpm_payload_expected_bin=/usr/bin/latticra
rpm_payload_expected_doc=/usr/share/doc/packages/latticra/README.md
```

Transcript Requirements

A future openSUSE RPM install/remove transcript must record:

```
environment_identifier
opensuse_target_distribution
operator_authorization_reference
rpm_artifact_name
rpm_artifact_sha256
pre_install_package_state
install_command
install_exit_code
post_install_payload_listing
post_install_cli_no_effect_output
```

```
rpm_query_after_install
service_state_after_install
remove_command
remove_exit_code
post_remove_absence_report
post_remove_package_state
scriptlet_effect_review
host_mutation_review
```

The transcript must be reviewed before an RPM artifact can be accepted as install/remove-valid.

Current Blockers

RPM install/remove acceptance remains blocked because the current repository still has:

```
rpm_artifact_created=0
rpm_artifact_sha256_recorded=0
rpm_payload_accepted=0
environment_transcript_present=0
explicit_operator_build_authorization=0
obs_publication_non_claim_review_present=1
```

Command Boundary

This contract does not:

```
run zypper install
run zypper remove
run rpm -i
run rpm -U
run rpm -e
install Latticra on a host
remove Latticra from a host
change service state
enable a systemd unit
create package artifacts
inspect package artifacts
publish package artifacts
create an Open Build Service project
submit Latticra to openSUSE
claim official openSUSE package status
claim SUSE endorsement
claim package readiness
```

Relationship To Existing Lanes

This contract depends on:

```
docs/OPENSUSE_RPMLINT_FINDINGS_CLASSIFICATION.md
docs/OPENSUSE_SOURCE_ARCHIVE_REPRODUCIBILITY_CONTRACT.md
docs/OPENSUSE_SOURCE_ARCHIVE_FIXTURE_LANE.md
docs/OPENSUSE_RPM_TOPDIR_HANDOFF_LANE.md
docs/OPENSUSE_LOCAL_RPM_BUILD_GATE_CONTRACT.md
docs/OPENSUSE_LOCAL_RPM_BUILD_ENVIRONMENT_CONTRACT.md
docs/OPENSUSE_RPM_ARTIFACT_NAMING_CONTRACT.md
docs/OPENSUSE_RPM_PAYLOAD_INSPECTION_CONTRACT.md
docs/OPENSUSE_OBS_PUBLICATION_NON_CLAIM_REVIEW_CONTRACT.md
```

The local RPM build gate remains closed. This install/remove transcript contract only defines the evidence future disposable validation environments must produce after RPM artifacts exist and payload inspection evidence is accepted.

Next Slice

Completed follow-on OBS publication non-claim review contract:

```
docs/OPENSUSE_OBS_PUBLICATION_NON_CLAIM_REVIEW_CONTRACT.md
scripts/test-opensuse-obs-publication-non-claim-review-contract.sh
.github/workflows/opensuse-obs-publication-non-claim-review-contract.yml
```

That lane records Open Build Service, submit-request, official-package, and SUSE endorsement non-claims without publishing packages.

Recommended next slice:

```
Add openSUSE RPM validation promotion blocker matrix before any package validation result can be
 accepted.
```

That future lane should tie source, environment, artifact, payload, install/remove, and OBS non-claim records together while keeping RPM builds and readiness blocked.

Validation

Run:

```
sh scripts/test-opensuse-rpm-install-remove-transcript-contract.sh
```

Expected output:

```
opensuse_rpm_install_remove_transcript_contract: ok
```

docs/OPENSUSE_RPM_PAYLOAD_INSPECTION_CONTRACT.md

Source title: openSUSE RPM Payload Inspection Contract

Lines: 230 | Words: 576 | SHA-256: a5d94cf62e57d138acf3d2e9fbe24f3c2dff5ca5485d03fe2463f736d045e58a

openSUSE RPM Payload Inspection Contract

Status: active RPM payload inspection contract Scope: define future openSUSE source RPM and binary RPM payload inspection evidence without creating or inspecting RPM artifacts.

Purpose

This contract records the RPM payload inspection evidence required before any future openSUSE source RPM or binary RPM artifact can be accepted as validation evidence.

The goal is narrow: a future RPM artifact must prove that it contains only the intended no-effect CLI payload, documentation payload, and expected RPM source inputs, with no services, privileged helpers, init files, kernel files, network authority, or host mutation hooks.

This contract is documentation-only and static. It does not run rpmbuild, run osc build, run rpm, run rpm2cpio, run cpio, create RPM artifacts, inspect RPM artifacts, install Latticra, publish packages, create an Open Build Service project, submit Latticra to openSUSE, or claim package readiness.

Current Payload Inspection State

```
opensuse_rpm_payload_inspection_contract_present=1
opensuse_rpm_install_remove_transcript_contract_present=1
opensuse_obs_publication_non_claim_review_contract_present=1
rpm_payload_inspection_contract_present=1
obs_publication_non_claim_review_present=1
publication_non_claim_review_present=1
payload_inspection_contract_present=1
opensuse_rpm_payload_inspection_contract_state=specified-no-effect
opensuse_rpm_install_remove_transcript_contract_state=specified-no-effect
payload_inspection_contract_state=specified-no-effect
opensuse_rpm_build_gate_state=closed-no-effect
opensuse_rpm_artifact_naming_contract_state=specified-no-effect
rpm_artifact_created=0
rpm_payload_inspection_run=0
source_rpm_payload_inspection_run=0
binary_rpm_payload_inspection_run=0
rpm_payload_accepted=0
rpm_install_remove_transcript_present=0
rpm_validation_result_promoted=0
rpm_artifact_sha256_recorded=0
rpm_installed_on_host=0
rpm_removed_from_host=0
package_readiness_claimed=0
```

Expected Payload

All future openSUSE RPM artifacts must preserve the current intentionally narrow payload:

```
rpm_payload_cli_path_required=1
rpm_payload_doc_readme_required=1
rpm_payload_service_files_allowed=0
rpm_payload_systemd_units_allowed=0
rpm_payload_init_files_allowed=0
rpm_payload_kernel_files_allowed=0
rpm_payload_privileged_helper_allowed=0
rpm_payload_network_authority_allowed=0
rpm_payload_host_mutation_hooks_allowed=0
```

The no-effect CLI payload must remain the only executable binary payload.

Source RPM Payload Inspection

Future source RPM payload inspection must verify:

```
source_rpm_expected_spec=packaging/opensuse/latticra.spec
source_rpm_expected_changes=packaging/opensuse/latticra.changes
source_rpm_expected_source_archive=latticra-0.0.0.tar.gz
source_rpm_payload_listing_required=1
source_rpm_metadata_inspection_required=1
source_rpm_unexpected_archive_count=0
source_rpm_payload_inspection_run=0
rpm2cpio_source_inspection_run=0
source_rpm_metadata_inspection_run=0
```

The future source RPM inspection transcript must bind the payload listing to:

```
rpm_source_package_name=latticra-0.0.0-0.local.src.rpm
source_rpm_artifact_sha256
source_rpm_payload_listing_sha256
```

Binary RPM Payload Inspection

Future binary RPM payload inspection must verify:

```
rpm_payload_expected_bin=/usr/bin/latticra
rpm_payload_expected_doc=/usr/share/doc/packages/latticra/README.md
rpm_payload_listing_required=1
rpm_metadata_inspection_required=1
rpm_scriptlet_absence_required=1
rpm_systemd_unit_absence_required=1
rpm_init_script_absence_required=1
rpm_privileged_helper_absence_required=1
rpm_payload_unexpected_file_count=0
binary_rpm_payload_inspection_run=0
rpm_query_payload_inspection_run=0
rpm_query_scriptlet_inspection_run=0
rpm2cpio_binary_listing_run=0
```

The future binary RPM inspection transcript must bind the payload listing to:

```
rpm_binary_package_name_pattern=latticra-0.0.0-0.local.${RPM_ARCH}.rpm
binary_rpm_artifact_sha256
binary_rpm_payload_listing_sha256
```

Inspection Transcript Requirements

A future RPM payload inspection transcript must record:

```
rpm_artifact_name
rpm_artifact_sha256
rpm_artifact_size_bytes
payload_listing_command
payload_listing_sha256
expected_payload_paths_present
unexpected_payload_paths_absent
service_files_absent
systemd_units_absent
scriptlets_absent
privileged_helpers_absent
host_mutation_hooks_absent
environment_identifier
operator_authorization_reference
```

The transcript must be reviewed before an RPM artifact can be accepted as payload-correct.

Current Blockers

RPM payload acceptance remains blocked because the current repository still has:

```
rpm_artifact_created=0
rpm_artifact_sha256_recorded=0
environment_transcript_present=0
explicit_operator_build_authorization=0
rpm_install_remove_transcript_contract_present=1
obs_publication_non_claim_review_present=1
```

Command Boundary

This contract does not:

```
run rpm -qlp
run rpm -qip
run rpm -qp --scripts
run rpm2cpio
run cpio
create .src.rpm artifacts
create binary .rpm artifacts
inspect RPM artifacts
install Latticra on a host
publish package artifacts
create an Open Build Service project
submit Latticra to openSUSE
claim official openSUSE package status
claim SUSE endorsement
claim package readiness
```

Relationship To Existing Lanes

This contract depends on:

```
docs/OPENSUSE_RPMLINT_FINDINGS_CLASSIFICATION.md
docs/OPENSUSE_SOURCE_ARCHIVE_REPRODUCIBILITY_CONTRACT.md
docs/OPENSUSE_SOURCE_ARCHIVE_FIXTURE_LANE.md
docs/OPENSUSE_RPM_TOPDIR_HANDOFF_LANE.md
docs/OPENSUSE_LOCAL_RPM_BUILD_GATE_CONTRACT.md
docs/OPENSUSE_LOCAL_RPM_BUILD_ENVIRONMENT_CONTRACT.md
docs/OPENSUSE_RPM_ARTIFACT_NAMING_CONTRACT.md
docs/OPENSUSE_RPM_INSTALL_REMOVE_TRANSCRIPT_CONTRACT.md
docs/OPENSUSE_OBS_PUBLICATION_NON_CLAIM_REVIEW_CONTRACT.md
```

The local RPM build gate remains closed. This payload inspection contract only defines the evidence future RPM artifacts must provide after they exist in a disposable validation environment.

Next Slice

Completed follow-on RPM install/remove transcript contract:

```
docs/OPENSUSE_RPM_INSTALL_REMOVE_TRANSCRIPT_CONTRACT.md
scripts/test-opensuse-rpm-install-remove-transcript-contract.sh
.github/workflows/opensuse-rpm-install-remove-transcript-contract.yml
```

That lane defines disposable install/remove transcript evidence without installing or removing RPM packages.

Completed follow-on OBS publication non-claim review contract:

```
docs/OPENSUSE_OBS_PUBLICATION_NON_CLAIM_REVIEW_CONTRACT.md
scripts/test-opensuse-obs-publication-non-claim-review-contract.sh
.github/workflows/opensuse-obs-publication-non-claim-review-contract.yml
```

That lane records Open Build Service, submit-request, official-package, and SUSE endorsement non-claims without publishing packages.

Recommended next slice:

```
Add openSUSE RPM validation promotion blocker matrix before any package validation result can be
 accepted.
```

That future lane should tie source, environment, artifact, payload, install/remove, and OBS non-claim records together while keeping RPM builds and readiness blocked.

Validation

Run:

```
sh scripts/test-opensuse-rpm-payload-inspection-contract.sh
```

Expected output:

```
opensuse_rpm_payload_inspection_contract: ok
```

docs/OPENSUSE_RPM_TOPDIR_HANDOFF_LANE.md

Source title: openSUSE RPM Topdir Handoff Lane

Lines: 156 | Words: 421 | SHA-256: 04cfea2d6a9ab347a295e7f17198cd1a4b623cceff3f94262de8859a76c2e4ed

openSUSE RPM Topdir Handoff Lane

Status: active temporary RPM topdir handoff lane Scope: stage the verified temporary openSUSE source archive into a disposable RPM topdir without running package builds, installing artifacts, or publishing to Open Build Service.

Purpose

This lane advances the openSUSE packaging path from source archive fixture evidence into RPM build-input staging.

The goal is conservative: prove that the temporary Source0 archive can be placed under SOURCES/, the local-only spec can be placed under SPECS/, and the staged archive keeps the same checksum and listing as the verified fixture.

This lane does not build a source RPM or binary RPM. It stages temporary RPM build inputs only.

Temporary RPM Topdir Layout

The handoff creates this layout under a disposable temporary directory:

```
rpmtop/BUILD/
rpmtop/BUILDROOT/
rpmtop/RPMS/
rpmtop/SOURCES/latticra-0.0.0.tar.gz
rpmtop/SPECS/latticra.spec
rpmtop/SPECS/latticra.changes
rpmtop/SRPMS/
```

The staged source archive name must match the resolved openSUSE spec inputs:

```
Source0:        %{name}-%{version}.tar.gz
%autosetup -n %{name}-%{version}
source_archive_name=latticra-0.0.0.tar.gz
source_archive_root=latticra-0.0.0/
```

Handoff Checks

The lane verifies:

```
opensuse_rpm_topdir_handoff_lane_present=1
opensuse_source_archive_fixture_lane_present=1
temporary_rpm_topdir_handoff_lane_present=1
temporary_rpm_topdir_created=1
temporary_rpm_sources_archive_staged=1
temporary_rpm_specs_spec_staged=1
temporary_rpm_specs_changes_staged=1
temporary_rpm_source_sha256_preserved=1
temporary_rpm_source_listing_preserved=1
temporary_rpm_source0_name_matched=1
temporary_rpm_autosetup_root_matched=1
rpm_build_dirs_created=1
source_archive_accepted_for_build=0
rpmbuild_run=0
osc_build_run=0
rpm_artifact_created=0
```

The handoff evidence is temporary package-input staging only. It does not promote the archive to accepted package-build input.

Boundary

This lane does not run rpmbuild.

It does not run osc build.

It does not run rpmlint.

It does not run spec-cleaner.

It does not create source RPM artifacts.

It does not create binary RPM artifacts.

It does not install Latticra.

It does not publish package artifacts.

It does not create an Open Build Service project.

It does not submit Latticra to openSUSE.

It does not claim official openSUSE package status, SUSE endorsement, Open Build Service publication, product readiness, operating-system readiness, runtime authority, kernel authority, boot authority, service authority, policy readiness, or security-hardening completion.

Next Slice

Completed follow-on local RPM build gate contract:

```
docs/OPENSUSE_LOCAL_RPM_BUILD_GATE_CONTRACT.md
scripts/test-opensuse-local-rpm-build-gate-contract.sh
.github/workflows/opensuse-local-rpm-build-gate-contract.yml
```

Completed follow-on local RPM build environment contract:

```
docs/OPENSUSE_LOCAL_RPM_BUILD_ENVIRONMENT_CONTRACT.md
scripts/test-opensuse-local-rpm-build-environment-contract.sh
.github/workflows/opensuse-local-rpm-build-environment-contract.yml
```

Completed follow-on RPM artifact naming contract:

```
docs/OPENSUSE_RPM_ARTIFACT_NAMING_CONTRACT.md
scripts/test-opensuse-rpm-artifact-naming-contract.sh
.github/workflows/opensuse-rpm-artifact-naming-contract.yml
```

Completed follow-on RPM payload inspection contract:

```
docs/OPENSUSE_RPM_PAYLOAD_INSPECTION_CONTRACT.md
scripts/test-opensuse-rpm-payload-inspection-contract.sh
.github/workflows/opensuse-rpm-payload-inspection-contract.yml
```

Completed follow-on RPM install/remove transcript contract:

```
docs/OPENSUSE_RPM_INSTALL_REMOVE_TRANSCRIPT_CONTRACT.md
scripts/test-opensuse-rpm-install-remove-transcript-contract.sh
.github/workflows/opensuse-rpm-install-remove-transcript-contract.yml
```

Completed follow-on OBS publication non-claim review contract:

```
docs/OPENSUSE_OBS_PUBLICATION_NON_CLAIM_REVIEW_CONTRACT.md
scripts/test-opensuse-obs-publication-non-claim-review-contract.sh
.github/workflows/opensuse-obs-publication-non-claim-review-contract.yml
```

Recommended next slice:

```
Add openSUSE RPM validation promotion blocker matrix before any package validation result can be
 accepted.
```

That future lane should tie source, environment, artifact, payload, install/remove, and OBS non-claim records together while keeping RPM builds and readiness blocked.

Validation

Run:

```
sh scripts/test-opensuse-rpm-topdir-handoff-lane.sh
```

Expected output:

```
opensuse_rpm_topdir_handoff_lane: ok
```

docs/OPENSUSE_RPMLINT_FINDINGS_CLASSIFICATION.md

Source title: openSUSE rpmlint Findings Classification

Lines: 236 | Words: 510 | SHA-256: 7863688f4bd9bc2e656a96815177467f1cc72e0da5ae050f20db48474cb7ad00

openSUSE rpmlint Findings Classification

Status: active findings classification record Scope: classify expected and unexpected rpmlint findings for the local-only openSUSE spec draft without promoting package-readiness claims.

Purpose

This record defines how rpmlint output from the openSUSE static spec lane should be interpreted while packaging/opensuse/latticra.spec remains a local-only draft.

The goal is to separate expected draft findings from findings that must block package promotion.

This record is classification only. It does not require a clean rpmlint result, run rpmbuild, run osc build, create package artifacts, publish to Open Build Service, submit Latticra to openSUSE, install Latticra, or claim package readiness.

Inputs

The classification applies to:

```
packaging/opensuse/latticra.spec
packaging/opensuse/latticra.changes
docs/OPENSUSE_RPMLINT_STATIC_SPEC_LANE.md
docs/OPENSUSE_SOURCE_ARCHIVE_REPRODUCIBILITY_CONTRACT.md
docs/OPENSUSE_SOURCE_ARCHIVE_FIXTURE_LANE.md
docs/OPENSUSE_RPM_TOPDIR_HANDOFF_LANE.md
docs/OPENSUSE_LOCAL_RPM_BUILD_GATE_CONTRACT.md
docs/OPENSUSE_LOCAL_RPM_BUILD_ENVIRONMENT_CONTRACT.md
docs/OPENSUSE_RPM_ARTIFACT_NAMING_CONTRACT.md
docs/OPENSUSE_RPM_PAYLOAD_INSPECTION_CONTRACT.md
docs/OPENSUSE_RPM_INSTALL_REMOVE_TRANSCRIPT_CONTRACT.md
scripts/test-opensuse-rpmlint-static-spec-lane.sh
scripts/test-opensuse-source-archive-reproducibility-contract.sh
scripts/test-opensuse-source-archive-fixture-lane.sh
scripts/test-opensuse-rpm-topdir-handoff-lane.sh
scripts/test-opensuse-local-rpm-build-gate-contract.sh
scripts/test-opensuse-local-rpm-build-environment-contract.sh
scripts/test-opensuse-rpm-artifact-naming-contract.sh
scripts/test-opensuse-rpm-payload-inspection-contract.sh
scripts/test-opensuse-rpm-install-remove-transcript-contract.sh
```

Expected Draft Finding Classes

These finding classes are expected while the package remains local-only:

```
placeholder_version_or_release
local_only_release_marker
placeholder_license_expression
missing_real_source_archive
limited_payload_surface
draft_doc_payload_mapping
local_only_changes_record
```

Expected draft findings do not unblock package readiness. They only explain why a local-only draft may produce rpmlint output before source archive, license, and maintenance evidence mature.

Unexpected Finding Classes

These finding classes must be treated as blockers until separately reviewed:

```
service_installation
systemd_mutation
kernel_module_payload
boot_path_payload
etc_path_payload
privileged_helper_payload
network_fetch_during_build
host_mutation_during_build
unreviewed_scriptlet
unowned_or_unsafe_file_path
license_claim_promotion
opensuse_official_status_claim
obs_publication_claim
suse_endorsement_claim
```

Unexpected findings do not automatically mean the package is unsafe; they mean the local-only draft has crossed a boundary that needs a separate review lane before promotion.

Classification Output Shape

A future accepted rpmlint findings transcript should record:

```
rpmlint_invocation
rpmlint_exit_status
rpmlint_output_present
expected_draft_findings_count
unexpected_findings_count
package_artifact_created
osc_build_run
obs_publication_claimed
package_readiness_claimed
classification_decision
```

Current classification baseline:

```
opensuse_rpmlint_findings_classification_present=1
opensuse_rpmlint_static_spec_lane_present=1
expected_draft_finding_classes_recorded=1
unexpected_finding_classes_recorded=1
accepted_rpmlint_transcript_present=0
expected_draft_findings_count_recorded=0
unexpected_findings_count_recorded=0
classification_decision=blocked-pending-reviewed-rpmlint-output
package_artifact_created=0
osc_build_run=0
obs_publication_claimed=0
package_readiness_claimed=0
```

Promotion Rule

Package promotion remains blocked unless all of these are true:

```
accepted_rpmlint_transcript_present=1
unexpected_findings_count=0
license_expression_reviewed=1
source_archive_reproducible=1
osc_build_transcript_present=1
install_remove_transcript_present=1
obs_publication_claimed=0
opensuse_official_package_claimed=0
suse_endorsement_claimed=0
```

Until those conditions are met, rpmlint output is evidence for maintenance review only, not package readiness.

Boundary

This record does not:

```
run rpmlint
run rpmbuild
run osc build
run spec-cleaner
create package artifacts
publish to Open Build Service
submit Latticra to openSUSE
install Latticra on a host
claim official openSUSE package status
claim SUSE endorsement
claim production readiness
```

Next Slice

Completed follow-on source archive contract:

```
docs/OPENSUSE_SOURCE_ARCHIVE_REPRODUCIBILITY_CONTRACT.md
scripts/test-opensuse-source-archive-reproducibility-contract.sh
.github/workflows/opensuse-source-archive-reproducibility-contract.yml
```

Completed follow-on source archive fixture:

```
docs/OPENSUSE_SOURCE_ARCHIVE_FIXTURE_LANE.md
scripts/test-opensuse-source-archive-fixture-lane.sh
.github/workflows/opensuse-source-archive-fixture-lane.yml
```

Completed follow-on RPM topdir handoff lane:

```
docs/OPENSUSE_RPM_TOPDIR_HANDOFF_LANE.md
scripts/test-opensuse-rpm-topdir-handoff-lane.sh
.github/workflows/opensuse-rpm-topdir-handoff-lane.yml
```

Completed follow-on local RPM build gate contract:

```
docs/OPENSUSE_LOCAL_RPM_BUILD_GATE_CONTRACT.md
scripts/test-opensuse-local-rpm-build-gate-contract.sh
.github/workflows/opensuse-local-rpm-build-gate-contract.yml
```

Completed follow-on local RPM build environment contract:

```
docs/OPENSUSE_LOCAL_RPM_BUILD_ENVIRONMENT_CONTRACT.md
scripts/test-opensuse-local-rpm-build-environment-contract.sh
.github/workflows/opensuse-local-rpm-build-environment-contract.yml
```

Completed follow-on RPM artifact naming contract:

```
docs/OPENSUSE_RPM_ARTIFACT_NAMING_CONTRACT.md
scripts/test-opensuse-rpm-artifact-naming-contract.sh
.github/workflows/opensuse-rpm-artifact-naming-contract.yml
```

Completed follow-on RPM payload inspection contract:

```
docs/OPENSUSE_RPM_PAYLOAD_INSPECTION_CONTRACT.md
scripts/test-opensuse-rpm-payload-inspection-contract.sh
.github/workflows/opensuse-rpm-payload-inspection-contract.yml
```

Completed follow-on RPM install/remove transcript contract:

```
docs/OPENSUSE_RPM_INSTALL_REMOVE_TRANSCRIPT_CONTRACT.md
scripts/test-opensuse-rpm-install-remove-transcript-contract.sh
.github/workflows/opensuse-rpm-install-remove-transcript-contract.yml
```

Recommended next slice:

```
Add openSUSE RPM validation promotion blocker matrix before any package validation result can be
 accepted.
```

That future lane should tie source, environment, artifact, payload, install/remove, and OBS non-claim records together while keeping RPM builds and readiness blocked.

Validation

Run:

```
sh scripts/test-opensuse-rpmlint-findings-classification.sh
```

Expected output:

```
opensuse_rpmlint_findings_classification: ok
```

docs/OPENSUSE_RPMLINT_OSC_AVAILABILITY.md

Source title: openSUSE rpmlint and osc Availability Lane

Lines: 102 | Words: 272 | SHA-256: fcd13916e733ca7799e85917998ff018554c02452c31c8718114ca91445070a6

openSUSE rpmlint and osc Availability Lane

Status: active tool availability lane Scope: verify that rpmlint and osc are available in an openSUSE Linux environment.

Purpose

This lane prepares the next openSUSE packaging validation step without linting, building, publishing, or installing the Latticra package draft.

The current goal is only to prove that rpmlint and osc can be installed and invoked inside the openSUSE compatibility environment.

Files

```
docs/OPENSUSE_RPMLINT_OSC_AVAILABILITY.md
docs/OPENSUSE_LOCAL_RPM_STATIC_VALIDATION.md
scripts/test-opensuse-rpmlint-osc-availability.sh
.github/workflows/opensuse-rpmlint-osc-availability.yml
```

Checks

This lane checks:

```
openSUSE environment marker exists
zypper is available
rpmlint installs
rpmlint command is available
rpmlint invocation probe can run
osc installs
osc command is available
osc invocation probe can run
local openSUSE RPM static validation lane remains green
```

Boundary

This lane does not lint the Latticra openSUSE spec yet.

It does not run rpmbuild, osc build, spec-cleaner, or zypper install against a Latticra artifact.

It does not create package artifacts, create an Open Build Service project, publish to Open Build Service, submit Latticra to openSUSE, install on a host, or claim package readiness.

Next Slice

Completed follow-on static spec lane:

```
docs/OPENSUSE_RPMLINT_STATIC_SPEC_LANE.md
docs/OPENSUSE_RPMLINT_FINDINGS_CLASSIFICATION.md
docs/OPENSUSE_SOURCE_ARCHIVE_REPRODUCIBILITY_CONTRACT.md
docs/OPENSUSE_SOURCE_ARCHIVE_FIXTURE_LANE.md
docs/OPENSUSE_RPM_TOPDIR_HANDOFF_LANE.md
docs/OPENSUSE_LOCAL_RPM_BUILD_GATE_CONTRACT.md
docs/OPENSUSE_LOCAL_RPM_BUILD_ENVIRONMENT_CONTRACT.md
docs/OPENSUSE_RPM_ARTIFACT_NAMING_CONTRACT.md
docs/OPENSUSE_RPM_PAYLOAD_INSPECTION_CONTRACT.md
docs/OPENSUSE_RPM_INSTALL_REMOVE_TRANSCRIPT_CONTRACT.md
scripts/test-opensuse-rpmlint-static-spec-lane.sh
scripts/test-opensuse-rpmlint-findings-classification.sh
```

```
scripts/test-opensuse-source-archive-reproducibility-contract.sh
scripts/test-opensuse-source-archive-fixture-lane.sh
scripts/test-opensuse-rpm-topdir-handoff-lane.sh
scripts/test-opensuse-local-rpm-build-gate-contract.sh
scripts/test-opensuse-local-rpm-build-environment-contract.sh
scripts/test-opensuse-rpm-artifact-naming-contract.sh
scripts/test-opensuse-rpm-payload-inspection-contract.sh
scripts/test-opensuse-rpm-install-remove-transcript-contract.sh
.github/workflows/opensuse-rpmlint-static-spec-lane.yml
.github/workflows/opensuse-rpmlint-findings-classification.yml
.github/workflows/opensuse-source-archive-reproducibility-contract.yml
.github/workflows/opensuse-source-archive-fixture-lane.yml
.github/workflows/opensuse-rpm-topdir-handoff-lane.yml
.github/workflows/opensuse-local-rpm-build-gate-contract.yml
.github/workflows/opensuse-local-rpm-build-environment-contract.yml
.github/workflows/opensuse-rpm-artifact-naming-contract.yml
.github/workflows/opensuse-rpm-payload-inspection-contract.yml
.github/workflows/opensuse-rpm-install-remove-transcript-contract.yml
```

Recommended next slice:

```
Add openSUSE RPM validation promotion blocker matrix before any package validation result can be
 accepted.
```

That future lane should tie source, environment, artifact, payload, install/remove, and OBS non-claim records together while keeping RPM builds and readiness blocked.

Validation

Run inside openSUSE:

```
sh scripts/test-opensuse-rpmlint-osc-availability.sh
```

Expected output:

```
opensuse_rpmlint_osc_availability: ok
```

docs/OPENSUSE_RPMLINT_STATIC_SPEC_LANE.md

Source title: openSUSE rpmlint Static Spec Lane

Lines: 155 | Words: 414 | SHA-256: cd06116bff08d681b14b2a29677e7b47a45db63a1db021402424ccf81ece5334

openSUSE rpmlint Static Spec Lane

Status: active static spec lint lane Scope: run rpmlint against the local-only openSUSE spec draft and capture findings without promoting package-readiness claims.

Purpose

This lane advances the openSUSE local RPM validation stack from tool availability to a static spec lint pass.

The current goal is conservative: prove that rpmlint can inspect the local draft spec file in an openSUSE environment and produce a reportable result.

This lane does not require a clean rpmlint result yet because the spec remains a local-only draft and still has source-archive and package-readiness metadata to review.

Files

.github/workflows/opensuse-rpm-payload-inspection-contract.yml
.github/workflows/opensuse-rpm-install-remove-transcript-contract.yml
packaging/opensuse/latticra.spec
```

Checks

This lane checks:

```
openSUSE environment marker exists
zypper is available
rpmlint installs
rpmlint command is available
rpmlint can inspect packaging/opensuse/latticra.spec
rpmlint output is captured for audit
previous rpmlint and osc availability lane remains green
```

Expected Draft Findings

The current local-only spec may still report findings related to draft metadata, including:

```
local-only release marker
placeholder version
AGPL-3.0-or-later AND CC-BY-4.0 package license expression
missing source archive for a real package build
limited installed file set
openSUSE maintenance metadata still local-only
```

Those findings are expected at this stage and are not package-readiness failures yet.

The purpose of this lane is visibility, not package promotion.

Boundary

This lane does not run rpmbuild.

It does not run osc build.

It does not run spec-cleaner.

It does not create package artifacts.

It does not create an Open Build Service project, publish to Open Build Service, submit Latticra to openSUSE, install on a host, or claim package readiness.

It does not claim official openSUSE package status, SUSE endorsement, product readiness, operating-system readiness, runtime authority, kernel authority, or security-hardening completion.

```
sh scripts/test-opensuse-rpmlint-static-spec-lane.sh
```

Expected output:

```
opensuse_rpmlint_static_spec_lane: ok
```

docs/OPENSUSE_SOURCE_ARCHIVE_FIXTURE_LANE.md

Source title: openSUSE Source Archive Fixture Lane

Lines: 237 | Words: 614 | SHA-256: 7d4f8eb6e745fab956e669eeb0a75ef0df8dbdfc84eedcd33eec1bc726bbbb57

openSUSE Source Archive Fixture Lane

Status: active fixture lane Scope: create and inspect a temporary openSUSE source archive fixture without running package builds, installing artifacts, or publishing to Open Build Service.

Purpose

This lane advances the openSUSE packaging path from a reproducibility contract into a concrete source archive shape check.

The goal is conservative: prove that Latticra can form a temporary source archive matching the current Source0 and %autosetup expectations in packaging/opensuse/latticra.spec, generate it twice, and confirm the repeated SHA-256 value matches.

This lane does not build a source RPM or binary RPM. It only creates disposable archive fixtures and inspects their contents.

Current Spec Relationship

The current local-only openSUSE spec expects:

```
Source0:        %{name}-%{version}.tar.gz
%autosetup -n %{name}-%{version}
```

For the current local draft, that resolves to:

```
latticra-0.0.0.tar.gz
latticra-0.0.0/
```

Fixture Rules

The archive fixture must:

```
use the Name field from packaging/opensuse/latticra.spec
use the Version field from packaging/opensuse/latticra.spec
create a root directory named latticra-&lt;version&gt;/
create an archive named latticra-&lt;version&gt;.tar.gz
generate the archive fixture twice
record matching SHA-256 values for both fixture archives
include README.md
include packaging/opensuse/latticra.spec
include packaging/opensuse/latticra.changes
include scripts used by the current %build section
include src/latticra_cli.c
exclude .git
exclude temporary RPM work directories
exclude build outputs
exclude RPM artifacts
exclude nested source archive artifacts
reject symlink entries before archiving
remain temporary and uncommitted
```

Inspection Checks

The lane inspects the archive with tar -tzf and verifies:

```
latticra-&lt;version&gt;/README.md
latticra-&lt;version&gt;/packaging/opensuse/latticra.spec
latticra-&lt;version&gt;/packaging/opensuse/latticra.changes
latticra-&lt;version&gt;/scripts/test-state-lattice.sh
latticra-&lt;version&gt;/scripts/test-system-bootstrap.sh
latticra-&lt;version&gt;/scripts/test-kernel.sh
latticra-&lt;version&gt;/scripts/test-kernel-lifecycle.sh
latticra-&lt;version&gt;/scripts/test-latticra-no-effect-cli-status-surface.sh
latticra-&lt;version&gt;/src/latticra_cli.c
```

The lane also fails if the archive contains:

```
.git/
.rpmwork/
build/
target/
*.rpm
nested latticra-*.tar.gz
symlink entries
```

Current Evidence

```
opensuse_source_archive_fixture_lane_present=1
opensuse_source_archive_reproducibility_contract_present=1
source_archive_transcript_present=1
source_archive_created=1
source_archive_sha256_recorded=1
source_archive_reproducible=1
source_archive_generated_twice=1
source_archive_repeated_sha256_match=1
source_archive_contains_spec=1
source_archive_contains_changes=1
source_archive_contains_readme=1
source_archive_excludes_git_dir=1
source_archive_excludes_nested_archives=1
source_archive_excludes_build_outputs=1
source_archive_excludes_rpm_artifacts=1
source_archive_symlink_policy_checked=1
source_archive_path_safety_checked=1
source_archive_accepted_for_build=0
opensuse_rpm_topdir_handoff_lane_present=1
opensuse_local_rpm_build_gate_contract_present=1
opensuse_local_rpm_build_environment_contract_present=1
opensuse_rpm_artifact_naming_contract_present=1
opensuse_rpm_payload_inspection_contract_present=1
opensuse_rpm_install_remove_transcript_contract_present=1
rpmbuild_run=0
osc_build_run=0
rpm_artifact_created=0
obs_publication_claimed=0
package_readiness_claimed=0
```

The source archive evidence is a temporary fixture transcript only. It does not promote the archive to an accepted package-build input.

Relationship To Later RPM Work

This fixture lane comes before RPM build execution.

The intended order is:

1. source archive reproducibility contract
2. source archive fixture lane
3. temporary RPM topdir handoff lane
4. local openSUSE RPM build lane
5. RPM payload inspection lane
6. install/remove behavior transcript lane
7. Open Build Service review and publication evidence

Boundary

This lane does not run rpmbuild.

It does not run osc build.

It does not run rpmlint.

It does not run spec-cleaner.

It does not create source RPM artifacts.

It does not create binary RPM artifacts.

It does not install Latticra.

It does not publish package artifacts.

It does not create an Open Build Service project.

It does not submit Latticra to openSUSE.

It does not claim official openSUSE package status, SUSE endorsement, Open Build Service publication, product readiness, operating-system readiness, runtime authority, kernel authority, boot authority, service authority, policy readiness, or security-hardening completion.

Next Slice

Completed follow-on RPM topdir handoff lane:

```
docs/OPENSUSE_RPM_TOPDIR_HANDOFF_LANE.md
scripts/test-opensuse-rpm-topdir-handoff-lane.sh
.github/workflows/opensuse-rpm-topdir-handoff-lane.yml
```

Completed follow-on local RPM build gate contract:

```
docs/OPENSUSE_LOCAL_RPM_BUILD_GATE_CONTRACT.md
scripts/test-opensuse-local-rpm-build-gate-contract.sh
.github/workflows/opensuse-local-rpm-build-gate-contract.yml
```

Completed follow-on local RPM build environment contract:

```
docs/OPENSUSE_LOCAL_RPM_BUILD_ENVIRONMENT_CONTRACT.md
scripts/test-opensuse-local-rpm-build-environment-contract.sh
.github/workflows/opensuse-local-rpm-build-environment-contract.yml
```

Completed follow-on RPM artifact naming contract:

```
docs/OPENSUSE_RPM_ARTIFACT_NAMING_CONTRACT.md
scripts/test-opensuse-rpm-artifact-naming-contract.sh
.github/workflows/opensuse-rpm-artifact-naming-contract.yml
```

Completed follow-on RPM payload inspection contract:

```
docs/OPENSUSE_RPM_PAYLOAD_INSPECTION_CONTRACT.md
scripts/test-opensuse-rpm-payload-inspection-contract.sh
.github/workflows/opensuse-rpm-payload-inspection-contract.yml
```

Completed follow-on RPM install/remove transcript contract:

```
docs/OPENSUSE_RPM_INSTALL_REMOVE_TRANSCRIPT_CONTRACT.md
scripts/test-opensuse-rpm-install-remove-transcript-contract.sh
.github/workflows/opensuse-rpm-install-remove-transcript-contract.yml
```

Completed follow-on OBS publication non-claim review contract:

```
docs/OPENSUSE_OBS_PUBLICATION_NON_CLAIM_REVIEW_CONTRACT.md
scripts/test-opensuse-obs-publication-non-claim-review-contract.sh
.github/workflows/opensuse-obs-publication-non-claim-review-contract.yml
```

Recommended next slice:

```
Add openSUSE RPM validation promotion blocker matrix before any package validation result can be
 accepted.
```

That future lane should tie source, environment, artifact, payload, install/remove, and OBS non-claim records together while keeping RPM builds and readiness blocked.

