This generated reference book preserves the current working-tree documentation corpus in a reader-oriented order. Public HTML pages and existing companion PDFs/DOCX files are indexed separately in the manifest.

Manual Part Order

- Part I - Orientation and Reader Routes: 16 source records
- Part II - Current Status, Evidence, and Public Boundaries: 6 source records
- Part III - Architecture and Foundation Concepts: 19 source records
- Part IV - Lat, LIR, and L-UI: 81 source records
- Part V - Nucleus and Runtime Boundary: 22 source records
- Part VI - Latticra Seal: 115 source records
- Part VII - Console, Panel, Installer, and Update Paths: 32 source records
- Part VIII - Nadia Offline AI Foundation: 47 source records
- Part IX - Kernel, Boot, and OS Image Research: 32 source records
- Part X - Security and Assurance: 18 source records
- Part XI - Platform Packaging and Distribution Lanes: 100 source records
- Part XII - Project Notes, Strategy, and Documentation Maintenance: 27 source records
- Part XIII - Status Record Archive: 220 source records
- Part XIV - Legal, License, and Remaining Records: 45 source records

Part I - Orientation and Reader Routes

- README.md - Latticra
- STATUS.md - Latticra Status

Latticra

Evidence-bound systems architecture for local authority, reports, receipts, and future runtime boundaries.

README route refreshed: 2026-05-27 CDT Default branch: main

Latticra is an early-stage systems substrate. It is built around a simple rule: before a system action becomes operational, the request, identity, capability, policy, boundary, and evidence posture should be explicit, inspectable, denied by default, and backed by reproducible records.

It is not a production platform, certified security product, hardened sandbox, root installer, network authority, operating-system replacement, Fedora-approved package, Ubuntu archive-ready package, Debian archive-ready package, FreeBSD official port, OpenBSD official port, or openSUSE official package.

```

What Latticra Is

Latticra is a contract-first architecture project for high-assurance local systems work. The current repository emphasizes visibility before authority: parser and report surfaces, no-effect validation, guarded local install paths, status mirrors, platform packaging lanes, and documentation that keeps claims tied to evidence.

The durable project direction is:

```
C is the metal.
C++ is the disciplined structure.
Latticra is the contract.
```

That direction does not mean unrestricted low-level code. It means each language and subsystem must earn its authority through explicit contracts, constrained boundaries, tests, reports, and status records.

Current Work Areas

Latticra Panel is the GUI-first local installer and first-run control workbench for Latticra, Lat, LIR, Latticra Seal, and the optional Nadia offline AI foundation.

Work area	Current posture	Documentation
Latticra Panel	User-local GUI workbench; guarded install and dry-run flows	installer/README.md, [installer docs](installer/docs/README.md)
Latticra Console	Metadata and command-surface planning; no broad host authority	docs/LATTICRA_CONSOLE_FOUNDATION.md
Latticra Seal	Report-only verification, policy, receipt, and trust-boundary records	docs/latticra-seal/README.md, [Seal contract](docs/LATTICRA_SEAL_CONTRACT.md)
Lat and LIR	Parse, validate, diagnose, and lower metadata; no language execution	[language strategy](docs/LANGUAGE_STRATEGY.md), [Lat pipeline](docs/LAT_PIPELINE_CONTRACT.md), [LIR shape](docs/LIR_SHAPE_CONTRACT.md)
L-UI	Parser, validation, and report/rendering foundations; no terminal-control authority	[L-UI parser](docs/L_UI_PARSER.md), [source grammar](docs/L_UI_SOURCE_GRAMMAR.md), [rendering contract](docs/L_UI_RENDERING_CONTRACT.md)
Nucleus and Runtime Boundary	Report-only task boundaries and denied-by-default classification	[supervisor architecture](docs/SUPERVISOR_ARCHITECTURE.md), [runtime boundary contract](docs/RUNTIME_BOUNDARY_CONTRACT.md)
Nadia offline AI	Stage-46 contract-only local AI foundation records; no model execution or tool authority	[Nadia foundation](docs/NADIA_OFFLINE_AI_FOUNDATION.md), [Nadia status

```
index](docs/status/README.md) |
| Kernel lifecycle research | No-effect lifecycle metadata and scheduler records; no OS
replacement claim | [kernel lifecycle seed](docs/KERNEL_LIFECYCLE_SEED.md), [kernel
summary](docs/KERNEL_LIFECYCLE_SUBSYSTEM_SUMMARY.md) |
| SeaBIOS and GRUB compatibility | User-local installer compatibility boundary; no bootloader,
firmware, partition, or bootable OS claim |
[docs/SEABIOS_GRUB_COMPATIBILITY_CONTRACT.md](docs/SEABIOS_GRUB_COMPATIBILITY_CONTRACT.md) |
| Platform packaging lanes | Local-only validation and package/port drafts |
[Fedora](packaging/fedora/README.md), [Ubuntu](packaging/ubuntu/README.md),
[Debian](packaging/debian/README.md), [openSUSE](packaging/opensuse/README.md),
[FreeBSD](packaging/freebsd/README.md), [OpenBSD](packaging/openbsd/README.md) |
| Security and assurance | Planning baselines and release gates; no production protection claim
| [security policy](SECURITY.md), [high-assurance
baseline](docs/HIGH_ASSURANCE_SECURITY_BASELINE.md), [memory-safety
roadmap](docs/MEMORY_SAFETY_ROADMAP.md) |
```

Current Estimate Table

```
| Estimate source | Current public estimate table below, mirrored from `STATUS.md` and
`docs/status/CURRENT_STATUS.md` |
| --- | --- |
```

Current public estimate table, as summarized by STATUS.md and docs/status/CURRENT_STATUS.md:

```
| Estimate note | Posture |
| --- | --- |
| Current public estimate | Roughly 45% overall system planning estimate |
| Foundation documents and contracts | Mature relative to implementation; around 94% planning
estimate |
| Public documentation posture | Strong but still evolving; around 91% planning estimate |
| Product readiness | Early; no production platform claimed |
| Area | Estimated completion |
| --- | --- |
| Overall Latticra system | 45% |
| Latticra Seal / local evidence layer | 39% |
| Latticra Panel / local control surface | 31% |
| Nadia offline AI foundation | 75% |
| L-UI parser / AST / string foundation | 87% |
| Foundation documents and contracts | 94% |
| Public documentation posture | 91% |
| Strategy/status/funding framework | 63% |
| Lat / Latticra Programming Language | 27% |
| LIR / Intermediate Representation | 24% |
| C/C++ foundation direction | 22% |
| Constrained C++ authority layer | 5% |
| Nucleus real task execution | 12% |
| Runtime / operating-system-universe direction | 26% |
| Security-hardening implementation | 10% |
| Public product readiness | 10% |
```

The current estimate table source alignment is docs/status/CURRENT_ESTIMATE_TABLE_SOURCE_ALIGNMENT.md. The latest mathematical estimate rebase is docs/status/CURRENT_ESTIMATE_MATHEMATICAL_REBASE_2026_05_26.md. The latest estimate refresh record is docs/status/CURRENT_ESTIMATE_REFRESH_2026_05_24.md. The latest estimate hold review is docs/status/COMPLETION_ESTIMATE_REVIEW_AFTER_RUNTIME_BOUNDARY_ABUSE_CASE_FIXTURES.md

Planning estimates are not release promises, product-readiness metrics, or security guarantees.

Boot Compatibility Markers

SeaBIOS and GRUB compatibility is tracked as a contract-only installer readiness surface in docs/SEABIOS_GRUB_COMPATIBILITY_CONTRACT.md.

Boot-preview evidence stays fixture-only and no-effect:

```
docs/SEABIOS_GRUB_BOOT_PREVIEW_EVIDENCE_CONTRACT.md
```

```
docs/SEABIOS_GRUB_BOOT_PREVIEW_PREFLIGHT.md
docs/SEABIOS_GRUB_BOOT_PREVIEW_EVIDENCE_CAPTURE_TEMPLATE.md
docs/SEABIOS_GRUB_BOOT_PREVIEW_EVIDENCE_VALIDATION.md
docs/SEABIOS_GRUB_BOOT_PREVIEW_QEMU_ARGV_TEMPLATE.md
docs/SEABIOS_GRUB_BOOT_PREVIEW_BOOT_ARTIFACT_MANIFEST_TEMPLATE.md
docs/SEABIOS_GRUB_BOOT_PREVIEW_BOOT_ARTIFACT_MANIFEST_VALIDATION.md
installer/manifests/seabios-grub-boot-preview.toml
scripts/seabios-grub-boot-preview-preflight.sh
scripts/seabios-grub-boot-preview-evidence-template.sh
scripts/seabios-grub-boot-preview-evidence-validate.sh
scripts/seabios-grub-boot-preview-qemu-argv-template.sh
scripts/seabios-grub-boot-preview-boot-artifact-manifest-template.sh
scripts/seabios-grub-boot-preview-boot-artifact-manifest-validate.sh
test-seabios-grub-boot-preview-evidence-contract.sh
test-seabios-grub-boot-preview-preflight.sh
test-seabios-grub-boot-preview-evidence-template.sh
test-seabios-grub-boot-preview-evidence-validate.sh
test-seabios-grub-boot-preview-qemu-argv-template.sh
test-seabios-grub-boot-preview-boot-artifact-manifest-template.sh
test-seabios-grub-boot-preview-boot-artifact-manifest-validate.sh
```

Runtime Boundary Markers

Runtime boundary abuse-case fixtures remain no-effect planning evidence:

```
runtime_boundary_abuse_case_fixture_expansion_present=1
docs/RUNTIME_BOUNDARY_ABUSE_CASE_FIXTURES_AFTER_POLICY_EXPANSION.md
```

Nadia README Compatibility Markers

These compact markers preserve the guarded Nadia README/status-row assertions after the README route refresh. They are documentation alignment evidence only; they do not add model execution, prompt evaluation, dialogue generation, runtime invocation, tool execution, source mutation, network authority, or production AI claims.

```
| Nadia offline AI foundation | 75% |
Nadia Offline AI
Nadia Murad
nadia_offline_ai_stage_0_foundation_present=1
installed_command=latticra-nadia
nadia_stage_46_contract_only_foundation_present=1
nadia_stage_32_prompt_evaluation_result_review_contract_present=1
latticra-nadia prompt-evaluation-result-review
nadia_stage_33_prompt_evaluation_result_disposition_contract_present=1
latticra-nadia prompt-evaluation-result-disposition
```

Seal README Compatibility Markers

These compact markers preserve the guarded Seal README/status-row assertions after the README route refresh. They are documentation alignment evidence only; they do not add runtime authority, host behavior, network behavior, policy enforcement, capability enforcement, cryptographic enforcement, signing, or tool execution.

```
| Latticra Seal | Report-only runtime gate path, sealed report-envelope metadata/status,
signature/signing/key/public-key/bounded-key parsing metadata/status, metadata-only verification
 policy/status, metadata-only verification receipt/status, metadata-only unverified
receipt/status, metadata-only denied capability gate/status, metadata-only denied effect
decision/status, inactive metadata-only runtime handoff/status, metadata-only status
rollup/status, report-only agentic automation security metadata/status/report
surface/public-entrypoint alignment, report-only parameter schema metadata/report
surface/status-public-entry alignment, report-only policy decision
metadata/status/report-surface public-entry alignment, and core negative-test evidence for
AI-era tool-boundary planning; no production enforcement |
Trust-boundary, request-boundary, policy-boundary, tool-boundary, and crypto-profile planning.
```

openSUSE integration and maintenance

openSUSE prerequisites: this lane has the same purpose as the Fedora and Ubuntu tracks, but stays local-only for openSUSE RPM integration and maintenance. It records package-shape, lint, source archive, build-gate, environment, artifact, payload, install/remove, and OBS non-claim evidence without creating RPM artifacts, running OBS publication, or claiming an official openSUSE package.

Primary records:

```
docs/OPENSUSE_DEVELOPER_WORKFLOW.md
docs/OPENSUSE_READINESS_PLAN.md
docs/OPENSUSE_LOCAL_RPM_STATIC_VALIDATION.md
docs/OPENSUSE_RPMLINT_OSC_AVAILABILITY.md

Seal Status Markers

This compact marker appendix preserves the guarded Seal status-chain assertions used by the local status scripts after the README route refresh. These markers are status evidence only; they do not add runtime authority, host behavior, network behavior, policy enforcement, capability enforcement, cryptographic enforcement, or tool execution.

```

seal_local_capability_registry_schema_implementation_present=1
local capability registry schema implementation preserves no registry loader, no file reads, no
host behavior, no network behavior, no capability enforcement, no effects, and no runtime
authority
docs/LATTICRA_SEAL_LOCAL_CAPABILITY_REGISTRY_SCHEMA_IMPLEMENTATION.md
```

Fast Local Path

Use the Quick Start Cheat Sheet for full prerequisites and cleanup commands. The shortest guarded flow from a checkout is:

```
make -C installer dry-run
make -C installer local-example
make -C installer verify-local
latticra-panel
```

Useful local commands after install:

```
latticra status
latticra path
latticra seal report
latticra lc status
nadia commands
latticra-nadia commands
```

It is intentionally user-local. It does not use root authority, kernel mutation, systemd mutation, SELinux mutation, or network authority.

SeaBIOS and GRUB compatibility is tracked as a no-effect readiness contract in docs/SEABIOS_GRUB_COMPATIBILITY_CONTRACT.md; it does not grant bootloader write, firmware mutation, partition mutation, or bootable OS authority.

When a Panel specification changes, users can remove the managed local install before reinstalling:

```
make -C installer reset-dry-run
make -C installer reset-local
make -C installer uninstall-dry-run
make -C installer uninstall-local
latticra reset --dry-run
latticra reset
latticra uninstall --dry-run
latticra uninstall
```

Reset and uninstall remove the same managed artifacts: command wrappers, the Panel desktop entry, known Panel icons, and the guarded local prefix.