Validation

Run:

```
sh scripts/test-opensuse-source-archive-fixture-lane.sh
```

Expected output:

```
opensuse_source_archive_fixture_lane: ok
```

docs/OPENSUSE_SOURCE_ARCHIVE_REPRODUCIBILITY_CONTRACT.md

Source title: openSUSE Source Archive Reproducibility Contract

Lines: 185 | Words: 430 | SHA-256: 3a77110a4d35d0eab74edfba4e743561a8d8550f2be8818deed7872e164736e7

openSUSE Source Archive Reproducibility Contract

Status: active source archive reproducibility contract Scope: define the evidence required before an openSUSE source archive can be accepted for package build evidence.

Purpose

This contract defines the source archive evidence required before Latticra accepts any openSUSE package build transcript.

The current goal is conservative: record the expected Source0 archive shape, reproducibility requirements, transcript fields, and promotion blockers without creating an archive or running a package build.

This contract sits after the rpmlint findings classification record and before the source archive fixture, rpmbuild, osc build, or Open Build Service publication evidence.

Current Spec Inputs

The current local-only openSUSE spec declares:

```
Name:           latticra
Version:        0.0.0
Source0:        %{name}-%{version}.tar.gz
%autosetup -n %{name}-%{version}
```

For the current draft, the expected source archive shape is:

```
source_archive_name=latticra-0.0.0.tar.gz
source_archive_root=latticra-0.0.0/
source_archive_matches_source0=1
source_archive_matches_autosetup_root=1
```

Required Future Evidence

A future accepted source archive transcript must record:

```
source_tree_revision
source_archive_command
source_archive_name
source_archive_root
source_archive_size_bytes
source_archive_sha256
source_archive_entry_count
source_archive_generated_twice
source_archive_repeated_sha256_match
source_archive_contains_spec
source_archive_contains_changes
source_archive_contains_readme
source_archive_excludes_git_dir
source_archive_excludes_nested_archives
source_archive_excludes_build_outputs
source_archive_excludes_rpm_artifacts
source_archive_symlink_policy_checked
source_archive_path_safety_checked
```

Acceptance Rule

An openSUSE source archive remains unaccepted unless all of these are true:

```
source_archive_transcript_present=1
source_archive_name_matches_source0=1
source_archive_root_matches_autosetup=1
source_archive_sha256_recorded=1
source_archive_generated_twice=1
source_archive_repeated_sha256_match=1
source_archive_excludes_git_dir=1
source_archive_excludes_nested_archives=1
source_archive_excludes_build_outputs=1
source_archive_excludes_rpm_artifacts=1
source_archive_symlink_policy_checked=1
source_archive_path_safety_checked=1
license_expression_reviewed=1
package_notice_obligations_reviewed=1
```

Until those conditions are met, source archive evidence is a review input only, not package build readiness.

Current Baseline

The current baseline includes the follow-on temporary fixture lane. The archive remains unaccepted for package build input until the remaining acceptance requirements are met.

```
opensuse_source_archive_reproducibility_contract_present=1
opensuse_rpmlint_findings_classification_present=1
opensuse_source_archive_fixture_lane_present=1
opensuse_rpm_topdir_handoff_lane_present=1
opensuse_local_rpm_build_gate_contract_present=1
opensuse_local_rpm_build_environment_contract_present=1
opensuse_rpm_artifact_naming_contract_present=1
opensuse_rpm_payload_inspection_contract_present=1
opensuse_rpm_install_remove_transcript_contract_present=1
source_archive_policy_recorded=1
source_archive_name_expected=latticra-0.0.0.tar.gz
source_archive_root_expected=latticra-0.0.0/
source_archive_matches_source0_required=1
source_archive_matches_autosetup_required=1
source_archive_transcript_present=1
source_archive_created=1
source_archive_sha256_recorded=1
source_archive_reproducible=1
source_archive_accepted_for_build=0
rpmbuild_run=0
osc_build_run=0
rpm_artifact_created=0
obs_publication_claimed=0
package_readiness_claimed=0
```

Boundary

This contract does not:

```
create a source archive
run tar
run gzip
run rpmbuild
run osc build
run spec-cleaner
create source RPM artifacts
create binary RPM artifacts
publish to Open Build Service
submit Latticra to openSUSE
install Latticra on a host
claim official openSUSE package status
claim SUSE endorsement
claim production readiness
```

Follow-On Handoff Lane

Completed follow-on fixture and handoff lanes:

```
docs/OPENSUSE_SOURCE_ARCHIVE_FIXTURE_LANE.md
docs/OPENSUSE_RPM_TOPDIR_HANDOFF_LANE.md
docs/OPENSUSE_LOCAL_RPM_BUILD_GATE_CONTRACT.md
docs/OPENSUSE_LOCAL_RPM_BUILD_ENVIRONMENT_CONTRACT.md
docs/OPENSUSE_RPM_ARTIFACT_NAMING_CONTRACT.md
docs/OPENSUSE_RPM_PAYLOAD_INSPECTION_CONTRACT.md
docs/OPENSUSE_RPM_INSTALL_REMOVE_TRANSCRIPT_CONTRACT.md
docs/OPENSUSE_OBS_PUBLICATION_NON_CLAIM_REVIEW_CONTRACT.md
scripts/test-opensuse-source-archive-fixture-lane.sh
scripts/test-opensuse-rpm-topdir-handoff-lane.sh
scripts/test-opensuse-local-rpm-build-gate-contract.sh
scripts/test-opensuse-local-rpm-build-environment-contract.sh
scripts/test-opensuse-rpm-artifact-naming-contract.sh
scripts/test-opensuse-rpm-payload-inspection-contract.sh
scripts/test-opensuse-rpm-install-remove-transcript-contract.sh
scripts/test-opensuse-obs-publication-non-claim-review-contract.sh
.github/workflows/opensuse-source-archive-fixture-lane.yml
.github/workflows/opensuse-rpm-topdir-handoff-lane.yml
.github/workflows/opensuse-local-rpm-build-gate-contract.yml
.github/workflows/opensuse-local-rpm-build-environment-contract.yml
.github/workflows/opensuse-rpm-artifact-naming-contract.yml
.github/workflows/opensuse-rpm-payload-inspection-contract.yml
.github/workflows/opensuse-rpm-install-remove-transcript-contract.yml
.github/workflows/opensuse-obs-publication-non-claim-review-contract.yml
```

Those lanes prove archive shape, reproducibility, temporary RPM topdir staging, build-gate closure, environment requirements, future artifact naming boundaries, payload inspection evidence requirements, install/remove transcript requirements, and OBS non-claim review while keeping package build and publication claims blocked.

Recommended next slice:

```
Add openSUSE RPM validation promotion blocker matrix before any package validation result can be
 accepted.
```

Validation

Run:

```
sh scripts/test-opensuse-source-archive-reproducibility-contract.sh
```

Expected output:

```
opensuse_source_archive_reproducibility_contract: ok
```

docs/strategy/2026-05-26-1959-cdt-console-read-only-host-inventory-review-package-index.md

Source title: Latticra Console Read-Only Host Inventory Review Package Index

Lines: 186 | Words: 703 | SHA-256: 85eea2eeeed0f7010189b73db011a702e6905ae4d39c4c21ce8121d84e7e8dfe

Latticra Console Read-Only Host Inventory Review Package Index

Status: active review-package index Created: 2026-05-26 19:59 CDT Decision: package index only Promotion decision: no Console, host-inventory, host-adapter, product-readiness, runtime, security, or OS-base promotion recommended Scope: strategy package map for Console read-only host-inventory planning records.

Purpose

This index organizes the Console read-only host-inventory planning package.

It shows the intended reading order, dependency order, and review gates for future evidence work. It does not capture evidence, perform reviews, implement tests, run Console, inspect a host, or change project posture.

Package goal

The package goal is:

```
define how Console read-only host-inventory evidence could eventually be reviewed
as a contract-only technical-evaluator workflow without performing live host
inventory, enabling a host adapter, granting runtime authority, or making
product-readiness, security, or OS-base claims
```

Package order

Read and apply the records in this order:

1. 2026-05-26-1702-cdt-overall-strategy-priority-map.md
2. 2026-05-26-1707-cdt-console-read-only-host-inventory-workflow-packet.md
3. 2026-05-26-1732-cdt-console-read-only-host-inventory-acceptance-checklist.md
4. 2026-05-26-1736-cdt-console-read-only-host-inventory-evidence-bundle-template.md
5. 2026-05-26-1757-cdt-console-read-only-host-inventory-non-claim-review-template.md
6. 2026-05-26-1919-cdt-console-read-only-host-inventory-public-entrypoint-review-template.md

7. 2026-05-26-1956-cdt-console-read-only-host-inventory-estimate-impact-review-template.md

Dependency map

```
overall strategy priority map
  -&gt; workflow packet
    -&gt; acceptance checklist
      -&gt; evidence bundle template
        -&gt; non-claim review
          -&gt; public-entrypoint review
            -&gt; estimate-impact review
```

The evidence bundle, non-claim review, public-entrypoint review, and estimate-impact review are all required before any estimate or public-entrypoint change can be considered.

Record responsibilities

```
overall strategy priority map
  Selects the Console read-only host-inventory planning package as the Tier 1 next lane.

workflow packet
  Selects the contract-only Console host-inventory evaluator workflow and rejects live inventory
 capture.

acceptance checklist
  Defines what future evidence must satisfy before it can be reviewable.

evidence bundle template
  Defines the future evidence bundle shape.

non-claim review template
  Defines how to prevent host, runtime, security, receipt, signing, product, or OS-base claims.

public-entrypoint review template
  Defines when README, status, project notes, or strategy index references may be justified.

estimate-impact review template
  Defines when completion estimate changes may be considered and why the default is no estimate
change.
```

Current package status

Current status:

```
planning_package_defined=1
workflow_selected=1
acceptance_criteria_defined=1
evidence_bundle_shape_defined=1
non_claim_review_shape_defined=1
public_entrypoint_review_shape_defined=1
estimate_impact_review_shape_defined=1
workflow_evidence_captured=0
live_host_inventory_performed=0
host_probe_performed=0
host_file_read_performed=0
host_file_write_performed=0
host_mutation_performed=0
network_scan_performed=0
host_adapter_enabled=0
receipt_materialized=0
receipt_signed=0
non_claim_review_performed=0
public_entrypoint_review_performed=0
estimate_impact_review_performed=0
estimate_change_recommended=0
product_readiness_promotion_recommended=0
```

Required future promotion sequence

Any future promotion review must proceed in this order:

1. Capture evidence only after a separate explicit evidence-capture request.
2. Complete the evidence bundle.
3. Complete the non-claim review.

4. Complete the public-entrypoint review.
5. Complete the estimate-impact review.
6. Decide whether public posture changes are justified.

Do not change estimates or public posture before step 6.

Stop conditions

Stop the package review if any of these appear:

```
live host inventory performed
host probing performed
host file read performed
host file write performed
host mutation performed
network scan performed
host adapter enabled
runtime enforcement claimed
boot behavior claimed
receipt signed
signing authority claimed
cryptographic authority claimed
non-claim review missing
public-entrypoint review missing
estimate-impact review missing
product-readiness claim introduced
security boundary claim introduced
security-hardening claim introduced
OS-base behavior claim introduced
```

Strategy index rule

The strategy index may link to planning records as they are created.

Index linking does not imply:

```
workflow evidence captured
workflow accepted
estimate changed
public posture changed
product readiness changed
runtime authority changed
host inventory performed
host adapter enabled
security posture changed
receipt signed
```

Current next planning action

The next planning action after this index is:

```
begin the Tier 2 Nucleus effect-contract and runtime-denial gate planning package
```

Reason:

```
the completion checkpoint closes this package, and the overall priority map
names runtime and Nucleus effect-boundary planning as the next planning priority
after public evaluator workflow clarity
```

Evidence capture should remain a separate explicit request because it may involve running commands, collecting transcripts, or producing review records.

Non-claims

This index does not capture evidence, perform a review, validate workflow evidence, run Console, run latticra-lc, run latticra_console_report, inspect a host, probe a host, read host files, write host files, scan a network, launch a host process, mutate a host, create an inventory artifact, create a receipt, request a signature, sign a receipt, enable a host adapter, enforce runtime policy, boot hardware, validate product readiness, update estimates, update public entry points, harden security, prevent malware, prevent ransomware, provide sandboxing, provide operating-system behavior, or provide production support.

It records a strategy package map only.

docs/UBUNTU_DEBIAN_COPYRIGHT_NOTICE_MAPPING_CONTRACT.md

Source title: Ubuntu Debian Copyright Notice Mapping Contract

Lines: 98 | Words: 335 | SHA-256: e6d2d70ec75b2f1c4498c0e36d3a5ce39b63aaae3b2b3bc8da7c676910e44329

Ubuntu Debian Copyright Notice Mapping Contract

Status: no-effect Debian copyright notice mapping contract Scope: define Debian copyright notice-mapping evidence required before the Ubuntu package notice review can be promoted.

Purpose

This contract turns the Ubuntu local deb packaging/ubuntu/debian/copyright notice-mapping blocker into a concrete review checklist.

It records the updated packaging/ubuntu/debian/copyright license mapping, but it does not create a NOTICE file, build a package, publish a package, submit to Ubuntu, or provide legal advice.

Current Inputs

```
package_scope=local-deb-draft
debian_copyright_file=packaging/ubuntu/debian/copyright
debian_copyright_present=1
debian_copyright_format_url_present=1
debian_copyright_agpl_mapping_present=1
debian_copyright_cc_by_mapping_present=1
binary_payload=usr/bin/latticra
binary_payload_source=src/latticra_cli.c
doc_payload=usr/share/doc/latticra/README.md
doc_payload_source=README.md
notice_file_present=0
ubuntu_package_notice_inventory_present=1
ubuntu_doc_payload_license_review_contract_present=1
ubuntu_third_party_material_review_contract_present=1
ubuntu_generated_artifact_notice_review_contract_present=1
ubuntu_notice_file_decision_contract_present=1
ubuntu_trademark_notice_boundary_contract_present=1
ubuntu_release_artifact_notice_requirements_contract_present=1
ubuntu_package_notice_review_contract_present=1
```

The current Debian copyright file is a local-only draft. It records Apache-2.0 as the existing-code default, AGPL-3.0-or-later for the no-effect CLI payload, and CC-BY-4.0 for documentation while third-party material, generated-artifact notices, NOTICE-file requirements, and broader notice mappings remain under review.

Required Mapping Before Promotion

```
debian_copyright_notice_mapping_reviewed=1
debian_copyright_binary_payload_mapping_reviewed=1
debian_copyright_doc_payload_mapping_reviewed=1
debian_copyright_third_party_notice_mapping_reviewed=1
debian_copyright_generated_artifact_notice_mapping_reviewed=1
debian_copyright_notice_file_mapping_reviewed=1
debian_copyright_trademark_notice_boundary_reviewed=1
debian_copyright_license_ref_replaced_or_justified=1
debian_copyright_missing_notice_entries=0
```

Current Decision

```
ubuntu_debian_copyright_notice_mapping_contract_present=1
ubuntu_debian_copyright_notice_mapping_status=blocked-pending-debian-copyright-notice-mapping
debian_copyright_notice_mapping_reviewed=0
debian_copyright_binary_payload_mapping_reviewed=0
debian_copyright_doc_payload_mapping_reviewed=1
debian_copyright_third_party_notice_mapping_reviewed=0
debian_copyright_generated_artifact_notice_mapping_reviewed=0
debian_copyright_notice_file_mapping_reviewed=0
debian_copyright_trademark_notice_boundary_reviewed=0
debian_copyright_license_ref_replaced_or_justified=1
debian_copyright_missing_notice_entries=0
ubuntu_package_notice_review_unblocked=0
ubuntu_package_license_review_unblocked=1
ubuntu_lintian_static_metadata_unblocked=0
ubuntu_local_deb_build_transcript_unblocked=0
```

Relationship To Notice Review

The Ubuntu package notice review may not be promoted until the local deb payload has a reviewed Debian copyright notice mapping. That review must explain how binary payload, documentation payload, third-party material, generated artifacts, NOTICE-file requirements, and trademark notice boundaries are represented in packaging/ubuntu/debian/copyright.

The trademark notice boundary remains separate, but it must also be resolved before the Ubuntu package notice review can be promoted.

The release artifact notice requirements remain separate, but they must also be resolved before the Ubuntu package notice review can be promoted.

This contract is scoped to the Ubuntu local deb draft. It is not a repository-wide license audit or a Debian Policy compliance claim.

Non-Claims

This contract is not legal advice. It does not claim NOTICE compliance, license-compliance completion, Ubuntu archive readiness, PPA readiness, Canonical endorsement, package publication readiness, production installer readiness, or release readiness.

Validation

Run:

```
sh scripts/test-ubuntu-debian-copyright-notice-mapping-contract.sh
```

Expected output:

```
ubuntu_debian_copyright_notice_mapping_contract: ok
```

docs/UBUNTU_DEVELOPER_WORKFLOW.md

Source title: Ubuntu Developer Workflow

Lines: 121 | Words: 428 | SHA-256: eb9a020836af6c803e1ae60428fccbc349dc4292b466d89336e3265abf402c22

Ubuntu Developer Workflow

Status: developer workflow record Scope: local Ubuntu Linux commands for productive Latticra development and user-local Panel work.

Purpose

This note gives a repeatable local workflow for working on Latticra from Ubuntu Linux after the Ubuntu build lane was added.

The goal is simple:

```
install the small toolchain
install the Panel desktop prerequisites
run the same guards as CI
keep local validation fast and repeatable
avoid archive or PPA claims until the deb lane has real evidence
```

Install Local Tools

On an Ubuntu workstation or Ubuntu container, install the basic guard toolchain:

```
sudo apt-get update
sudo apt-get install -y git build-essential make gcc pkg-config coreutils findutils diffutils
grep
```

In a root container, omit sudo:

```
apt-get update
apt-get install -y git build-essential make gcc pkg-config coreutils findutils diffutils grep
```

Install Panel Prerequisites

For the Rust/egui Latticra Panel and desktop metadata refresh path, install:

```
sudo apt-get update
sudo apt-get install -y rustc cargo make gcc pkg-config \
  libx11-dev libxcb1-dev libxcursor-dev libxrandr-dev libxi-dev \
  libxkbcommon-dev libgl1-mesa-dev libwayland-dev desktop-file-utils \
  libgtk-3-bin
```

If the distro Rust toolchain is too old for the locked Cargo dependency graph, use a current stable Rust toolchain through the operator's approved toolchain source before running Panel commands. The repository does not grant network authority or install Rust by itself.

Fast Local Guard Loop

For a quick sanity check while editing C/kernel files, run:

```
sh scripts/test-state-lattice.sh
sh scripts/test-system-bootstrap.sh
sh scripts/test-kernel.sh
sh scripts/test-kernel-lifecycle.sh
sh scripts/test-latticra-no-effect-cli-status-surface.sh
```

Ubuntu Lane Guard

Before merging Ubuntu-facing work, run this on Ubuntu:

```
sh scripts/test-ubuntu-build-lane.sh
```

Expected output:

```
ubuntu_build_lane: ok
```

Panel From Source

After the prerequisites are present:

```
export PATH=&quot;$HOME/.local/bin:$PATH&quot;
make -C installer gui
```

The guarded user-local install remains the same on Ubuntu:

```
make -C installer dry-run
make -C installer local-example
make -C installer verify-local
```

Suggested Work Rhythm

Use this loop for productive development:

1. Create a small branch.
2. Make one bounded change.
3. Run the fast local guard loop.
4. Run the Ubuntu lane guard when the branch touches build, installer, packaging, or Ubuntu-facing docs.
5. Keep package language local-only until real lint/build/install evidence exists.

Current Boundary

This workflow is for local developer productivity and user-local Panel work. It does not publish a deb, create a PPA, submit to Ubuntu, claim Ubuntu archive readiness, install a root service, modify systemd, modify the kernel, or claim production readiness.

Validation

This workflow note is guarded by:

```
sh scripts/test-ubuntu-developer-workflow.sh
```

Expected output:

```
ubuntu_developer_workflow: ok
```

docs/UBUNTU_DOC_PAYLOAD_LICENSE_REVIEW_CONTRACT.md

Source title: Ubuntu Doc Payload License Review Contract

Lines: 106 | Words: 356 | SHA-256: 27392bd4ab82356f78a43606b9fd41e8cb4e3f8877464ca47a3e0a82e9a7c265

Ubuntu Doc Payload License Review Contract

Status: no-effect documentation-license review contract Scope: define the review evidence required before README.md can be treated as a resolved Ubuntu local deb documentation payload.

Purpose

This contract records the Ubuntu local deb documentation-license decision and its package mapping checklist.

It does not publish a package, create a PPA, submit to Ubuntu, or provide legal advice.

Current Inputs

```
doc_payload=usr/share/doc/latticra/README.md
doc_payload_source=README.md
doc_payload_source_present=1
root_license_file=LICENSE
root_license_current=hybrid-license-overview
license_policy_present=1
license_migration_plan_present=1
documentation_license_decision_present=1
ubuntu_package_notice_inventory_present=1
ubuntu_third_party_material_review_contract_present=1
ubuntu_generated_artifact_notice_review_contract_present=1
ubuntu_notice_file_decision_contract_present=1
ubuntu_debian_copyright_notice_mapping_contract_present=1
ubuntu_trademark_notice_boundary_contract_present=1
ubuntu_release_artifact_notice_requirements_contract_present=1
ubuntu_package_notice_review_contract_present=1
```

The current license migration plan records documentation licensing as decided.

Current package documentation license:

```
candidate_doc_payload_license=CC-BY-4.0
candidate_doc_payload_license_applied_to_packaging=1
```

Required Review Before Promotion

```
doc_payload_license_decision_recorded=1
doc_payload_license_expression_recorded=1
doc_payload_license_compatible_with_package=1
readme_embedded_material_reviewed=1
readme_generated_artifact_notice_reviewed=1
documentation_trademark_boundary_reviewed=1
documentation_notice_requirements_recorded=1
debian_copyright_doc_payload_mapping_reviewed=1
```

Current Decision

```
ubuntu_doc_payload_license_review_contract_present=1
ubuntu_doc_payload_license_review_status=resolved-cc-by-4.0
doc_payload_license_reviewed=1
doc_payload_license_unresolved=0
documentation_license_decision_present=1
doc_payload_license_decision_recorded=1
doc_payload_license_compatible_with_package=1
debian_copyright_doc_payload_mapping_reviewed=1
ubuntu_package_notice_review_unblocked=0
ubuntu_package_license_review_unblocked=1
ubuntu_lintian_static_metadata_unblocked=0
ubuntu_local_deb_build_transcript_unblocked=0
```

Relationship To Notice Review

The Ubuntu package notice review may not be promoted until this documentation payload license review is resolved and mapped into Debian copyright metadata.

The third-party material review remains separate, but it must also be resolved before the Ubuntu package notice review can be promoted.

The generated-artifact notice review remains separate, but it must also be resolved before the Ubuntu package notice review can be promoted.

The NOTICE file decision remains separate, but it must also be resolved before the Ubuntu package notice review can be promoted.

The Debian copyright notice mapping remains separate, but it must also be resolved before the Ubuntu package notice review can be promoted.

The trademark notice boundary remains separate, but it must also be resolved before the Ubuntu package notice review can be promoted.

The release artifact notice requirements remain separate, but they must also be resolved before the Ubuntu package notice review can be promoted.

This contract is a guardrail for the current README.md package payload. It is not a general documentation relicensing decision for the whole repository.

Non-Claims

This contract is not legal advice. It does not claim license-compliance completion, Ubuntu archive readiness, PPA readiness, Canonical endorsement, package publication readiness, production installer readiness, or release readiness.

Validation

Run:

```
sh scripts/test-ubuntu-doc-payload-license-review-contract.sh
```

Expected output:

```
ubuntu_doc_payload_license_review_contract: ok
```

docs/UBUNTU_GENERATED_ARTIFACT_NOTICE_REVIEW_CONTRACT.md

Source title: Ubuntu Generated-Artifact Notice Review Contract

Lines: 104 | Words: 352 | SHA-256: 6812a8f951795ecbce6c4f3179fb59c74469d44c8bafa810712dd3ee651ded1b

Ubuntu Generated-Artifact Notice Review Contract

Status: no-effect generated-artifact notice review contract Scope: define generated-artifact notice evidence required before the Ubuntu local deb notice review can be promoted.

Purpose

This contract turns the Ubuntu local deb generated-artifact notice blocker into a concrete review checklist.

It does not build artifacts, inspect a built deb, decide notice obligations, create a NOTICE file, update packaging/ubuntu/debian/copyright, publish a package, submit to Ubuntu, or provide legal advice.

Current Inputs

```
package_scope=local-deb-draft
binary_payload=usr/bin/latticra
binary_payload_source=src/latticra_cli.c
doc_payload=usr/share/doc/latticra/README.md
doc_payload_source=README.md
generated_artifact_notice_policy_present=1
ubuntu_package_notice_inventory_present=1
ubuntu_package_notice_inventory_report_present=1
ubuntu_doc_payload_license_review_contract_present=1
ubuntu_third_party_material_review_contract_present=1
ubuntu_notice_file_decision_contract_present=1
ubuntu_debian_copyright_notice_mapping_contract_present=1
ubuntu_trademark_notice_boundary_contract_present=1
ubuntu_release_artifact_notice_requirements_contract_present=1
ubuntu_package_notice_review_contract_present=1
deb_artifact_created=0
package_build_performed=0
package_publish_performed=0
```

The current Ubuntu local deb draft has packaging metadata only. No deb artifact, changes file, build log, or installed package payload has been produced for notice review.

Required Review Before Promotion

```
generated_artifact_notice_reviewed=1
generated_artifact_notice_requirements_recorded=1
binary_payload_generation_path_reviewed=1
doc_payload_generation_path_reviewed=1
deb_artifact_notice_requirements_recorded=1
changes_file_notice_requirements_recorded=1
build_log_notice_requirements_recorded=1
installed_payload_notice_requirements_recorded=1
generated_artifact_missing_notice_entries=0
```

Current Decision

```
ubuntu_generated_artifact_notice_review_contract_present=1
ubuntu_generated_artifact_notice_review_status=blocked-pending-generated-artifact-notice-review
generated_artifact_notice_reviewed=0
generated_artifact_notice_requirements_recorded=0
binary_payload_generation_path_reviewed=0
doc_payload_generation_path_reviewed=0
deb_artifact_notice_requirements_recorded=0
changes_file_notice_requirements_recorded=0
build_log_notice_requirements_recorded=0
installed_payload_notice_requirements_recorded=0
generated_artifact_missing_notice_entries=0
deb_artifact_created=0
package_build_performed=0
package_publish_performed=0
ubuntu_package_notice_review_unblocked=0
ubuntu_package_license_review_unblocked=1
ubuntu_lintian_static_metadata_unblocked=0
ubuntu_local_deb_build_transcript_unblocked=0
```

Relationship To Notice Review

The Ubuntu package notice review may not be promoted until generated-artifact notice requirements are reviewed for the current local deb payload and any future build artifacts.

The NOTICE file decision remains separate, but it must also be resolved before the Ubuntu package notice review can be promoted.

The Debian copyright notice mapping remains separate, but it must also be resolved before the Ubuntu package notice review can be promoted.

The trademark notice boundary remains separate, but it must also be resolved before the Ubuntu package notice review can be promoted.

The release artifact notice requirements remain separate, but they must also be resolved before the Ubuntu package notice review can be promoted.

This contract is scoped to the Ubuntu local deb draft. It is not evidence that an artifact exists, that an artifact is distributable, or that release notices are complete.

Non-Claims

This contract is not legal advice. It does not claim generated-artifact notice compliance, Ubuntu archive readiness, PPA readiness, Canonical endorsement, package publication readiness, production installer readiness, or release readiness.

Validation

Run:

```
sh scripts/test-ubuntu-generated-artifact-notice-review-contract.sh
```

Expected output:

```
ubuntu_generated_artifact_notice_review_contract: ok
```

docs/UBUNTU_LINTIAN_AVAILABILITY.md

Source title: Ubuntu lintian Availability Lane

Lines: 67 | Words: 237 | SHA-256: f4c77421dec6b0ae64a7494210423af5290467cd31e234f761c70aa6f7d1378b

Ubuntu lintian Availability Lane

Status: active tool availability lane Scope: verify that lintian is available in an Ubuntu Linux environment.

Purpose

This lane prepares the next packaging validation step without linting or building the Latticra package draft yet.

The current goal is only to prove that lintian can be installed and invoked inside the Ubuntu compatibility environment.

Files

```
docs/UBUNTU_LINTIAN_AVAILABILITY.md
scripts/test-ubuntu-lintian-availability.sh
.github/workflows/ubuntu-lintian-availability.yml
docs/UBUNTU_LINTIAN_STATIC_METADATA_CONTRACT.md
```

Checks

This lane checks:

```
Ubuntu environment marker exists
apt-get is available
lintian installs
lintian command is available
lintian version command can run
local deb static validation lane remains green
```

Boundary

This lane does not lint the Latticra deb draft yet.

It does not run dpkg-buildpackage, debuild, sbuild, or pbuilder.

It does not create package artifacts.

It does not submit Latticra to Ubuntu, create a PPA, or claim Ubuntu archive readiness.

Next Slice

Recommended next slice:

```
Review the Ubuntu lintian static metadata contract after package license promotion is unblocked.
Keep lintian execution, lintian finding classification, build transcript evidence, and deb
artifact creation blocked until package notice and license prerequisites are reviewed.
```

That future lane may run lintian against the local debian metadata or a locally built artifact and classify expected draft findings separately from unexpected package findings. The current static metadata contract records the evidence shape without running lintian.

Validation

Run inside Ubuntu:

```
sh scripts/test-ubuntu-lintian-availability.sh
```

Expected output:

```
ubuntu_lintian_availability: ok
```

docs/UBUNTU_LINTIAN_STATIC_METADATA_CONTRACT.md

Source title: Ubuntu Lintian Static Metadata Contract

Lines: 85 | Words: 211 | SHA-256: 844d3f511f5e29294d7f1749fc7e324a4e604f025f9e27f12ff761d6b18ec852

Ubuntu Lintian Static Metadata Contract

Status: no-effect lintian static metadata contract Scope: define the static lintian metadata evidence required before Ubuntu local deb build transcript evidence can advance.

Purpose

This contract turns the future Ubuntu lintian/static metadata lane into a guarded evidence schema.

It does not run lintian, dpkg-buildpackage, debuild, sbuild, or pbuilder. It does not create, install, publish, or upload a deb package.

Required Inputs

```
ubuntu_lintian_availability_present=1
ubuntu_local_deb_static_validation_present=1
ubuntu_package_license_promotion_gate_contract_present=1
ubuntu_package_license_promotion_gate_status=blocked-pending-package-notice-prerequisites
```

Required Evidence Before Promotion

```
debian_control_present=1
debian_rules_present=1
debian_changelog_present=1
debian_copyright_present=1
debian_install_present=1
debian_source_format_present=1
rules_requires_root_no=1
license_expression_reviewed=1
license_expression_unresolved=0
packaging_license_expression_updated=1
lintian_command_recorded=1
lintian_static_metadata_findings_classified=1
lintian_expected_draft_findings_classified=1
lintian_unexpected_findings_classified=1
ubuntu_lintian_static_metadata_unblocked=1
```

Current State

```
ubuntu_lintian_static_metadata_contract_present=1
ubuntu_lintian_static_metadata_status=blocked-pending-package-license-promotion
ubuntu_lintian_availability_present=1
ubuntu_local_deb_static_validation_present=1
ubuntu_package_license_promotion_gate_contract_present=1
ubuntu_package_license_promotion_gate_status=blocked-pending-package-notice-prerequisites
lintian_static_metadata_run=0
lintian_command_recorded=0
lintian_static_metadata_findings_classified=0
lintian_expected_draft_findings_classified=0
lintian_unexpected_findings_classified=0
license_expression_reviewed=1
license_expression_unresolved=0
packaging_license_expression_updated=1
deb_artifact_created=0
ubuntu_lintian_static_metadata_unblocked=0
ubuntu_local_deb_build_transcript_unblocked=0
```

Relationship To Build Evidence

The Ubuntu local deb build transcript contract may not accept build evidence until this static lintian metadata contract is unblocked and any lintian findings are recorded and classified.

This contract is deliberately static. It records the future evidence shape without running lintian or creating package artifacts.

Non-Claims

This contract does not claim lintian success, Debian Policy compliance, Ubuntu archive readiness, PPA readiness, Canonical endorsement, package publication readiness, production installer readiness, or release readiness.

Validation

Run:

```
sh scripts/test-ubuntu-lintian-static-metadata-contract.sh
```

Expected output:

```
ubuntu_lintian_static_metadata_contract: ok
```

docs/UBUNTU_LOCAL_DEB_BUILD_TRANSCRIPT_ACCEPTANCE_GATE_CONTRACT.md

Source title: Ubuntu Local Deb Build Transcript Acceptance Gate Contract

Lines: 94 | Words: 266 | SHA-256: 6b76477ff90a7add58cc025a7f26fe22cda908f0174bfcb31f85db24b9ee68a8

Ubuntu Local Deb Build Transcript Acceptance Gate Contract

Status: no-effect local deb build transcript acceptance gate contract Scope: aggregate the evidence required before a future Ubuntu local deb build transcript can be accepted.

Purpose

This contract turns the Ubuntu local deb build transcript acceptance boundary into a single guarded gate.

It does not run dpkg-buildpackage, debuild, lintian, sbuild, or pbuilder. It does not create, install, publish, upload, or accept a deb package.

Required Inputs

```
ubuntu_local_deb_build_transcript_contract_present=1
ubuntu_lintian_static_metadata_contract_present=1
ubuntu_package_license_promotion_gate_contract_present=1
ubuntu_lintian_static_metadata_unblocked=1
ubuntu_local_deb_build_transcript_unblocked=1
```

Required Evidence Before Acceptance

```
ubuntu_local_deb_build_transcript_present=1
transcript_header_reviewed=1
tooling_evidence_reviewed=1
package_evidence_reviewed=1
build_evidence_reviewed=1
payload_evidence_reviewed=1
non_claims_reviewed=1
deb_artifact_digest_recorded=1
changes_file_digest_recorded=1
build_log_digest_recorded=1
lintian_output_digest_recorded=1
expected_draft_findings_classified=1
unexpected_findings_classified=1
build_transcript_acceptance_gate_unblocked=1
local_deb_build_transcript_accepted=1
```

Current Gate State

```
ubuntu_local_deb_build_transcript_acceptance_gate_contract_present=1
ubuntu_local_deb_build_transcript_acceptance_gate_status=blocked-pending-lintian-static-metadata
-and-build-transcript
ubuntu_local_deb_build_transcript_present=0
build_transcript_acceptance_gate_open=0
build_transcript_acceptance_gate_unblocked=0
local_deb_build_transcript_accepted=0
transcript_header_reviewed=0
tooling_evidence_reviewed=0
package_evidence_reviewed=0
build_evidence_reviewed=0
payload_evidence_reviewed=0
non_claims_reviewed=0
deb_artifact_created=0
deb_artifact_installed=0
deb_installed_on_host=0
deb_removed_from_host=0
ubuntu_lintian_static_metadata_unblocked=0
ubuntu_local_deb_build_transcript_unblocked=0
ubuntu_local_deb_install_remove_evidence_contract_present=1
ubuntu_local_deb_install_remove_evidence_status=blocked-pending-accepted-build-transcript
ppa_claimed=0
ubuntu_archive_ready=0
production_installer_ready=0
```

Relationship To Build Evidence

The Ubuntu local deb build transcript contract defines the fields a future transcript must contain. This gate records the separate acceptance decision for that transcript after lintian/static metadata and package license promotion have been reviewed.

This contract is intentionally closed today. It is not evidence that a build transcript exists, that a deb artifact exists, or that a package is installable.

The Ubuntu local deb install/remove evidence contract remains separate and blocked until a reviewed local deb build transcript is accepted.

Non-Claims

This contract does not claim build success, lintian success, install success, Debian Policy compliance, Ubuntu archive readiness, PPA readiness, Canonical endorsement, package publication readiness, production installer readiness, or release readiness.