If LC was installed with a custom lc.install.command_wrapper, set LC_WRAPPER to that command name; the default is latticra-lc.

```
LC_WRAPPER=&quot;${LC_WRAPPER:-latticra-lc}&quot;
$HOME/.local/bin/$LC_WRAPPER
```

Installed LC wrapper path: ~/.local/bin/<lc.install.command_wrapper> (default: latticra-lc; when LC wrapper enabled).

Quality gates:

```
make quality-safety-guards
make quality-packaging-static
make quality
```

- macOS installer lane

```
| macOS installer lane | Mac-specific no-effect installer path exists |
```

macOS installer lane

The macOS installer lane targets macOS infrastructure specifically. It is a guarded no-effect route for installer planning, dry-run bundle shape checks, reset/uninstall denial handling, and status evidence only. It cannot yet create, install, sign, notarize, open, verify, reset, or uninstall a real macOS .app.

```

Repository Map

Path	Purpose
`docs/`	Documentation hub, foundation records, status, architecture, public site pages, and subsystem records
`installer/`	Latticra Panel, guarded local install flows, installer docs, and evidence surfaces
`src/`, `include/`, `tests/`	C/C++ implementation, headers, and deterministic tests
`scripts/`	Guard scripts, no-effect validation lanes, package checks, and report runners
`packaging/`	Local-only Fedora, Ubuntu, Debian, openSUSE, FreeBSD, and OpenBSD package/port draft records
`examples/`, `fixtures/`	Input samples, fixtures, and validation material
`assets/`, `docs/assets/`	Project and documentation visual assets

Boundaries

Latticra should be read as evidence-bound foundation work. Current documentation may describe future directions, but future directions are not product claims.

Do not interpret the repository as claiming:

- production runtime enforcement
- host protection, malware prevention, or ransomware prevention
- kernel, systemd, SELinux, secure boot, or root authority
- production cryptography or key-management readiness
- distribution approval or archive readiness
- bootable OS, daily-driver OS, or operating-system replacement readiness

Development Rhythm

Before changing public claims, read Documentation Maintenance, Documentation Validation Playbook, and Documentation Drift Response Playbook.

Before changing code behavior, find the relevant contract or implementation record in the Foundation Index, update the status path if the posture changes, and run the guard script named by that record.

Canonical quality commands:

```
make quality
make quality-safety-guards
make quality-packaging-static
```

Security, License, and Support

Security reports belong in the private reporting path described in SECURITY.md. Public reports should not include exploit details, secrets, or destructive reproduction steps.

License and third-party material guidance is tracked in LICENSE, LICENSES/README.md, docs/LICENSE_POLICY.md, and TRADEMARK_POLICY.md.

For support, start with the documentation routes above. The project is early-stage and does not promise production support, response-time SLAs, package support, or security support beyond best-effort review.

STATUS.md

Source title: Latticra Status

```

Current high-level estimate

```
| Area | Estimated completion |
| --- | ---: |
| Overall Latticra system | 45% |
| Latticra Seal / local evidence layer | 39% |
| Latticra Panel / local control surface | 31% |
| Nadia offline AI foundation | 75% |
| L-UI parser / AST / string foundation | 87% |
| Foundation documents and contracts | 94% |
| Public documentation posture | 91% |
| Strategy/status/funding framework | 63% |
```

```
| Lat / Latticra Programming Language | 27% |
| LIR / Intermediate Representation | 24% |
| C/C++ foundation direction | 22% |
| Constrained C++ authority layer | 5% |
| Nucleus real task execution | 12% |
| Runtime / operating-system-universe direction | 26% |
| Security-hardening implementation | 10% |
| Public product readiness | 10% |
```

These percentages are planning estimates only. They are not release promises, production-readiness metrics, security guarantees, Fedora approval claims, Debian archive claims, FreeBSD ports-tree claims, OpenBSD ports-tree claims, runtime-enforcement claims, or operating-system completeness claims.

Current direction checkpoint

```
C is the metal.
C++ is the disciplined structure.
Latticra is the contract.
```

Completion estimate review only if capability posture changes remains the estimate rule after this non-change review.

Current Seal crypto verify backend boundary

The Seal crypto verify backend status record makes the existing metadata-only backend implementation visible from public entry points while preserving unsupported cryptographic verification and no authority.

Current crypto verify backend fields:

```
seal_crypto_verify_backend_contract_present=1
seal_crypto_verify_backend_implementation_present=1
seal_crypto_verify_backend_status_present=1
crypto_verify_state=unsupported
cryptographic_verification_supported=0
cryptographic_verification_performed=0
verified=0
authority_usable=0
capability_gate_allowed=0
runtime_authority_granted=0
real_cryptographic_verification_added=0
```

Current Seal Ed25519 verify-only boundary

The Seal Ed25519 verify-only status record makes the existing local provider-backed verification result surface visible from public entry points while preserving authority-neutral behavior and no production cryptography claim.

Current Ed25519 verify-only fields:

```
seal_ed25519_verify_only_contract_present=1
seal_ed25519_verify_implementation_present=1
seal_ed25519_verify_status_present=1
ed25519_verify_profile=latticra-seal-ed25519-verify/0.1
ed25519_cryptographic_verification_performed=1
ed25519_authority_usable=0
crypto_verify_state=verified
cryptographic_verification_supported=1
```

```
cryptographic_verification_performed=1
verified=1
authority_usable=0
capability_gate_allowed=0
runtime_authority_granted=0
implementation_behavior_changed=0
signing_added=0
key_generation_added=0
private_key_handling_added=0

revocation_lookup_added=0
network_behavior_changed=0
host_behavior_changed=0
capability_enforcement_added=0
effect_execution_added=0
production_cryptography_claimed=0
estimate_adjustment_required=0
```

Current Seal verified receipt promotion boundary

The Seal verified receipt promotion status record makes the existing metadata promotion surface visible from public entry points while preserving authority-neutral behavior and no capability authorization.

Current verified receipt promotion fields:

```
seal_verified_receipt_promotion_contract_present=1
seal_verified_receipt_promotion_implementation_present=1
seal_verified_receipt_promotion_status_present=1
receipt_profile=latticra-seal-verified-receipt/0.1
verify_profile=latticra-seal-ed25519-verify/0.1
verification_state=verified
receipt_state=verified
verified_receipt_promotion_cryptographic_verification_performed=1

cryptographic_verification_supported=1
cryptographic_verification_performed=1
verified=1
authority_usable=0
capability_gate_allowed=0
runtime_authority_granted=0
capability_authorization_added=0
effect_execution_added=0
signing_added=0
key_generation_added=0
private_key_handling_added=0
trust_store_behavior_added=0
revocation_lookup_added=0
network_behavior_changed=0
host_behavior_changed=0
estimate_adjustment_required=0
```

Current Seal crypto graduation gate boundary

The Seal crypto graduation gate status record makes the existing local Ed25519 verify-only result and verified receipt promotion pass through explicit standards expectations while preserving authority-neutral behavior and no production cryptography claim.

Current crypto graduation gate fields:

```
seal_crypto_graduation_gate_present=1
crypto_graduation_profile=latticra-seal-crypto-graduation-gate/0.1
assurance_baseline_profile=latticra-cryptographic-assurance-key-management/0.1
verify_profile=latticra-seal-ed25519-verify/0.1
receipt_profile=latticra-seal-verified-receipt/0.1
signature_algorithm=Ed25519-development
message_digest_algorithm=SHA-256
provider_backed_verification_required=1

key_generation_allowed=0
key_storage_allowed=0
authority_promotion_allowed=0
capability_gate_allowed=0
runtime_authority_granted=0
gate_state=graduated-authority-neutral
```

Current Seal verified capability gate boundary

The Seal verified capability gate status record makes the existing metadata-only gate evaluation visible from public entry points while preserving no capability enforcement, no effect execution, and no runtime authority. The stricter entry point now requires a passing crypto graduation gate before recording the same metadata-only allowance.

Current verified capability gate fields:

```
seal_verified_capability_gate_contract_present=1
seal_verified_capability_gate_implementation_present=1
seal_verified_capability_gate_status_present=1
gate_profile=latticra-seal-verified-capability-gate/0.1
receipt_profile=latticra-seal-verified-receipt/0.1
verify_profile=latticra-seal-ed25519-verify/0.1
crypto_graduation_gate_present=1
crypto_graduation_gate_passed=1
standard_expectations_met=1
local_verify_graduated=1
receipt_promotion_graduated=1
authority_promotion_allowed=0
requested_capability=verified-receipt-report
requested_effect=report-only
verified_capability_gate_allowed=1
verified_capability_gate_state=allowed-metadata-only
verified_capability_gate_runtime_authority_granted=0
runtime_authority_granted=0

host_read_performed=0
host_write_performed=0
network_performed=0
capability_enforcement_added=0
effect_execution_added=0
signing_added=0
key_generation_added=0
private_key_handling_added=0
trust_store_behavior_added=0
revocation_lookup_added=0
network_behavior_changed=0
host_behavior_changed=0
estimate_adjustment_required=0
```

Current Seal verified effect decision boundary

The Seal verified effect decision status record makes the existing metadata-only effect classification visible from public entry points while preserving no effect execution, no capability enforcement, and no runtime authority.

Current verified effect decision fields:

```
seal_verified_effect_decision_contract_present=1
seal_verified_effect_decision_implementation_present=1
seal_verified_effect_decision_status_present=1
decision_profile=latticra-seal-verified-effect-decision/0.1
gate_profile=latticra-seal-verified-capability-gate/0.1
requested_capability=verified-receipt-report
requested_effect=report-only
verified_effect_decision_crypto_graduation_gate_present=1
verified_effect_decision_crypto_graduation_gate_passed=1
verified_effect_decision_standard_expectations_met=1
verified_effect_decision_authority_promotion_allowed=0
verified_effect_decision_allowed=1
```

```
verified_effect_decision_state=allowed-report-only
verified_effect_decision_effect_performed=0
verified_effect_decision_runtime_authority_granted=0
effect_allowed=1
effect_performed=0
runtime_authority_granted=0
host_read_performed=0
host_write_performed=0
network_performed=0
effect_execution_added=0
capability_enforcement_added=0
estimate_adjustment_required=0
```

Current Seal runtime handoff evaluation boundary

The Seal runtime handoff evaluation status record makes the existing metadata-only handoff eligibility classification visible from public entry points while preserving no runtime handoff execution, no effect execution, no capability enforcement, and no runtime authority.

Current runtime handoff evaluation fields:

```
seal_runtime_handoff_evaluation_contract_present=1
seal_runtime_handoff_evaluation_implementation_present=1
seal_runtime_handoff_evaluation_status_present=1
handoff_profile=latticra-seal-runtime-handoff-evaluation/0.1
decision_profile=latticra-seal-verified-effect-decision/0.1
requested_capability=verified-receipt-report
requested_effect=report-only
requested_handoff=report-only
runtime_handoff_evaluation_crypto_graduation_gate_present=1
runtime_handoff_evaluation_crypto_graduation_gate_passed=1
runtime_handoff_evaluation_standard_expectations_met=1
runtime_handoff_evaluation_authority_promotion_allowed=0
runtime_handoff_evaluation_eligible=1
runtime_handoff_evaluation_state=eligible-report-only

Current Seal request freshness predecessor status boundary

The Seal request freshness predecessor status alignment ties the existing report-only request freshness status record to the guarded parameter schema status predecessor while preserving no timestamp parsing, no trusted clock behavior, no nonce storage, no replay-cache storage, no context hashing, no parameter hashing, no freshness validation, no replay detection, no signature verification, no signed request enforcement, no policy evaluation, no policy enforcement, no runtime execution, no runtime authority, no effect execution, no capability enforcement, no cryptographic verification, no host behavior, no network behavior, and no production enforcement claim.

Current request freshness predecessor status fields:

```

Current Seal core evidence boundary

The Seal core evidence status surface is now public-entrypoint visible.

It records a report-only runtime gate path with core negative-test evidence for AI-era tool-boundary planning. The latest Seal status/public-entry slice makes the report-only policy decision metadata and deterministic policy decision report surface visible from public status surfaces while preserving no real policy evaluation, no policy enforcement, no runtime execution, no effect execution, no capability enforcement, no cryptographic verification, no signature verification, no freshness validation, no replay detection, no signing, no host behavior, no network behavior, no MCP behavior, no AI agent execution, no model execution, no tool execution, no shell execution, or runtime authority.

The Seal README status row alignment now keeps the compact README Seal row and Seal current-posture summary aligned with the current status checkpoint without changing implementation behavior, production enforcement, public readiness, security hardening, completion estimates, or runtime authority.

Current status fields:

Current runtime boundary policy expansion boundary

Runtime boundary policy expansion after threat-model validation is now documented and guarded as a policy/evidence map. It expands request-family, effect, authority-prerequisite, future-gate, abuse-case, and evidence-gap mapping without changing runtime implementation behavior.

Current runtime boundary policy expansion fields:

```
runtime_boundary_policy_expansion_after_threat_model_present=1

host_behavior_changed=0
network_behavior_changed=0
mcp_behavior_changed=0
runtime_authority_granted=0
completion_estimate_review_required=0
```

Current completion estimate review boundary

Completion estimate review after runtime-boundary abuse-case fixtures confirms that the latest fixture/evidence slice improves denied-case coverage without changing capability posture, implementation behavior, public readiness, security hardening, product readiness, or runtime authority.

Completion estimate review README/status alignment makes the latest estimate hold review discoverable from README and status entry points without changing capability posture, implementation behavior, public readiness, security hardening, product readiness, completion estimates, or runtime authority.

The current high-level estimate table above is the live reader-facing estimate source. Dated review records remain slice-specific evidence records and may preserve the estimate snapshot that applied when that review was written.

Current estimate mathematical rebase records the live table as a weighted planning estimate after recent guarded Seal, Ubuntu, macOS, Nadia, Lat/LIR, kernel lifecycle, and public-entry alignment work. It changes the planning estimate table only; it does not change implementation behavior, security posture, public readiness, product readiness, runtime enforcement, or runtime authority.

Current completion estimate review fields:

```
current_estimate_table_source_alignment_present=1
current_estimate_mathematical_rebase_present=1

production_readiness_claimed=0
runtime_authority_granted=0
estimate_adjustment_required=0
completion_estimate_review_required=0
```

Current runtime boundary domain matrix report boundary

The runtime boundary domain matrix now has deterministic report rendering for domain-matrix cell, domain label, known/operational/declarative/future-gated flags, effect-allowed status, authority-available status, and evidence level.