Validation

Run:

```
sh scripts/test-ubuntu-local-deb-build-transcript-acceptance-gate-contract.sh
```

Expected output:

```
ubuntu_local_deb_build_transcript_acceptance_gate_contract: ok
```

docs/UBUNTU_LOCAL_DEB_BUILD_TRANSCRIPT_CONTRACT.md

Source title: Ubuntu Local Deb Build Transcript Contract

Lines: 166 | Words: 334 | SHA-256: be3edf6a4af2e3677a32bce69d2ac0751e5dbc5f6fe294d40fc647a7f6194f78

Ubuntu Local Deb Build Transcript Contract

Status: no-effect transcript contract Scope: evidence schema for a future reviewed local Ubuntu deb build transcript.

Purpose

This contract defines the transcript fields required before a future Ubuntu local deb build can be treated as evidence.

It does not run dpkg-buildpackage, debuild, lintian, sbuild, or pbuilder. It does not create, install, publish, or upload a deb package.

Required Transcript Header

```
transcript_kind=ubuntu-local-deb-build
transcript_version=1
host_os_id=ubuntu
host_os_version_recorded=1
kernel_recorded=1

deb_artifact_installed=0
deb_removed_from_host=0
license_expression_reviewed=1
license_expression_unresolved=0
ubuntu_lintian_static_metadata_unblocked=0
```

Acceptance Rule

A future transcript may only be accepted if all required fields are present, the license expression has been reviewed, lintian/static metadata is unblocked, expected draft findings are classified, unexpected findings are either absent or explicitly reviewed, the acceptance gate is unblocked, and all non-claims remain zero.

The Ubuntu local deb build transcript acceptance gate records that acceptance decision separately from this evidence schema.

The Ubuntu local deb install/remove evidence contract is downstream of this schema and remains blocked until a reviewed build transcript is accepted.

Validation

Run:

```
sh scripts/test-ubuntu-local-deb-build-transcript-contract.sh
```

Expected output:

```
ubuntu_local_deb_build_transcript_contract: ok
```

docs/UBUNTU_LOCAL_DEB_INSTALL_REMOVE_EVIDENCE_CONTRACT.md

Source title: Ubuntu Local Deb Install Remove Evidence Contract

Lines: 96 | Words: 266 | SHA-256: c539c70afa1120b4f7e5526ff09aeac16c70ebe5d92b8c785403305ae3283988

Ubuntu Local Deb Install Remove Evidence Contract

Status: no-effect local deb install/remove evidence contract Scope: evidence schema for a future reviewed Ubuntu local deb install/remove transcript.

Purpose

This contract defines the evidence required before a future local Ubuntu deb can claim install or remove behavior.

It does not run dpkg -i, apt install, apt remove, dpkg -r, dpkg -P, lintian, dpkg-buildpackage, debuild, sbuild, or pbuilder. It does not create, install, remove, publish, upload, or accept a deb package.

Required Inputs

```
ubuntu_local_deb_build_transcript_acceptance_gate_contract_present=1
ubuntu_local_deb_build_transcript_acceptance_gate_status=blocked-pending-lintian-static-metadata
-and-build-transcript
local_deb_build_transcript_accepted=1
deb_artifact_created=1
deb_artifact_digest_recorded=1
```

Required Evidence Before Promotion

```
install_remove_test_environment_recorded=1
install_command_recorded=1
install_exit_status_recorded=1
installed_payload_listing_recorded=1
usr_bin_latticra_installed=1
status_command_after_install_recorded=1
remove_command_recorded=1

ubuntu_publication_gate_unblocked=0
ppa_claimed=0
ubuntu_archive_ready=0
production_installer_ready=0
root_installer_ready=0
```

Relationship To Build Evidence

The Ubuntu local deb build transcript acceptance gate must be unblocked and a reviewed local deb build transcript must be accepted before this install/remove evidence contract can advance.

This contract is intentionally closed today. It records the future evidence shape without installing a package, removing a package, or mutating the host.

The Ubuntu PPA/archive publication gate is downstream of this contract and remains blocked until install/remove evidence is unblocked.

Non-Claims

This contract does not claim install success, remove success, package-manager integration, Debian Policy compliance, Ubuntu archive readiness, PPA readiness, Canonical endorsement, package publication readiness, production installer readiness, daily-driver readiness, root installer readiness, or release readiness.

Validation

Run:

```
sh scripts/test-ubuntu-local-deb-install-remove-evidence-contract.sh
```

Expected output:

```
ubuntu_local_deb_install_remove_evidence_contract: ok
```

docs/UBUNTU_LOCAL_DEB_STATIC_VALIDATION.md

Source title: Ubuntu Local Deb Static Validation

Lines: 169 | Words: 279 | SHA-256: 71f21cb8e3a248ad3fbb6c6854a7dcfb87f2e41bab9df6b176779097c9c03a0f

Ubuntu Local Deb Static Validation

Status: active static validation lane Scope: static checks for the local-only Ubuntu deb packaging draft.

Purpose

This lane checks that the Ubuntu packaging draft is present, narrow, and honest.

It verifies local packaging shape for the no-effect CLI payload, but it does not run dpkg-buildpackage, debuild, lintian, sbuild, or pbuilder, and it does not create package artifacts.

Guarded Files

launchpad_upload_run=0
ubuntu_publication_gate_unblocked=0
ppa_claimed=0
ubuntu_archive_ready=0
production_readiness_claimed=0
```

Package Intent

The local deb draft records only this initial payload shape:

```
usr/bin/latticra
usr/share/doc/latticra/README.md
```

The CLI remains the no-effect status surface from:

```
src/latticra_cli.c
```

Explicit Non-Claims

This static lane does not:

```
build a deb artifact
install a deb artifact
publish a PPA
submit to Ubuntu
claim Ubuntu archive readiness
install a systemd service
install kernel modules
write /etc/latticra
claim root installer readiness
claim production readiness
```

Next Recommended Lane

Review the Ubuntu source package evidence contract before any source package can be treated as publication input.

Validation

Run:

```
sh scripts/test-ubuntu-local-deb-static-validation.sh
```

Expected output:

```
ubuntu_local_deb_static_validation: ok
```

docs/UBUNTU_NOTICE_FILE_DECISION_CONTRACT.md

Source title: Ubuntu NOTICE File Decision Contract

Lines: 95 | Words: 326 | SHA-256: d40888b06bd4f18debc37617ac9e7e0f9fd73d3ea3c76fe1a90a0b0493c29687

Ubuntu NOTICE File Decision Contract

Status: no-effect NOTICE file decision contract Scope: define NOTICE file decision evidence required before the Ubuntu local deb notice review can be promoted.

Purpose

This contract turns the Ubuntu local deb NOTICE file blocker into a concrete review checklist.

It does not create a NOTICE file, decide that one is required or unnecessary, update packaging/ubuntu/debian/copyright, build a package, publish a package, submit to Ubuntu, or provide legal advice.

Current Inputs

```
package_scope=local-deb-draft
binary_payload=usr/bin/latticra
binary_payload_source=src/latticra_cli.c
doc_payload=usr/share/doc/latticra/README.md
doc_payload_source=README.md
notice_file_present=0
license_policy_present=1
third_party_material_policy_present=1
generated_artifact_notice_policy_present=1
ubuntu_package_notice_inventory_present=1
ubuntu_doc_payload_license_review_contract_present=1
ubuntu_third_party_material_review_contract_present=1
ubuntu_generated_artifact_notice_review_contract_present=1
ubuntu_debian_copyright_notice_mapping_contract_present=1
ubuntu_trademark_notice_boundary_contract_present=1
ubuntu_release_artifact_notice_requirements_contract_present=1
ubuntu_package_notice_review_contract_present=1
```

The current repository has no root NOTICE file and no reviewed package decision saying whether one is required for the Ubuntu local deb draft.

Required Decision Before Promotion

```
notice_file_decision_recorded=1
notice_file_required_decision_recorded=1
notice_file_content_requirements_recorded=1
notice_file_install_path_reviewed=1
notice_file_packaging_mapping_reviewed=1
notice_file_absence_justification_recorded=1
notice_file_missing_required_entries=0
```

Current Decision

```
ubuntu_notice_file_decision_contract_present=1
ubuntu_notice_file_decision_status=blocked-pending-notice-file-decision
notice_file_present=0
notice_file_decision_recorded=0
notice_file_required_decision_recorded=0
notice_file_content_requirements_recorded=0
notice_file_install_path_reviewed=0
notice_file_packaging_mapping_reviewed=0
notice_file_absence_justification_recorded=0
notice_file_missing_required_entries=0
ubuntu_package_notice_review_unblocked=0
ubuntu_package_license_review_unblocked=1
ubuntu_lintian_static_metadata_unblocked=0
ubuntu_local_deb_build_transcript_unblocked=0
```

Relationship To Notice Review

The Ubuntu package notice review may not be promoted until the package has a reviewed NOTICE file decision. That decision may later require a file or record why no file is required, but this contract does not make that decision.

The Debian copyright notice mapping review remains separate, but it must also be resolved before the Ubuntu package notice review can be promoted.

The trademark notice boundary remains separate, but it must also be resolved before the Ubuntu package notice review can be promoted.

The release artifact notice requirements remain separate, but they must also be resolved before the Ubuntu package notice review can be promoted.

This contract is scoped to the Ubuntu local deb draft. It is not a repository-wide release notice decision.

Non-Claims

This contract is not legal advice. It does not claim NOTICE compliance, Ubuntu archive readiness, PPA readiness, Canonical endorsement, package publication readiness, production installer readiness, or release readiness.

Validation

Run:

```
sh scripts/test-ubuntu-notice-file-decision-contract.sh
```

Expected output:

```
ubuntu_notice_file_decision_contract: ok
```

docs/UBUNTU_PACKAGE_LICENSE_PROMOTION_GATE_CONTRACT.md

Source title: Ubuntu Package License Promotion Gate Contract

Lines: 84 | Words: 259 | SHA-256: d7fad60e6202e94a6b20afcd57ddb5b9e520f5065158f076d9ae22db70d1efcf

Ubuntu Package License Promotion Gate Contract

Status: no-effect package license promotion gate contract Scope: aggregate the Ubuntu package license prerequisites that must be reviewed before lintian/static metadata or local deb build transcript evidence can advance.

Purpose

This contract turns the Ubuntu package license promotion boundary into a single guarded gate.

It does not run lintian, build a package, publish a package, submit to Ubuntu, or provide legal advice.

Required Inputs

```
license_policy_present=1
license_migration_plan_present=1
ubuntu_package_notice_promotion_gate_contract_present=1
ubuntu_package_notice_review_contract_present=1
ubuntu_package_license_review_contract_present=1
```

Required Gate Before Promotion

```
root_license_state_reviewed=1
cli_payload_spdx_reviewed=1
doc_payload_license_reviewed=1
documentation_license_decision_present=1
third_party_notice_reviewed=1
debian_copyright_format_reviewed=1
candidate_expression_accepted=1
packaging_license_expression_updated=1
license_expression_reviewed=1
license_expression_unresolved=0
ubuntu_lintian_static_metadata_unblocked=1
ubuntu_local_deb_build_transcript_unblocked=1
```

Current Gate State

```
ubuntu_package_license_promotion_gate_contract_present=1
ubuntu_package_license_promotion_gate_status=blocked-pending-package-notice-prerequisites
ubuntu_package_notice_promotion_gate_contract_present=1
ubuntu_package_notice_promotion_gate_status=blocked-pending-package-notice-prerequisites
ubuntu_package_license_review_contract_present=1
ubuntu_package_license_review_status=resolved-license-expression-recorded
ubuntu_lintian_static_metadata_contract_present=1
ubuntu_lintian_static_metadata_status=blocked-pending-package-license-promotion
ubuntu_package_notice_review_unblocked=0
ubuntu_package_license_review_unblocked=1
license_expression_candidate_recorded=1
license_expression_reviewed=1
license_expression_unresolved=0
packaging_license_expression_updated=1
ubuntu_lintian_static_metadata_unblocked=0
ubuntu_local_deb_build_transcript_unblocked=0
```

Relationship To Lintian And Build Evidence

The Ubuntu static metadata lint lane and local deb build transcript evidence may not advance until this gate records that the package notice gate is unblocked, the package license review is complete, the packaging license expression is updated, and license expression review is no longer unresolved.

The Ubuntu lintian static metadata contract records the next evidence schema while keeping lintian execution blocked behind this gate.

This gate is a coordination record for the current local deb draft. It is not a package publication claim or a compliance certification.

Non-Claims

This contract is not legal advice. It does not claim license-compliance completion, Ubuntu archive readiness, PPA readiness, Canonical endorsement, package publication readiness, production installer readiness, or release readiness.

Validation

Run:

```
sh scripts/test-ubuntu-package-license-promotion-gate-contract.sh
```

Expected output:

```
ubuntu_package_license_promotion_gate_contract: ok
```

docs/UBUNTU_PACKAGE_LICENSE_REVIEW_CONTRACT.md

Source title: Ubuntu Package License Review Contract

Lines: 152 | Words: 337 | SHA-256: 5f3ec3966436d975d70148819d7cbd14993acb121ea9e22352dab31a31d0ef8d

Ubuntu Package License Review Contract

Status: no-effect package license review contract Scope: record the license-review evidence for the Ubuntu local deb draft package payload.

Purpose

This contract records the Ubuntu package license expression decision and the remaining promotion blockers.

It does not publish a package, create a PPA, submit to Ubuntu, or provide legal advice.

Current Inputs

```
root_license_file=LICENSE
root_license_current=hybrid-license-overview
license_policy_present=1
license_migration_plan_present=1
new_software_direction=AGPL-3.0-or-later
no_silent_relicensing=1
documentation_license_decision_present=1
```

The current no-effect CLI payload input is:

```
cli_payload_source=src/latticra_cli.c
cli_payload_spdx_present=1
cli_payload_spdx=AGPL-3.0-or-later
```

The current local deb draft also records README documentation as an intended package payload:

```
doc_payload_source=README.md
doc_payload_license_reviewed=1
doc_payload_license_unresolved=0
```

Candidate Expressions

These are review candidates, not release claims:

```
candidate_binary_payload_license=AGPL-3.0-or-later
candidate_doc_payload_license=CC-BY-4.0
candidate_source_package_license=AGPL-3.0-or-later AND Apache-2.0 AND CC-BY-4.0
candidate_expression_recorded=1
candidate_expression_applied_to_packaging=1
```

The candidate expression is applied to the local Ubuntu packaging metadata for the current no-effect CLI plus README payload. Broader notice obligations remain blocked until the package notice review is promoted.

The current notice-review dependency is:

```
ubuntu_package_notice_inventory_present=1
ubuntu_package_notice_inventory_report_present=1
ubuntu_doc_payload_license_review_contract_present=1
ubuntu_doc_payload_license_review_status=resolved-cc-by-4.0

license_expression_reviewed=1
license_expression_unresolved=0
packaging_license_expression_updated=1
ubuntu_lintian_static_metadata_unblocked=0
ubuntu_local_deb_build_transcript_unblocked=0
```

Relationship To Ubuntu Lanes

The Ubuntu lintian availability lane may run because it only proves tool availability.

The Ubuntu static metadata lint lane and local deb build transcript evidence remain blocked until the package notice review and promotion gates are satisfied.

The Ubuntu package license promotion gate aggregates this contract with the package notice promotion gate before static lint or build transcript evidence can advance.

Non-Claims

This contract is not legal advice. It does not claim Ubuntu archive readiness, PPA readiness, Canonical endorsement, production installer readiness, package publication readiness, or license-compliance completion.

Validation

Run:

```
sh scripts/test-ubuntu-package-license-review-contract.sh
```

Expected output:

```
ubuntu_package_license_review_contract: ok
```

docs/UBUNTU_PACKAGE_NOTICE_INVENTORY.md

Source title: Ubuntu Package Notice Inventory

Lines: 79 | Words: 168 | SHA-256: bbfdc4421add074585d44a0ba88f4f749c772b4fec8cceefabdc54ef320de0a1

Ubuntu Package Notice Inventory

Status: no-effect package notice inventory Scope: deterministic inventory report for the current Ubuntu local deb draft payload.

Purpose

This inventory records the current notice inputs for the Ubuntu local deb draft.

It does not create a NOTICE file, build a package, publish a package, submit to Ubuntu, or provide legal advice.

Current Payload Inventory

```
package_scope=local-deb-draft
binary_payload=usr/bin/latticra
binary_payload_source=src/latticra_cli.c
binary_payload_spdx=AGPL-3.0-or-later
doc_payload=usr/share/doc/latticra/README.md
doc_payload_source=README.md
root_license_file=LICENSE
root_license_current=hybrid-license-overview
debian_copyright_file=packaging/ubuntu/debian/copyright
```

Current Notice Posture

```
ubuntu_package_notice_inventory_present=1
ubuntu_package_notice_inventory_report_present=1
third_party_material_inventory_recorded=1
third_party_material_inventory_reviewed=0
third_party_material_missing_entries=0
generated_artifact_notice_reviewed=0
notice_file_present=0
notice_file_decision_recorded=0
doc_payload_license_reviewed=1
doc_payload_license_unresolved=0
debian_copyright_notice_mapping_reviewed=0
packaging_license_expression_updated=1
ubuntu_package_notice_review_unblocked=0
```

Report Command

Run:

```
sh scripts/ubuntu-package-notice-inventory.sh
```

Expected key lines include:

```
UBUNTU PACKAGE NOTICE INVENTORY
inventory_status=ok
inventory_mode=no-effect
ubuntu_package_notice_review_unblocked=0
```

Relationship To Notice Review

The inventory is a fact report. It does not promote the Ubuntu package notice review contract.

The notice review remains blocked until third-party notices, generated-artifact notices, trademark notice boundaries, and the remaining Debian copyright notice mapping are reviewed.

Validation

Run:

```
sh scripts/test-ubuntu-package-notice-inventory.sh
```

Expected output:

```
ubuntu_package_notice_inventory: ok
```

docs/UBUNTU_PACKAGE_NOTICE_PROMOTION_GATE_CONTRACT.md

Source title: Ubuntu Package Notice Promotion Gate Contract

Lines: 79 | Words: 225 | SHA-256: a12c4e158ae17ad6eb1389915265627a84990bf95ea32da526b0b818b6c4811c

Ubuntu Package Notice Promotion Gate Contract

Status: no-effect package notice promotion gate contract Scope: aggregate the Ubuntu package notice prerequisites that must be reviewed before package license promotion can proceed.

Purpose

This contract turns the Ubuntu package notice promotion boundary into a single guarded gate.

It does not promote the notice review, decide licenses, create a NOTICE file, update Debian copyright metadata, build a package, publish a package, submit to Ubuntu, or provide legal advice.

Required Inputs

```
ubuntu_doc_payload_license_review_contract_present=1
ubuntu_third_party_material_review_contract_present=1
ubuntu_generated_artifact_notice_review_contract_present=1
ubuntu_notice_file_decision_contract_present=1
ubuntu_debian_copyright_notice_mapping_contract_present=1
ubuntu_trademark_notice_boundary_contract_present=1
ubuntu_release_artifact_notice_requirements_contract_present=1
ubuntu_package_notice_review_contract_present=1
```

Required Gate Before Promotion

```
doc_payload_license_decision_recorded=1
third_party_material_inventory_reviewed=1
generated_artifact_notice_reviewed=1
notice_file_decision_recorded=1
debian_copyright_notice_mapping_reviewed=1
trademark_notice_boundary_recorded=1
release_artifact_notice_requirements_recorded=1
ubuntu_package_notice_review_unblocked=1
ubuntu_package_license_review_unblocked=1
```

Current Gate State

```
ubuntu_package_notice_promotion_gate_contract_present=1
ubuntu_package_notice_promotion_gate_status=blocked-pending-package-notice-prerequisites
doc_payload_license_decision_recorded=1
third_party_material_inventory_reviewed=0
generated_artifact_notice_reviewed=0
notice_file_decision_recorded=0
debian_copyright_notice_mapping_reviewed=0
trademark_notice_boundary_recorded=0
release_artifact_notice_requirements_recorded=0
ubuntu_package_notice_review_unblocked=0
ubuntu_package_license_review_unblocked=1
ubuntu_lintian_static_metadata_unblocked=0
ubuntu_local_deb_build_transcript_unblocked=0
```

Relationship To Package License Review

The Ubuntu package license review may not advance until this gate records that all package notice prerequisites are reviewed and the package notice review is unblocked.

This gate is a coordination record for the current local deb draft. It is not a package publication claim or a compliance certification.

Non-Claims

This contract is not legal advice. It does not claim NOTICE compliance, license-compliance completion, Ubuntu archive readiness, PPA readiness, Canonical endorsement, package publication readiness, production installer readiness, or release readiness.

Validation

Run:

```
sh scripts/test-ubuntu-package-notice-promotion-gate-contract.sh
```

Expected output:

```
ubuntu_package_notice_promotion_gate_contract: ok
```

docs/UBUNTU_PACKAGE_NOTICE_REVIEW_CONTRACT.md

Source title: Ubuntu Package Notice Review Contract

Lines: 173 | Words: 464 | SHA-256: e572b28a1baded806a54e7f14c0443da64c652489e5d6af5a09a3ea1464f5e28

Ubuntu Package Notice Review Contract

Status: no-effect notice review contract Scope: define notice, attribution, and package evidence required before Ubuntu package license promotion.

Purpose

This contract defines the remaining notice review layer for the Ubuntu local deb draft.

It does not create a NOTICE file, publish a package, create a PPA, submit to Ubuntu, or provide legal advice.

Current Inputs

```
license_policy_present=1
license_migration_plan_present=1
third_party_material_policy_present=1
generated_artifact_notice_policy_present=1

ubuntu_local_deb_build_transcript_unblocked=0
```

Relationship To License Review

The Ubuntu package license review contract records the accepted package expression. Package promotion remains blocked until this notice review contract is promoted by a reviewed notice decision.

The Ubuntu package notice inventory report records current payload facts and open notice obligations, but it does not unblock this review by itself.

The Ubuntu doc payload license review contract records the resolved README.md CC-BY-4.0 documentation-license decision required before this notice review can be promoted.

The Ubuntu third-party material review contract records the source, license, compatibility, and notice-requirement evidence required before this notice review can be promoted.

The Ubuntu generated-artifact notice review contract records the generated payload, build artifact, changes-file, build-log, and installed-payload notice evidence required before this notice review can be promoted.

The Ubuntu NOTICE file decision contract records the reviewed decision required before a package can claim NOTICE obligations are satisfied.

The Ubuntu Debian copyright notice mapping contract records the reviewed mapping required before package notice obligations can be represented in packaging/ubuntu/debian/copyright.

The Ubuntu trademark notice boundary contract records the reviewed project-identity and endorsement boundary required before package notice obligations can be promoted.

The Ubuntu release artifact notice requirements contract records the reviewed source-package, deb-artifact, changes-file, build-log, installed-payload, and release-notes notice requirements required before package notice obligations can be promoted.

The Ubuntu package notice promotion gate aggregates these prerequisites before package license promotion can proceed.

Non-Claims

This contract is not legal advice. It does not claim license-compliance completion, Ubuntu archive readiness, PPA readiness, Canonical endorsement, production installer readiness, package publication readiness, or release readiness.

Validation

Run:

```
sh scripts/test-ubuntu-package-notice-review-contract.sh
```

Expected output:

```
ubuntu_package_notice_review_contract: ok
```

docs/UBUNTU_PPA_ARCHIVE_PUBLICATION_GATE_CONTRACT.md

Source title: Ubuntu PPA Archive Publication Gate Contract

Lines: 110 | Words: 304 | SHA-256: 29290fda0b6cf9e6f21987a903553415adb5ebc0c454a69726484ef489618a61

Ubuntu PPA Archive Publication Gate Contract

Status: no-effect PPA/archive publication gate contract Scope: evidence schema for future Ubuntu PPA upload or Ubuntu archive submission review.

Purpose

This contract defines the evidence required before any future Ubuntu PPA upload, Launchpad build, Ubuntu archive submission, or publication-readiness claim can be accepted.

It does not run debsign, dput, dpkg-buildpackage, debuild, lintian, sbuild, or pbuilder. It does not create a source package, sign artifacts, upload to Launchpad, create a PPA, submit to Ubuntu, publish a package, or claim archive readiness.

Required Inputs

```
ubuntu_package_notice_promotion_gate_contract_present=1
ubuntu_package_license_promotion_gate_contract_present=1
ubuntu_lintian_static_metadata_contract_present=1
ubuntu_local_deb_build_transcript_acceptance_gate_contract_present=1

signature_fingerprint_recorded=0
dput_command_recorded=0
upload_exit_status_recorded=0
launchpad_build_log_recorded=0
launchpad_build_result_reviewed=0
publication_non_claims_reviewed=0
ubuntu_publication_gate_unblocked=0
ppa_created=0
ppa_claimed=0
launchpad_upload_run=0
ubuntu_archive_submission_claimed=0
ubuntu_archive_ready=0
ubuntu_publication_ready=0
production_installer_ready=0
root_installer_ready=0
```

Relationship To Install Remove Evidence

The Ubuntu source package evidence contract, upload/signing authority evidence contract, and local deb install/remove evidence contract must be unblocked before this publication gate can advance. Publication evidence is downstream of notice, license, lintian/static metadata, build transcript acceptance, source package evidence, payload review, install evidence, remove evidence, upload authority, signing evidence, Launchpad evidence, and non-claim review.

This contract is intentionally closed today. It records the future evidence shape without signing artifacts, uploading artifacts, creating a PPA, submitting to Ubuntu, or publishing a package.

Non-Claims

This contract does not claim PPA readiness, Launchpad build success, Ubuntu archive readiness, Ubuntu upload rights, Ubuntu sponsorship, Canonical endorsement, package publication readiness, production installer readiness, daily-driver readiness, root installer readiness, or release readiness.

Validation

Run:

```
sh scripts/test-ubuntu-ppa-archive-publication-gate-contract.sh
```

Expected output:

```
ubuntu_ppa_archive_publication_gate_contract: ok
```

docs/UBUNTU_READINESS_PLAN.md

Source title: Ubuntu Readiness Plan

Lines: 286 | Words: 611 | SHA-256: c4d47a332236ec802a9ede3b5f4c09012e70267364d498d8c885ecb2336ec4b5

Ubuntu Readiness Plan

Status: planning and compatibility record Scope: preparing Latticra for Ubuntu-friendly development, local validation, and local-only deb packaging.

Purpose

This plan prepares Latticra for an Ubuntu-facing path without claiming Ubuntu archive acceptance, Canonical endorsement, PPA readiness, production installer readiness, or distribution status.

The near-term target is:

```
Latticra builds cleanly on Ubuntu Linux.
Latticra Panel can be run from source on Ubuntu with documented apt prerequisites.
Latticra has a local-only deb packaging draft for the no-effect CLI payload.
Latticra preserves its current non-claims.
```

Terminology Boundary

Use:

```
Ubuntu readiness
Ubuntu compatibility lane
Ubuntu local deb draft
Latticra on Ubuntu
local-only deb packaging draft
```

Avoid claiming:

```
official Ubuntu package
Ubuntu archive package
PPA release
Canonical endorsement
Ubuntu flavor
Ubuntu derivative
operating-system replacement
```

Those terms require separate packaging, policy, legal, trademark, and community review.

Ubuntu-Facing Requirements To Respect

Before Latticra can be proposed beyond a local deb draft, it should be checked against Ubuntu/Debian package expectations:

```
source package layout
debian/control hygiene
debian/copyright accuracy
license expression review
Build-Depends completeness
Rules-Requires-Root posture
no maintainer scripts without review
no systemd service installation without review
no root-owned host mutation without review
lintian output classification
pbuilder/sbuild or equivalent build evidence
install/remove behavior evidence
```

Current Latticra Posture

Current Latticra evidence is still early-stage and report-oriented.

Known current posture:

```
ubuntu_build_lane_present=1
ubuntu_panel_prerequisites_documented=1
ubuntu_local_deb_draft_present=1

production_installer_ready=0
daily_driver_install_ready=0
root_installer_ready=0
```

The first Ubuntu target is development and local validation. It is not an Ubuntu archive package, PPA package, image, flavor, distribution, or replacement operating system.

Phase 1: Ubuntu Build Lane

The Ubuntu build lane proves the current guarded project foundation compiles with Ubuntu toolchains.

Current guarded files:

```
scripts/test-ubuntu-build-lane.sh
.github/workflows/ubuntu-build-lane.yml
docs/UBUNTU_DEVELOPER_WORKFLOW.md
scripts/test-ubuntu-lintian-availability.sh
.github/workflows/ubuntu-lintian-availability.yml
```

Initial checks remain conservative:

```
C compiler available
project C guards compile
kernel lifecycle guards compile
no-effect CLI status surface present
no external authority claims added
```

Phase 2: Panel Prerequisites Lane

The Panel remains user-local on Ubuntu. The apt prerequisites support local Rust/egui development and desktop metadata refresh without adding root-installed Latticra services.

Current guarded files:

```
README.md
docs/QUICK_START_CHEATSHEET.md
installer/README.md
docs/UBUNTU_DEVELOPER_WORKFLOW.md
```

Phase 3: Local Deb Draft Lane

Packaging metadata is present as a local-only draft after the Ubuntu build lane.

Current guarded files:

```
packaging/ubuntu/README.md
packaging/ubuntu/debian/control
packaging/ubuntu/debian/rules
packaging/ubuntu/debian/changelog
packaging/ubuntu/debian/copyright
packaging/ubuntu/debian/install
packaging/ubuntu/debian/source/format

.github/workflows/ubuntu-ppa-archive-publication-gate-contract.yml
```

The first deb draft is only a packaging-shape record until lint/build/install evidence is added.

Non-Claims

This plan does not:

```
publish a deb package
create a PPA
submit Latticra to Ubuntu
run dpkg-source
run debsign
run dput
claim Ubuntu archive readiness
claim Canonical endorsement
install a root service
modify systemd
modify the kernel
claim production readiness
claim operating-system completeness
```

Recommended Next Slice

Recommended next slice:

```
Review the Ubuntu upload/signing authority evidence contract, then keep signing and upload
evidence blocked until source package evidence is reviewed.
```

That should preserve the current no-artifact, no-submission, local-only Ubuntu package posture while the local deb path matures.

docs/UBUNTU_RELEASE_ARTIFACT_NOTICE_REQUIREMENTS_CONTRACT.md

Source title: Ubuntu Release Artifact Notice Requirements Contract

Lines: 91 | Words: 275 | SHA-256: cf81d2e8d8e50cea8fb0e3e8ad42bc90f15c2e6bf720a7ac1318f7d937e58daf

Ubuntu Release Artifact Notice Requirements Contract

Status: no-effect release artifact notice requirements contract Scope: define release-artifact notice evidence required before the Ubuntu package notice review can be promoted.

Purpose

This contract turns the Ubuntu local deb release-artifact notice blocker into a concrete review checklist.

It does not build a deb, create a .changes file, create a build log, install a package, publish a package, create release notes, submit to Ubuntu, or provide legal advice.

Current Inputs

```
package_scope=local-deb-draft
binary_payload=usr/bin/latticra
binary_payload_source=src/latticra_cli.c
doc_payload=usr/share/doc/latticra/README.md
doc_payload_source=README.md
deb_artifact_created=0
changes_file_created=0
build_log_created=0
package_installed_for_notice_review=0
package_publish_performed=0
ubuntu_package_notice_inventory_present=1
ubuntu_doc_payload_license_review_contract_present=1
ubuntu_third_party_material_review_contract_present=1
ubuntu_generated_artifact_notice_review_contract_present=1
ubuntu_notice_file_decision_contract_present=1
ubuntu_debian_copyright_notice_mapping_contract_present=1
ubuntu_trademark_notice_boundary_contract_present=1
ubuntu_package_notice_review_contract_present=1
```

The current Ubuntu local deb draft has no release artifact, no .changes file, no build log, and no installed payload evidence for release-artifact notice review.

Required Requirements Before Promotion

```
release_artifact_notice_requirements_recorded=1
source_package_notice_requirements_recorded=1
deb_artifact_notice_requirements_recorded=1
changes_file_notice_requirements_recorded=1
build_log_notice_requirements_recorded=1
installed_payload_notice_requirements_recorded=1
release_notes_notice_requirements_recorded=1
release_artifact_missing_notice_entries=0
```

Current Decision

```
ubuntu_release_artifact_notice_requirements_contract_present=1
ubuntu_release_artifact_notice_requirements_status=blocked-pending-release-artifact-notice-requi
rements
release_artifact_notice_requirements_recorded=0
source_package_notice_requirements_recorded=0
deb_artifact_notice_requirements_recorded=0
changes_file_notice_requirements_recorded=0

installed_payload_notice_requirements_recorded=0
release_notes_notice_requirements_recorded=0
release_artifact_missing_notice_entries=0
ubuntu_package_notice_review_unblocked=0
ubuntu_package_license_review_unblocked=1
ubuntu_lintian_static_metadata_unblocked=0
ubuntu_local_deb_build_transcript_unblocked=0
```

Relationship To Notice Review

The Ubuntu package notice review may not be promoted until release-artifact notice requirements are reviewed for the source package, deb artifact, .changes file, build log, installed payload, and any release notes or publication material.

This contract is scoped to the Ubuntu local deb draft. It is not evidence that any artifact exists, that any artifact is distributable, or that release notices are complete.

Non-Claims

This contract is not legal advice. It does not claim release-artifact notice compliance, generated-artifact notice compliance, license-compliance completion, Ubuntu archive readiness, PPA readiness, Canonical endorsement, package publication readiness, production installer readiness, or release readiness.

Validation

Run:

```
sh scripts/test-ubuntu-release-artifact-notice-requirements-contract.sh
```

Expected output:

```
ubuntu_release_artifact_notice_requirements_contract: ok
```

Ubuntu Source Package Evidence Contract

Status: no-effect source package evidence contract Scope: evidence schema for a future reviewed Ubuntu source package transcript.

Purpose

This contract defines the evidence required before a future Ubuntu source package can be treated as publication input.

It does not run dpkg-source, dpkg-buildpackage -S, debuild -S, debsign, dput, lintian, sbuild, or pbuilder. It does not create a source package, sign artifacts, upload to Launchpad, create a PPA, submit to Ubuntu, publish a package, or claim archive readiness.

Required Inputs

```
ubuntu_package_notice_promotion_gate_contract_present=1
ubuntu_package_license_promotion_gate_contract_present=1
ubuntu_lintian_static_metadata_contract_present=1
ubuntu_local_deb_build_transcript_acceptance_gate_contract_present=1

ubuntu_upload_signing_authority_evidence_unblocked=0
ppa_claimed=0
ubuntu_archive_ready=0
ubuntu_publication_ready=0
production_installer_ready=0
root_installer_ready=0
```

Relationship To Publication

The Ubuntu PPA/archive publication gate must not unblock until this source package evidence contract is unblocked alongside install/remove evidence, upload authority, signing evidence, Launchpad evidence, and non-claim review.

This contract is intentionally closed today. It records the future source package evidence shape without creating, signing, uploading, or publishing artifacts.

The Ubuntu upload/signing authority evidence contract is downstream of this contract and remains blocked until source package evidence is unblocked.

Non-Claims

This contract does not claim source package creation, source package correctness, source package upload readiness, PPA readiness, Launchpad build success, Ubuntu archive readiness, Ubuntu sponsorship, Canonical endorsement, package publication readiness, production installer readiness, daily-driver readiness, root installer readiness, or release readiness.

Validation

Run:

```
sh scripts/test-ubuntu-source-package-evidence-contract.sh
```

Expected output:

```
ubuntu_source_package_evidence_contract: ok
```

docs/UBUNTU_THIRD_PARTY_MATERIAL_REVIEW_CONTRACT.md

Source title: Ubuntu Third-Party Material Review Contract

Lines: 102 | Words: 345 | SHA-256: da3026209f79b0f166eaa0da06dea9a4efa85bcbb73ba6780ef7c4689c20c7fb

Ubuntu Third-Party Material Review Contract

Status: no-effect third-party material review contract Scope: define third-party material evidence required before the Ubuntu local deb notice review can be promoted.

Purpose

This contract turns the Ubuntu local deb third-party material blocker into a concrete review checklist.

It does not add third-party material, decide license compatibility, update packaging/ubuntu/debian/copyright, create a NOTICE file, build a package, publish a package, submit to Ubuntu, or provide legal advice.

Current Inputs

```
package_scope=local-deb-draft
binary_payload=usr/bin/latticra
binary_payload_source=src/latticra_cli.c
doc_payload=usr/share/doc/latticra/README.md
doc_payload_source=README.md
third_party_material_policy_present=1
ubuntu_package_notice_inventory_present=1
ubuntu_package_notice_inventory_report_present=1
ubuntu_doc_payload_license_review_contract_present=1
ubuntu_generated_artifact_notice_review_contract_present=1
ubuntu_notice_file_decision_contract_present=1
ubuntu_debian_copyright_notice_mapping_contract_present=1
ubuntu_trademark_notice_boundary_contract_present=1
ubuntu_release_artifact_notice_requirements_contract_present=1
ubuntu_package_notice_review_contract_present=1
```

The current inventory records the third-party material posture but does not complete review.

Required Review Before Promotion

```
third_party_material_inventory_reviewed=1
third_party_material_missing_entries=0
third_party_material_source_records_present=1
third_party_material_license_records_present=1
third_party_material_compatibility_notes_present=1
binary_payload_third_party_material_reviewed=1
doc_payload_third_party_material_reviewed=1
packaging_metadata_third_party_material_reviewed=1
third_party_notice_requirements_recorded=1
```

Current Decision

```
ubuntu_third_party_material_review_contract_present=1
ubuntu_third_party_material_review_status=blocked-pending-third-party-material-review
third_party_material_inventory_recorded=1
third_party_material_inventory_reviewed=0
third_party_material_missing_entries=0
third_party_material_source_records_present=0
third_party_material_license_records_present=0
third_party_material_compatibility_notes_present=0
binary_payload_third_party_material_reviewed=0
doc_payload_third_party_material_reviewed=0
packaging_metadata_third_party_material_reviewed=0
third_party_notice_reviewed=0
third_party_notice_requirements_recorded=0
ubuntu_package_notice_review_unblocked=0
ubuntu_package_license_review_unblocked=1
ubuntu_lintian_static_metadata_unblocked=0
ubuntu_local_deb_build_transcript_unblocked=0
```

Relationship To Notice Review

The Ubuntu package notice review may not be promoted until third-party material inventory review is complete and any notice requirements are mapped into package metadata.

The generated-artifact notice review remains separate, but it must also be resolved before the Ubuntu package notice review can be promoted.

The NOTICE file decision remains separate, but it must also be resolved before the Ubuntu package notice review can be promoted.

The Debian copyright notice mapping remains separate, but it must also be resolved before the Ubuntu package notice review can be promoted.

The trademark notice boundary remains separate, but it must also be resolved before the Ubuntu package notice review can be promoted.

The release artifact notice requirements remain separate, but they must also be resolved before the Ubuntu package notice review can be promoted.

This contract is scoped to the current Ubuntu local deb draft payload. It is not a repository-wide third-party materials audit.

Non-Claims

This contract is not legal advice. It does not claim third-party license compliance, Ubuntu archive readiness, PPA readiness, Canonical endorsement, package publication readiness, production installer readiness, or release readiness.

Validation

Run:

```
sh scripts/test-ubuntu-third-party-material-review-contract.sh
```

Expected output:

```
ubuntu_third_party_material_review_contract: ok
```

docs/UBUNTU_TRADEMARK_NOTICE_BOUNDARY_CONTRACT.md

Source title: Ubuntu Trademark Notice Boundary Contract

Lines: 92 | Words: 287 | SHA-256: a078facab49d33529b8e05a9d5b41866201a7ed0a5f7e7c05bbdc4000a1cdc91

Ubuntu Trademark Notice Boundary Contract

Status: no-effect trademark notice boundary contract Scope: define trademark, identity, and endorsement-boundary evidence required before the Ubuntu package notice review can be promoted.

Purpose

This contract turns the Ubuntu local deb trademark notice blocker into a concrete review checklist.

It does not update package metadata, change packaging/ubuntu/debian/copyright, create a NOTICE file, decide the documentation license, build a package, publish a package, submit to Ubuntu, grant trademark rights, or provide legal advice.

Current Inputs

```
package_scope=local-deb-draft
trademark_policy_present=1
project_identity_terms_recorded=1
binary_payload=usr/bin/latticra
binary_payload_source=src/latticra_cli.c
doc_payload=usr/share/doc/latticra/README.md
doc_payload_source=README.md
debian_control_file=packaging/ubuntu/debian/control
debian_copyright_file=packaging/ubuntu/debian/copyright
ubuntu_package_notice_inventory_present=1
ubuntu_doc_payload_license_review_contract_present=1
ubuntu_third_party_material_review_contract_present=1
ubuntu_generated_artifact_notice_review_contract_present=1
ubuntu_notice_file_decision_contract_present=1
ubuntu_debian_copyright_notice_mapping_contract_present=1
ubuntu_release_artifact_notice_requirements_contract_present=1
ubuntu_package_notice_review_contract_present=1
```

The current package draft is local-only and makes no Ubuntu archive, PPA, Canonical endorsement, or production readiness claim.

Required Boundary Before Promotion

```
trademark_notice_boundary_recorded=1
trademark_policy_applied_to_package_notice=1
package_description_endorsement_boundary_reviewed=1
debian_copyright_trademark_notice_boundary_reviewed=1
documentation_trademark_boundary_reviewed=1
canonical_endorsement_boundary_reviewed=1
project_identity_downstream_use_boundary_recorded=1
trademark_notice_missing_required_entries=0
```

Current Decision

```
ubuntu_trademark_notice_boundary_contract_present=1
ubuntu_trademark_notice_boundary_status=blocked-pending-trademark-notice-boundary
trademark_notice_boundary_recorded=0
trademark_policy_applied_to_package_notice=0
package_description_endorsement_boundary_reviewed=0
debian_copyright_trademark_notice_boundary_reviewed=0
documentation_trademark_boundary_reviewed=0
canonical_endorsement_boundary_reviewed=0
project_identity_downstream_use_boundary_recorded=0
trademark_notice_missing_required_entries=0
ubuntu_package_notice_review_unblocked=0
ubuntu_package_license_review_unblocked=1
ubuntu_lintian_static_metadata_unblocked=0
ubuntu_local_deb_build_transcript_unblocked=0
```

Relationship To Notice Review

The Ubuntu package notice review may not be promoted until the local deb payload has a reviewed trademark and endorsement boundary. That review must preserve the distinction between open-source license permissions and Latticra/Bryforge project identity rights.

The release artifact notice requirements remain separate, but they must also be resolved before the Ubuntu package notice review can be promoted.

This contract is scoped to the Ubuntu local deb draft. It is not a trademark registration, enforcement plan, Ubuntu archive claim, or downstream redistribution approval.

Non-Claims

This contract is not legal advice. It does not claim trademark compliance, NOTICE compliance, license-compliance completion, Ubuntu archive readiness, PPA readiness, Canonical endorsement, package publication readiness, production installer readiness, or release readiness.

Validation

Run:

```
sh scripts/test-ubuntu-trademark-notice-boundary-contract.sh
```

Expected output:

```
ubuntu_trademark_notice_boundary_contract: ok
```

```

Expected output:

```
ubuntu_upload_signing_authority_evidence_contract: ok
```

packaging/debian/README.md

Source title: Debian Packaging Draft

Lines: 161 | Words: 418 | SHA-256: 05bf6ff826676cdd155b1b3fc2ad31b5b1483c46b0d6c28269d3ea6487ff5dda

Debian Packaging Draft

Status: local-only packaging draft

This directory contains Debian-oriented packaging experiments for Latticra.

The current debian metadata is a local-only draft used by static guards. It is not a Debian archive package, not a mentors.debian.net upload, not sponsorship evidence, not ftp-master acceptance evidence, not a local dpkg-buildpackage result, not a lintian result, and not package-readiness evidence.

Where This Fits

- Documentation hub: ../../docs/README.md
- Debian status: ../../docs/status/DEBIAN_ECOSYSTEM_INTEGRATION_STATUS.md
- Current status: ../../docs/status/CURRENT_STATUS.md

Current guarded files:

production_readiness_claimed=0
```

The draft payload remains intentionally narrow:

```
usr/bin/latticra
usr/share/doc/latticra/README.md
```

The CLI reports no-effect status and disabled runtime behavior.

The source archive contract records the expected latticra_0.0.0.orig.tar.gz boundary, but it does not create an archive, run dpkg-source, run dpkg-buildpackage, or accept Debian build evidence.

The package-build gate is recorded in ../../docs/DEBIAN_FREEBSD_OPENBSD_PACKAGE_BUILD_GATE_CONTRACT.md. It keeps package_build_gate_state=closed-no-effect and debian_build_allowed=0 until source, checksum, license, notice, environment, authorization, payload inspection, install/remove, and publication non-claim evidence exists.

The package-build environment contract is recorded in ../../docs/DEBIAN_FREEBSD_OPENBSD_PACKAGE_BUILD_ENVIRONMENT_CONTRACT.md. It documents the Debian clean build environment requirement while keeping debian_build_environment_provisioned=0, explicit_operator_build_authorization=0, and all Debian build commands disabled.

The package artifact naming contract is recorded in ../../docs/DEBIAN_FREEBSD_OPENBSD_PACKAGE_ARTIFACT_NAMING_CONTRACT.md. It records the future Debian source and binary artifact names while keeping package_artifact_created=0, repository_package_artifact_write_allowed=0, and package_artifact_sha256_recorded=0.

The package payload inspection contract is recorded in ../../docs/DEBIAN_FREEBSD_OPENBSD_PACKAGE_PAYLOAD_INSPECTION_CONTRACT.md. It records the expected Debian payload paths while keeping debian_payload_inspection_run=0, package_payload_accepted=0, and package_artifact_created=0.

The package install/remove transcript contract is recorded in ../../docs/DEBIAN_FREEBSD_OPENBSD_PACKAGE_INSTALL_REMOVE_TRANSCRIPT_CONTRACT.md. It records future disposable install/remove transcript requirements while keeping debian_package_install_run=0, debian_package_remove_run=0, and install_on_host_run=0.

The package publication non-claim review contract is recorded in ../../docs/DEBIAN_FREEBSD_OPENBSD_PACKAGE_PUBLICATION_NON_CLAIM_REVIEW_CONTRACT.md. It records local-only Debian publication non-claims while keeping debian_package_publication_claimed=0, debian_dput_run=0, and package validation promotion blocked.

The package validation promotion blocker matrix is recorded in ../../docs/DEBIAN_FREEBSD_OPENBSD_PACKAGE_VALIDATION_PROMOTION_BLOCKER_MATRIX_CONTRACT.md. It ties Debian source, environment, artifact, payload, install/remove, and publication non-claim blockers together while keeping debian_platform_build_evidence_accepted=0 and debian_validation_result_promoted=0.

Source title: Fedora Packaging Draft

Lines: 39 | Words: 99 | SHA-256: 0b0635aa2fe43784dcde826e9b57a35324758980d515934adfccb79e427596d0

Fedora Packaging Draft

Status: local-only packaging draft

This directory contains Fedora-oriented packaging experiments for Latticra.

The current spec is a local-only draft used by static guards. It is not a Fedora package submission, not Fedora approval evidence, not a Copr build record, not a mock build result, and not package-readiness evidence.

Where this fits

- Documentation hub: ../../docs/README.md
- Fedora workflow: ../../docs/FEDORA_DEVELOPER_WORKFLOW.md
- Fedora readiness plan: ../../docs/FEDORA_READINESS_PLAN.md
- Current status: ../../docs/status/CURRENT_STATUS.md

Current guarded files:

```
packaging/fedora/latticra.spec
packaging/fedora/README.md
scripts/test-fedora-spec-static.sh
scripts/test-fedora-local-rpm-static-validation.sh
scripts/test-fedora-rpmlint-static-spec-lane.sh
.github/workflows/fedora-spec-static.yml
.github/workflows/fedora-local-rpm-static-validation.yml
.github/workflows/fedora-rpmlint-static-spec-lane.yml
```

The static lanes preserve:

```
local_only_draft=1
package_artifact_created=0
rpmbuild_run_required=0
mock_run_required=0
fedora_submission_claimed=0
fedora_approval_claimed=0
production_readiness_claimed=0
```

production_readiness_claimed=0
```

The draft payload remains intentionally narrow:

```
bin/latticra
%%DOCSDIR%%/README.md
```

The CLI reports no-effect status and disabled runtime behavior.

The source archive contract records the expected latticra-0.0.0.tar.gz distfile and future distinfo boundary, but it does not create an archive, generate distinfo, run make stage, run make package, run portlint, or accept FreeBSD build evidence.

The package-build gate is recorded in ../../docs/DEBIAN_FREEBSD_OPENBSD_PACKAGE_BUILD_GATE_CONTRACT.md. It keeps package_build_gate_state=closed-no-effect and freebsd_build_allowed=0 until source, checksum, license, notice, ports environment, operator authorization, payload inspection, install/remove, and publication non-claim evidence exists.

The package-build environment contract is recorded in ../../docs/DEBIAN_FREEBSD_OPENBSD_PACKAGE_BUILD_ENVIRONMENT_CONTRACT.md. It documents the FreeBSD jail or VM ports environment requirement while keeping freebsd_build_environment_provisioned=0, explicit_operator_build_authorization=0, and all FreeBSD build commands disabled.

The package artifact naming contract is recorded in ../../docs/DEBIAN_FREEBSD_OPENBSD_PACKAGE_ARTIFACT_NAMING_CONTRACT.md. It records the future latticra-0.0.0.pkg artifact name while keeping freebsd_package_artifact_created=0, repository_package_artifact_write_allowed=0, and package_artifact_sha256_recorded=0.

The package payload inspection contract is recorded in ../../docs/DEBIAN_FREEBSD_OPENBSD_PACKAGE_PAYLOAD_INSPECTION_CONTRACT.md. It records the expected FreeBSD payload paths while keeping freebsd_payload_inspection_run=0, package_payload_accepted=0, and package_artifact_created=0.

The package install/remove transcript contract is recorded in ../../docs/DEBIAN_FREEBSD_OPENBSD_PACKAGE_INSTALL_REMOVE_TRANSCRIPT_CONTRACT.md. It records future disposable install/remove transcript requirements while keeping freebsd_package_install_run=0, freebsd_package_remove_run=0, and install_on_host_run=0.

The package publication non-claim review contract is recorded in ../../docs/DEBIAN_FREEBSD_OPENBSD_PACKAGE_PUBLICATION_NON_CLAIM_REVIEW_CONTRACT.md. It records local-only FreeBSD publication and official-port non-claims while keeping freebsd_package_publication_claimed=0, freebsd_pkg_repo_publish_run=0, and package validation promotion blocked.

The package validation promotion blocker matrix is recorded in ../../docs/DEBIAN_FREEBSD_OPENBSD_PACKAGE_VALIDATION_PROMOTION_BLOCKER_MATRIX_CONTRACT.md. It ties FreeBSD source, environment, artifact, payload, install/remove, and publication non-claim blockers together while keeping freebsd_platform_build_evidence_accepted=0 and freebsd_validation_result_promoted=0.

```

The draft payload remains intentionally narrow:

```
bin/latticra
share/doc/latticra/README.md
```

The CLI reports no-effect status and disabled runtime behavior.

The source archive contract records the expected latticra-0.0.0.tar.gz distfile and future distinfo boundary, but it does not create an archive, generate distinfo, run make plist, run make package, run portcheck, run a bulk build, or accept OpenBSD build evidence.

The package-build gate is recorded in ../../docs/DEBIAN_FREEBSD_OPENBSD_PACKAGE_BUILD_GATE_CONTRACT.md. It keeps package_build_gate_state=closed-no-effect, openbsd_build_allowed=0, and PERMIT_PACKAGE=No until source, checksum, license, redistribution, notice, ports environment, operator authorization, payload inspection, install/remove, and publication non-claim evidence exists.

The package-build environment contract is recorded in ../../docs/DEBIAN_FREEBSD_OPENBSD_PACKAGE_BUILD_ENVIRONMENT_CONTRACT.md. It documents the OpenBSD disposable ports environment requirement while keeping openbsd_build_environment_provisioned=0, explicit_operator_build_authorization=0, PERMIT_PACKAGE=No, and all OpenBSD build commands disabled.

The package artifact naming contract is recorded in ../../docs/DEBIAN_FREEBSD_OPENBSD_PACKAGE_ARTIFACT_NAMING_CONTRACT.md. It records the future latticra-0.0.0.tgz artifact name while keeping openbsd_package_artifact_created=0, repository_package_artifact_write_allowed=0, package_artifact_sha256_recorded=0, and PERMIT_PACKAGE=No.

The package payload inspection contract is recorded in ../../docs/DEBIAN_FREEBSD_OPENBSD_PACKAGE_PAYLOAD_INSPECTION_CONTRACT.md. It records the expected OpenBSD payload paths while keeping openbsd_payload_inspection_run=0, package_payload_accepted=0, package_artifact_created=0, and PERMIT_PACKAGE=No.

The package install/remove transcript contract is recorded in ../../docs/DEBIAN_FREEBSD_OPENBSD_PACKAGE_INSTALL_REMOVE_TRANSCRIPT_CONTRACT.md. It records future disposable install/remove transcript requirements while keeping openbsd_package_install_run=0, openbsd_package_remove_run=0, install_on_host_run=0, and PERMIT_PACKAGE=No.

The package publication non-claim review contract is recorded in ../../docs/DEBIAN_FREEBSD_OPENBSD_PACKAGE_PUBLICATION_NON_CLAIM_REVIEW_CONTRACT.md. It records local-only OpenBSD publication and official-port non-claims while keeping openbsd_package_publication_claimed=0, openbsd_pkg_repo_publish_run=0, package validation promotion blocked, and PERMIT_PACKAGE=No.

The package validation promotion blocker matrix is recorded in ../../docs/DEBIAN_FREEBSD_OPENBSD_PACKAGE_VALIDATION_PROMOTION_BLOCKER_MATRIX_CONTRACT.md. It ties OpenBSD source, environment, artifact, payload, install/remove, and publication non-claim blockers together while keeping openbsd_platform_build_evidence_accepted=0, openbsd_validation_result_promoted=0, and PERMIT_PACKAGE=No.

openSUSE Packaging Draft

Status: local-only packaging draft

This directory contains openSUSE-oriented packaging experiments and maintenance records for Latticra.

The current spec and .changes metadata are a local-only draft used by static guards. They are not an official openSUSE package, not SUSE endorsement evidence, not Open Build Service publication evidence, not a submit-request record, not a local osc build result, not a rpmlint result, and not package-readiness evidence.

The local RPM build environment contract is recorded in ../../docs/OPENSUSE_LOCAL_RPM_BUILD_ENVIRONMENT_CONTRACT.md. It documents the disposable openSUSE build environment requirement while keeping opensuse_build_environment_provisioned=0, explicit_operator_build_authorization=0, environment_transcript_present=0, and all openSUSE build commands disabled.

The RPM artifact naming contract is recorded in ../../docs/OPENSUSE_RPM_ARTIFACT_NAMING_CONTRACT.md. It records future latticra-0.0.0-0.local.src.rpm and latticra-0.0.0-0.local.${RPM_ARCH}.rpm names while keeping repository_rpm_artifact_write_allowed=0, rpm_artifact_created=0, and rpm_artifact_sha256_recorded=0.

The RPM payload inspection contract is recorded in ../../docs/OPENSUSE_RPM_PAYLOAD_INSPECTION_CONTRACT.md. It records expected source RPM and binary RPM payload checks while keeping rpm_payload_inspection_run=0, rpm_payload_accepted=0, and rpm_artifact_created=0.

The RPM install/remove transcript contract is recorded in ../../docs/OPENSUSE_RPM_INSTALL_REMOVE_TRANSCRIPT_CONTRACT.md. It records future disposable install/remove evidence while keeping rpm_install_remove_transcript_present=0, rpm_package_install_run=0, rpm_package_remove_run=0, and host_mutation_allowed=0.

The OBS publication non-claim review contract is recorded in ../../docs/OPENSUSE_OBS_PUBLICATION_NON_CLAIM_REVIEW_CONTRACT.md. It records Open Build Service, submit-request, official-package, and SUSE endorsement non-claims while keeping obs_project_created=0, osc_commit_run=0, osc_submitreq_run=0, and rpm_validation_result_promoted=0.

The draft payload remains intentionally narrow:

```
/usr/bin/latticra
/usr/share/doc/packages/latticra/README.md
```

The CLI reports no-effect status and disabled runtime behavior.

The .changes file records local-only openSUSE maintenance history. It is not accepted Open Build Service history, package submission evidence, or production maintenance evidence.

Lines: 183 | Words: 257 | SHA-256: 80559a62089e8419702e0190df8fe68bbfd5e56ca54a326327ae045cb16e594e

Ubuntu Packaging Draft

Status: local-only packaging draft

This directory contains Ubuntu-oriented packaging experiments for Latticra.

The current debian metadata is a local-only draft used by static guards. It is not an Ubuntu archive package, not a PPA package, not Canonical approval evidence, not a Launchpad build record, not a lintian result, and not package-readiness evidence.

Where this fits

- Documentation hub: ../../docs/README.md
- Ubuntu workflow: ../../docs/UBUNTU_DEVELOPER_WORKFLOW.md
- Ubuntu readiness plan: ../../docs/UBUNTU_READINESS_PLAN.md
- Current status: ../../docs/status/CURRENT_STATUS.md

Source title: Documentation Change Review Packet

Lines: 143 | Words: 654 | SHA-256: 49bb7548ee5f7923c0621c0549c152a642602f7e201cea91573ef8e89e8e3438

Documentation Change Review Packet

Status: active documentation review template Last updated: 2026-05-26 CDT Scope: documentation-only changes that affect public wording, reader routes, product-facing pages, non-claims, status mirrors, platform posture, installer posture, package posture, subsystem landing pages, or documentation navigation.

Purpose

Use this packet before merging or publishing documentation changes that could change how readers understand Latticra.

The packet is intentionally lightweight. It exists to make sure a documentation change names its claim boundary, source records, mirrors, non-claims, validation, and rollback path before public wording drifts.

When To Use

Use this packet when a change touches any of these:

- ../README.md
- README.md
- STATUS.md
- status/CURRENT_STATUS.md
- status/README.md
- public HTML pages such as index.html, map.html, status.html, roadmap.html, validation.html, or security.html
- installer, platform, package, security, or subsystem landing pages
- public estimates, public claims, product copy, non-claim wording, or reader routes

Do not use this packet as evidence for a stronger capability. It reviews documentation posture only.

Packet

Copy this section into the relevant review record, pull request, or status note.

```

Review Steps

1. Classify the change as wording-only, navigation-only, status mirror, estimate mirror, platform posture, installer posture, package posture, subsystem landing page, or security wording.
2. Identify the source records that make the wording true.
3. Compare the wording against PUBLIC_CLAIMS_LEDGER.md.
4. Compare the reader route against PRODUCT_DOCUMENTATION_COHESION.md.
5. Compare audience-specific paths against DOCUMENTATION_READER_JOURNEY_MAP.md when routes change.
6. Compare source records, mirrors, validation, and non-claim boundaries against DOCUMENTATION_TRACEABILITY_MATRIX.md.
7. Select validation commands with DOCUMENTATION_VALIDATION_PLAYBOOK.md.
8. Choose a drift-response, narrowing, or demotion path with DOCUMENTATION_DRIFT_RESPONSE_PLAYBOOK.md when records disagree.
9. Compare terminology, headings, dates, and replacement wording against DOCUMENTATION_STYLE_GUIDE.md.
10. Compare mirror requirements against DOCUMENTATION_MAINTENANCE.md.
11. Confirm that adjacent non-claims remain visible.
12. Run the narrowest relevant validation commands.
13. Name how to demote or roll back the wording if the evidence changes.

Claim Classification

Classification	Meaning	Required handling
Navigation-only	Links, entry points, or ordering changed without claim change.	Check local links and affected reader routes.
Wording-only	Existing evidence is described more clearly without capability change.	Check claims ledger, non-claims, and source records.
Status mirror	Public status wording is mirrored from an existing status record.	Check `STATUS.md`, `docs/status/CURRENT_STATUS.md`, and status index alignment.
Estimate mirror	Planning estimate wording or displayed values changed.	Check estimate source alignment and static HTML mirrors.
Platform posture	Fedora, Ubuntu, Debian, FreeBSD, OpenBSD, openSUSE, macOS, installer, or package wording changed.	Preserve local-only or no-effect boundaries unless official evidence exists.
Security wording	Security, threat-model, runtime authority, sandbox, malware, or ransomware wording changed.	Preserve security non-claims and safe-testing boundaries.
Claim promotion	A public claim becomes stronger.	Stop unless contract, implementation, validation, status, non-claim update, and public-entry alignment all exist.

Minimum Validation

For most documentation-only packets:

```
git diff --check
sh scripts/test-project-strategy-status-framework.sh
```

Add these when relevant:

```
sh scripts/test-current-estimate-table-source-alignment.sh
sh scripts/test-latticra-seal-docs.sh
sh scripts/test-fedora-developer-workflow.sh
sh scripts/test-ubuntu-developer-workflow.sh
sh scripts/test-opensuse-developer-workflow.sh
```

Add the exact subsystem or milestone guard named by the source record when a specialized status or public-entry alignment changes.

Use DOCUMENTATION_VALIDATION_PLAYBOOK.md for guard selection, local link checks, and failure handling.

Outcome Language

Use one of these outcome labels:

```
accepted_navigation_only
accepted_wording_only
accepted_status_mirror
accepted_estimate_mirror
accepted_local_only_platform_posture
blocked_claim_promotion
blocked_missing_source_record
blocked_missing_validation
blocked_non_claim_drift
blocked_public_entry_drift
```

Boundary

This packet does not change source behavior, installer authority, package authority, runtime authority, shell guard behavior, workflow permissions, security posture, or product readiness.

If the proposed wording requires implementation or validation to become true, the documentation change must stay blocked until that evidence exists.

docs/DOCUMENTATION_DRIFT_RESPONSE_PLAYBOOK.md

Source title: Documentation Drift Response Playbook

Lines: 107 | Words: 907 | SHA-256: f234d5c99744c460a00d0604d8008ad3ce686d1d55feee42a10a53add455c835

Documentation Drift Response Playbook

Status: active documentation drift-response playbook Last updated: 2026-05-26 CDT Scope: public wording drift, status mirror drift, estimate drift, non-claim drift, link drift, platform posture drift, security wording drift, stale evidence, and claim demotion.

Purpose

This playbook defines what to do when Latticra documentation disagrees with itself.

Use it when a public page, source record, status mirror, estimate table, package README, installer guide, security page, or subsystem landing page appears to overstate, understate, or contradict the current evidence.

This playbook does not promote claims. It narrows or aligns documentation until the evidence supports stronger wording.

Drift Types

Drift type	Signal	First response
Link drift	A local link is broken or points to the wrong record.	Fix the link or remove it if no source exists.
Source-record drift	A public statement has no source record.	Narrow or remove the statement until a source record exists.
Status mirror drift	`README.md`, `STATUS.md`, `docs/status/CURRENT_STATUS.md`, or public HTML pages disagree.	Use the narrowest current status wording and align mirrors.
Estimate drift	Estimate values differ across public tables or static pages.	Treat the current estimate source record as authoritative and run the estimate alignment guard.
Non-claim drift	A public page drops a required non-claim or weakens blocked language.	Restore the non-claim near the claim it constrains.
Product-copy drift	Product-facing wording implies production, approval, security, or runtime authority.	Replace it with wording from the claims ledger and style guide.
Platform drift	Package or platform docs imply official approval, archive readiness, or production installability.	Restore local-only or no-effect posture.
Security drift	Security docs imply protection, prevention, sandboxing, certification, or hardening without evidence.	Restore security non-claims and source-tracked wording.
Validation drift	A guard fails because the docs and expected public posture disagree.	Fix the docs or mirrors; do not edit the guard for convenience.
Stale evidence	A record relies on older evidence contradicted by newer status.	Demote the public wording to the latest supported status.

Response Order

When drift appears:

1. Read the public surface that contains the questionable wording.
2. Find the source record through DOCUMENTATION_TRACEABILITY_MATRIX.md.
3. Check allowed and blocked wording in PUBLIC_CLAIMS_LEDGER.md.
4. Check terminology in DOCUMENTATION_STYLE_GUIDE.md.
5. Select validation commands with DOCUMENTATION_VALIDATION_PLAYBOOK.md.
6. Use DOCUMENTATION_CHANGE_REVIEW_PACKET.md if public wording, mirrors, estimates, platform posture, security wording, or non-claims change.
7. Update only the surfaces whose reader-facing claim changed.
8. Run the selected validation checks.

Demotion Rule

Demotion is required when a public statement is stronger than the evidence.

Use this pattern:

```
strong claim -&gt; current evidence-bound claim -&gt; explicit blocked adjacent claim
```

Examples:

Strong claim	Demoted wording	Blocked adjacent claim
Latticra is secure.	Latticra documents defensive boundaries and security non-claims.	No production security guarantee.
The installer is ready.	The Panel path is guarded and user-local for the documented workflow.	No root installer or daily-driver installer claim.
Fedora support is ready.	The Fedora lane has local-only package and validation records.	No Fedora approval or distribution-readiness claim.
Seal protects AI agents.	Latticra Seal records report-only AI-era tool-boundary evidence.	No active AI-agent control or host protection claim.
Runtime enforcement exists.	Runtime Boundary classification and reports are denied by default.	No runtime authority or effect-performing execution claim.

Alignment Actions

Situation	Action	Validation

Public page is broader than status.	Narrow the public page to the status record.	Public-entry guard and link check.
Status record is broader than implementation evidence.	Narrow the status record and public mirrors.	Exact source guard plus public-entry guard.
Estimate mirror differs.	Update mirror from the estimate source record.	Estimate source-alignment guard.
Platform docs omit local-only status.	Add local-only and no-approval wording.	Platform workflow guard plus exact platform guard.
Security docs overpromise.	Restore non-claims and source-tracked wording.	Exact security or threat-model guard.
Source record is missing.	Remove or block the claim until the source record exists.	Link check and review packet outcome.
Validation command is missing.	Mark the claim blocked for missing validation.	Review packet outcome `blocked_missing_validation`.

Do Not

Do not:

- broaden a public claim to make a product page sound better;
- edit a guard script only to make documentation pass;
- hide non-claims in deep source files when a public page implies the adjacent claim;
- treat subsystem progress as overall product readiness;
- treat local static validation as platform approval;
- treat report-only evidence as runtime enforcement;
- treat planning estimates as release promises;
- claim security, safety, hardening, prevention, approval, or certification without explicit source evidence.

Review Packet Outcomes

Use these outcomes from DOCUMENTATION_CHANGE_REVIEW_PACKET.md when drift is found:

```
blocked_claim_promotion
blocked_missing_source_record
blocked_missing_validation
blocked_non_claim_drift
blocked_public_entry_drift
accepted_wording_only
accepted_status_mirror
accepted_local_only_platform_posture
```

Boundary

This playbook changes documentation posture only.

It does not change implementation behavior, installer authority, package authority, runtime authority, workflow permissions, security posture, public estimates, or product readiness.

docs/DOCUMENTATION_LICENSE.md

Source title: Latticra Documentation License

Lines: 60 | Words: 158 | SHA-256: ed0d53d83fc179846e77b6cc0fe82d86a59f0009ab66089608b3355227858f95

Latticra Documentation License

Status: active documentation license decision Scope: documentation, handbooks, architecture notes, policy notes, public project notes, and reader-facing project material unless otherwise marked.

Decision

Latticra documentation is licensed under:

```
CC-BY-4.0
```

The local license text is:

```
LICENSES/CC-BY-4.0.txt
```

Covered material

This documentation license applies to:

```
README.md
STATUS.md
SECURITY.md
CONTRIBUTING.md
docs/**
installer/README.md
installer/INSTALLER_ROADMAP.md
installer/docs/**
packaging/*/README.md
```

unless a file or embedded notice says otherwise.

Boundaries

Embedded code snippets, copied source excerpts, generated build outputs, third-party material, images, fonts, logos, and other bundled assets may have separate license or notice requirements.

The Latticra and Bryforge names, logos, marks, slogans, and distinctive identity are not licensed under CC-BY-4.0. They remain governed by:

```
TRADEMARK_POLICY.md
```

SPDX

New documentation files may use:

```
SPDX-License-Identifier: CC-BY-4.0
```

Existing documentation is covered by this path-level notice unless otherwise marked.

Non-Claims

This document records the project documentation license decision and is not legal advice.

docs/DOCUMENTATION_MAINTENANCE.md

Source title: Documentation Maintenance

Lines: 129 | Words: 702 | SHA-256: d6513be1fe58d8d2af815f706497857bf2c0a026b4d9244ac33066071adeffa7

Documentation Maintenance

Status: active documentation maintenance guide Last updated: 2026-05-26 CDT Scope: public documentation entry points, status mirrors, estimate sources, static HTML mirrors, platform guides, and documentation-only validation.

Purpose

This guide defines how Latticra documentation should stay cohesive as the project changes.

Use it when a change affects public wording, capability posture, estimates, platform readiness, security claims, installer authority, package claims, subsystem status, or reader navigation.

Source Of Truth

```
| Subject | Source of truth | Mirrors that may need updates |
| --- | --- | --- |

```

Public-Entry Checklist

When a milestone changes capability posture or public wording, review these files:

```
README.md
STATUS.md
docs/README.md
docs/FOUNDATION_INDEX.md
docs/status/CURRENT_STATUS.md
docs/status/README.md
docs/project_notes/README.md
docs/map.html
docs/status.html
docs/roadmap.html
docs/index.html
```

Do not update every file mechanically. Update only the files whose reader-facing claim actually changes.

Use DOCUMENTATION_CHANGE_REVIEW_PACKET.md when a public-entry change needs an explicit record of touched surfaces, source records, claim classification, mirrors, validation commands, and rollback or demotion path.

Use DOCUMENTATION_TRACEABILITY_MATRIX.md when a public-entry change needs a source-record, mirror, validation, or non-claim lookup.

Use DOCUMENTATION_VALIDATION_PLAYBOOK.md when choosing hygiene, link, public-entry, estimate, platform, subsystem, or claim-promotion checks.

Use DOCUMENTATION_DRIFT_RESPONSE_PLAYBOOK.md when public pages, source records, status mirrors, estimate tables, platform docs, security wording, or non-claims disagree.

Use DOCUMENTATION_STYLE_GUIDE.md when a public-entry change edits terminology, status labels, date style, heading shape, link style, platform names, or replacement wording.

Estimate Rule

Planning estimates are posture markers, not release promises.

When an estimate changes:

1. Update the source record under docs/status/.
2. Mirror the current public table in README.md, STATUS.md, and docs/status/CURRENT_STATUS.md.
3. Update static HTML summary values in docs/index.html, docs/status.html, and docs/roadmap.html when those pages display the changed values.
4. Run the current estimate table source-alignment guard.

Non-Claim Rule

Never promote these claims without implementation, tests, status records, and public-entry alignment:

```
production runtime
host protection
hardened sandbox
malware prevention
ransomware prevention
kernel enforcement
root installer
network authority
package approval
official distribution readiness
OS replacement
certification
compliance
production cryptography
AI-agent execution control
```

Use narrower language when evidence is narrow. For example, a disposable VM transcript can support a bounded local validation claim without supporting daily-driver, production, security, update-safety, recovery-safety, or distribution-readiness claims.

Platform Documentation Rule

Platform and package documentation must state the current authority boundary:

- Fedora: local-only unless Fedora approval evidence exists.
- Ubuntu: local-only unless Ubuntu archive or PPA evidence exists.
- Debian: local-only unless Debian archive evidence exists.
- openSUSE: local-only unless Open Build Service publication or official package evidence exists.
- FreeBSD and OpenBSD: local-only unless official port evidence exists.
- macOS: no-effect or user-local only unless app-bundle write, signing, notarization, install, verification, reset, and uninstall evidence exists.

Validation

For documentation-only work, run the narrowest relevant guard set:

```
git diff --check
sh scripts/test-project-strategy-status-framework.sh
```

```
sh scripts/test-current-estimate-table-source-alignment.sh
sh scripts/test-latticra-seal-docs.sh
```

Add platform guards when platform docs move:

```
sh scripts/test-fedora-developer-workflow.sh
sh scripts/test-ubuntu-developer-workflow.sh
sh scripts/test-opensuse-developer-workflow.sh
```

Add the exact milestone guard named by the status record when changing a milestone-specific status or public-entry alignment.

For command selection and failure handling, use DOCUMENTATION_VALIDATION_PLAYBOOK.md.

Documentation-Only Boundary

Documentation-only changes should not change source behavior, installer authority, package authority, runtime authority, shell guard behavior, workflow permissions, or security posture. If a documentation update requires code or guard changes to become true, keep the documentation claim blocked until that implementation evidence exists.

docs/DOCUMENTATION_STYLE_GUIDE.md

Source title: Documentation Style Guide

Lines: 202 | Words: 808 | SHA-256: dcd7dc157007f1c0a8fcf20483724e817e39875749179bc056bf9556f351a41c

Documentation Style Guide

Status: active documentation style guide Last updated: 2026-05-26 CDT Scope: public Markdown, public HTML copy, status records, installer docs, package docs, subsystem landing pages, strategy records, and review packets.

Purpose

This guide keeps Latticra documentation consistent at the wording level.

Use it with DOCUMENTATION_GLOSSARY.md, PUBLIC_CLAIMS_LEDGER.md, PRODUCT_DOCUMENTATION_COHESION.md, DOCUMENTATION_MAINTENANCE.md, and DOCUMENTATION_CHANGE_REVIEW_PACKET.md.

This guide does not decide whether a claim is true. It decides how true claims should be written once the source records support them.

Use DOCUMENTATION_GLOSSARY.md for definitions of shared posture, validation, platform, and reader terms.