Current Lat pipeline diagnostic boundary

The Lat pipeline now has a companion diagnostic integration surface that combines pipeline error/stage state with parser line-comment count and first-comment span metadata, Lat semantic diagnostic class, semantic error, diagnostic count, first-diagnostic indices, model-stage classification, optional Lat-to-LIR lowering diagnostic metadata, first lowered declaration metadata, and first lowered clause metadata while preserving no-execution behavior. The companion diagnostic integration is now covered by both the focused guard and the main Lat pipeline test runner.

Current runtime boundary domain matrix boundary

The runtime boundary now has a companion domain matrix evaluator for classifying resolved boundary domains as declarative, operational, future-gated, blocked, invalid, or unknown.

Current LIR boundary

The LIR layer now reports deterministic report classification, graph-shape labels, edge-kind summary counts, no-effect-chain status, and evidence level while preserving lowering outcomes and non-execution behavior.

Current Lat semantic boundary

Lat semantic validation now reports deterministic diagnostic classes, diagnostic category counters, first-diagnostic declaration and clause indices, and expanded report fields while preserving validation outcomes and no-effect behavior.

Current Lat grammar boundary

Lat grammar parsing now reports deterministic first declaration, first clause, and line-comment metadata from successful AST parses while preserving no-effect parsing behavior and avoiding operator evaluation. Line comments remain metadata-only, may contain otherwise forbidden behavior-marker words, and do not grant execution authority. Block-comment openers outside strings and line comments now fail deterministically with unsupported_block_comment.

Current Lat model normalization boundary

Lat now has a bounded no-effect normalized model layer after semantic validation. It builds typed declaration and clause index tables for states, policies, transitions, assertions, and effect declarations, resolves transition source-state metadata, preserves first normalized declaration metadata and first-clause role/effect/name/operator/value report metadata, preserves source spans and no-effect flags, and emits deterministic reports without reading source bytes or adding execution.

Current Nucleus task boundary

The Nucleus task layer remains no-effect and denied-by-default. It now reports explicit task report classification, task-domain labels, authorization-state labels, prerequisite status, no-effect-chain status, report-alignment status, no-effect-policy status, representation-gate status, execution status, effect status, and runtime status while preserving non-execution behavior.

Current project notes boundary

The project-notes surfaces now reflect the Nucleus task report-only execution README/status alignment and keep completion-estimate review conditional on capability posture changes.

Current announcement boundary

The Nucleus report-only announcement review confirms that no separate public announcement is needed because the recent Nucleus report-only and project-notes slices were documentation/status alignment only and did not change capability posture.

Current README/project-notes alignment boundary

The Nucleus report-only announcement README alignment makes the no-new-announcement review discoverable from README and the project-notes index without adding a public announcement entry or changing implementation behavior.

Current project-notes status/index boundary

The project notes Nucleus announcement README status/index check verifies that the project-note body alignment after the Nucleus announcement README alignment is represented from root status, the status index, and the foundation index without changing implementation behavior or completion estimates.

Current runtime boundary refinement boundary

The runtime boundary now carries no-effect Lat pipeline evidence, Lat pipeline first-clause evidence, Lat pipeline first-declaration evidence, Lat pipeline module/count evidence, Lat pipeline stage-summary evidence, Lat pipeline line-comment count and first-comment span evidence, Lat-specific LIR module-summary evidence, Lat-specific LIR source-span evidence, Lat-specific LIR node-kind evidence, Lat-specific LIR first-node evidence, Lat-specific LIR first-node span evidence, Lat-specific LIR first transition-node evidence, Lat-specific LIR first transition-node span evidence, Lat-specific LIR first-edge evidence, Lat-specific LIR first-edge span evidence, Lat-specific LIR first transition-source edge evidence, Lat-specific LIR first transition-source edge endpoint evidence, Lat-specific LIR first transition-source edge span evidence, Lat-specific LIR no-effect flag evidence, and Lat-specific LIR edge-kind evidence in records and reports. It also reports explicit classification, boundary-domain, authorization-state, evidence-level, and policy-matrix fields for runtime-boundary requests while preserving disabled-by-default behavior and future-gated execution requests.

Current Lat pipeline boundary

Lat now has a bounded no-effect path from source bytes through grammar parsing, semantic validation, model normalization, Lat-to-LIR lowering, and deterministic pipeline reporting.

The current pipeline implementation composes existing parser, semantic, model normalization, lowering, and LIR metadata outputs. It preserves no-effect flags and produces a LAT PIPELINE REPORT without executing Lat or LIR.

The Lat pipeline report now includes deterministic stage-summary metadata for last completed stage, failed stage, per-stage OK flags, model normalization status, no-effect-chain status, evidence level, parser line-comment count plus first-comment span metadata, first lowered declaration kind/name/source/index/clause metadata, and first lowered clause role/effect/name/operator/value/node metadata.

Current Lat-specific LIR refinement boundary

Lat-to-LIR lowering now emits explicit Lat declaration nodes and an explicit transition-source edge. This makes Lat state, policy, transition, assertion, requirement, and effect-declaration metadata visible inside the LIR shape while preserving the no-effect boundary.

Current Lat-to-LIR lowering boundary

Lat now has a bounded no-effect path from parser metadata through semantic validation and model normalization into LIR metadata.

The current lowering implementation consumes normalized Lat model metadata directly, creates a lat_module LIR module shape, preserves source spans, no-effect flags, model counts, first lowered declaration metadata, and transition source indices, and emits deterministic lowering reports. The parser-plus-semantic entry point remains available as a compatibility wrapper.

The Lat-to-LIR diagnostic refinement classifies lowering outcomes as valid, parse, semantic, model, effect-check, capacity, LIR, or internal, and emits deterministic diagnostic reports without changing lowering behavior.

The Lat-to-LIR diagnostic declaration metadata integration copies first lowered declaration node index, kind, name, source name, parse index, first-clause index, clause count, and source declaration index into deterministic diagnostic reports without evaluating operators.

The Lat-to-LIR diagnostic clause metadata integration copies first lowered clause node index, role, effect, name, operator, and value into deterministic diagnostic reports without evaluating operators.

The Lat pipeline diagnostic integration now has a lowering-aware evaluator that can copy parser line-comment count and first-comment span metadata, Lat-to-LIR diagnostic class, lowering error, model error, LIR error, model counts, transition source metadata, first lowered declaration metadata, first lowered clause metadata, and failure flags into the pipeline diagnostic report.

The Lat-to-LIR clause metadata refinement preserves clause operators in LIR node metadata and reports the first lowered clause role, effect, name, operator, value, and node index without evaluating operators or adding execution.

Boundary terms tracked by the project status guard:

```
runtime behavior
command execution
effect-performing implemented C++ authority layer
```

Non-claims

This status file is a public shortcut. Detailed non-claims are maintained in docs/status/CURRENT_STATUS.md and docs/FOUNDATION_INDEX.md.