Core Voice

Latticra documentation should be:

```
specific
evidence-bound
plainspoken
operator-visible
careful about claims
clear about blocked effects
```

Prefer short, concrete sentences over broad promise language.

Canonical Project Description

Use this shape when a short project description is needed:

```
Latticra is an early-stage, evidence-bound systems architecture repository for contract-first
authority, no-effect reporting, guarded local validation, and AI-era tool-boundary planning.
```

Do not shorten this into "security product", "AI security platform", "operating system", "installer", or "runtime enforcement system".

Canonical Terms

```
| Use | Avoid |
| --- | --- |
| Latticra | Lattice OS, Latticra OS, Latticra Linux |
| Latticra Panel | the installer, the app, the product |
| Latticra Seal | Seal security platform, Seal enforcement layer |
| Lat | L, .l, LatticraScript |
| LIR | execution IR, runtime IR |
| L-UI | terminal UI runtime, shell UI |
| Runtime Boundary | runtime enforcement, sandbox runtime |
| Nucleus | task executor, agent runner |
| no-effect | harmless, safe, guaranteed safe |
| report-only | enforcement, protection |
| guarded user-local | production install, root install |
| local-only package draft | official package, distribution package |
| public status | release status, readiness guarantee |
```

Platform Names

Use the official spelling in public docs:

```
Fedora
Ubuntu
Debian
FreeBSD
OpenBSD
openSUSE
macOS
GitHub Pages
Open Build Service
```

Use "local-only" for package lanes unless official publication evidence exists.

Status And Date Style

Markdown records should use this header shape when practical:

```
Status: active documentation guide
Last updated: 2026-05-26 CDT
Scope: public documentation entry points and related records.
```

Use concrete dates for review snapshots and status records. Use CDT for current local documentation timestamps when the record is tied to the project working context.

Do not use vague status labels such as:

```
soon
almost ready
basically done
ship-ready
production-ish
```

Claim Wording

Prefer:

```
current posture
current evidence
validated by local guard
report-only metadata
denied-by-default classification
local-only draft
guarded user-local workflow
blocked until later evidence exists
```

Avoid:

```
secure
safe
complete
production-ready
approved
certified
official
```

```text
hardened
unbreakable
fully supported
```

If a sentence contains a strong word such as "secure", "safe", "ready", "approved", "official", or "enforced", check PUBLIC_CLAIMS_LEDGER.md before keeping it.

Headings

Use predictable headings for source records:

```text
Purpose
Scope
Current Posture
Evidence
Validation
Non-Claims
Boundary
Next Valid Work
```

Do not create dramatic or marketing-style headings for technical source records.

Link Style

Use relative Markdown links for repository files.

Prefer linking to source records instead of repeating long claims. A public summary should point to:

1. status record;
2. contract or implementation record;
3. validation guard or transcript;
4. non-claims;
5. review packet when public wording changed.

Tables And Lists

Use tables for comparison surfaces:

- source of truth and mirrors;
- allowed and blocked wording;
- product surface responsibilities;
- platform posture;
- validation commands.

Use numbered lists for ordered review or validation steps.

Use bullets for unordered examples.

Code Blocks

Use fenced code blocks for commands, status key/value output, guard output, packet templates, and exact labels.

Use text fences for non-command labels and sh fences for shell commands.

Non-Claim Placement

Put non-claims near the claim they constrain.

For public product pages, do not hide non-claims only in a deep source file. The page should either state the relevant boundary directly or link to NON_CLAIMS.md and PUBLIC_CLAIMS_LEDGER.md.

Replacement Examples

Replace	With
Latticra is secure.	Latticra documents defensive boundaries and security non-claims.
Seal protects AI agents.	Latticra Seal records report-only AI-era tool-boundary evidence.
The installer is ready.	The Panel workflow is guarded and user-local for the documented path.
Fedora support is ready.	The Fedora lane has local-only package and validation records.
Runtime enforcement exists.	Runtime Boundary classification and reports are denied by default.
Nadia runs offline AI.	Nadia has staged offline AI foundation and prompt-evaluation planning contracts.

Boundary

Style changes should not change source behavior, installer authority, package authority, runtime authority, workflow permissions, status estimates, security posture, or product readiness.

When a style change would make a claim stronger, stop and use DOCUMENTATION_CHANGE_REVIEW_PACKET.md.

docs/DOCUMENTATION_TRACEABILITY_MATRIX.md

Source title: Documentation Traceability Matrix

Lines: 84 | Words: 1022 | SHA-256: 508adbc418fd0cf29483e1ef7c6f54942992c8136e68dfff38013f6aa869430b

Documentation Traceability Matrix

Status: active documentation traceability matrix Last updated: 2026-05-26 CDT Scope: public entry points, source records, mirrors, validation guards, non-claims, product surfaces, installer docs, package docs, security docs, and subsystem maps.

Purpose

This matrix maps reader-facing documentation surfaces back to their source records and validation checks.

Use it to answer:

1. where a public statement should be sourced;
2. which mirrors may need updates;
3. which validation commands are relevant;
4. which non-claims must remain visible;
5. where to look when a public page and a source record disagree.

This document does not promote claims. It makes documentation traceability visible.

Traceability Rule

Every public-facing claim should have a path to:

```
public surface -&gt; source record -&gt; validation or review record -&gt; non-claim boundary
```

If that path is missing, keep the claim narrow or remove it until a source record exists.

Matrix

Topic	Public surfaces	Source records	Validation or review	Non-claim boundary
Reader journeys	[`README.md`](README.md), [`map.html`](map.html), [`index.html`](index.html)	[`DOCUMENTATION_READER_JOURNEY_MAP.md`](DOCUMENTATION_READER_JOURNEY_MAP.md), [`PRODUCT_DOCUMENTATION_COHESION.md`](PRODUCT_DOCUMENTATION_COHESION.md)	Local link check and	

public-entry guard | Audience routes must not imply capability promotion. |
Project identity	[`../README.md`](../README.md), [`index.html`](index.html), [`map.html`](map.html)	[`REAL_SYSTEM_CONTRACT.md`](REAL_SYSTEM_CONTRACT.md), [`FOUNDATION_INDEX.md`](FOUNDATION_INDEX.md), [`README.md`](README.md)	[`DOCUMENTATION_CHANGE_REVIEW_PACKET.md`](DOCUMENTATION_CHANGE_REVIEW_PACKET.md), `git diff --check`	[`NON_CLAIMS.md`](NON_CLAIMS.md), [`PUBLIC_CLAIMS_LEDGER.md`](PUBLIC_CLAIMS_LEDGER.md)
Current status and estimates	[`../README.md`](../README.md), [`../STATUS.md`](../STATUS.md), [`status.html`](status.html), [`roadmap.html`](roadmap.html)	[`status/CURRENT_STATUS.md`](status/CURRENT_STATUS.md), [`status/CURRENT_ESTIMATE_TABLE_SOURCE_ALIGNMENT.md`](status/CURRENT_ESTIMATE_TABLE_SOURCE_ALIGNMENT.md)	`sh scripts/test-current-estimate-table-source-alignment.sh`	Estimates are planning posture, not release promises.
Documentation navigation	[`README.md`](README.md), [`map.html`](map.html), [`index.html`](index.html)	[`FOUNDATION_INDEX.md`](FOUNDATION_INDEX.md), [`DOCUMENTATION_MAINTENANCE.md`](DOCUMENTATION_MAINTENANCE.md)	Local link check, `git diff --check`	Navigation must not imply capability promotion.
Product-facing wording	[`../README.md`](../README.md), [`index.html`](index.html), [`start.html`](start.html), [`validation.html`](validation.html)	[`PRODUCT_DOCUMENTATION_COHESION.md`](PRODUCT_DOCUMENTATION_COHESION.md), [`PUBLIC_CLAIMS_LEDGER.md`](PUBLIC_CLAIMS_LEDGER.md), [`DOCUMENTATION_STYLE_GUIDE.md`](DOCUMENTATION_STYLE_GUIDE.md)	[`DOCUMENTATION_CHANGE_REVIEW_PACKET.md`](DOCUMENTATION_CHANGE_REVIEW_PACKET.md)	Product copy must stay evidence-bound and non-production.
Public claim language	All public Markdown and HTML summaries	[`PUBLIC_CLAIMS_LEDGER.md`](PUBLIC_CLAIMS_LEDGER.md), [`EVIDENCE_LADDER.md`](EVIDENCE_LADDER.md), [`NON_CLAIMS.md`](NON_CLAIMS.md)	Claim review packet outcome when wording changes	Unsupported adjacent claims stay blocked.
Shared public terminology	Public Markdown, public HTML, package docs, installer docs, status records, and subsystem landing pages	[`DOCUMENTATION_GLOSSARY.md`](DOCUMENTATION_GLOSSARY.md), [`DOCUMENTATION_STYLE_GUIDE.md`](DOCUMENTATION_STYLE_GUIDE.md), [`NAMING_SYSTEM.md`](NAMING_SYSTEM.md), [`LANGUAGE_NAMING_POLICY.md`](LANGUAGE_NAMING_POLICY.md)	Local link check and public-entry guard	Shared terms must not imply stronger capability than source records.
Security posture	[`../SECURITY.md`](../SECURITY.md), [`security.html`](security.html), [`../README.md`](../README.md)	[`DEFENSIVE_THREAT_MODEL_CONTRACT.md`](DEFENSIVE_THREAT_MODEL_CONTRACT.md), [`HIGH_ASSURANCE_SECURITY_BASELINE.md`](HIGH_ASSURANCE_SECURITY_BASELINE.md), [`ZERO_TRUST_RUNTIME_AUTHORITY_BASELINE.md`](ZERO_TRUST_RUNTIME_AUTHORITY_BASELINE.md)	Security-specific guard named by the changed source record	No malware prevention, ransomware prevention, hardened sandbox, certification, or production protection claim.
Installer and Panel posture	[`../installer/README.md`](../installer/README.md), [`../installer/docs/README.md`](../installer/docs/README.md), [`start.html`](start.html), [`validation.html`](validation.html)	[`PRODUCTION_INSTALLER_READINESS_CONTRACT.md`](PRODUCTION_INSTALLER_READINESS_CONTRACT.md), installer docs and status records	Installer or Panel guard named by the changed record	No root installer, daily-driver installer, production installer, or unattended host mutation claim.
Fedora lane	[`FEDORA_READINESS_PLAN.md`](FEDORA_READINESS_PLAN.md), [`FEDORA_DEVELOPER_WORKFLOW.md`](FEDORA_DEVELOPER_WORKFLOW.md), [`../packaging/fedora/README.md`](../packaging/fedora/README.md), [`validation.html`](validation.html)	Fedora package, workflow, and status records	`sh scripts/test-fedora-developer-workflow.sh` plus exact Fedora guard	Local-only unless Fedora approval evidence exists.
Ubuntu lane	[`UBUNTU_READINESS_PLAN.md`](UBUNTU_READINESS_PLAN.md), [`UBUNTU_DEVELOPER_WORKFLOW.md`](UBUNTU_DEVELOPER_WORKFLOW.md), [`../packaging/ubuntu/README.md`](../packaging/ubuntu/README.md), [`validation.html`](validation.html)	Ubuntu package, workflow, notice, license, and status records	`sh scripts/test-ubuntu-developer-workflow.sh` plus exact Ubuntu guard	Local-only unless Ubuntu archive or PPA evidence exists.
Debian, FreeBSD, and OpenBSD lanes	[`../packaging/debian/README.md`](../packaging/debian/README.md), [`../packaging/freebsd/README.md`](../packaging/freebsd/README.md), [`../packaging/openbsd/README.md`](../packaging/openbsd/README.md), [`validation.html`](validation.html)	Platform package draft and package-input/build-gate records	Exact platform guard named by the changed record	Local-only unless archive, ports-tree, or official publication evidence exists.
openSUSE lane	[`OPENSUSE_READINESS_PLAN.md`](OPENSUSE_READINESS_PLAN.md), [`OPENSUSE_DEVELOPER_WORKFLOW.md`](OPENSUSE_DEVELOPER_WORKFLOW.md), [`../packaging/opensuse/README.md`](../packaging/opensuse/README.md), [`validation.html`](validation.html)	openSUSE package, workflow, rpmlint, osc, and status records	`sh scripts/test-opensuse-developer-workflow.sh` plus exact openSUSE guard	Local-only unless Open Build Service or official package evidence exists.
Runtime Boundary and Nucleus	[`runtime.html`](runtime.html), [`../README.md`](../README.md), subsystem records	[`RUNTIME_BOUNDARY_CONTRACT.md`](RUNTIME_BOUNDARY_CONTRACT.md), [`RUNTIME_BOUNDARY_IMPLEMENTATION.md`](RUNTIME_BOUNDARY_IMPLEMENTATION.md),

[`NUCLEUS_TASK_EXECUTION_CONTRACT.md`](NUCLEUS_TASK_EXECUTION_CONTRACT.md), [`NUCLEUS_TASK_EXECUTION_IMPLEMENTATION.md`](NUCLEUS_TASK_EXECUTION_IMPLEMENTATION.md) | Runtime or Nucleus guard named by the changed source record | No runtime authority, effect-performing execution, process isolation, or sandbox claim. |

| Latticra Seal | [`seal.html`](seal.html), [`latticra-seal/README.md`](latticra-seal/README.md), [`latticra-seal/STATUS.md`](latticra-seal/STATUS.md), [`../README.md`](../README.md) | [`LATTICRA_SEAL_CONTRACT.md`](LATTICRA_SEAL_CONTRACT.md), [`LATTICRA_SEAL_CORE_EVIDENCE_REPORT.md`](LATTICRA_SEAL_CORE_EVIDENCE_REPORT.md), Seal status records | `sh scripts/test-latticra-seal-docs.sh` plus exact Seal guard | No production enforcement, AI-agent control, host protection, network blocking, or cryptographic authority claim. |

| Lat, LIR, and L-UI | [`language.html`](language.html), [`examples.html`](examples.html), [`../README.md`](../README.md) | [`LANGUAGE_STRATEGY.md`](LANGUAGE_STRATEGY.md), [`LAT_PIPELINE_CONTRACT.md`](LAT_PIPELINE_CONTRACT.md), [`LIR_SHAPE_CONTRACT.md`](LIR_SHAPE_CONTRACT.md), [`L_UI_PARSER.md`](L_UI_PARSER.md) | Language or parser guard named by the changed source record | No production language runtime, LIR execution, or terminal-control renderer claim. |

| Nadia offline AI | [`nadia.html`](nadia.html), [`../README.md`](../README.md), Nadia status records | [`NADIA_OFFLINE_AI_FOUNDATION.md`](NADIA_OFFLINE_AI_FOUNDATION.md) and staged Nadia contracts | Exact Nadia guard named by the changed source record | No model loading, inference, token generation, dialogue generation, prompt evaluation, or tool execution claim. |

| Boot and OS-base preview | [`boot.html`](boot.html), [`../README.md`](../README.md), installer records | SeaBIOS/GRUB boot-preview contracts, templates, preflight, and validation records | Exact SeaBIOS/GRUB guard named by the changed source record | No bootable OS image, OS replacement, GRUB installer, firmware mutation, or hardware boot success claim. |

| Handbook and long-form docs | [`latticra-system-substrate/README.md`](latticra-system-substrate/README.md), generated handbook artifacts | [`FOUNDATION_INDEX.md`](FOUNDATION_INDEX.md), project notes, status records, subsystem contracts | Documentation change review packet and local link check | Handbook summaries must not outrun current status. |

Drift Indicators

Treat these as documentation drift:

- a public page names a capability without a source record;
- a status record and public page use different posture words;
- a platform README omits local-only or no-effect boundaries;
- a security page uses "secure", "safe", "hardened", "protection", or "prevention" without a supporting source record;
- an estimate appears in public HTML but not in the current estimate source records;
- a subsystem landing page implies product readiness from subsystem progress alone;
- a quick-start path omits reset, cleanup, or non-claim context for a runnable local path.

Review Flow

When drift is found:

1. Identify the topic row in this matrix.
2. Read the source records before editing public wording.
3. Check PUBLIC_CLAIMS_LEDGER.md and DOCUMENTATION_STYLE_GUIDE.md.
4. Use DOCUMENTATION_DRIFT_RESPONSE_PLAYBOOK.md to choose a narrowing, alignment, or demotion path.
5. Use DOCUMENTATION_VALIDATION_PLAYBOOK.md to choose the narrowest relevant validation commands.
6. Use DOCUMENTATION_CHANGE_REVIEW_PACKET.md when wording, mirrors, estimates, status, platform posture, or non-claims change.
7. Run the selected validation commands.

8. Update only the public surfaces whose reader-facing claim actually changed.

Boundary

This matrix is documentation traceability only.

It does not change implementation behavior, installer authority, package authority, runtime authority, workflow permissions, security posture, public estimates, or product readiness.

docs/DOCUMENTATION_VALIDATION_PLAYBOOK.md

Source title: Documentation Validation Playbook

Lines: 133 | Words: 864 | SHA-256: 8542c13d0307a12c9a2f1f50ff8e7dbcbe0427cec5569146fe646cf521e460d8

Documentation Validation Playbook

Status: active documentation validation playbook Last updated: 2026-05-26 CDT Scope: documentation-only validation commands, link checks, public-entry checks, estimate checks, subsystem guards, platform guards, and failure handling.

Purpose

This playbook explains which validation checks to run for documentation-only changes.

Use it with DOCUMENTATION_MAINTENANCE.md, DOCUMENTATION_TRACEABILITY_MATRIX.md, DOCUMENTATION_CHANGE_REVIEW_PACKET.md, and PUBLIC_CLAIMS_LEDGER.md.

Validation should prove only the documentation claim being made. It should not be used to imply production readiness, security guarantees, installer authority, package approval, runtime authority, or product readiness.

Validation Levels

Level	Use when	Minimum checks
Hygiene	Any documentation file changes.	`git diff --check`, trailing-whitespace check.
Local links	New or changed Markdown links.	Local Markdown link sanity check over touched files.
Public entry	README, docs hub, map, public site pages, status index, project notes, or strategy docs change.	`sh scripts/test-project-strategy-status-framework.sh`.
Estimate mirror	Completion estimates or public estimate tables change.	`sh scripts/test-current-estimate-table-source-alignment.sh`.
Seal docs	Seal README, Seal status, Seal public wording, or Seal source records change.	`sh scripts/test-latticra-seal-docs.sh` plus exact Seal guard.
Platform docs	Fedora, Ubuntu, openSUSE, Debian, FreeBSD, OpenBSD, macOS, installer, or package posture changes.	Platform workflow guard plus exact platform guard.
Subsystem docs	Runtime, Nucleus, Lat, LIR, L-UI, Nadia, boot preview, security, installer, or package source record changes.	Exact guard named by the source or status record.
Claim promotion	Public wording becomes stronger.	Stop unless contract, implementation, validation, status, non-claim update, traceability, and public-entry alignment all exist.

Minimum Documentation-Only Check

Run this for most documentation-only changes:

```
git diff --check
sh scripts/test-project-strategy-status-framework.sh
```

Add a local link check for changed Markdown files when links are added or moved.

Local Link Check

Use a local Markdown link sanity check on the files you touched:

```
perl -MFile::Basename=dirname -e &#x27;my $bad=0; for my $file (@ARGV) { open my $fh, q{&lt;},
$file or
```

```
die qq{$file: $!\n}; my $base = dirname($file); while (my $line = &lt;$fh&gt;) { while ($line
=~
/\[[^\]]+\]\(([^)]+)\)/g) { my $target = $1; next if $target =~ /^(https?:|mailto:|#)/; $target
=~ s/#.*\z//; next if $target eq q{}; my $path = $target =~ m{^/} ? $target : qq{$base/$target};
 unless (-e $path) { print qq{$file:$.: missing $target\n}; $bad=1; } } } } exit $bad&#x27;
FILES...
```

This check is intentionally local. It does not prove that a public claim is true; it only catches broken repository links.

Estimate And Status Checks

Run the estimate source-alignment guard when a change touches:

- public estimate tables;
- overall completion percentage;
- status dashboard estimate text;
- roadmap estimate text;
- README.md, STATUS.md, or docs/status/CURRENT_STATUS.md estimate mirrors.

```
sh scripts/test-current-estimate-table-source-alignment.sh
```

If this guard fails because source records and mirrors disagree, do not hand-edit the guard to force a pass. Fix the documented source or mirror drift, or keep the public claim unchanged.

Platform Checks

Add platform guards when platform or package docs change:

```
sh scripts/test-fedora-developer-workflow.sh
sh scripts/test-ubuntu-developer-workflow.sh
sh scripts/test-opensuse-developer-workflow.sh
```

Also run the exact guard named by the platform source record when the change is narrower than the general workflow.

Examples:

```
Fedora RPM static validation -&gt; run the Fedora static validation guard.
Ubuntu notice/license wording -&gt; run the Ubuntu notice or license guard.
openSUSE rpmlint/osc wording -&gt; run the openSUSE rpmlint or osc guard.
macOS reset/uninstall wording -&gt; run the matching macOS reset/uninstall guard.
```

Seal Checks

Run the Seal docs guard when any Seal public wording, Seal status row, Seal README, Seal public-entrypoint alignment, or Seal source record changes:

```
sh scripts/test-latticra-seal-docs.sh
```

Also run the exact Seal guard named by the changed status or implementation record when applicable.

Security Checks

Security documentation changes should always preserve security non-claims.

For security wording changes, validate:

1. PUBLIC_CLAIMS_LEDGER.md does not block the wording.
2. DOCUMENTATION_STYLE_GUIDE.md permits the terminology.
3. DOCUMENTATION_TRACEABILITY_MATRIX.md identifies the source and non-claim boundary.
4. The exact security, threat-model, supply-chain, memory-safety, or runtime-authority guard named by the source record passes.

Failure Handling

When a documentation validation fails:

1. Read the failing message before editing.
2. Identify whether the failure is link drift, mirror drift, status drift, guard expectation drift, or claim drift.
3. Fix the documentation source or mirror that is wrong.
4. Do not weaken non-claims to make a public summary sound better.
5. Do not edit guard scripts for documentation-only convenience.
6. Use DOCUMENTATION_DRIFT_RESPONSE_PLAYBOOK.md when source records, public pages, mirrors, estimates, non-claims, or validation expectations disagree.
7. If the stronger wording lacks evidence, demote the wording and record the blocked claim in the review packet.

Review Packet Fields

When using DOCUMENTATION_CHANGE_REVIEW_PACKET.md, put the selected commands in validation_commands.

Use blocked_missing_validation when a claim would require a guard or evidence record that does not exist yet.

Use blocked_public_entry_drift when public pages and source records disagree.

Use accepted_navigation_only only when links or route ordering changed without changing claims.

Boundary

This playbook validates documentation hygiene, traceability, and public-entry consistency.

It does not validate production runtime behavior, installer safety, package publication, platform approval, security guarantees, host protection, network protection, cryptographic authority, or AI-agent execution control.

docs/latticra/DOCUMENTATION_MAP.md

Source title: Latticra Documentation Map

Lines: 80 | Words: 620 | SHA-256: 5c20b91497db051ae43d835faf3ab6025c6aac575b4a1cf54ea0b26635b3c085

Latticra Documentation Map

Status: active documentation map Last updated: 2026-05-26 CDT Scope: reader routes, foundation documents, C/C++ direction, security profile, ABI boundaries, platform lanes, subsystem handbooks, and validation posture.

Purpose

This map records how the Latticra documentation set is meant to fit together.

For the shortest reader route, start with ../README.md. For the exhaustive architecture and operations index, use ../FOUNDATION_INDEX.md. This file explains the relationship between those layers and the older C/C++ foundation package that originally lived here.

Documentation Layers

```
| Layer | Purpose | Primary entry |
| --- | --- | --- |
```

Reader hub	Short route through the whole documentation set	[`../README.md`](../README.md)
Public project overview	Product identity, current status, quick start, and non-claims	[`../../README.md`](../../README.md)
Live status	Current public posture, estimates, status records, announcements	[`../../STATUS.md`](../../STATUS.md), [`../status/CURRENT_STATUS.md`](../status/CURRENT_STATUS.md), [`../status/README.md`](../status/README.md)
Foundation index	Full project operations, architecture, implementation, and guard index	[`../FOUNDATION_INDEX.md`](../FOUNDATION_INDEX.md)
System handbook	Project-level book for the durable Latticra story	[`../latticra-system-substrate/README.md`](../latticra-system-substrate/README.md)
Seal subsystem	Focused trust-boundary and report-only Seal docs	[`../latticra-seal/README.md`](../latticra-seal/README.md)
Installer docs	Panel installer authority, configuration, receipts, and evidence	[`../../installer/docs/README.md`](../../installer/docs/README.md)
Project notes	Short direction and queue notes	[`../project_notes/README.md`](../project_notes/README.md)

C/C++ Foundation Package

The C/C++ foundation direction remains active and is intentionally evidence-bound:

- C is the narrow platform substrate.
- Restricted C++ is the governed authority layer.
- Latticra is the contract language above the implementation substrate.

This does not claim that C/C++ is automatically safe. It defines the project posture required to use C/C++ responsibly inside a security-conscious systems project.

Document	Purpose
[`../architecture/LATTICRA_LANGUAGE_FOUNDATION.md`](../architecture/LATTICRA_LANGUAGE_FOUNDATION.md)	Defines the architectural language layering and project posture.
[`../security/C_CPP_SECURITY_PROFILE.md`](../security/C_CPP_SECURITY_PROFILE.md)	Defines the restricted C/C++ profile for trusted code.
[`../security/C_ABI_BOUNDARY_POLICY.md`](../security/C_ABI_BOUNDARY_POLICY.md)	Defines how C ABI boundaries are exposed, controlled, and reviewed.
[`../roadmap/LATTICRA_C_CPP_FOUNDATION_ROADMAP.md`](../roadmap/LATTICRA_C_CPP_FOUNDATION_ROADMAP.md)	Defines staged work required to make this direction real.
[`../C_CPP_FOUNDATION_DIRECTION.md`](../C_CPP_FOUNDATION_DIRECTION.md)	Records the active C is the metal, C++ is the disciplined structure, Latticra is the contract direction.
[`../CONSTRAINED_CPP_AUTHORITY_LAYER_CONTRACT.md`](../CONSTRAINED_CPP_AUTHORITY_LAYER_CONTRACT.md)	Defines the guarded C++ authority-layer contract before broad authority is allowed.

Platform and Product Lanes

Lane	Entry points	Current posture
Panel installer	[`../../installer/README.md`](../../installer/README.md), [`../../installer/docs/README.md`](../../installer/docs/README.md)	User-local, dry-run-first, no root, no network authority.
macOS installer lane	[`../MACOS_INTEGRATION_TRANSFERABILITY_PLAN.md`](../MACOS_INTEGRATION_TRANSFERABILITY_PLAN.md), [`../MACOS_COMMIT_GATE_CONTRACT.md`](../MACOS_COMMIT_GATE_CONTRACT.md)	No-effect probes and dry-run planning; no `.app` write or signing claim.
Fedora	[`../FEDORA_DEVELOPER_WORKFLOW.md`](../FEDORA_DEVELOPER_WORKFLOW.md), [`../../packaging/fedora/README.md`](../../packaging/fedora/README.md)	Local-only package and validation lanes; no Fedora approval.
Ubuntu	[`../UBUNTU_DEVELOPER_WORKFLOW.md`](../UBUNTU_DEVELOPER_WORKFLOW.md), [`../../packaging/ubuntu/README.md`](../../packaging/ubuntu/README.md)	Local-only deb draft and static checks; no archive or PPA readiness.
openSUSE	[`../OPENSUSE_DEVELOPER_WORKFLOW.md`](../OPENSUSE_DEVELOPER_WORKFLOW.md), [`../../packaging/opensuse/README.md`](../../packaging/opensuse/README.md)	Local-only RPM maintenance draft; no OBS publication or official package claim.

Summary

Latticra is not rejecting memory safety. Latticra is rejecting uncontrolled authority and replacing it with explicit security architecture, narrow unsafe boundaries, hard build discipline, and validation before promotion.

Core statement:

C is the metal. C++ is the disciplined structure. Latticra is the contract.

External Guidance Used For Alignment

These sources are used as security-alignment references, not as project endorsements:

- C++ Core Guidelines

https://isocpp.github.io/CppCoreGuidelines/CppCoreGuidelines

Promotion Rule

No future claim about Latticra security, runtime authority, host protection, package readiness, boot readiness, or production maturity should be promoted unless the relevant code, tests, documentation, and review evidence support it.

docs/LICENSE_MIGRATION_PLAN.md

Source title: Latticra License Migration Plan

Lines: 199 | Words: 467 | SHA-256: 522b71a594ceb496876b32cc6a8740e0af4cbfcde3b615dc3e460bda29c9963c

Latticra License Migration Plan

Status: active migration planning record Scope: path-by-path transition planning after the open ecosystem policy.

Purpose

This plan defines how Latticra should move from a repository-wide Apache-2.0 default toward the hybrid open ecosystem direction without silently relicensing files.

The goal is to keep Latticra open, auditable, transparent, and community-improvable while preserving a clear legal trail for each migration step.

Current state

Current canonical root license text:

```
LICENSE: hybrid license overview
```

Current policy direction:

```
core software work: AGPL-3.0-or-later
adoption-facing helpers: Apache-2.0
documentation and handbooks: CC-BY-4.0
existing code files: current license until intentionally migrated or otherwise marked
branding: separate trademark and identity policy
```

Related records:

```
docs/OPEN_ECOSYSTEM_POLICY.md
docs/LICENSE_POLICY.md
docs/DOCUMENTATION_LICENSE.md
CONTRIBUTING.md
TRADEMARK_POLICY.md
LICENSES/README.md
```

Migration principles

Migration must be:

```
explicit
path-scoped
reviewed
SPDX-marked
compatible with contributor rights
recorded before release
```

No file should be relicensed silently.

Phase 1: governance baseline

Status: complete

Scope:

```
docs/OPEN_ECOSYSTEM_POLICY.md
docs/LICENSE_POLICY.md
CONTRIBUTING.md
TRADEMARK_POLICY.md
LICENSES/README.md
scripts/test-open-ecosystem-policy.sh
.github/workflows/open-ecosystem-policy.yml
```

Purpose:

```
declare open ecosystem direction
preserve existing license state
record documentation license decision
add contribution and identity policy
add governance guard
```

Phase 2: SPDX planning guard

Status: this plan

Scope:

```
docs/LICENSE_MIGRATION_PLAN.md
scripts/test-license-migration-plan.sh
.github/workflows/license-migration-plan.yml
```

Purpose:

```
record migration phases
require new-source SPDX direction to stay discoverable
define first migration candidate paths
avoid accidental whole-repository relicensing
```

Phase 3: first source SPDX migration candidates

Recommended first candidate group:

```
include/latticra/kernel*.h
src/kernel*.c
tests/kernel*.c
tools/kernel*.c
```

Reason:

```
These files are kernel/core oriented and closely match the open ecosystem reciprocal direction.
```

The first source migration PR should:

1. add SPDX-License-Identifier headers;
2. document affected paths;
3. update or add a guard for SPDX coverage;
4. avoid mixing license migration with behavior changes;
5. preserve existing code behavior and tests.

Phase 4: system/bootstrap/core source candidates

Recommended second candidate group:

```
include/latticra/system_bootstrap.h
src/system_bootstrap.c
tests/system_bootstrap.c
tools/system_bootstrap_report.c
```

Reason:

```
These files are core system surfaces and should be reviewed after kernel/core paths.
```

Phase 5: non-core path review

Review separately:

```
Lat language tooling
L-UI tooling
LIR tooling
runtime-boundary support
scripts
examples
fixtures
assets
```

Do not assume all non-core paths should use the same license immediately.

Documentation license decision

Documentation license is decided in this plan.

The documentation and handbook license is:

```
CC-BY-4.0
```

The path-level documentation license record is:

```
docs/DOCUMENTATION_LICENSE.md
```

CC-BY-SA-4.0 may be used for future standalone handbook material only when a file or path-level notice explicitly marks that choice.

Release checklist impact

Before any public release artifact, verify:

```
root license state
file-level SPDX state
third-party notices
source-offer requirements
trademark use
release artifact license notes
```

Non-legal-advice boundary

This plan is project guidance and not legal advice.

Formal relicensing, commercial distribution, dual licensing, or release review should receive qualified legal review.

docs/LICENSE_POLICY.md

Source title: Latticra License Policy

Lines: 192 | Words: 576 | SHA-256: 3eac61a4e2ef53944f2d3c1bfa4b91741f0e6abd8434add853be6cf8c4f5eec4

Latticra License Policy

Status: active hybrid license policy Scope: hybrid software licensing, documentation licensing, SPDX usage, branding, contributions, and future artifacts.

Purpose

Latticra is intended to remain open, auditable, transparent, and community-improvable.

This policy explains the current hybrid repository license state and the transition-aware rules for future work.

See also:

```
docs/OPEN_ECOSYSTEM_POLICY.md
docs/DOCUMENTATION_LICENSE.md
CONTRIBUTING.md
TRADEMARK_POLICY.md
LICENSES/README.md
```

Current repository posture

The root repository license overview is:

```
LICENSE
```

Latticra uses this hybrid posture:

```
core/runtime/security substrate: AGPL-3.0-or-later
SDKs/examples/packaging helpers/integration helpers: Apache-2.0
documentation/handbooks/policy notes: CC-BY-4.0
names/logos/identity: TRADEMARK_POLICY.md
```

Existing repository code remains Apache-2.0 unless a file-level SPDX identifier, path-level notice, or reviewed migration explicitly marks it otherwise.

Core software direction

The intended software licensing direction for new software work is:

```
AGPL-3.0-or-later
```

This direction applies to core runtime, security-substrate, tool-boundary, runtime-gating, verification, and evidence-bound computing components.

It is meant to preserve open, auditable, transparent access to Latticra-derived core software while the project grows into system, kernel, language, tool, and operator-facing components.

Adoption-facing software direction

The intended license for SDKs, examples, packaging helpers, installer glue, integration helpers, and other adoption-facing software is:

```
Apache-2.0
```

This keeps integration surfaces commercially friendly and packaging friendly while preserving an express patent grant.

Documentation direction

The documentation and handbook license decision is:

```
CC-BY-4.0
```

See:

```
docs/DOCUMENTATION_LICENSE.md
LICENSES/CC-BY-4.0.txt
```

No silent relicensing

This policy does not silently relicense every existing file.

Existing files remain under their current license until a later migration PR updates them clearly and intentionally.

A file-level or path-level migration should include:

```
SPDX license identifier update
reason for migration
affected paths
compatibility notes
review before release
```

New source file rule

New software source files should declare their license with an SPDX identifier.

The preferred identifier for new core software source files is:

```
SPDX-License-Identifier: AGPL-3.0-or-later
```

The preferred identifier for new adoption-facing helper source files is:

```
SPDX-License-Identifier: Apache-2.0
```

Documented exceptions are allowed when the exception is intentional and reviewed.

New documentation file rule

New documentation files may declare:

```
SPDX-License-Identifier: CC-BY-4.0
```

Existing documentation is covered by the path-level decision in:

```
docs/DOCUMENTATION_LICENSE.md
```

Contributions

Contributions are accepted under the license declared by the files being modified.

New software contributions should follow the project direction documented in:

```
docs/OPEN_ECOSYSTEM_POLICY.md
CONTRIBUTING.md
```

No proprietary relicensing contributor license agreement is adopted by this policy.

Branding and trademarks

Software and documentation licenses do not grant trademark, branding, endorsement, or official-project identity rights.

Project names, logos, marks, and Bryforge/Latticra branding are handled separately.

See:

```
TRADEMARK_POLICY.md
```

Third-party material

Third-party material must include source, license, and compatibility notes before being added.

Required fields:

```
name:
source:
```

```
license:
compatible with current path license: yes|no|unknown
purpose:
notes:
```

Generated artifacts

Generated artifacts may need additional notices depending on source inputs, build process, and bundled dependencies.

No release artifact should be published until its licensing and notice requirements are reviewed.

NOTICE file

A future NOTICE file may be added when Latticra has third-party notices, attribution requirements, or distribution notes to preserve.

Future work

Recommended follow-up work:

```
add SPDX headers to new software files
add a license guard for source paths
review path-by-path migration from Apache-2.0
add release license checklist
add NOTICE if needed
```

Non-claims

This policy is project guidance and not legal advice.

For commercial licensing strategy, patent strategy, trademark strategy, formal relicensing, or release review, obtain qualified legal review.

Current direction

Latticra is being built as a contract-first open systems architecture and programming-language project.

The public direction is:

```
open source
auditable
defensive
contract-driven
evidence-bound
operator-visible
security-conscious from the beginning
constrained C/C++ foundation
```

The current security-guidance posture is aligned across the high-assurance baseline, memory-safety roadmap, supply-chain baseline, zero-trust runtime authority baseline, and runtime-boundary policy expansion. Those records now carry explicit workload or service identity, operator identity, host or device integrity, command-boundary, update-integrity, and retained-C/C++ hazard-class expectations while preserving Latticra's no-compliance-claim and no-production-security-boundary posture.