SECURITY.md

Source title: Security Policy

Lines: 204 | Words: 1532 | SHA-256: 632e658b134348e8b61259c7805655869ce531b65d94191b8c2899e2021b156e

Security Policy

Project status

Latticra is an early-stage systems architecture and language implementation project.

It is not currently a finished operating system, hardened sandbox, production runtime, installer, recovery writer, hardware mutation tool, server agent, or security boundary.

Security-related work in this repository should remain evidence-bound:

```
no claim without evidence
no execution before a contract
no mutation before visibility
no hardware effect before an explicit gate
no recovery behavior before rollback and failure behavior are documented
```

Supported versions

Latticra does not currently publish stable production releases.

Security reports should target the current main branch unless a maintainer explicitly identifies another supported branch or release line.

```
| Version or branch | Supported |
| --- | --- |
| `main` | Best-effort security review |
| Active feature/design branches | Best-effort while active |
| Tags/releases | Not security-supported unless explicitly marked |
```

Reporting a vulnerability

Please do not publish exploit details in a public issue, pull request, discussion, social post, or comment thread.

Preferred reporting path:

1. Use GitHub private vulnerability reporting or the repository security advisory flow if available.

2. If a private reporting path is not available, open a minimal public issue that says only that you need a private security contact path. Do not include exploit details, proof-of-concept payloads, secrets, or reproduction steps in that public issue.

A useful private report should include:

- affected file, component, or document;

- whether the issue is in code, tests, documentation, CI, or a claim boundary;

- clear reproduction steps, when safe to share privately;

- expected behavior;

- observed behavior;

- potential impact;

- whether the issue requires local access, malformed input, repository write access, CI access, network access, or hardware access;

- suggested fix, if known.

Vulnerability scope

Reports are in scope when they involve:

- parser memory safety risk;

- unchecked buffer behavior;

- malformed L-UI source handling;
- source-span or diagnostic confusion that could hide rejected behavior;
- CI or test gaps that allow unsupported behavior to appear accepted;
- documentation that overstates security maturity;
- repository workflow behavior that could expose secrets or unsafe automation;
- future server, update, recovery, hardware, or execution code once such code exists.

Reports are also welcome when they identify a mismatch between an implementation and a merged contract.

Currently out of scope

The following are usually out of scope unless they reveal a concrete security issue in this repository:

- requests for production hardening of unfinished features;
- claims that Latticra is not a complete operating system, because that is already a documented non-claim;
- issues in third-party tools not controlled by this repository;
- social engineering against maintainers or users;
- denial-of-service against GitHub, CI providers, package registries, or unrelated infrastructure;
- attacks against systems you do not own or have explicit permission to test.

Safe testing rules

Security testing must be limited to code, files, and systems you own or have explicit permission to test.

Do not:

- run destructive tests against third-party systems;
- attempt unauthorized access;
- exfiltrate data;
- publish secrets;
- test against unrelated production services;
- submit payloads designed to damage a maintainer's system;
- use Latticra security reports to coordinate malware, ransomware, credential theft, botnets, persistence, evasion, or unauthorized exploitation.

For parser and source-handling reports, prefer minimal local fixtures and deterministic reproduction steps.

Disclosure expectations

Maintainers will make a best-effort attempt to:

1. acknowledge private reports;
2. assess whether the report is security-relevant;
3. create or update a contract when the security boundary is unclear;
4. add tests before or alongside fixes;

5. avoid overstating the maturity of the fix;
6. credit reporters when appropriate and requested.

No response-time SLA is promised at this stage.

Security boundaries and non-claims

Latticra currently does not claim to provide:

- kernel isolation;
- hardened sandboxing;
- privilege separation;
- malware containment;
- ransomware prevention;
- secure boot;
- secure update delivery;
- hardware recovery safety;
- production-ready cryptography;
- production server security;
- operating-system completeness.

If future work introduces any of these areas, it should first receive a contract, tests, documentation, and explicit non-claims before being treated as security-relevant capability.

Secrets and sensitive data

Do not include real secrets in issues, pull requests, tests, fixtures, screenshots, logs, or documentation.

Examples of secrets and sensitive data include:

- API keys;
- tokens;
- passwords;
- private keys;
- recovery phrases;
- session cookies;
- personal identifying information;
- private infrastructure details;
- exploit details for unpatched third-party systems.

If a secret is accidentally committed, assume it is compromised and rotate it immediately.

Security development principles

Security-relevant changes should prefer:

- small, reviewable diffs;
- explicit contracts before implementation;

- deterministic tests;
- no-effect defaults;
- fail-closed behavior;
- stable diagnostics;
- source-span clarity;
- explicit non-claims;
- clear rollback or failure behavior when mutation is ever introduced.

High-assurance standards posture

The current high-assurance standards checkpoint is recorded in docs/HIGH_ASSURANCE_SECURITY_BASELINE.md.

That baseline tracks current NSA, CISA, FBI, and NIST security guidance as source input for Latticra security work. It requires memory-safety roadmap discipline, zero-trust runtime-boundary prerequisites, SSDF-style secure development evidence, CPG-inspired operational readiness gates, KEV-aware release review, SBOM evidence before production installer claims, a FIPS 140-3 cryptographic module boundary decision before any production cryptography claim, identity/access evidence before privileged or remote access claims, logging/detection evidence before hosted-service or monitoring claims, recovery evidence before backup, restore, rollback, failover, or continuity claims, and secure configuration/change-control evidence before hosted-service or hardening claims.

The component-level memory-safety roadmap is recorded in docs/MEMORY_SAFETY_ROADMAP.md.

The supply-chain security baseline is recorded in docs/SUPPLY_CHAIN_SECURITY_BASELINE.md.

The zero-trust runtime authority baseline is recorded in docs/ZERO_TRUST_RUNTIME_AUTHORITY_BASELINE.md.

It requires caller identity, resource identity, per-request authorization, least-privilege effect scope, policy decision visibility, denial reason visibility, and audit records before any future runtime authority is considered. Operator confirmation remains metadata-only and must not override denied effects.

The cyber incident reporting and response baseline is recorded in docs/CYBER_INCIDENT_REPORTING_RESPONSE_BASELINE.md.

It documents CISA, FBI, IC3, and joint #StopRansomware reporting paths, evidence-preservation requirements, out-of-band communication expectations, and the future gates required before any incident-response or report-assistance feature exists. Latticra does not report incidents, notify customers, contact law enforcement, collect forensic evidence, or provide incident-response services.

The vulnerability management release gate baseline is recorded in docs/VULNERABILITY_MANAGEMENT_RELEASE_GATE_BASELINE.md.

It keeps release claims blocked until vulnerability source review, KEV/NVD review, disclosure path evidence, exception ownership, exception expiration, and non-exploitability evidence are recorded. Latticra does not publish security advisories, submit CVEs, generate SBOMs, claim vulnerability-free status, or authorize production releases.

The cryptographic assurance and key management baseline is recorded in docs/CRYPTOGRAPHIC_ASSURANCE_KEY_MANAGEMENT_BASELINE.md.