C/C++ foundation checkpoint

```
C is the metal.
C++ is the disciplined structure.
Latticra is the contract.
```

Meaning:

```
C: secure substrate, boot paths, ABI boundaries, platform shims.
C++: governed authority layer, policy, validators, effect gates, audit logic.
Lat / Latticra Language: contract, semantic validation, metadata lowering, and declaration
layer.
```

This does not mean unrestricted C++.

Current Lat language boundary

The Lat lane now has:

```
bounded grammar parser
bounded no-effect Lat grammar report metadata integration
bounded no-effect Lat grammar line-comment metadata refinement
bounded no-effect Lat grammar unsupported block-comment rejection refinement
bounded no-effect Lat pipeline comment metadata integration
bounded no-effect Lat pipeline diagnostic comment metadata integration
bounded no-effect Lat parse-failure comment evidence propagation
bounded no-effect Lat pipeline failure span evidence propagation
bounded no-effect Lat pipeline parse-error evidence propagation
bounded no-effect Lat pipeline semantic-error evidence propagation
bounded no-effect Lat pipeline downstream stage-error evidence propagation
bounded no-effect Lat pipeline stage-summary evidence propagation
bounded no-effect Lat pipeline module/count evidence propagation
bounded no-effect Lat pipeline first-declaration evidence propagation
bounded no-effect Lat pipeline first-clause evidence propagation
bounded no-effect Lat LIR edge-kind evidence propagation
bounded no-effect Lat LIR no-effect evidence propagation
bounded no-effect Lat LIR module-summary evidence propagation
bounded no-effect Lat LIR source-span evidence propagation
bounded no-effect Lat LIR node-kind evidence propagation
bounded no-effect Lat LIR first-node evidence propagation
bounded no-effect Lat LIR first-node span evidence propagation
bounded no-effect Lat LIR first transition-node evidence propagation
bounded no-effect Lat LIR first transition-node span evidence propagation
bounded no-effect Lat LIR first-edge evidence propagation
bounded no-effect Lat LIR first-edge span evidence propagation
bounded no-effect Lat LIR first transition-source edge evidence propagation
bounded no-effect Lat LIR first transition-source edge endpoint evidence propagation
bounded no-effect Lat LIR first transition-source edge span evidence propagation
bounded no-effect semantic validation
bounded no-effect Lat model normalization
bounded no-effect Lat model report declaration metadata integration
bounded no-effect Lat model report clause metadata integration
bounded no-effect Lat pipeline model normalization integration
bounded no-effect Lat-to-LIR model lowering integration
bounded no-effect Lat-to-LIR declaration metadata refinement
bounded no-effect Lat-to-LIR diagnostic refinement
bounded no-effect Lat-to-LIR diagnostic declaration metadata integration
bounded no-effect Lat pipeline lowering diagnostic integration
bounded no-effect Lat-to-LIR clause metadata refinement
bounded no-effect Lat-to-LIR diagnostic clause metadata integration
bounded no-effect Lat pipeline diagnostic declaration metadata integration
bounded no-effect Lat pipeline diagnostic clause metadata integration
bounded no-effect Lat pipeline report declaration metadata integration
bounded no-effect Lat pipeline report clause metadata integration
bounded no-effect Lat-to-LIR metadata lowering
bounded no-effect Lat pipeline reporting
bounded no-effect Lat pipeline diagnostic integration
bounded no-effect Lat pipeline diagnostic main test audit
bounded no-effect Lat-specific LIR refinement
```

The current Lat grammar report metadata integration copies the first parsed declaration kind/name/source/first-clause metadata and first parsed clause keyword/name/operator/value/effect into deterministic grammar reports when parsing succeeds.

The current Lat grammar line-comment metadata refinement records deterministic comment count and first-comment span metadata in parse results and grammar reports. Comments remain no-effect metadata, can carry otherwise forbidden marker words, and do not change clause parsing or operator behavior.

The current Lat grammar unsupported block-comment rejection refinement rejects block-comment openers outside strings and line comments with a deterministic unsupported_block_comment parse error. Block-comment marker text inside string literals remains ordinary string content.

The current Lat model normalization implementation consumes parser and semantic metadata, builds typed declaration and clause index tables for states, policies, transitions, assertions, and effect declarations, resolves transition source-state metadata, preserves source spans and no-effect flags, and emits deterministic normalization reports.

The current Lat model report declaration metadata integration copies the first normalized declaration index, kind, name, source name, parse index, first-clause index, clause count, and source declaration index into deterministic model normalization reports.

The current Lat model report clause metadata integration copies the first normalized clause role, effect, name, operator, value, and index into deterministic model normalization reports without evaluating operators or changing normalization behavior.

The current Lat-to-LIR lowering implementation consumes normalized Lat model metadata directly, creates a lat_module LIR shape, preserves source spans, no-effect flags, model counts, transition source indices, declaration metadata, and clause operator metadata, and emits deterministic lowering reports. The older parser-plus-semantic lowering entry point remains available as a compatibility wrapper that normalizes a local model first.

The current Lat-to-LIR declaration metadata refinement copies the first lowered declaration node index, kind, name, source name, parse index, first-clause index, clause count, and source declaration index into deterministic lowering reports.

The current Lat-to-LIR clause metadata refinement stores clause operators in LIR node metadata and reports the first lowered clause role, effect, name, operator, value, and node index for deterministic audit visibility.

The current Lat-to-LIR diagnostic refinement classifies lowering outcomes as valid, parse, semantic, model, effect-check, capacity, LIR, or internal, copies first-declaration and first-clause metadata from lowering results, and preserves no-effect behavior without changing lowering behavior.

The current Lat-to-LIR diagnostic declaration metadata integration copies first lowered declaration node index, kind, name, source name, parse index, first-clause index, clause count, and source declaration index into deterministic diagnostic reports.

The current Lat pipeline composes Lat source parsing, semantic validation, Lat model normalization, model-driven Lat-to-LIR lowering, LIR metadata, deterministic pipeline reporting, and companion diagnostic reporting into one no-effect integration path. The original pipeline entry point remains available, and a model-aware entry point can return the normalized model to callers.

The current Lat pipeline comment metadata integration copies parser line-comment count and first-comment span metadata into deterministic LAT PIPELINE REPORT output while preserving no execution, no operator evaluation, and no runtime authority.

The current Lat pipeline report declaration metadata integration copies first lowered declaration node index, kind, name, source name, parse index, first-clause index, clause count, and source declaration index from the lowering result into deterministic LAT PIPELINE REPORT output without evaluating operators or changing pipeline behavior.

The current Lat pipeline report clause metadata integration copies first lowered clause role, effect, name, operator, value, and node index from the lowering result into deterministic LAT PIPELINE REPORT output without evaluating operators or changing pipeline behavior.

The current Lat pipeline diagnostic integration combines pipeline error/stage state with Lat semantic diagnostic class, semantic error, diagnostic count, first-diagnostic indices, model-stage classification, and optional Lat-to-LIR lowering diagnostic metadata.

The current Lat pipeline diagnostic comment metadata integration copies parser line-comment count and first-comment span metadata into deterministic pipeline diagnostic reports without evaluating operators or changing pipeline behavior.

The current Lat parse-failure comment evidence propagation guard verifies that line comments before an unsupported block-comment parse failure remain visible through pipeline reports, pipeline diagnostics, and denied runtime-boundary records without adding execution or runtime authority.

The current Lat pipeline failure span evidence propagation copies parser diagnostic/module spans into the pipeline result, pipeline diagnostic reports, and runtime-boundary Lat pipeline evidence so parse-failure locations remain visible without adding execution or runtime authority.

The current Lat pipeline parse-error evidence propagation copies parser error labels into pipeline diagnostic reports and runtime-boundary Lat pipeline evidence so parse-failure reasons remain visible without adding execution or runtime authority.

The current Lat pipeline semantic-error evidence propagation copies semantic error labels into runtime-boundary Lat pipeline evidence so semantic-failure reasons remain visible without adding execution or runtime authority.

The current Lat pipeline downstream stage-error evidence propagation copies model, lowering, and LIR error labels into runtime-boundary Lat pipeline evidence so downstream-stage failure reasons remain visible without adding execution or runtime authority.

The current Lat pipeline stage-summary evidence propagation copies last-completed stage, failed stage, per-stage OK flags, no-effect-chain status, and evidence level into runtime-boundary Lat pipeline evidence so boundary records preserve the pipeline audit summary without adding execution or runtime authority.

The current Lat pipeline module/count evidence propagation copies module identity, parser declaration/clause counts, and model declaration/clause counts into runtime-boundary Lat pipeline evidence so boundary records preserve the source/model shape summary without adding execution or runtime authority.

The current Lat pipeline first-declaration evidence propagation copies first lowered declaration node, kind, name, source, parse index, clause span/count, source index, and first transition source index into runtime-boundary Lat pipeline evidence so boundary records preserve declaration identity without adding execution or runtime authority.

The current Lat pipeline first-clause evidence propagation copies first lowered clause node, role, effect, name, operator, and value into runtime-boundary Lat pipeline evidence so boundary records preserve clause identity without adding execution or runtime authority.

The current Lat LIR edge-kind evidence propagation copies contains, binds, annotates, orders-before, and transition edge-kind counts from Lat-specific LIR into runtime-boundary evidence so boundary records preserve graph shape without adding execution or runtime authority.

The current Lat LIR no-effect evidence propagation copies no-effect-chain status, evidence level, no-effect flag, and execution/mutation/server/recovery/hardware allowance flags from Lat-specific LIR into runtime-boundary evidence so boundary records preserve LIR authority posture without adding execution or runtime authority.

The current Lat LIR module-summary evidence propagation copies module name, report classification, shape kind, node count, edge count, binding count, and text count from Lat-specific LIR into runtime-boundary evidence so boundary records preserve LIR graph identity without adding execution or runtime authority.

The current Lat LIR source-span evidence propagation copies source-span offsets, lines, and columns from Lat-specific LIR into runtime-boundary evidence so boundary records preserve LIR source location without adding execution or runtime authority.

The current Lat LIR node-kind evidence propagation copies Lat-specific state, policy, transition, assertion, requirement, and effect-declaration node counts from Lat-specific LIR into runtime-boundary evidence so boundary records preserve Lat-derived LIR node shape without adding execution or runtime authority.

The current Lat LIR first-node evidence propagation copies the first Lat-specific LIR node presence flag, index, kind, name, value, operator, and binding into runtime-boundary evidence so boundary records preserve the first Lat-derived LIR node identity without adding execution or runtime authority.

The current Lat LIR first-node span evidence propagation copies the first Lat-specific LIR node source-span offsets, lines, and columns into runtime-boundary evidence so boundary records preserve the first Lat-derived LIR node location without adding execution or runtime authority.

The current Lat LIR first transition-node evidence propagation copies the first Lat-specific LIR transition node presence flag, index, kind, name, value, operator, and binding into runtime-boundary evidence so boundary records preserve the first Lat-derived transition node identity without adding execution or runtime authority.

The current Lat LIR first transition-node span evidence propagation copies the first Lat-specific LIR transition node source-span offsets, lines, and columns into runtime-boundary evidence so boundary records preserve the first Lat-derived transition node location without adding execution or runtime authority.

The current Lat LIR first-edge evidence propagation copies the first Lat-specific LIR edge presence flag, index, from/to indices, and kind into runtime-boundary evidence so boundary records preserve the first Lat-derived LIR edge identity without adding execution or runtime authority.

The current Lat LIR first-edge span evidence propagation copies the first Lat-specific LIR edge source-span offsets, lines, and columns into runtime-boundary evidence so boundary records preserve the first Lat-derived LIR edge location without adding execution or runtime authority.

The current Lat LIR first transition-source edge evidence propagation copies the first Lat-specific LIR transition-source edge presence flag, index, from/to indices, and kind into runtime-boundary evidence so boundary records preserve the first Lat-derived transition-source relationship without adding execution or runtime authority.

The current Lat LIR first transition-source edge endpoint evidence propagation copies the first Lat-specific LIR transition-source edge endpoint node kinds and names into runtime-boundary evidence so boundary records preserve which transition points to which source state without adding execution or runtime authority.

The current Lat LIR first transition-source edge span evidence propagation copies the first Lat-specific LIR transition-source edge source-span offsets, lines, and columns into runtime-boundary evidence so boundary records preserve the first Lat-derived transition-source relationship location without adding execution or runtime authority.

The current Lat pipeline diagnostic declaration metadata integration copies first lowered declaration node index, kind, name, source name, parse index, first-clause index, clause count, and source declaration index from Lat-to-LIR diagnostics into deterministic pipeline diagnostic reports.

The current Lat pipeline diagnostic clause metadata integration copies first lowered clause role, effect, name, operator, value, and node index from Lat-to-LIR diagnostics into deterministic pipeline diagnostic reports without evaluating operators or changing pipeline behavior.

The current Lat pipeline diagnostic main test audit verifies that the diagnostic integration is covered by both the focused guard and the main Lat pipeline test runner.

The current Lat-specific LIR refinement makes Lat declarations and transition-source edges explicit in LIR while preserving source spans, counts, and no-effect flags.

It does not provide Lat execution, Lat interpretation, Lat compilation, LIR execution, runtime behavior, command execution, state mutation, file I/O, network I/O, recovery behavior, hardware behavior, or operating-system behavior.

Current C++ authority boundary

The C++ authority layer is contract-bound, implementation-plan-bound, and represented by its first no-effect implementation slice plus an implementation review.

Planning milestone preserved:

```
Constrained C++ authority layer implementation plan
```

It currently implements no-effect authority behavior only:

```
explicit status labels
explicit effect labels
explicit validator labels
fixed-capacity audit records
Lat parse-result metadata validation
LIR shape metadata validation
effect classification without performing effects
deterministic authority report rendering
```

The authority implementation review confirmed that the layer remains no-effect, metadata-only, fixed-capacity, and denied-by-default.

The implementation does not provide unrestricted C++ authority, an effect-performing implemented C++ authority layer, runtime execution, mutation authority, file authority, network authority, recovery authority, hardware authority, or production security guarantees.

Current L-UI rendering boundary

The L-UI rendering lane has a contract, implementation plan, first no-effect C implementation, and detailed report refinement.

The current renderer provides deterministic operator-visible text reports over already validated L-UI/LIR metadata and a C-compatible authority summary.

It does not provide terminal control, interactive UI behavior, command behavior, Lat execution, LIR execution, Nucleus effect execution, mutation, file I/O, network I/O, recovery behavior, hardware behavior, or production UI claims.

Current Nucleus task boundary

The Nucleus task execution lane has a contract, implementation plan, first no-effect C classification/report implementation, deterministic task report refinement, no-effect report alignment, and report-only execution metadata refinement.

Planning and implementation milestones preserved:

```
Nucleus task execution implementation plan
Nucleus task execution implementation
Nucleus task report refinement
Nucleus task no-effect report alignment
Nucleus task report-only execution refinement
Nucleus task report-only execution README/status alignment
Nucleus report-only announcement review
Nucleus report-only announcement README alignment
```

The current implementation provides denied-by-default task classification and deterministic task reports with explicit request kinds, effects, policies, denial reasons, authorization labels, prerequisite status, authority metadata, preview prerequisites, no-effect-chain status, no-effect-policy status, representation-gate status, execution status, effect status, runtime status, and no-effect flags.

The report-only execution refinement makes the execution boundary explicit with execution_status=not-executed, effect_status=report-only, and runtime_status=not-entered while preserving non-execution behavior.

The no-new-announcement review confirms that the recent Nucleus report-only and project-notes slices were documentation/status alignment only and did not justify a separate public announcement entry.

It does not implement effect-performing Nucleus task execution, command behavior, mutation, network behavior, recovery behavior, hardware behavior, boot behavior, rollback, public-product readiness, or production runtime claims.

Current runtime boundary

The runtime boundary lane now has a contract, implementation plan, initial no-effect C API/report surface, no-effect Lat evidence refinement, Lat pipeline comment evidence reporting, runtime boundary report refinement, runtime boundary policy matrix refinement, runtime boundary policy expansion after threat-model validation, runtime boundary domain matrix refinement, runtime boundary domain matrix report integration, and main-test audit coverage.

Planning milestone preserved:

```
Runtime boundary implementation plan
```

The current implementation adds the public runtime boundary header, source file, smoke invariants, report entry point, implementation record, and dedicated runtime-boundary workflow. It establishes a compileable boundary surface while preserving a disabled-by-default posture.

The current runtime boundary domain matrix evaluator classifies resolved boundary domains as declarative, operational, future-gated, blocked, invalid, or unknown.

The current runtime boundary domain matrix report integration renders deterministic report fields for matrix cell, domain label, domain flags, effect-allowed state, authority-available state, and evidence level.

The current runtime boundary policy expansion after threat-model validation maps request families, effect families, authority prerequisites, future gates, threat-model abuse cases, and remaining evidence gaps while preserving no-effect behavior.

The current runtime boundary Lat pipeline comment evidence integration copies Lat pipeline line-comment count and first-comment span metadata into deterministic runtime-boundary records and reports, including denied failed-pipeline records, without granting execution or runtime authority.

It does not implement effect-performing runtime behavior, command execution, Lat execution, LIR execution, task effect execution, mutation, file I/O, network I/O, recovery behavior, rollback, hardware behavior, boot behavior, terminal control, sandboxing, or production runtime claims.

Public entry-point posture

The recent Nucleus report-only announcement README alignment refreshed README, the project-notes index, root status, current status, the status index, and the foundation index after the Nucleus report-only announcement review.

That alignment was documentation/status-only. It did not add a public announcement entry, implementation behavior, capability posture change, or completion-estimate change.

Mission target

The long-term mission is to build a complete open-source operating-system universe and programming-language stack that makes unsafe behavior harder to hide and easier to inspect.

This includes long-term defensive goals against malware, ransomware, unauthorized persistence, hidden mutation, unclear execution, and opaque system behavior.

Target users

Primary target users include:

- intellectuals;
- scientists;
- computer scientists;
- security researchers;
- defensive engineering teams;
- infrastructure maintainers;
- government infrastructure stakeholders.

Current technical lane

The current technical lane has moved through L-UI parser, AST, source-policy, diagnostic, semantic validation, LIR shape, LIR report refinement, Lat parser foundation, Lat grammar report metadata integration, Lat grammar line-comment metadata refinement, Lat grammar unsupported block-comment rejection refinement, Lat pipeline comment metadata integration, Lat pipeline diagnostic comment metadata integration, Lat parse-failure comment evidence propagation, Lat pipeline failure span evidence propagation, Lat pipeline parse-error evidence propagation, Lat pipeline semantic-error evidence propagation, Lat pipeline downstream stage-error evidence propagation, Lat pipeline stage-summary evidence propagation, Lat pipeline module/count evidence propagation, Lat pipeline first-declaration evidence propagation, Lat pipeline first-clause evidence propagation, Lat LIR edge-kind evidence propagation, Lat LIR no-effect evidence propagation, Lat LIR module-summary evidence propagation, Lat LIR source-span evidence propagation, Lat LIR node-kind evidence propagation, Lat LIR first-node evidence propagation, Lat LIR first-node span evidence propagation, Lat LIR first transition-node evidence propagation, Lat LIR first transition-node span evidence propagation, Lat LIR first-edge evidence propagation, Lat LIR first-edge span evidence propagation, Lat LIR first transition-source edge evidence propagation, Lat LIR first transition-source edge endpoint evidence propagation, Lat LIR first transition-source edge span evidence propagation, runtime boundary Lat pipeline comment evidence integration, Lat semantic validation, Lat semantic diagnostics, Lat model normalization, Lat model report declaration metadata integration, Lat model report clause metadata integration, Lat-to-LIR lowering, Lat pipeline, Lat pipeline model normalization integration, Lat-to-LIR model lowering integration, Lat-to-LIR declaration metadata refinement, Lat-to-LIR diagnostic refinement, Lat-to-LIR diagnostic declaration metadata integration, Lat pipeline lowering diagnostic integration, Lat-to-LIR clause metadata refinement, Lat-to-LIR diagnostic clause metadata integration, Lat pipeline diagnostic declaration metadata integration, Lat pipeline diagnostic clause metadata integration, Lat pipeline report declaration metadata integration, Lat pipeline report clause metadata integration, Lat pipeline report refinement, Lat pipeline diagnostic integration, Lat pipeline diagnostic main-test audit, Lat-specific LIR refinement, C/C++ foundation direction, constrained C++ authority-layer contract, constrained C++ authority-layer implementation plan, first no-effect C++ authority implementation, authority implementation review, L-UI rendering contract, L-UI rendering implementation plan, first no-effect L-UI renderer implementation, L-UI rendering detailed report refinement, Nucleus task execution contract, Nucleus task execution implementation implementation plan, Latticra Seal bounded key parsing metadata implementation, Latticra Seal key parsing status/public-entry alignment, Latticra Seal verification policy status/public-entry alignment, Latticra Seal verification receipt status/public-entry alignment, Latticra Seal capability gate status/public-entry alignment, Latticra Seal effect decision status/public-entry alignment, Latticra Seal runtime handoff status/public-entry alignment, Latticra Seal status rollup status/public-entry alignment, Latticra Seal agentic automation security public-entrypoint alignment, Latticra Seal parameter schema status/public-entry alignment, Latticra Seal request freshness status/public-entry alignment, Latticra Seal signed request status/public-entry alignment, Latticra Seal policy decision status/public-entry alignment, Latticra Seal README status row alignment, Latticra Seal product spine, Latticra Seal product spine status, Latticra Seal operator receipt report contract, Latticra Seal operator receipt report implementation plan, Latticra Seal operator receipt report implementation, Latticra Seal operator receipt report surface/status, defensive threat model validation refinement, runtime boundary policy expansion after threat-model validation, runtime boundary abuse-case fixture expansion, and completion estimate review README/status alignment.

Runtime boundary abuse-case fixture expansion after policy expansion is now the latest no-effect fixture/evidence slice.

Latticra Seal README status row alignment keeps the first README Seal summary surfaces aligned with the current public status checkpoint while preserving no runtime execution, effect execution, capability enforcement, cryptographic verification, signing, production enforcement, or runtime authority.

Latticra Seal operator receipt report implementation composes report-only capability metadata, policy decision metadata, request freshness metadata, signed request metadata, and runtime dry-run metadata into one denied operator receipt while preserving no receipt file writes, tool execution, host mutation, network behavior, capability enforcement, effects, or runtime authority.

Latticra Seal operator receipt report surface/status alignment makes that denied receipt visible from a deterministic local report runner and public status record while preserving no runtime execution, effect execution, host mutation, network behavior, capability enforcement, or runtime authority.

Latticra Seal local capability registry schema contract defines future local capability-record fields and vocabulary while preserving no registry loader, no file reads, no network behavior, no capability enforcement, no effects, and no runtime authority.

Latticra Seal local capability registry schema implementation plan defines exact future header, source, test, report, enum, capacity, fixture, and negative-case behavior while preserving no registry loader, no file reads, no network behavior, no capability enforcement, no effects, and no runtime authority.

Latticra Seal local capability registry schema implementation adds bounded local schema records, deterministic validation, a default descriptive fixture entry, and negative-case invariants while preserving no registry loader, no registry file access, no host behavior, no network behavior, no capability enforcement, no effects, and no runtime authority.

Previous policy/evidence slice: Runtime boundary policy expansion after threat-model validation.

Completion estimate review after runtime-boundary abuse-case fixtures keeps the planning estimates unchanged because capability posture, public readiness, security hardening, and runtime authority did not change.

Completion estimate review README/status alignment makes that hold review discoverable from README and status surfaces without changing capability posture, public readiness, security hardening, completion estimates, or runtime authority.

Current estimate table source alignment makes the live public estimate table source explicit from README, root status, detailed status, status index, foundation index, and project notes without changing estimates or runtime authority.

Current estimate mathematical rebase updates the live public estimate table to a weighted 45% overall planning estimate after recent guarded Seal, Ubuntu, macOS, Nadia Stage-43 prompt-evaluation release-receipt contract-chain evidence, Lat/LIR, kernel lifecycle scheduler-credit and scheduler-selection-ready evidence, vulnerability-management release-gate baseline coverage, and public-entry alignment work while preserving no implementation behavior change, no product-security claim, no product-readiness promotion, and no runtime authority.

Latticra Seal crypto verify backend status/public-entry alignment makes the existing metadata-only unsupported backend visible from public status surfaces while preserving no real cryptographic verification, signing, key handling, host behavior, network behavior, capability enforcement, effect execution, or runtime authority.

Latticra Seal Ed25519 verify-only status/public-entry alignment makes the existing local provider-backed verify-only result visible from public status surfaces while preserving no signing, key generation, private-key handling, trust-store behavior, revocation lookup, host behavior, network behavior, capability enforcement, effect execution, runtime authority, or production cryptography claim.

Latticra Seal verified receipt promotion status/public-entry alignment makes the existing verified receipt promotion metadata visible from public status surfaces while preserving evidence promotion only, no capability authorization, no effect execution, no runtime authority, no signing, no key handling, no host behavior, no network behavior, and no production cryptography claim.

Latticra Seal verified capability gate status/public-entry alignment makes the existing metadata-only verified capability gate visible from public status surfaces while preserving no capability enforcement, no effect execution, no runtime authority, no signing, no key handling, no host behavior, no network behavior, and no production cryptography claim.

Latticra Seal verified effect decision status/public-entry alignment makes the existing metadata-only verified effect decision visible from public status surfaces while preserving no effect execution, no capability enforcement, no runtime authority, no signing, no key handling, no host behavior, no network behavior, and no production cryptography claim.

Latticra Seal effect decision predecessor status alignment preserves the denied metadata-only effect decision's guarded capability gate predecessor without adding effect execution, capability enforcement, host behavior, network behavior, or runtime authority.

Latticra Seal runtime handoff predecessor status alignment preserves the inactive metadata-only runtime handoff's guarded effect decision predecessor without adding runtime handoff execution, effect execution, capability enforcement, host behavior, network behavior, or runtime authority.

Latticra Seal status rollup predecessor status alignment preserves the metadata-only status rollup's guarded runtime handoff predecessor without adding runtime execution, runtime handoff execution, effect execution, capability enforcement, host behavior, network behavior, or runtime authority.

Latticra Seal agentic automation security predecessor status alignment preserves the report-only automation status record's guarded status rollup predecessor without adding MCP behavior, AI-agent execution, model execution, tool execution, shell execution, runtime execution, capability enforcement, host behavior, network behavior, or runtime authority.

Latticra Seal runtime handoff evaluation status/public-entry alignment makes the existing metadata-only runtime handoff evaluation visible from public status surfaces while preserving no runtime handoff execution, no effect execution, no capability enforcement, no runtime authority, no signing, no key handling, no host behavior, no network behavior, and no production cryptography claim.

Latticra Seal runtime handoff report status/public-entry alignment makes the existing metadata-only runtime handoff report visible from public status surfaces while preserving no runtime handoff execution, no effect execution, no capability enforcement, no runtime authority, no signing, no key handling, no host behavior, no network behavior, and no production cryptography claim.

Latticra Seal report envelope status/public-entry alignment makes the existing metadata-only sealed report envelope visible from public status surfaces while preserving no signing, no signature verification, no object sealing, no runtime handoff execution, no effect execution, no capability enforcement, no runtime authority, no key handling, no host behavior, no network behavior, and no production cryptography claim.

Latticra Seal signature request predecessor status alignment ties the existing metadata-only signature request status to the guarded report-envelope status predecessor while preserving no signing, no signature verification, no object sealing, no runtime handoff execution, no capability enforcement, no runtime authority, no key handling, no host behavior, no network behavior, and no production cryptography claim.

Latticra Seal signing authorization predecessor status alignment ties the existing metadata-only signing authorization status to the guarded signature-request status predecessor while preserving no signing, no signature verification, no object sealing, no runtime handoff execution, no capability enforcement, no runtime authority, no key handling, no host behavior, no network behavior, and no production cryptography claim.

Latticra Seal signer handoff predecessor status alignment ties the existing metadata-only signer handoff status to the guarded signing-authorization status predecessor while preserving no signing, no signature verification, no signer invocation behavior, no object sealing, no runtime handoff execution, no capability enforcement, no runtime authority, no key handling, no host behavior, no network behavior, and no production cryptography claim.

Latticra Seal signer invocation predecessor status alignment ties the existing metadata-only signer invocation status to the guarded signer-handoff status predecessor while preserving no signing, no signature verification, no signer invocation behavior, no signer process execution, no object sealing, no runtime handoff execution, no capability enforcement, no runtime authority, no key handling, no host behavior, no network behavior, and no production cryptography claim.

Latticra Seal signing operation predecessor status alignment ties the existing metadata-only signing operation status to the guarded signer-invocation status predecessor while preserving no signing, no signature verification, no signer invocation behavior, no signer process execution, no object sealing, no runtime handoff execution, no capability enforcement, no runtime authority, no key handling, no host behavior, no network behavior, and no production cryptography claim.

Latticra Seal key-handling predecessor status alignment ties the existing metadata-only key-handling status to the guarded signing-operation status predecessor while preserving no public-key parsing, no key material loading, no private-key handling, no key generation, no hardware-key use, no trust-store behavior, no revocation lookup, no signing, no signature verification, no signer invocation behavior, no signer process execution, no object sealing, no runtime handoff execution, no capability enforcement, no runtime authority, no host behavior, no network behavior, and no production cryptography claim.

Latticra Seal key-material predecessor status alignment ties the existing metadata-only key-material status to the guarded key-handling status predecessor while preserving no public-key parsing, no key material loading, no private-key handling, no key generation, no hardware-key use, no trust-store behavior, no revocation lookup, no signing, no signature verification, no signer invocation behavior, no signer process execution, no object sealing, no runtime handoff execution, no capability enforcement, no runtime authority, no host behavior, no network behavior, and no production cryptography claim.

Latticra Seal public-key parsing predecessor status alignment ties the existing metadata-only public-key parsing status to the guarded key-material status predecessor while preserving no public-key parsing, no key material loading, no private-key handling, no key generation, no hardware-key use, no trust-store behavior, no revocation lookup, no signing, no signature verification, no signer invocation behavior, no signer process execution, no object sealing, no runtime handoff execution, no capability enforcement, no runtime authority, no host behavior, no network behavior, and no production cryptography claim.

Latticra Seal key parsing predecessor status alignment ties the existing bounded key parsing status to the guarded public-key parsing status predecessor while preserving the existing caller-provided public-key byte metadata behavior, no key material loading, no private-key handling, no key generation, no hardware-key use, no trust-store behavior, no revocation lookup, no signing, no signature verification, no signer invocation behavior, no signer process execution, no object sealing, no runtime handoff execution, no capability enforcement, no runtime authority, no host behavior, no network behavior, and no production cryptography claim.

Latticra Seal verification policy predecessor status alignment ties the existing metadata-only verification policy status to the guarded key parsing status predecessor while preserving no cryptographic verification, no public-key byte verification, no key material loading, no private-key handling, no key generation, no hardware-key use, no trust-store behavior, no revocation lookup, no signing, no signature verification, no signer invocation behavior, no signer process execution, no object sealing, no runtime handoff execution, no capability enforcement, no runtime authority, no host behavior, no network behavior, and no production cryptography claim.

Latticra Seal verification receipt predecessor status alignment ties the existing metadata-only verification receipt status to the guarded verification policy status predecessor while preserving no cryptographic verification, no verified receipt authority, no public-key byte verification, no key material loading, no private-key handling, no key generation, no hardware-key use, no trust-store behavior, no revocation lookup, no signing, no signature verification, no signer invocation behavior, no signer process execution, no object sealing, no runtime handoff execution, no capability enforcement, no runtime authority, no host behavior, no network behavior, and no production cryptography claim.

Latticra Seal capability gate predecessor status alignment ties the existing metadata-only denied capability gate status to the guarded verification receipt status predecessor while preserving no capability enforcement, no effect execution, no runtime handoff execution, no cryptographic verification, no verified receipt authority, no public-key byte verification, no key material loading, no private-key handling, no key generation, no hardware-key use, no trust-store behavior, no revocation lookup, no signing, no signature verification, no signer invocation behavior, no signer process execution, no object sealing, no runtime authority, no host behavior, no network behavior, and no production enforcement claim.

Latticra Seal parameter schema predecessor status alignment ties the existing report-only parameter schema status to the guarded agentic automation security status predecessor while preserving no schema parsing, no schema validation, no policy evaluation, no policy enforcement, no MCP behavior, no AI-agent execution, no model execution, no tool execution, no shell execution, no runtime execution, no runtime authority, no effect execution, no capability enforcement, no host behavior, no network behavior, and no production enforcement claim.

Latticra Seal request freshness predecessor status alignment ties the existing report-only request freshness status to the guarded parameter schema status predecessor while preserving no timestamp parsing, no trusted clock behavior, no nonce storage, no replay-cache storage, no context hashing, no parameter hashing, no freshness validation, no replay detection, no signature verification, no signed request enforcement, no policy evaluation, no policy enforcement, no runtime execution, no runtime authority, no effect execution, no capability enforcement, no host behavior, no network behavior, and no production enforcement claim.

Latticra Seal signed request predecessor status alignment ties the existing report-only signed request status to the guarded request freshness status predecessor while preserving no signature generation, no signature verification, no public-key parsing, no trust-store loading, no private-key handling, no key generation, no hardware-key use, no revocation lookup, no network trust lookup, no signed request enforcement, no policy evaluation, no policy enforcement, no freshness validation, no replay detection, no runtime execution, no runtime authority, no effect execution, no capability enforcement, no host behavior, no network behavior, and no production enforcement claim.

Latticra Seal policy decision predecessor status alignment ties the existing report-only policy decision status to the guarded signed request status predecessor while preserving no policy evaluation, no policy enforcement, no signature verification, no freshness validation, no replay detection, no signed request enforcement, no runtime execution, no runtime authority, no effect execution, no capability enforcement, no host behavior, no network behavior, and no production enforcement claim.

Latticra Seal operator receipt report predecessor status alignment ties the existing denied report-only operator receipt status to the guarded policy decision status predecessor while preserving no receipt file writes, no tool execution, no policy enforcement, no capability enforcement, no cryptographic verification, no signature verification, no freshness validation, no replay detection, no runtime execution, no runtime authority, no effect execution, no host behavior, no network behavior, and no production enforcement claim.

The current recommended review lane is:

```
Latticra Seal local capability registry schema report surface or Panel-visible Seal dashboard
planning checkpoint
```

Completion estimate review only if capability posture changes remains the estimate rule after this non-change review.

If capability posture does not change, the project should follow this rule: Continue small guarded report/status alignment only when drift appears.

Current non-claim

Latticra does not currently prevent malware or ransomware, provide a hardened sandbox, replace an operating system, provide unrestricted C++ authority, provide an effect-performing C++ authority layer, provide effect-performing Nucleus task execution, provide effect-performing runtime behavior, provide command execution, provide interactive L-UI rendering, provide terminal-control L-UI rendering, provide a Lat runtime, provide Lat execution, provide LIR execution, or provide a production security boundary.

Those are long-term goals and design targets, not current claims.

Latticra Project Notes

Status: active project notes index Last updated: 2026-05-26 CDT

Purpose

This folder collects short public notes about current Latticra direction, status, and upcoming work.

The project notes are intentionally lighter than the foundation documents. They summarize the active direction and queue without replacing the guarded contracts, implementation records, status records, or announcement log.

Reader route

Use ../README.md as the documentation hub, ../FOUNDATION_INDEX.md as the exhaustive evidence index, and these project notes as short narrative orientation. The long slice names below are preserved because guard scripts assert public-entry alignment across recent milestones.