It keeps cryptographic claims blocked until module boundaries, algorithm and parameter inventory, key lifecycle, key storage, key destruction, randomness, self-tests, sensitive-data handling, post-quantum migration planning, and FIPS/CMVP claim gates are recorded. Latticra does not implement production cryptography, signing authority, key storage, key generation, entropy collection, random-bit generation, FIPS validation, CMVP submission, CAVP testing, or post-quantum migration.

The identity, credential, and access management baseline is recorded in docs/IDENTITY_CREDENTIAL_ACCESS_MANAGEMENT_BASELINE.md.

It keeps hosted service, remote access, privileged operator, SSO/federation, MFA, and identity-security claims blocked until human/service/machine identity inventory, phishing-resistant MFA planning, account lifecycle, privileged role mapping, break-glass policy, credential handling, identity logging, and access-exception evidence are recorded. Latticra does not implement an identity provider, MFA provider, remote login, account database, credential store, hosted administration surface, or privileged access authority.

The security logging, monitoring, and detection baseline is recorded in docs/SECURITY_LOGGING_MONITORING_BASELINE.md.

It keeps production monitoring, SIEM integration, telemetry export, log collection, hosted service, and detection-service claims blocked until event-source inventory, audit-event selection, log schema, runtime decision events, denial reason events, identity/access events, privileged-action events, redaction, integrity, retention, disposal, time-source, triage, and incident-handoff evidence are recorded. Latticra does not implement a log collector, SIEM, telemetry export, host sensor, network sensor, alerting service, detection rule, log storage service, or monitoring authority.

The backup, recovery, and cyber resilience baseline is recorded in docs/BACKUP_RECOVERY_RESILIENCE_BASELINE.md.

It keeps backup, restore, rollback, failover, disaster-recovery, ransomware-recovery, hosted-service recovery, and continuity claims blocked until critical asset inventory, restore ordering, RTO/RPO, backup scope, backup integrity verification, restore testing, clean recovery environment planning, recovery authorization, recovery communications, incident handoff, and lessons-learned evidence are recorded. Latticra does not implement backup creation, backup storage, restore execution, rollback execution, failover, disaster recovery, recovery orchestration, continuity operations, or recovery authority.

The secure configuration and change management baseline is recorded in docs/SECURE_CONFIGURATION_CHANGE_MANAGEMENT_BASELINE.md.

It keeps secure-default, configuration hardening, configuration scanning, drift-detection, infrastructure-as-code, hosted-service configuration, and production configuration claims blocked until configuration item inventory, secure baseline configuration, checklist evidence, default-credential absence review, approved change record, risk review, test evidence, rollback plan, drift-detection plan, secret review, configuration-change logging, and exception ownership are recorded. Latticra does not implement host configuration mutation, infrastructure configuration mutation, configuration enforcement, configuration scanning, drift detection, change approval workflow, rollback execution, or configuration authority.

This posture is an allocation of required work, not a compliance claim. It does not certify Latticra, accredit Latticra, make Latticra a production security product, or create a hardened runtime boundary.

Contact and attribution

Use GitHub private vulnerability reporting or the repository security advisory flow when available.

If public contact is the only available path, open a minimal public issue requesting a private security contact and wait for maintainer direction before sharing details.

CONTRIBUTING.md

Source title: Contributing to Latticra

Lines: 124 | Words: 383 | SHA-256: fedf2b222a95e7f14bb23276bd30179272aca612621dc9372fd25e90ae712b72

Contributing to Latticra

Status: active contribution policy

Purpose

Latticra welcomes contributions that support an open, auditable, transparent systems project.

Contributions should preserve the project direction:

```
open source
auditable
transparent
security-conscious
evidence-bound
community-improvable
```

License expectation

Contributions are accepted under the license declared by the files being modified.

New core software source files should use:

```
SPDX-License-Identifier: AGPL-3.0-or-later
```

New SDK, example, packaging-helper, installer-glue, and integration-helper source files should use:

```
SPDX-License-Identifier: Apache-2.0
```

New documentation files may use:

```
SPDX-License-Identifier: CC-BY-4.0
```

These expectations are documented in:

```
docs/OPEN_ECOSYSTEM_POLICY.md
docs/LICENSE_POLICY.md
docs/DOCUMENTATION_LICENSE.md
```

New software source files should include an SPDX license identifier unless a documented exception exists.

No proprietary relicensing CLA

This project does not adopt a proprietary relicensing contributor license agreement through this policy.

By contributing, contributors represent that they have the right to submit the contribution under the applicable project license terms.

Developer Certificate of Origin direction

The project intends to use a Developer Certificate of Origin style contribution model.

A follow-up slice may add a formal Signed-off-by requirement and DCO guard.

Contribution quality

Contributions should be:

```
small enough to review
tested or guarded
evidence-bound
clear about effect boundaries
```

```
clear about non-claims
compatible with public project direction
```

Before changing safety guards, CI workflows, shell checks, or quality gates, run:

```
make quality-safety-guards
```

Before changing distro packaging metadata, package-readiness docs, or local package handoff lanes, run:

```
make quality-packaging-static
```

Before submitting broader code or installer changes, run:

```
make quality
```

Documentation changes

Documentation changes should preserve reader-facing cohesion and current non-claims.

Before changing public status, estimates, platform readiness, installer authority, security wording, subsystem status, or top-level navigation, read:

```
docs/README.md
docs/DOCUMENTATION_MAINTENANCE.md
```

For documentation-only changes, run the narrowest relevant guards from docs/DOCUMENTATION_MAINTENANCE.md and avoid changing source behavior, installer authority, package authority, runtime authority, workflow permissions, or security posture.

Security-sensitive changes

Changes that affect runtime behavior, state mutation, external effects, command behavior, file behavior, network behavior, hardware behavior, boot behavior, recovery behavior, or security claims require explicit tests and documentation.

Trademark and identity

Contribution rights do not grant permission to use the Latticra name, logos, marks, or Bryforge identity in a confusing way.

See:

```
TRADEMARK_POLICY.md
```

Legal note

This document is project guidance, not legal advice.

TRADEMARK_POLICY.md

Source title: Latticra Trademark and Identity Policy

Lines: 70 | Words: 323 | SHA-256: 527b28e366506095da08fc9d0a1dcfb8641dc4caf31d2b05817c291b3e0c953f

Latticra Trademark and Identity Policy

Status: initial trademark and identity policy

Purpose

This policy protects the Latticra project identity while preserving the freedom to study, modify, fork, and improve the software under its applicable open-source licenses.

Project identity

The following names and marks are project identity terms:

```
Latticra
Bryforge
```

```
Latticra logo
Bryforge logo
project slogans, marks, and distinctive visual identity
```

Code license boundary

Software and documentation licenses do not grant trademark, branding, endorsement, or official-project identity rights. Software and documentation licenses, including AGPL-3.0-or-later, Apache-2.0, and CC-BY-4.0, do not grant trademark, branding, endorsement, or official-project identity rights.

A fork may use the code according to the applicable code license, but it may not present itself as the official Latticra project unless authorized.

Allowed descriptive use

Forks, downstream projects, papers, articles, packages, and integrations may truthfully describe their relationship to Latticra.

Examples:

```
fork of Latticra
based on Latticra
compatible with Latticra
uses Latticra-derived code
```

Not allowed without permission

Do not use Latticra or Bryforge identity in a way that creates confusion about sponsorship, endorsement, or official status.