Files

- CURRENT_DIRECTION.md — current technical lane, boundaries, non-claims, and project direction after the recent Latticra Seal operator receipt report predecessor status alignment, Latticra Seal policy decision predecessor status alignment, Latticra Seal signed request predecessor status alignment, Latticra Seal request freshness predecessor status alignment, Latticra Seal parameter schema predecessor status alignment, Latticra Seal agentic automation security predecessor status alignment, Latticra Seal status rollup predecessor status alignment, Latticra Seal runtime handoff predecessor status alignment, Latticra Seal capability gate predecessor status alignment, Latticra Seal verification receipt predecessor status alignment, Latticra Seal verification policy predecessor status alignment, Latticra Seal key parsing predecessor status alignment, Latticra Seal public-key parsing predecessor status alignment, Seal key-material predecessor status alignment, Seal key-handling predecessor status alignment, Seal signing operation predecessor status alignment, Seal signer invocation predecessor status alignment, Seal signer handoff predecessor status alignment, Seal signing authorization predecessor status alignment, Seal signature request predecessor status alignment, Seal report envelope status/public-entry alignment, Seal runtime handoff report status/public-entry alignment, Seal runtime handoff evaluation status/public-entry alignment, Seal verified effect decision status/public-entry alignment, Seal verified capability gate status/public-entry alignment, Seal verified receipt promotion status/public-entry alignment, Seal Ed25519 verify-only status/public-entry alignment, Seal crypto verify backend status/public-entry alignment, Seal README status row alignment, completion estimate review README/status alignment, completion estimate review after runtime-boundary abuse-case fixtures, runtime boundary abuse-case fixture expansion, runtime boundary policy expansion after threat-model validation, defensive threat model validation refinement, Seal policy decision status/public-entry alignment, Seal signed request status/public-entry alignment, Seal request freshness status/public-entry alignment, Seal parameter schema status/public-entry alignment, Seal agentic automation security public-entrypoint alignment, Seal status rollup status alignment, Seal runtime handoff status alignment, Latticra Seal effect decision predecessor status alignment, Seal effect decision status alignment, Seal capability gate status alignment, Seal verification receipt status alignment, Seal verification policy status alignment, Seal key parsing status alignment, Seal key parsing implementation, Seal planning, Lat pipeline diagnostic, RBDM report, authority review, L-UI report, Nucleus task, runtime-boundary, README/status alignment, and no-new-announcement review slices. See docs/status/SEAL_OPERATOR_RECEIPT_REPORT_STATUS.md; predecessor docs/status/SEAL_POLICY_DECISION_STATUS.md.
- UPCOMING_WORK.md — current near-term queue after the recent Latticra Seal operator receipt report predecessor status alignment, Latticra Seal policy decision predecessor status alignment, Latticra Seal signed request predecessor status alignment, Latticra Seal request freshness predecessor status alignment, Latticra Seal parameter schema predecessor status alignment, Latticra Seal agentic automation security predecessor status alignment, Latticra Seal status rollup predecessor status alignment, Latticra Seal runtime handoff predecessor status alignment, Latticra Seal capability gate predecessor status alignment, Latticra Seal verification receipt predecessor status alignment, Latticra Seal verification policy predecessor status alignment, Latticra Seal key parsing predecessor status alignment, Latticra Seal public-key parsing predecessor status alignment, Seal key-material predecessor status alignment, Seal key-handling predecessor status alignment, Seal signing operation predecessor status alignment, Seal signer invocation predecessor status alignment, Seal signer handoff predecessor status alignment, Seal signing authorization predecessor status alignment, Seal signature request predecessor status alignment, Seal report envelope status/public-entry alignment, Seal runtime handoff report status/public-entry

alignment, Seal runtime handoff evaluation status/public-entry alignment, Seal verified effect decision status/public-entry alignment, Seal verified capability gate status/public-entry alignment, Seal verified receipt promotion status/public-entry alignment, Seal Ed25519 verify-only status/public-entry alignment, Seal crypto verify backend status/public-entry alignment, Seal README status row alignment, completion estimate review README/status alignment, completion estimate review after runtime-boundary abuse-case fixtures, runtime boundary abuse-case fixture expansion, runtime boundary policy expansion after threat-model validation, defensive threat model validation refinement, Seal policy decision status/public-entry alignment, Seal signed request status/public-entry alignment, Seal request freshness status/public-entry alignment, Seal parameter schema status/public-entry alignment, Seal agentic automation security public-entrypoint alignment, Seal status rollup status alignment, Seal runtime handoff status alignment, Latticra Seal effect decision predecessor status alignment, Seal effect decision status alignment, Seal capability gate status alignment, Seal verification receipt status alignment, Seal verification policy status alignment, Seal key parsing status alignment, Seal key parsing implementation, Seal implementation plan, Seal contract, no-effect report, diagnostic, audit, README, foundation-index, announcement-review, public-entry, project-notes, and Nucleus report-only execution alignment slices. See docs/status/SEAL_OPERATOR_RECEIPT_REPORT_STATUS.md; predecessor docs/status/SEAL_POLICY_DECISION_STATUS.md.

Current note posture

```
CURRENT_DIRECTION.md is the narrative direction note.
UPCOMING_WORK.md is the queue and priority note.
```

The project-level handbook in docs/latticra-system-substrate/ should be kept current as these notes evolve. When a slice changes the durable project story, architecture, evidence posture, public wording, or non-claim boundary, reflect that change in the handbook path as part of the same working rhythm.

Both notes should remain:

```
small
public
evidence-bound
clear about non-claims
consistent with the C/C++ foundation direction
consistent with the no-effect runtime boundary
consistent with the Nucleus report-only execution boundary
consistent with no-new-announcement decisions unless capability posture changes
```

Purpose

This note tracks the near-term work queue after the recent no-effect Lat, LIR, Nucleus, runtime-boundary, authority review, status, announcement-review, foundation-index, public-entry, project-notes, and Nucleus report-only announcement README alignment slices.

The project remains evidence-bound and report/classification oriented. The queue should continue to prefer small, reviewable, guarded slices over broad runtime behavior.

The security-guidance refresh slices are aligned across the baseline, roadmap, supply-chain, zero-trust, and runtime-boundary policy docs. Near-term follow-up should stay narrow: summary/status consistency only when wording drifts, and capability-bearing work only under separate guarded contracts.

Latticra Seal README status row alignment remains complete for the compact README Seal row and current-posture summary.

Latticra Seal crypto verify backend status/public-entry alignment is complete for the current metadata-only unsupported backend surface. It does not add real cryptographic verification, signing, key handling, host behavior, network behavior, capability enforcement, effect execution, or runtime authority.

Latticra Seal Ed25519 verify-only status/public-entry alignment is complete for the existing local provider-backed verification result surface. It does not add new implementation behavior, signing, key generation, private-key handling, trust-store behavior, revocation lookup, host behavior, network behavior, capability enforcement, effect execution, runtime authority, or production cryptography claims.

Latticra Seal verified receipt promotion status/public-entry alignment is complete for the existing evidence-promotion metadata surface. It does not add new implementation behavior, capability authorization, effect execution, runtime authority, signing, key generation, private-key handling, trust-store behavior, revocation lookup, host behavior, network behavior, or production cryptography claims.

Latticra Seal verified capability gate status/public-entry alignment is complete for the existing metadata-only gate evaluation surface. It does not add new implementation behavior, capability enforcement, effect execution, runtime authority, signing, key generation, private-key handling, trust-store behavior, revocation lookup, host behavior, network behavior, or production cryptography claims.

Latticra Seal verified effect decision status/public-entry alignment is complete for the existing metadata-only effect classification surface. It does not add new implementation behavior, effect execution, capability enforcement, runtime authority, signing, key generation, private-key handling, trust-store behavior, revocation lookup, host behavior, network behavior, or production cryptography claims.

Latticra Seal runtime handoff evaluation status/public-entry alignment is complete for the existing metadata-only handoff eligibility classification surface. It does not add runtime handoff execution, effect execution, capability enforcement, runtime authority, signing, key generation, private-key handling, trust-store behavior, revocation lookup, host behavior, network behavior, or production cryptography claims.

Latticra Seal runtime handoff report status/public-entry alignment is complete for the existing metadata-only report readiness classification surface. It does not add runtime handoff execution, effect execution, capability enforcement, runtime authority, signing, key generation, private-key handling, trust-store behavior, revocation lookup, host behavior, network behavior, or production cryptography claims.

Latticra Seal report envelope status/public-entry alignment is complete for the existing metadata-only sealed report envelope surface. It does not add signing, signature verification, object sealing, runtime handoff execution, effect execution, capability enforcement, runtime authority, key generation, private-key handling, trust-store behavior, revocation lookup, host behavior, network behavior, or production cryptography claims.

Latticra Seal signature request predecessor status alignment is complete for the existing metadata-only signature request status surface. It does not add signing, signature verification, object sealing, runtime handoff execution, capability enforcement, runtime authority, key generation, private-key handling, trust-store behavior, revocation lookup, host behavior, network behavior, or production cryptography claims.

Latticra Seal signing authorization predecessor status alignment is complete for the existing metadata-only signing authorization status surface. It does not add signing, signature verification, object sealing, runtime handoff execution, capability enforcement, runtime authority, key generation, private-key handling, trust-store behavior, revocation lookup, host behavior, network behavior, or production cryptography claims.

Latticra Seal signer handoff predecessor status alignment is complete for the existing metadata-only signer handoff status surface. It does not add signing, signature verification, signer invocation behavior, object sealing, runtime handoff execution, capability enforcement, runtime authority, key generation, private-key handling, trust-store behavior, revocation lookup, host behavior, network behavior, or production cryptography claims.

Latticra Seal signer invocation predecessor status alignment is complete for the existing metadata-only signer invocation status surface. It does not add signing, signature verification, signer invocation behavior, signer process execution, object sealing, runtime handoff execution, capability enforcement, runtime authority, key generation, private-key handling, trust-store behavior, revocation lookup, host behavior, network behavior, or production cryptography claims.

Latticra Seal signing operation predecessor status alignment is complete for the existing metadata-only signing operation status surface. It does not add signing, signature verification, signer invocation behavior, signer process execution, object sealing, runtime handoff execution, capability enforcement, runtime authority, key generation, private-key handling, trust-store behavior, revocation lookup, host behavior, network behavior, or production cryptography claims.

Latticra Seal key-handling predecessor status alignment is complete for the existing metadata-only key-handling status surface. It does not add public-key parsing, key material loading, private-key handling, key generation, hardware-key use, trust-store behavior, revocation lookup, signing, signature verification, signer invocation behavior, signer process execution, object sealing, runtime handoff execution, capability enforcement, runtime authority, host behavior, network behavior, or production cryptography claims.

Latticra Seal key-material predecessor status alignment is complete for the existing metadata-only key-material status surface. It does not add public-key parsing, key material loading, private-key handling, key generation, hardware-key use, trust-store behavior, revocation lookup, signing, signature verification, signer invocation behavior, signer process execution, object sealing, runtime handoff execution, capability enforcement, runtime authority, host behavior, network behavior, or production cryptography claims.

Latticra Seal public-key parsing predecessor status alignment is complete for the existing metadata-only public-key parsing status surface. It does not add public-key parsing, key material loading, private-key handling, key generation, hardware-key use, trust-store behavior, revocation lookup, signing, signature verification, signer invocation behavior, signer process execution, object sealing, runtime handoff execution, capability enforcement, runtime authority, host behavior, network behavior, or production cryptography claims.

Latticra Seal key parsing predecessor status alignment is complete for the existing bounded key parsing status surface. It does not change the caller-provided public-key byte metadata behavior, add key material loading, private-key handling, key generation, hardware-key use, trust-store behavior, revocation lookup, signing, signature verification, signer invocation behavior, signer process execution, object sealing, runtime handoff execution, capability enforcement, runtime authority, host behavior, network behavior, or production cryptography claims.

Latticra Seal verification policy predecessor status alignment is complete for the existing metadata-only verification policy status surface. It does not add cryptographic verification, public-key byte verification, key material loading, private-key handling, key generation, hardware-key use, trust-store behavior, revocation lookup, signing, signature verification, signer invocation behavior, signer process execution, object sealing, runtime handoff execution, capability enforcement, runtime authority, host behavior, network behavior, or production cryptography claims.

Latticra Seal verification receipt predecessor status alignment is complete for the existing metadata-only verification receipt status surface. It does not add cryptographic verification, verified receipt authority, public-key byte verification, key material loading, private-key handling, key generation, hardware-key use, trust-store behavior, revocation lookup, signing, signature verification, signer invocation behavior, signer process execution, object sealing, runtime handoff execution, capability enforcement, runtime authority, host behavior, network behavior, or production cryptography claims.

Latticra Seal capability gate predecessor status alignment is complete for the existing metadata-only denied capability gate status surface. It does not add capability enforcement, effect execution, runtime handoff execution, cryptographic verification, verified receipt authority, public-key byte verification, key material loading, private-key handling, key generation, hardware-key use, trust-store behavior, revocation lookup, signing, signature verification, signer invocation behavior, signer process execution, object sealing, runtime authority, host behavior, network behavior, or production enforcement claims.

Latticra Seal runtime handoff predecessor status alignment is complete for the existing inactive metadata-only runtime handoff status surface. It does not add runtime handoff execution, effect execution, capability enforcement, runtime authority, cryptographic verification, verified receipt authority, public-key byte verification, key material loading, private-key handling, key generation, hardware-key use, trust-store behavior, revocation lookup, signing, signer invocation behavior, signer process execution, object sealing, host behavior, network behavior, or production cryptography claims.

Latticra Seal status rollup predecessor status alignment is complete for the existing metadata-only status rollup status surface. It does not add runtime execution, runtime handoff execution, effect execution, capability enforcement, runtime authority, cryptographic verification, verified receipt authority, public-key byte verification, key material loading, private-key handling, key generation, hardware-key use, trust-store behavior, revocation lookup, signing, signer invocation behavior, signer process execution, object sealing, host behavior, network behavior, or production enforcement claims.

Latticra Seal agentic automation security predecessor status alignment is complete for the existing report-only automation security status surface. It does not add MCP behavior, AI-agent execution, model execution, tool execution, shell execution, runtime execution, runtime authority, effect execution, capability enforcement, cryptographic verification, verified receipt authority, public-key byte verification, key material loading, private-key handling, object sealing, host behavior, network behavior, or production enforcement claims.

Latticra Seal parameter schema predecessor status alignment is complete for the existing report-only parameter schema status surface. It does not add schema parsing, schema validation, policy evaluation, policy enforcement, MCP behavior, AI-agent execution, model execution, tool execution, shell execution, runtime execution, runtime authority, effect execution, capability enforcement, cryptographic verification, verified receipt authority, key material loading, private-key handling, object sealing, host behavior, network behavior, or production enforcement claims.

Latticra Seal request freshness predecessor status alignment is complete for the existing report-only request freshness status surface. It does not add timestamp parsing, trusted clock behavior, nonce storage, replay-cache storage, context hashing, parameter hashing, freshness validation, replay detection, signature verification, signed request enforcement, policy evaluation, policy enforcement, runtime execution, runtime authority, effect execution, capability enforcement, cryptographic verification, verified receipt authority, key material loading, private-key handling, object sealing, host behavior, network behavior, or production enforcement claims.

Latticra Seal signed request predecessor status alignment is complete for the existing report-only signed request status surface. It does not add signature generation, signature verification, public-key parsing, trust-store loading, private-key handling, key generation, hardware-key use, revocation lookup, network trust lookup, signed request enforcement, policy evaluation, policy enforcement, freshness validation, replay detection, runtime execution, runtime authority, effect execution, capability enforcement, cryptographic verification, verified receipt authority, key material loading, private-key handling, object sealing, host behavior, network behavior, or production enforcement claims.

Latticra Seal policy decision predecessor status alignment is complete for the existing report-only policy decision status surface. It does not add policy evaluation, policy enforcement, signature verification, freshness validation, replay detection, signed request enforcement, runtime execution, runtime authority, effect execution, capability enforcement, cryptographic verification, verified receipt authority, key material loading, private-key handling, object sealing, host behavior, network behavior, or production enforcement claims.

Latticra Seal operator receipt report predecessor status alignment is complete for the existing denied report-only operator receipt status surface. It does not add receipt file writes, tool execution, policy enforcement, capability enforcement, cryptographic verification, signature verification, freshness validation, replay detection, runtime execution, runtime authority, effect execution, verified receipt authority, key material loading, private-key handling, object sealing, host behavior, network behavior, or production enforcement claims.

Latest completed planning slice

```
Latticra Seal local capability registry schema implementation plan
```

Purpose completed:

```
define exact future local capability registry schema header, source, tests, report shape, enum
labels, capacity, fixture, and negative-case behavior while preserving no registry loader, no
file reads, no tool execution, no host mutation, no network behavior, no capability enforcement,
 no effects, and no runtime authority
```

Latest completed implementation slice

```
Latticra Seal local capability registry schema implementation
```

Purpose completed:

```
add bounded local schema records, deterministic validation, a default descriptive fixture entry,
 and negative-case invariants while preserving no registry loader, no registry file access, no
tool execution, no host mutation, no network behavior, no capability enforcement, no effects,
and no runtime authority
```

Previous implementation slice

```
Latticra Seal operator receipt report surface/status
```

Purpose completed:

```
render the no-effect operator receipt report through a deterministic local report runner and
status checkpoint while preserving no receipt file writes, no tool execution, no host mutation,
no network behavior, no capability enforcement, no effects, and no runtime authority
```

Earlier implementation slice

```
Lat LIR first transition-node span evidence propagation
```

Purpose completed:

```
copy the first Lat-specific LIR transition node source-span offsets/lines/columns into
runtime-boundary records/reports so boundary evidence keeps the first Lat-derived transition
node location visible while preserving no Lat execution, no LIR execution, no operator
evaluation, no runtime execution, no state mutation, no file I/O, no network I/O, and no runtime
 authority
```

Earlier implementation slice

```
Lat LIR first transition-node evidence propagation
```

Purpose completed:

copy the first Lat-specific LIR transition node presence flag, index, kind, name, value, operator, and binding into runtime-boundary records/reports so boundary evidence keeps the first Lat-derived transition node identity visible while preserving no Lat execution, no LIR execution, no operator evaluation, no runtime execution, no state mutation, no file I/O, no network I/O, and no runtime authority

Earlier implementation slice

Lat LIR first transition-source edge span evidence propagation

Purpose completed:

copy the first Lat-specific LIR transition-source edge source-span offsets/lines/columns into runtime-boundary records/reports so boundary evidence keeps the first Lat-derived transition-source relationship location visible while preserving no Lat execution, no LIR execution, no operator evaluation, no runtime execution, no state mutation, no file I/O, no network I/O, and no runtime authority

Earlier implementation slice

Lat LIR first transition-source edge evidence propagation

Purpose completed:

copy the first Lat-specific LIR transition-source edge presence flag, index, from/to indices, and kind into runtime-boundary records/reports so boundary evidence keeps the first Lat-derived transition-source relationship visible while preserving no Lat execution, no LIR execution, no operator evaluation, no runtime execution, no state mutation, no file I/O, no network I/O, and no runtime authority

Earlier implementation slice

Lat LIR first-edge span evidence propagation

Purpose completed:

copy the first Lat-specific LIR edge source-span offsets/lines/columns into runtime-boundary records/reports so boundary evidence keeps the first Lat-derived LIR edge location visible while preserving no Lat execution, no LIR execution, no operator evaluation, no runtime execution, no state mutation, no file I/O, no network I/O, and no runtime authority

Earlier implementation slice

Lat LIR first-edge evidence propagation

Purpose completed:

copy the first Lat-specific LIR edge presence flag, index, from/to indices, and kind into runtime-boundary records/reports so boundary evidence keeps the first Lat-derived LIR edge identity visible while preserving no Lat execution, no LIR execution, no operator evaluation, no runtime execution, no state mutation, no file I/O, no network I/O, and no runtime authority

Earlier implementation slice

Lat LIR first-node span evidence propagation

Purpose completed:

copy the first Lat-specific LIR node source-span offsets/lines/columns into runtime-boundary records/reports so boundary evidence keeps the first Lat-derived LIR node location visible while preserving no Lat execution, no LIR execution, no operator evaluation, no runtime execution, no state mutation, no file I/O, no network I/O, and no runtime authority

Earlier implementation slice

Lat LIR first-node evidence propagation

Purpose completed:

copy the first Lat-specific LIR node presence flag, index, kind, name, value, operator, and binding into runtime-boundary records/reports so boundary evidence keeps the first Lat-derived LIR node identity visible while preserving no Lat execution, no LIR execution, no operator evaluation, no runtime execution, no state mutation, no file I/O, no network I/O, and no runtime authority

Earlier implementation slice

Lat LIR node-kind evidence propagation

Purpose completed:

copy Lat-specific LIR state, policy, transition, assertion, requirement, and effect-declaration node-kind counts into runtime-boundary records/reports so boundary evidence keeps Lat-derived LIR node shape visible while preserving no Lat execution, no LIR execution, no operator evaluation, no runtime execution, no state mutation, no file I/O, no network I/O, and no runtime authority

Earlier implementation slice

Lat LIR source-span evidence propagation

Purpose completed:

copy Lat-specific LIR source-span offsets/lines/columns into runtime-boundary records/reports so boundary evidence keeps LIR source location visible while preserving no Lat execution, no LIR execution, no operator evaluation, no runtime execution, no state mutation, no file I/O, no network I/O, and no runtime authority

Earlier implementation slice

Lat LIR module-summary evidence propagation

Purpose completed:

copy Lat-specific LIR module name, report classification, shape kind, node count, edge count, binding count, and text count into runtime-boundary records/reports so boundary evidence keeps LIR graph identity visible while preserving no Lat execution, no LIR execution, no operator evaluation, no runtime execution, no state mutation, no file I/O, no network I/O, and no runtime authority

Earlier implementation slice

Lat LIR no-effect evidence propagation

Purpose completed:

copy Lat-specific LIR no-effect-chain status, evidence level, no-effect flag, and execution/mutation/server/recovery/hardware allowance flags into runtime-boundary records/reports so boundary evidence keeps LIR authority posture visible while preserving no Lat execution, no LIR execution, no operator evaluation, no runtime execution, no state mutation, no file I/O, no network I/O, and no runtime authority

Earlier implementation slice

Lat LIR edge-kind evidence propagation

Purpose completed:

copy Lat-specific LIR contains, binds, annotates, orders-before, and transition edge-kind counts into runtime-boundary records/reports so boundary evidence keeps LIR graph shape visible while preserving no Lat execution, no LIR execution, no operator evaluation, no runtime execution, no state mutation, no file I/O, no network I/O, and no runtime authority

Earlier implementation slice

Lat pipeline first-clause evidence propagation

Purpose completed:

copy Lat pipeline first lowered clause node, role, effect, name, operator, and value into runtime-boundary Lat pipeline records/reports so boundary evidence keeps clause identity visible while preserving no Lat execution, no LIR execution, no operator evaluation, no runtime execution, no state mutation, no file I/O, no network I/O, and no runtime authority

Earlier implementation slice

Lat pipeline first-declaration evidence propagation

Purpose completed:

copy Lat pipeline first lowered declaration node, kind, name, source, parse index, clause span/count, source index, and first transition source index into runtime-boundary Lat pipeline records/reports so boundary evidence keeps declaration identity visible while preserving no Lat execution, no LIR execution, no operator evaluation, no runtime execution, no state mutation, no file I/O, no network I/O, and no runtime authority

Earlier implementation slice

Lat pipeline module/count evidence propagation

Purpose completed:

copy Lat pipeline module name, parser declaration/clause counts, and model declaration/clause counts into runtime-boundary Lat pipeline records/reports so boundary evidence keeps source and model shape counts visible while preserving no Lat execution, no LIR execution, no operator evaluation, no runtime execution, no state mutation, no file I/O, no network I/O, and no runtime authority

Earlier implementation slice

Lat pipeline stage-summary evidence propagation

Purpose completed:

copy Lat pipeline last-completed stage, failed stage, per-stage OK flags, no-effect-chain status, and evidence level into runtime-boundary Lat pipeline records/reports so boundary evidence keeps the pipeline stage summary visible while preserving no Lat execution, no LIR execution, no operator evaluation, no runtime execution, no state mutation, no file I/O, no network I/O, and no runtime authority

Earlier implementation slice

Lat pipeline downstream stage-error evidence propagation

Purpose completed:

copy Lat pipeline model, lowering, and LIR error labels into runtime-boundary Lat pipeline records/reports so downstream-stage failure reasons remain visible while preserving no Lat execution, no LIR execution, no operator evaluation, no runtime execution, no state mutation, no file I/O, no network I/O, and no runtime authority

Earlier implementation slice

Lat pipeline semantic-error evidence propagation

Purpose completed:

copy Lat pipeline semantic error labels into runtime-boundary Lat pipeline records/reports so semantic-failure reasons remain visible while preserving no Lat execution, no LIR execution, no operator evaluation, no runtime execution, no state mutation, no file I/O, no network I/O, and no runtime authority

Earlier implementation slice

Lat pipeline parse-error evidence propagation

Purpose completed:

copy parser error labels from Lat pipeline summaries into Lat pipeline diagnostic reports and runtime-boundary Lat pipeline records/reports so parse-failure reasons remain visible while preserving no Lat execution, no LIR execution, no operator evaluation, no runtime execution, no state mutation, no file I/O, no network I/O, and no runtime authority

Earlier implementation slice

Lat pipeline failure span evidence propagation

Purpose completed:

copy parser diagnostic/module spans into Lat pipeline summaries, Lat pipeline diagnostic reports, and runtime-boundary Lat pipeline records/reports so parse-failure locations remain visible while preserving no Lat execution, no LIR execution, no operator evaluation, no runtime execution, no state mutation, no file I/O, no network I/O, and no runtime authority

Earlier implementation slice

Lat parse-failure comment evidence propagation

Purpose completed:

verify that line-comment count and first-comment span metadata remain visible through Lat pipeline reports, Lat pipeline diagnostics, and denied runtime-boundary records when parsing fails on an unsupported block-comment opener while preserving no Lat execution, no LIR execution, no operator evaluation, no runtime execution, no state mutation, no file I/O, no network I/O, and no runtime authority

Earlier implementation slice

Runtime boundary Lat pipeline comment evidence integration

Purpose completed:

copy Lat pipeline line-comment count and first-comment span metadata into deterministic runtime-boundary records and reports while preserving no Lat execution, no LIR execution, no operator evaluation, no runtime execution, no state mutation, no file I/O, no network I/O, and no runtime authority

Earlier implementation slice

Lat pipeline diagnostic comment metadata integration

Purpose completed:

copy parser line-comment count and first-comment span metadata into deterministic Lat pipeline diagnostic reports while preserving no Lat execution, no LIR execution, no operator evaluation, no state mutation, no file I/O, no network I/O, and no runtime authority

Earlier implementation slice

Lat pipeline comment metadata integration

Purpose completed:

copy parser line-comment count and first-comment span metadata into deterministic Lat pipeline reports while preserving no Lat execution, no LIR execution, no operator evaluation, no state mutation, no file I/O, no network I/O, and no runtime authority

Earlier implementation slice

Lat grammar unsupported block-comment rejection refinement

Purpose completed:

reject Lat block-comment openers outside strings and line comments with a deterministic unsupported_block_comment parse error while preserving no Lat execution, no operator evaluation, no state mutation, no file I/O, no network I/O, no runtime authority, and normal string handling for block-comment marker text

Earlier implementation slice

Lat grammar line-comment metadata refinement

Purpose completed:

record deterministic Lat line-comment count and first-comment span metadata in parse results and grammar reports while preserving no Lat execution, no operator evaluation, no state mutation, no file I/O, no network I/O, no runtime authority, and no effect authority from comments

Earlier implementation slice

Lat pipeline report declaration metadata integration

Purpose completed:

copy first lowered declaration node index, kind, name, source name, parse index, first-clause index, clause count, and source declaration index from Lat-to-LIR lowering results into deterministic Lat pipeline reports while preserving no Lat execution, no LIR execution, no operator evaluation, no state mutation, no file I/O, no network I/O, and no runtime authority

Earlier implementation slice

Lat pipeline diagnostic declaration metadata integration

Purpose completed:

copy first lowered declaration node index, kind, name, source name, parse index, first-clause index, clause count, and source declaration index from Lat-to-LIR diagnostics into deterministic Lat pipeline diagnostic reports while preserving no Lat execution, no LIR execution, no operator evaluation, no state mutation, no file I/O, no network I/O, and no runtime authority

Earlier implementation slice

Lat-to-LIR diagnostic declaration metadata integration

Purpose completed:

copy first lowered declaration node index, kind, name, source name, parse index, first-clause index, clause count, and source declaration index from Lat-to-LIR lowering results into deterministic Lat-to-LIR diagnostic reports while preserving no Lat execution, no LIR execution, no operator evaluation, no state mutation, no file I/O, no network I/O, and no runtime authority

Earlier implementation slice

Lat-to-LIR declaration metadata refinement

Purpose completed:

copy first lowered declaration node index, kind, name, source name, parse index, first-clause index, clause count, and source declaration index from normalized Lat model metadata into deterministic Lat-to-LIR lowering reports while preserving no Lat execution, no LIR execution, no operator evaluation, no state mutation, no file I/O, no network I/O, and no runtime authority

Earlier implementation slice

Lat model report declaration metadata integration

Purpose completed:

copy first normalized declaration index, kind, name, source name, parse index, first-clause index, clause count, and source declaration index from the normalized Lat model table into deterministic Lat model normalization reports while preserving no Lat execution, no LIR execution, no operator evaluation, no state mutation, no file I/O, no network I/O, and no runtime authority

Earlier implementation slice

Lat grammar report metadata integration

Purpose completed:

copy first parsed declaration and first parsed clause metadata from successful Lat AST parses into deterministic Lat grammar reports while preserving no Lat execution, no LIR execution, no operator evaluation, no state mutation, no file I/O, no network I/O, and no runtime authority

Earlier implementation slice

Lat model report clause metadata integration

Purpose completed:

copy first normalized clause index, role, effect, name, operator, and value from the normalized Lat model table into deterministic Lat model normalization reports while preserving no Lat execution, no LIR execution, no operator evaluation, no state mutation, no file I/O, no network I/O, and no runtime authority

Earlier implementation slice

Lat pipeline report clause metadata integration

Purpose completed:

copy first lowered clause node index, role, effect, name, operator, and value from Lat-to-LIR lowering results into deterministic Lat pipeline reports while preserving no Lat execution, no LIR execution, no operator evaluation, no state mutation, no file I/O, no network I/O, and no runtime authority

Earlier implementation slice

Lat pipeline diagnostic clause metadata integration

Purpose completed:

copy first lowered clause node index, role, effect, name, operator, and value from Lat-to-LIR diagnostics into deterministic Lat pipeline diagnostic reports while preserving no Lat execution, no LIR execution, no operator evaluation, no state mutation, no file I/O, no network I/O, and no runtime authority

Earlier implementation slice

Lat-to-LIR diagnostic clause metadata integration

Purpose completed:

copy first lowered clause node index, role, effect, name, operator, and value from Lat-to-LIR lowering results into deterministic Lat-to-LIR diagnostic reports while preserving no Lat execution, no LIR execution, no operator evaluation, no state mutation, no file I/O, no network I/O, and no runtime authority

Earlier implementation slice

Lat-to-LIR clause metadata refinement

Purpose completed:

preserve Lat clause operators in LIR node metadata, expose first lowered clause role, effect, name, operator, value, and node index in deterministic Lat-to-LIR reports, add focused and aggregate guards, and preserve no Lat execution, no LIR execution, no operator evaluation, no state mutation, no file I/O, no network I/O, and no runtime authority

Earlier implementation slice

Lat pipeline lowering diagnostic integration

Purpose completed:

extend the Lat pipeline diagnostic evaluator with optional Lat-to-LIR lowering diagnostics, copy lowering class, lowering error, model error, LIR error, model counts, transition source metadata, and failure flags into deterministic pipeline diagnostic reports, keep the older evaluator compatible, and preserve no Lat execution, no LIR execution, no state mutation, no file I/O, no network I/O, and no runtime authority

Older implementation slice

Lat-to-LIR diagnostic refinement

Purpose completed:

add deterministic Lat-to-LIR diagnostic classification and reports for valid, parse, semantic, model, effect-check, capacity, LIR, and internal lowering outcomes while copying model/lowering/LIR errors, model counts, transition source metadata, no-effect flags, and evidence level, and preserving no Lat execution, no LIR execution, no state mutation, no file I/O, no network I/O, and no runtime authority

Older implementation slice

Lat-to-LIR model lowering integration

Purpose completed:

make Lat-to-LIR lowering consume the normalized Lat model directly, keep the parser-plus-semantic lowering entry point as a compatibility wrapper, expose model error/count/source-index metadata in lowering reports, route the Lat pipeline through model-driven lowering, and preserve no Lat execution, no LIR execution, no state mutation, no file I/O, no network I/O, and no runtime authority

Older implementation slice

Lat pipeline model normalization integration

Purpose completed:

integrate bounded no-effect Lat model normalization into the Lat pipeline, keep the original pipeline entry point compatible, add a model-aware entry point for callers that need normalized model metadata, expand pipeline reports with model error/count/source-index fields, and preserve no Lat execution, no LIR execution, no state mutation, no file I/O, no network I/O, and no runtime authority

Older Lat implementation slice

Lat model normalization implementation

Purpose completed:

implement bounded no-effect Lat model normalization after semantic validation, with typed declaration and clause index tables, transition source-state metadata, deterministic reports, source-span preservation, no source-byte reading, no Lat execution, no LIR execution, no state mutation, no file I/O, no network I/O, and no runtime authority

Earlier Lat implementation slice

Latticra Seal bounded no-effect key parsing implementation

Purpose completed:

implement bounded key parsing metadata for caller-provided Ed25519 public-key bytes only while preserving no key material loading, no private-key handling, no key generation, no hardware-key use, no trust-store behavior, no signing, no verification, no signer invocation behavior, no host behavior, no network behavior, no capability enforcement, and no runtime authority

Latest completed validation slice

Defensive threat model validation refinement

Purpose completed:

refine the defensive threat model validation surface, external-source checkpoint posture, and next-gap triage while preserving no runtime execution, no effect execution, no capability enforcement, no cryptographic verification, no signing, no host behavior, no network behavior, no MCP behavior, no AI agent execution, no model execution, no tool execution, no shell execution, production protection, or runtime authority

Latest completed policy/evidence slice

Runtime boundary policy expansion after threat-model validation

Purpose completed:

map runtime-boundary request families, effect families, authority prerequisites, future gates, defensive-threat-model abuse cases, and remaining evidence gaps while preserving no runtime execution, no effect execution, no capability enforcement, no cryptographic verification, no signing, no host behavior, no network behavior, no MCP behavior, no AI agent execution, no model execution, no tool execution, no shell execution, production protection, and no runtime authority

Latest completed status/public-entry slice

Latticra Seal operator receipt report predecessor status alignment

Purpose completed:

tie and guard the existing denied report-only Seal operator receipt status to the policy decision status predecessor while preserving no new implementation behavior, no receipt file writes, no tool execution, no policy enforcement, no capability enforcement, no cryptographic verification, no signature verification, no freshness validation, no replay detection, no runtime execution, no runtime authority, no effect execution, no verified receipt authority, no key material loading, no private-key handling, no object sealing, no host behavior, no network behavior, and no production enforcement claim

Previous status/public-entry slice

Latticra Seal policy decision predecessor status alignment

Purpose completed:

tie and guard the existing report-only Seal policy decision status to the signed request status predecessor while preserving no new implementation behavior, no policy evaluation, no policy enforcement, no signature verification, no freshness validation, no replay detection, no signed request enforcement, no runtime execution, no runtime authority, no effect execution, no capability enforcement, no cryptographic verification, no verified receipt authority, no key material loading, no private-key handling, no object sealing, no host behavior, no network behavior, and no production enforcement claim

Earlier status/public-entry slice

Latticra Seal signed request predecessor status alignment

Purpose completed:

tie and guard the existing report-only Seal signed request status to the request freshness status predecessor while preserving no new implementation behavior, no signature generation, no signature verification, no public-key parsing, no trust-store loading, no private-key handling, no key generation, no hardware-key use, no revocation lookup, no network trust lookup, no signed request enforcement, no policy evaluation, no policy enforcement, no freshness validation, no replay detection, no runtime execution, no runtime authority, no effect execution, no capability enforcement, no cryptographic verification, no verified receipt authority, no key material loading, no private-key handling, no object sealing, no host behavior, no network behavior, and no production enforcement claim

Earlier status/public-entry slice

Latticra Seal signed request status/public-entry alignment

Purpose completed:

publish and guard the existing report-only Seal signed request metadata from README/status/foundation entry points while preserving no signature generation, no signature verification, no public-key parsing, no trust-store loading, no private-key handling, no key generation, no hardware-key use, no revocation lookup, no network trust lookup, no signed request enforcement, no runtime execution, no effect execution, no capability enforcement, no cryptographic verification, no verified receipt authority, no signing, no host behavior, no network behavior, no MCP behavior, no AI agent execution, no model execution, no tool execution, no shell execution, and no runtime authority

Older status/public-entry slice

Latticra Seal policy decision status/public-entry alignment

Purpose completed:

publish and guard the existing report-only Seal policy decision metadata and deterministic report surface from README/status/foundation entry points while preserving no policy evaluation, no policy enforcement, no runtime execution, no effect execution, no capability enforcement, no cryptographic verification, no signature verification, no host behavior, no network behavior, no MCP behavior, no AI agent execution, no model execution, no tool execution, no shell execution, and no runtime authority

Older status/public-entry slice

Latticra Seal request freshness status/public-entry alignment

Purpose completed:

publish and guard the existing report-only Seal request freshness metadata and report surface from README/status/foundation entry points while preserving no timestamp parsing, no trusted clock behavior, no nonce storage, no replay-cache storage, no context hashing, no parameter hashing, no freshness validation, no replay detection, no runtime execution, no effect execution, no capability enforcement, no cryptographic verification, no verified receipt authority, no signing, no host behavior, no network behavior, no MCP behavior, no AI agent execution, no model execution, no tool execution, no shell execution, and no runtime authority

Older status/public-entry slice

Latticra Seal parameter schema status/public-entry alignment

Purpose completed:

publish and guard the existing report-only Seal parameter schema metadata and report surface from README/status/foundation entry points while preserving no schema parsing, no schema validation, no runtime execution, no effect execution, no capability enforcement, no cryptographic verification, no verified receipt authority, no signing, no host behavior, no network behavior, no MCP behavior, no AI agent execution, no model execution, no tool execution, no shell execution, and no runtime authority

Older status/public-entry slice

Latticra Seal agentic automation security public-entrypoint alignment

Purpose completed:

publish and guard the existing report-only Seal agentic automation security surface from README/status/foundation entry points while preserving no runtime execution, no effect execution, no capability enforcement, no cryptographic verification, no verified receipt authority, no signing, no host behavior, no network behavior, no MCP behavior, no AI agent execution, no model execution, no tool execution, no shell execution, and no runtime authority

Older status/public-entry slice

Latticra Seal status rollup status/public-entry alignment

Purpose completed:

publish and guard the existing metadata-only status rollup surface from public/status entry points while preserving no runtime execution, no effect execution, no capability enforcement, no cryptographic verification, no verified receipt authority, no signing, no host behavior, no network behavior, and no runtime authority

Earlier status/public-entry slice

Latticra Seal runtime handoff status/public-entry alignment
Latticra Seal runtime handoff report status/public-entry alignment

Purpose completed:

publish and guard the existing inactive metadata-only runtime handoff surface from public/status entry points while preserving no runtime execution, no effect execution, no capability enforcement, no cryptographic verification, no verified receipt authority, no signing, no host behavior, no network behavior, and no runtime authority

Older status/public-entry slice

Latticra Seal effect decision status/public-entry alignment
Latticra Seal effect decision predecessor status alignment

Purpose completed:

publish and guard the existing metadata-only denied effect decision surface from public/status entry points while preserving no effect execution, no capability enforcement, no runtime handoff execution, no cryptographic verification, no verified receipt authority, no signing, no host behavior, no network behavior, and no runtime authority

Earlier planning slice

Constrained C++ authority layer implementation plan

Purpose completed:

define exact public API, namespace, file paths, C++ standard, compiler flags, exception policy, RTTI policy, allocation policy, ownership/lifetime rules, result labels, C ABI boundaries, validators, audit reports, and tests before any C++ authority-layer code

Latest completed contract slice

Latticra Seal local capability registry schema contract

Purpose completed:

define the local capability registry schema boundary after operator receipt status readiness while preserving no registry loader, no registry file access, no trust-store behavior, no signing, no verification, no host behavior, no network behavior, no capability enforcement, no effects, and no runtime authority

Previous status/public-entry slice

Latticra Seal capability gate status/public-entry alignment

Purpose completed:

publish and guard the existing metadata-only denied capability gate surface from public/status entry points while preserving no capability enforcement, no effect execution, no cryptographic verification, no verified receipt authority, no signing, no key material loading, no private-key handling, no trust-store behavior, no revocation lookup, no host behavior, no network behavior, and no runtime authority

Earlier status/public-entry slice

Latticra Seal verification receipt status/public-entry alignment

Purpose completed:

publish and guard the existing metadata-only verification receipt surface from public/status entry points while preserving no cryptographic verification, no verified receipt authority, no signing, no key material loading, no private-key handling, no trust-store behavior, no revocation lookup, no host behavior, no network behavior, no capability enforcement, and no runtime authority

Earlier status/public-entry slice

Latticra Seal verification policy status/public-entry alignment

Purpose completed:

publish and guard the existing metadata-only verification policy surface from public/status entry points while preserving no cryptographic verification, no signing, no public-key byte verification, no key material loading, no private-key handling, no trust-store behavior, no revocation lookup, no host behavior, no network behavior, no capability enforcement, and no runtime authority

Earlier status/public-entry slice

Latticra Seal key parsing status/public-entry alignment

Purpose completed:

publish and guard the bounded no-effect key parsing metadata surface from public/status entry points while preserving no key material loading, no private-key handling, no key generation, no hardware-key use, no trust-store behavior, no revocation lookup, no signing, no verification, no signer invocation behavior, no host behavior, no network behavior, no capability enforcement, and no runtime authority

Previous implementation slice

Latticra Seal public-key parsing metadata implementation

Purpose completed:

implement metadata-only public-key parsing classification after key-material status readiness while preserving no public-key parsing, no key material loading, no private-key handling, no key generation, no hardware-key use, no trust-store loading, no signing, no verification, no signer invocation behavior, no host behavior, no network behavior, no capability enforcement, and no runtime authority

Previous contract slice

Latticra Seal public-key parsing boundary contract

Purpose completed:

define the next metadata-only public-key parsing boundary after key-material status readiness while preserving no public-key parsing, no key material loading, no private-key handling, no key generation, no hardware-key use, no trust-store loading, no signing, no verification, no signer invocation behavior, no host behavior, no network behavior, no capability enforcement, and no runtime authority

Previous status/public-entry slice

Latticra Seal key-material status/public-entry alignment

Purpose completed:

publish and guard the key-material metadata implementation in the status and public-entry surfaces while preserving no public-key parsing, no key material loading, no private-key handling, no key generation, no hardware-key use, no trust-store behavior, no signing, no verification, no signer invocation behavior, no host behavior, no network behavior, no capability enforcement, and no runtime authority

Previous implementation slice

Latticra Seal key-material metadata implementation

Purpose completed:

implement metadata-only key-material classification after key-handling readiness while preserving no public-key parsing, no key material loading, no private-key handling, no key generation, no hardware-key use, no trust-store loading, no signing, no verification, no signer invocation behavior, no host behavior, no network behavior, no capability enforcement, and no runtime authority

Previous contract slice

Latticra Seal key-material boundary contract

Purpose completed:

define the next metadata-only key-material boundary after key-handling readiness while preserving no public-key parsing, no key material loading, no private-key handling, no key generation, no hardware-key use, no trust-store loading, no signing, no verification, no signer invocation behavior, no host behavior, no network behavior, no capability enforcement, and no runtime authority

Previous status/public-entry slice

Latticra Seal key-handling status/public-entry alignment

Previous implementation slice

Latticra Seal key-handling metadata implementation

Previous contract slice

Latticra Seal key-handling boundary contract

Previous status/public-entry slice

Latticra Seal signing operation status/public-entry alignment

Earlier implementation slice

Latticra Seal signing operation metadata implementation

Previous contract slices retained for continuity

Lat-to-LIR lowering contract
Lat semantic validation contract
Runtime boundary contract
Nucleus task execution contract
Lat-specific LIR refinement contract
Latticra Seal signing authorization contract
Latticra Seal signer handoff contract
Latticra Seal signer invocation contract
Latticra Seal signing operation contract

Previous planning slice

Runtime boundary refinement plan

Purpose completed:

define the next no-effect runtime boundary refinement after Lat pipeline and Lat-specific LIR refinement, including compatibility requirements, report expectations, prerequisite metadata, and non-claims before any runtime behavior expands

Historical planning slices retained for continuity

Constrained C++ authority layer implementation plan
Lat-to-LIR lowering implementation plan
Lat semantic validation implementation plan
Runtime boundary implementation plan
Nucleus task execution implementation plan

Earlier completed status/public-entry slice

Latticra Seal signer invocation status/public-entry alignment

Purpose completed:

make the Seal signer invocation metadata implementation visible from public/status entry points while preserving no signing, no verification, no signer invocation behavior, no private-key handling, no host behavior, no network behavior, no capability enforcement, and no runtime authority

Previous implementation slices

```
Latticra Seal signer invocation metadata implementation
Latticra Seal signer handoff status/public-entry alignment
Latticra Seal signer handoff metadata implementation
Latticra Seal signing authorization metadata implementation
Latticra Seal signature request metadata implementation
Latticra Seal report envelope metadata implementation

Recommended next slice

Latest completed review slice:

```
Completion estimate review README/status alignment
```

Latest completed estimate slice:

```
Current estimate mathematical rebase
```

Previous review slice:

```
Completion estimate review after runtime-boundary abuse-case fixtures
```

Latest completed fixture/evidence slice:

```
Runtime boundary abuse-case fixture expansion after policy expansion
```

Previous policy/evidence slice:

```
Runtime boundary policy expansion after threat-model validation
```

Current runtime boundary abuse-case fixture fields:

```
current_estimate_table_source_alignment_present=1
current_estimate_mathematical_rebase_present=1
seal_readme_status_row_alignment_present=1
completion_estimate_review_readme_status_alignment_present=1
source_alignment_estimate_changed=0
mathematical_rebase_estimate_changed=1
runtime_boundary_abuse_case_fixture_expansion_present=1
runtime_boundary_abuse_case_fixture_guard_present=1
runtime_boundary_abuse_case_c_fixtures_present=1
runtime_boundary_abuse_case_fixture_count=8
runtime_execution_added=0
effect_execution_added=0
runtime_authority_granted=0
completion_estimate_review_required=0
```

Current estimate table source alignment is the source-map cleanup for the public estimate table. Current estimate mathematical rebase is the latest planning-estimate update for that table, moving the overall value to a weighted 45% after Nadia Stage-43 prompt-evaluation release-receipt contract-chain evidence, kernel lifecycle scheduler-credit/scheduler-selection-ready evidence, and vulnerability-management release-gate baseline coverage while changing no implementation behavior, product-security posture, public readiness, product readiness, or runtime authority.

Recommended next slice:

```
Continue small guarded report/status alignment only when drift appears
```

Completion estimate review only if capability posture changes remains the estimate rule after this non-change review.

Purpose:

```
continue small guarded report/status alignment only when drift appears while preserving no
runtime execution, no effect execution, no capability enforcement, no cryptographic
verification, no signing, no host behavior, no network behavior, no MCP behavior, no AI agent
execution, no model execution, no tool execution, no shell execution, production protection, and
 no runtime authority
```

Near-term queue

1. Continue small guarded report/status alignment only when drift appears.
2. Authority status announcement only if public messaging changes.
3. C++ authority expansion contract only if new authority behavior is proposed.
4. Nucleus task execution refinement only after the next language representation review and a separate effect contract.
5. Runtime boundary domain matrix report status audit only if new status drift appears.
6. Lat pipeline diagnostic README follow-up only if future guard requirements demand additional public links.
7. Runtime behavior expansion only after separate contract, plan, tests, and explicit non-claim review.

Quality rules

Upcoming work should remain:

```
small
reviewable
tested or guarded
evidence-bound
clear about non-claims
consistent with public Latticra identity
consistent with the C/C++ foundation direction
consistent with the report-only Nucleus boundary
consistent with no-new-announcement decisions unless capability posture changes
```

Current project priorities

- Preserve the C/C++ foundation checkpoint: C is the metal, C++ is the disciplined structure, Latticra is the contract.
- Keep the constrained C++ authority layer no-effect until separate effect contracts exist.
- Keep L-UI rendering no-effect and presentation-only.
- Keep Nucleus task execution no-effect, report-only, and denied-by-default.
- Keep runtime behavior no-effect and disabled-by-default.
- Keep Lat semantic validation no-effect and metadata-only.
- Keep Lat-to-LIR lowering no-effect and metadata-only.
- Keep Lat-specific LIR refinement no-effect and metadata-only.
- Keep Lat pipeline diagnostic integration no-effect and metadata-only.
- Keep Runtime boundary domain matrix report integration report-only and no-effect.
- Keep Seal key-handling no-effect and unsigned until separate key-material and signing contracts exist.
- Do not update completion estimates after documentation/status-only alignment.
- Do not add public announcement entries for documentation/status-only alignment.
- Maintain professional public docs.
- Keep status and completion estimates current only when capability posture changes.
- Keep Lat metadata-only until separate execution contracts exist.
- Keep C++ constrained by the governed authority-layer implementation plan.

Source title: Latticra Strategy Estimate Review

Lines: 60 | Words: 254 | SHA-256: 9720ef04af5a2f917bcd383e1ced546ba07775cb5dc28116da81fb1f430f3c94

Latticra Strategy Estimate Review

Status: strategy estimate review Created: 2026-05-19 18:45 CDT Scope: strategy alignment after project-notes refresh and completion-percentage review.

Purpose

This record updates the strategy layer after the recent report, diagnostic, audit, README, foundation-index, project-notes, status-consistency, and completion-percentage review slices.

It preserves the original active strategy record as historical context while documenting the current planning estimate posture.

Current planning estimate posture

The current public estimate posture is:

```
Overall Latticra system: 35%
Foundation documents and contracts: 89%
Public documentation posture: 83%
Strategy/status/funding framework: 57%
Lat / Latticra Programming Language: 25%
Runtime / operating-system-universe direction: 17%
```

These estimates remain planning estimates only. They are not release promises, production-readiness claims, security guarantees, or operating-system completeness claims.

Strategic interpretation

Recent work improved public posture, auditability, and diagnostic/report coverage more than operational capability.

The strategy should therefore continue to emphasize:

```
small reviewable slices
evidence-bound status updates
no-effect defaults
deterministic diagnostics
operator-visible reports
explicit non-claims
C/C++ foundation direction
Lat metadata-only behavior until separate execution contracts exist
runtime boundary disabled-by-default posture
```

Current next strategic review lane

Recommended next strategic review lane:

```
C++ authority implementation review after initial no-effect validator/audit slice
```

Before moving into any broader authority behavior, the project should review the existing no-effect constrained C++ authority implementation against the current Lat/LIR/runtime-boundary evidence surfaces.

Non-claims

This record does not implement security controls, operating-system behavior, malware prevention, ransomware prevention, sandboxing, update safety, recovery safety, runtime behavior, command execution, or production readiness.

It records strategy and planning estimates only.

docs/strategy/2026-05-25-1951-cdt-strategy-posture-refresh.md

Source title: Latticra Strategy Posture Refresh

Lines: 115 | Words: 509 | SHA-256: 65778a2f18cece56588ff5c625af1288f608330dd5044346eeac7cdddc4ab0f0

Latticra Strategy Posture Refresh

Status: strategy posture refresh Created: 2026-05-25 19:51 CDT Scope: current strategic posture, promotion discipline, estimate-change rules, and next operating rhythm.

Purpose

This record refreshes the strategy layer after the current public status, project-notes, completion-estimate, runtime-boundary, Seal, Lat, Nadia, and no-effect alignment work.

It preserves the active national-security open-system strategy as mission context while updating the operating posture for the current evidence state.

Current strategic posture

Latticra remains an early-stage, evidence-bound systems architecture and programming-language project.

Current strategy should treat the repository as having:

```
strong foundation documents
strong public status posture
mature no-effect report surfaces in several lanes
bounded Lat parse/validate/normalize/lower metadata paths
metadata-only Seal trust-boundary planning
report-only Nucleus and Runtime Boundary behavior
early product readiness
early security-hardening implementation
no production runtime authority
```

Source-of-truth alignment

The current public status posture is governed by:

```
README.md
STATUS.md
docs/status/CURRENT_STATUS.md
docs/project_notes/CURRENT_DIRECTION.md
docs/project_notes/UPCOMING_WORK.md
```

Older strategy records remain useful historical context, but their estimates and recommended next slices should not override the current public status files.

Current operating rule

The current next-step rule is:

```
Continue small guarded report/status alignment only when drift appears.
```

Completion-estimate review remains required only when capability posture changes.

Documentation-only, status-only, index-only, and announcement-review-only work should not promote product readiness, security-hardening posture, runtime authority, or operating-system completeness.

Promotion discipline

Future capability promotion should require explicit evidence before public posture changes.

Minimum promotion inputs:

```
contract
implementation plan
bounded implementation or fixture
focused guard or test
public status record
non-claim review
estimate-impact review when capability posture changes
```

For runtime behavior, effect execution, capability enforcement, cryptographic authority, signing authority, host behavior, network behavior, model execution, tool execution, shell execution, or operating-system behavior, strategy should require a separate contract, plan, tests, and explicit non-claim review before implementation expansion.

Near-term strategic priorities

1. Preserve no-effect boundaries unless a separate promotion packet exists.
2. Keep public estimates synchronized only with capability posture changes.
3. Treat status drift as maintenance, not capability growth.
4. Prefer fewer, sharper next-slice candidates over broad parallel expansion.

5. Keep product-readiness language conservative until user-facing workflows exist.
6. Keep security-hardening language conservative until real enforcement evidence exists.
7. Keep strategy records dated, reviewable, and subordinate to current public status.

Current strategic frontier

The next useful strategic frontier is not broad feature expansion.

The next useful strategic frontier is promotion criteria:

```
What exact evidence would justify the next capability posture change?
```

Candidate promotion packets should be written before execution-oriented work starts.

Priority promotion-packet candidates:

```
runtime behavior expansion gate
Nucleus effect-contract gate
Seal cryptographic verification authority gate
Panel user-facing workflow readiness gate
Nadia offline inference readiness gate
security-hardening evidence gate
public product-readiness gate
```

These are planning candidates only. They do not authorize implementation or change estimates by themselves.

Non-claims

This record does not implement security controls, operating-system behavior, malware prevention, ransomware prevention, sandboxing, update safety, recovery safety, runtime behavior, command execution, cryptographic verification authority, signing authority, model execution, tool execution, production readiness, or public product readiness.

It records strategy and organization only.

docs/strategy/2026-05-25-2017-cdt-capability-promotion-gate-map.md

Source title: Latticra Capability Promotion Gate Map

Lines: 386 | Words: 996 | SHA-256: 1d085bc6698a414a41502b79986105481b6c848260110715bbf71c5b251fbff0

Latticra Capability Promotion Gate Map

Status: strategy gate map Created: 2026-05-25 20:17 CDT Scope: strategic promotion criteria for future capability-posture changes.

Purpose

This record translates the evidence ladder, precursor promotion rule, real-system contract, and current strategy posture into concrete promotion gates for Latticra's major work lanes.

It is an organizing record only. It does not authorize implementation expansion or change any current estimate.

Source rules

Promotion remains governed by:

```
docs/EVIDENCE_LADDER.md
docs/PRECURSOR_PROMOTION_RULE.md
docs/REAL_SYSTEM_CONTRACT.md
docs/strategy/2026-05-25-1951-cdt-strategy-posture-refresh.md
```

The controlling principle is:

```
No public capability posture change without evidence that matches the next claimed level.
```

Promotion classes

Use these classes before changing public language, estimates, or next-priority posture.

```
maintenance_alignment
  Status, README, index, announcement-review, or source-map cleanup.
  Does not change capability posture.

metadata_capability
  A bounded no-effect implementation, fixture, parser, report, diagnostic,
  classifier, validator, or metadata path exists and is guarded.

preview_capability
  A capability is wired into a runtime or workflow model but remains
  preview-only, denied-by-default, and non-mutating.

guarded_local_capability
  A narrow local operation is possible only through explicit opt-in gates,
  audit output, failure handling, and rollback or reset boundaries.

real_system_capability
  A repeated, supported, documented capability with tests, release boundary,
  operator-facing status, and safety review.
```

Estimate-change rule

Estimate changes should be considered only when a lane moves from one promotion class to another.

Do not adjust estimates for:

```
index updates
README wording alignment
status-only publication
announcement-review decisions
source-of-truth cleanup
historical strategy records
non-claim restatement
```

Do consider estimate review for:

```
new guarded implementation evidence
new test-backed capability class
new user-facing workflow evidence
new runtime preview integration
new enforcement or authority evidence
new security-hardening evidence
new product-readiness evidence
```

Gate A: Runtime Behavior Expansion

Current posture:

```
report-only
disabled-by-default
denied-by-default
no runtime authority
```

Promotion target:

```
preview_capability before guarded_local_capability
```

Required before promotion:

```
runtime behavior expansion contract
runtime behavior implementation plan
specific request family and effect family
authority prerequisite matrix
denial and failure fixtures
operator-visible report fields
rollback or non-mutation boundary
focused guard
aggregate guard
non-claim review
estimate-impact review
```

Forbidden shortcut:

```
No direct move from report-only metadata to local mutation.
```

Gate B: Nucleus Effect Contract

Current posture:

```
report-only task boundary
classification-only execution labels
no effect-performing task execution
```

Promotion target:

```
preview_capability for a single named effect family
```

Required before promotion:

```
named effect family
effect contract
task authority prerequisites
Runtime Boundary dependency statement
Seal dependency statement when trust evidence is involved
denied-case fixtures
failure-state report
operator-visible status
guard coverage
non-claim review
estimate-impact review
```

Forbidden shortcut:

```
No generic task execution umbrella before a narrow effect family is reviewed.
```

Gate C: Seal Cryptographic Authority

Current posture:

```
trust-boundary planning
bounded key metadata
verification metadata and result surfaces
no capability authorization from cryptographic result alone
no signing authority
no runtime authority
```

Promotion target:

```
metadata_capability or preview_capability before any authority-bearing gate
```

Required before promotion:

```
cryptographic authority contract
provider and algorithm boundary
public-key parsing evidence
negative verification fixtures
verified receipt semantics
capability-gate separation proof
effect-decision separation proof
key-material non-claim review
signing non-claim review
guard coverage
estimate-impact review
```

Forbidden shortcut:

```
No verified cryptographic result may imply capability enforcement, signing authority,
effect execution, runtime handoff, host behavior, network behavior, or production trust.
```

Gate D: Panel User-Facing Workflow Readiness

Current posture:

```
local control surface direction
guarded user-local posture
early product readiness
```

Promotion target:

```
guarded_local_capability for a named local workflow
```

Required before promotion:

```
named user workflow
```

```
no-root boundary
network boundary
dry-run transcript
local path plan
failure and reset path
operator-visible status
accessibility and usability review
guarded install or no-effect proof
non-claim review
estimate-impact review
```

Forbidden shortcut:

```
No public product-readiness promotion from architecture documentation alone.
```

Gate E: Nadia Offline Inference Readiness

Current posture:

```
offline AI foundation planning
context and tokenizer contracts
no prompt evaluation
no model loading
no inference
no tool execution
```

Promotion target:

```
preview_capability before guarded local inference
```

Required before promotion:

```
offline inference readiness contract
local model identity boundary
tokenizer artifact evidence
prompt materialization evidence
context-window assembly evidence
runtime invocation non-claim review
tool authority non-claim review
protective safety boundary check
guard coverage
operator-visible report
estimate-impact review
```

Forbidden shortcut:

```
No dialogue, inference, tool authority, or source mutation before the offline
runtime and safety gates are independently evidenced.
```

Gate F: Security-Hardening Evidence

Current posture:

```
security-conscious design
defensive threat model records
early security-hardening implementation
no production security boundary
```

Promotion target:

```
metadata_capability for security evidence before any protection claim
```

Required before promotion:

```
threat model mapping
abuse-case fixtures
negative tests
external-source checkpoint when relevant
manual review record
residual-risk statement
non-claim review
estimate-impact review
```

Forbidden shortcut:

```
No malware-prevention, ransomware-prevention, sandbox, hardening, or security
boundary claim without tested enforcement evidence.
```

Gate G: Public Product Readiness

Current posture:

```
early product readiness
strong documentation posture
no deployed platform
no production product claim
```

Promotion target:

```
guarded_local_capability with a coherent user-facing workflow
```

Required before promotion:

```
named target user
named workflow
installation or no-install path
first-run success criteria
failure and uninstall/reset criteria
support boundary
known limitations
operator-facing evidence
release note or readiness note
non-claim review
estimate-impact review
```

Forbidden shortcut:

```
No product-readiness promotion from internal implementation evidence unless a
target user can complete a bounded workflow and understand its limitations.
```

Strategic next-use rule

When the project wants to move beyond maintenance alignment, choose exactly one gate and write a promotion packet before implementation work starts.

The packet should include:

```
gate:
target promotion class:
current evidence level:
target evidence level:
named capability:
allowed behavior:
forbidden behavior:
required fixtures:
required tests or guards:
operator-visible report:
non-claims:
estimate-impact question:
public-entrypoint question:
```

Non-claims

This record does not implement runtime behavior, effect execution, capability enforcement, cryptographic authority, signing authority, host behavior, network behavior, model execution, tool execution, shell execution, product readiness, security hardening, malware prevention, ransomware prevention, sandboxing, or operating-system behavior.

It records strategy and promotion criteria only.

docs/strategy/2026-05-25-2025-cdt-capability-promotion-packet-template.md

Source title: Latticra Capability Promotion Packet Template

Lines: 228 | Words: 665 | SHA-256: ced676593d2838145ed7a60dfa32a4da1c98dde120f5df1828442d9a007995d2

Latticra Capability Promotion Packet Template

Status: strategy template Created: 2026-05-25 20:25 CDT Scope: reusable planning template for future capability-promotion proposals.

Purpose

This template gives future Latticra promotion work a standard packet shape before implementation expansion begins.

It exists to keep capability changes evidence-bound, reviewable, narrow, and honest about non-claims.

Usage rule

Use this template when a proposal would move any lane beyond maintenance alignment.

Do not use this template to justify a capability after implementation has already expanded. The packet should exist before execution-oriented work starts.

Packet header

```
packet name:
created:
owner:
status: draft|under-review|accepted-for-planning|rejected|superseded
gate:
target lane:
target promotion class:
current evidence level:
target evidence level:
current source-of-truth files:
related contracts:
related status records:
```

Capability statement

```
named capability:
one-sentence purpose:
target user or operator:
current posture:
proposed posture:
why this promotion is needed now:
```

Allowed behavior

List only the behavior that the promotion would permit.

```
allowed behavior:
-
-
-
```

Forbidden behavior

List behavior that remains out of scope even if the packet is accepted.

```
forbidden behavior:
- no hidden execution
- no hidden mutation
- no unreviewed authority expansion
- no unsupported security claim
- no production-readiness claim unless explicitly evidenced
```

Add lane-specific exclusions:

```
runtime behavior:
effect execution:
capability enforcement:
cryptographic authority:
signing authority:
host behavior:
network behavior:
model execution:
tool execution:
shell execution:
file mutation:
hardware behavior:
```

Evidence inventory

```
existing contracts:
-

existing implementation or fixture evidence:
-

existing tests or guards:
-

existing status or public-entry records:
-

known evidence gaps:
-
```

Required new evidence

```
new contract required:

```
expected failure states:
-

expected denial states:
-

stale evidence behavior:
ambiguous evidence behavior:
operator-cancel behavior:
unsupported-platform behavior:
capacity-limit behavior:
```

Estimate-impact question

Answer before any estimate changes.

```
Does this packet move a lane to a new promotion class?
Does it add runtime behavior?
Does it add effect execution?
Does it add authority?
Does it add user-facing workflow readiness?
Does it add security-hardening evidence?
Does it add public product-readiness evidence?
Estimate change recommended: no|yes
Reason:
```

Public-entrypoint question

Answer before README, root status, or public docs change.

```
Does this packet change public capability wording?
Does it require README update?
Does it require STATUS.md update?
Does it require docs/status/CURRENT_STATUS.md update?
Does it require docs/project_notes/CURRENT_DIRECTION.md update?
Does it require docs/project_notes/UPCOMING_WORK.md update?
Does it require announcement review?
Public entrypoint change recommended: no|yes
Reason:
```

Acceptance criteria

```
accepted only if:
- scope is narrow and named
- evidence level is explicit
- allowed behavior is bounded
- forbidden behavior is explicit
- tests or guards are named
- operator-visible status exists or is required
- non-claims are stated
- estimate-impact question is answered
- public-entrypoint question is answered
```

Rejection criteria

```
reject if:
- the proposal skips evidence levels
- the proposal bundles multiple unrelated capabilities
- the proposal implies production readiness without user-facing evidence
- the proposal implies security protection without enforcement evidence
- the proposal grants authority from metadata alone
- the proposal hides mutation, host behavior, network behavior, or tool execution
- the proposal lacks a denial or failure model
```

Non-claims

This template does not implement runtime behavior, effect execution, capability enforcement, cryptographic authority, signing authority, host behavior, network behavior, model execution, tool execution, shell execution, product readiness, security hardening, malware prevention, ransomware prevention, sandboxing, or operating-system behavior.

It records a planning form only.

docs/strategy/2026-05-25-2114-cdt-public-product-readiness-promotion-packet.md

Source title: Latticra Public Product Readiness Promotion Packet

Lines: 255 | Words: 898 | SHA-256: d655248c274e807ce68c2636ef36ca0b41d515df4b0348929edeb44bda2d6a8f

Latticra Public Product Readiness Promotion Packet

Status: draft promotion packet Created: 2026-05-25 21:14 CDT Decision: no promotion recommended Scope: public product-readiness criteria for a future bounded user-facing Latticra workflow.

Purpose

This packet defines what evidence would be required before Latticra's public product-readiness posture should move beyond its current early estimate.

It does not request or authorize product-readiness promotion. It records the gap between the current evidence state and a future bounded user-facing workflow.

Packet header

```
packet name: public product readiness promotion packet
gate: public product readiness
target lane: Latticra public product posture
target promotion class: guarded local user-facing workflow
current evidence level: documentation/status plus local no-effect workbench evidence
target evidence level: bounded first-run workflow with operator-visible evidence
status: draft
decision: no promotion recommended
```

Current source-of-truth files:

```
README.md
STATUS.md
docs/status/CURRENT_STATUS.md
docs/project_notes/CURRENT_DIRECTION.md
docs/project_notes/UPCOMING_WORK.md
docs/EVIDENCE_LADDER.md
docs/PRECURSOR_PROMOTION_RULE.md
docs/REAL_SYSTEM_CONTRACT.md
docs/strategy/2026-05-25-1951-cdt-strategy-posture-refresh.md
```

Current posture

Current public estimate:

```
Public product readiness: 8%
Latticra Panel / local control surface: 28%
Public documentation posture: 88%
Foundation documents and contracts: 92%
```

Strategic interpretation:

```
Latticra is publicly legible and well documented, but it is not yet a public product.
```

The current repository has strong documentation, status, contracts, no-effect reports, and local workbench direction. It does not yet have enough bounded user-facing workflow evidence to promote product readiness.

Candidate target user

The first bounded product-readiness target should be narrow:

```
security researcher
systems engineer
infrastructure maintainer
technical evaluator
```

The first target user should be comfortable with a source checkout, local commands, no-effect reports, and explicit non-claims.

This packet does not target nontechnical end users.

Candidate first workflow

Candidate workflow:

```
Evaluate Latticra locally without granting runtime authority.
```

The future workflow should let a technical evaluator:

1. clone or open the repository;
2. identify current status and non-claims;
3. launch or inspect the Latticra Panel / local control surface;
4. run a no-effect dry-run or evidence review path;
5. inspect generated status, plan, or report output;
6. understand what did not happen;
7. exit, reset, or uninstall any local artifacts created by the workflow.

Allowed future behavior

For this product-readiness packet, allowed future behavior would be limited to:

```
guided local evaluation
no-effect dry-run review
operator-visible evidence review
local reset or uninstall path
explicit status and non-claim display
technical evaluator workflow documentation
```

Forbidden behavior

This packet does not permit:

```
production installer claim
daily-driver claim
runtime authority
effect execution
capability enforcement
cryptographic authority
signing authority
host mutation
network behavior
model execution
tool execution
shell execution beyond documented local developer commands
security protection claim
malware-prevention claim
ransomware-prevention claim
operating-system replacement claim
```

Existing evidence

Existing strengths:

```
public README and status surfaces
current high-level estimate table
explicit non-claims
foundation contracts
evidence ladder
project notes
Latticra Panel direction
local installer/workbench command documentation
no-effect runtime and Nucleus posture
metadata/report-heavy Seal posture
```

Existing gaps:

```
no declared first public workflow acceptance test
no product-readiness-specific user journey record
no product-readiness support boundary
no dedicated first-run evidence transcript for public readiness
no release-readiness note for a technical evaluator workflow
no public product-readiness non-claim review
no estimate-impact review tied to a user-facing workflow
```

Required evidence before promotion

Before any public product-readiness estimate increases, require:

```
named target user
named first workflow
first-run checklist
bounded local execution or no-effect dry-run transcript
operator-visible status output
failure and reset path
uninstall or cleanup path if local artifacts are created
known limitations section
support boundary
public product-readiness non-claim review
guard or test for the documented workflow
estimate-impact review
public-entrypoint review
```

Operator visibility requirements

A future product-readiness workflow should show:

```
current project status
what the workflow will do
what the workflow will not do
whether mutation is possible
whether network behavior is possible
where local artifacts may be written
how to reset or remove local artifacts
which reports or receipts were generated
which authority remains denied
```

Failure and denial model

Required failure and denial labels:

```
unsupported_platform
missing_dependency
dry_run_only
no_runtime_authority
no_network_authority
no_root_authority
reset_available
manual_review_required
```

The workflow should fail closed when the operator cannot understand or inspect the action boundary.

Estimate-impact answer

```
Does this packet move public product readiness to a new promotion class? no
Does it add runtime behavior? no
Does it add effect execution? no
Does it add authority? no
Does it add user-facing workflow evidence? no
Does it add security-hardening evidence? no
Does it add product-readiness evidence? no
Estimate change recommended: no
Reason: this packet defines future criteria only.
```

Public-entrypoint answer

```
Does this packet change public capability wording? no
Does it require README update? no
Does it require STATUS.md update? no
Does it require docs/status/CURRENT_STATUS.md update? no
Does it require docs/project_notes/CURRENT_DIRECTION.md update? no
Does it require docs/project_notes/UPCOMING_WORK.md update? no
Does it require announcement review? no
Public entrypoint change recommended: no
Reason: no capability posture changes.
```

Next planning action

The next planning action after this packet is to choose whether the first public-readiness workflow should be:

```
Panel-guided local evaluation
CLI-only no-effect evidence review
documentation-first technical evaluator path
```

Only one should be selected for the first workflow packet.

Non-claims

This packet does not implement product readiness, runtime behavior, effect execution, capability enforcement, cryptographic authority, signing authority, host behavior, network behavior, model execution, tool execution, shell execution, security hardening, malware prevention, ransomware prevention, sandboxing, operating-system behavior, installer readiness, or production support.

It records planning criteria only.

docs/strategy/2026-05-26-1702-cdt-overall-strategy-priority-map.md

Source title: Latticra Overall Strategy Priority Map After Panel-Guided Planning Completion

Lines: 363 | Words: 949 | SHA-256: d7a7c2d9ef876ea1b78f4fed39e7486cc62e027b500fa8447157562940d17dcc

Latticra Overall Strategy Priority Map After Panel-Guided Planning Completion

Status: strategy priority map Created: 2026-05-26 17:02 CDT Decision: prioritize next planning lanes without starting evidence capture or implementation Promotion decision: no product-readiness, runtime, security, cryptographic-authority, AI, or execution promotion recommended Scope: overall planning sequence after completion of the Panel-guided local evaluation planning package.

Purpose

This record defines the next strategic priorities after the Panel-guided local evaluation planning package reached planning completion.

It exists to keep the project moving deliberately without converting planning work into unsupported product, runtime, security, AI, or execution claims.

Source records

This map follows:

```
docs/strategy/2026-05-26-1356-cdt-panel-guided-local-evaluation-planning-completion-checkpoint.m
d
docs/strategy/2026-05-26-0410-cdt-panel-guided-local-evaluation-review-package-index.md
docs/strategy/2026-05-25-1951-cdt-strategy-posture-refresh.md
STATUS.md
docs/status/CURRENT_STATUS.md
README.md
```

Current estimate posture

Current public planning estimates remain:

```
| Area | Estimated completion |
| --- | ---: |
| Overall Latticra system | 45% |
| Latticra Seal / local evidence layer | 39% |
| Latticra Panel / local control surface | 31% |
| Nadia offline AI foundation | 74% |
| L-UI parser / AST / string foundation | 87% |
| Foundation documents and contracts | 94% |
| Public documentation posture | 91% |
| Strategy/status/funding framework | 63% |
| Lat / Latticra Programming Language | 27% |
| LIR / Intermediate Representation | 24% |
| C/C++ foundation direction | 22% |
| Constrained C++ authority layer | 5% |
| Nucleus real task execution | 12% |
| Runtime / operating-system-universe direction | 25% |
| Security-hardening implementation | 9% |
| Public product readiness | 10% |
```

Estimate decision:

```
change_completion_estimates=0
```

Reason:

```
the latest work completed planning organization only; no workflow evidence,
guard/test result, public-entrypoint review, runtime behavior, security
behavior, AI behavior, or production-support behavior has changed
```

Priority rules

Current rules:

```
contracts_before_code=1
fixtures_before_runtime=1
read_only_before_mutation=1
evidence_before_claims=1
non_claim_reviews_before_public_positioning=1
estimate_changes_only_after_capability_change=1
```

Priority map

Tier 0: Source-of-truth health

Priority:

```
ongoing
```

Purpose:

```
keep README.md, STATUS.md, docs/status/CURRENT_STATUS.md, and dated strategy
records aligned when drift appears
```

Planning rule:

```
continue small guarded report/status alignment only when drift appears
```

Do not create broad status rewrites unless a specific inconsistency is found.

Tier 1: Public evaluator workflow clarity

Priority:

```
highest next planning priority
```

Purpose:

```
make it easy for an evaluator to understand what Latticra can inspect,
what remains read-only, what evidence exists, and what claims are deliberately
withheld
```

Current state:

```
Panel_guided_local_evaluation_planning_package_complete=1
Panel_guided_local_evaluation_evidence_captured=0
Public_product_readiness_promotion_recommended=0
```

Recommended next planning package:

```
Latticra Console read-only host inventory and evaluator workflow planning package
```

Reason:

```
it extends the public/evaluator path while staying inside read-only,
metadata-only, non-effect boundaries
```

Expected package contents:

```