Examples of restricted uses:

```
calling a fork the official Latticra project
using the Latticra logo as the primary mark for an unrelated fork
claiming Bryforge endorsement without permission
using confusingly similar names for closed or unrelated offerings
```

Fork naming

Forks should use a distinct name if they are distributed publicly as separate projects.

They may describe their relationship to Latticra, but the fork name should not imply official project status.

Security and trust

Because Latticra is intended to be open, auditable, and transparent, identity clarity is a security concern.

Users should be able to tell whether they are using the official Latticra project, a fork, an experiment, or a third-party derivative.

Legal note

This document is project guidance, not legal advice.

Formal trademark registration, enforcement, or commercial use should receive qualified legal review.

Latticra Documentation Hub

Status: active reader-facing documentation hub

Last updated: 2026-05-27 CDT Scope: public orientation, live status, foundation contracts, subsystem records, installer and packaging docs, security baselines, strategy notes, and documentation maintenance.

Purpose

This file is the deeper map behind the root README.

Latticra keeps a large evidence trail on purpose: status records, contracts, implementation notes, guard scripts, package lanes, platform notes, reports, public site pages, and non-claim ledgers. This hub keeps that material reachable without asking a new reader to absorb everything at once.

First Routes

Reader	Start	Then read
New user	[Quick Start Cheat Sheet](QUICK_START_CHEATSHEET.md)	[Installer README](../installer/README.md), [Status](../STATUS.md)
Reviewer	[Current Status](status/CURRENT_STATUS.md)	[Public Claims Ledger](PUBLIC_CLAIMS_LEDGER.md), [Non-Claims](NON_CLAIMS.md), [Evidence Ladder](EVIDENCE_LADDER.md)
Contributor	[Contributing](../CONTRIBUTING.md)	[Foundation Index](FOUNDATION_INDEX.md), [Documentation Maintenance](DOCUMENTATION_MAINTENANCE.md)
Packager	Platform README below	Platform workflow or validation lane below
Security reviewer	[Security Policy](../SECURITY.md)	[High-Assurance Security Baseline](HIGH_ASSURANCE_SECURITY_BASELINE.md), [Defensive Threat Model](DEFENSIVE_THREAT_MODEL_CONTRACT.md)

Runtime authority	[Zero Trust Runtime Authority Baseline](ZERO_TRUST_RUNTIME_AUTHORITY_BASELINE.md), [Runtime Boundary Contract](RUNTIME_BOUNDARY_CONTRACT.md)
Crypto and keys	[Cryptographic Assurance and Key Management Baseline](CRYPTOGRAPHIC_ASSURANCE_KEY_MANAGEMENT_BASELINE.md), [Seal key material contract](LATTICRA_SEAL_KEY_MATERIAL_CONTRACT.md), [Seal verification policy contract](LATTICRA_SEAL_VERIFICATION_POLICY_CONTRACT.md)
Incident response and resilience	[Cyber Incident Reporting Response Baseline](CYBER_INCIDENT_REPORTING_RESPONSE_BASELINE.md), [Security Logging Monitoring Baseline](SECURITY_LOGGING_MONITORING_BASELINE.md), [Backup Recovery Resilience Baseline](BACKUP_RECOVERY_RESILIENCE_BASELINE.md)
Identity and access	[Identity Credential Access Management Baseline](IDENTITY_CREDENTIAL_ACCESS_MANAGEMENT_BASELINE.md)

Documentation Operations

Use these before changing public wording, navigation, claim posture, mirrored estimates, platform posture, or subsystem landing pages.

Document	Use it for
[Product Documentation Cohesion](PRODUCT_DOCUMENTATION_COHESION.md)	Product-facing copy, reader routes, public site resources, and subsystem landing pages
[Documentation Maintenance](DOCUMENTATION_MAINTENANCE.md)	Public entry points, status mirrors, static HTML summaries, and documentation-only validation
[Documentation Style Guide](DOCUMENTATION_STYLE_GUIDE.md)	Canonical terms, date style,

headings, link style, and claim wording |

| [Documentation Traceability Matrix](DOCUMENTATION_TRACEABILITY_MATRIX.md) | Mapping public surfaces to source records, validation, mirrors, and non-claims |

| [Documentation Validation Playbook](DOCUMENTATION_VALIDATION_PLAYBOOK.md) | Hygiene, link, public-entry, estimate, platform, subsystem, and claim-promotion checks |

| [Documentation Drift Response Playbook](DOCUMENTATION_DRIFT_RESPONSE_PLAYBOOK.md) | Mirror drift, stale evidence, non-claim drift, and claim demotion |

| [Documentation Change Review Packet](DOCUMENTATION_CHANGE_REVIEW_PACKET.md) | Explicit claim, mirror, validation, and rollback review |

Status and Strategy

| Area | Entry points |

| --- | --- |

| Current status | status/CURRENT_STATUS.md, [status index](status/README.md), [announcements](status/ANNOUNCEMENTS.md) |

| Current project direction | [project notes](project_notes/README.md), [current direction](project_notes/CURRENT_DIRECTION.md), [upcoming work](project_notes/UPCOMING_WORK.md) |

| Strategy records | [strategy index](strategy/README.md), [overall strategy priority map](strategy/2026-05-26-1702-cdt-overall-strategy-priority-map.md) |

| Public site status pages | status.html, validation.html, evidence.html, architecture.html, security.html, packaging.html, panel.html, kernel.html |

Maintenance Rules

- Keep the root README short, navigable, and user-facing.
- Keep this hub as the route map for deeper docs.
- Keep Foundation Index evidence-heavy and exhaustive.
- Keep Status, Current Status, and status mirrors aligned when public posture changes.
- Keep non-claims near any security, packaging, installer, runtime, or OS-adjacent wording.
- Do not promote production runtime, host protection, package approval, certification, or OS replacement claims without implementation evidence, tests, status records, and public-entry alignment.

Current Non-Claim Reminder

Latticra is early-stage and evidence-bound. It is not a production security product, hardened sandbox, operating-system replacement, root installer, network authority, production runtime, Fedora-approved package, Ubuntu archive-ready package, Debian archive-ready package, FreeBSD official port, OpenBSD official port, or openSUSE official package.

docs/QUICK_START_CHEATSHEET.md

Source title: Latticra Quick Start Cheat Sheet

Lines: 247 | Words: 653 | SHA-256: c6322b22532d980fe757deed1ba80761a956a51862fe083ea1ccdf8358591a76

Latticra Quick Start Cheat Sheet

Audience: users who want the shortest safe path to install, run, update, and remove the current user-local Latticra Panel.

Status: Latticra is still early-stage and evidence-bound. The current installer is user-local. It does not install a root service, change the kernel, change systemd, change SELinux, or use network authority.

Fast Install

Ubuntu prerequisites:

```
sudo apt-get update
sudo apt-get install -y rustc cargo make gcc pkg-config \
  libx11-dev libxcb1-dev libxcursor-dev libxrandr-dev libxi-dev \
  libxkbcommon-dev libgl1-mesa-dev libwayland-dev desktop-file-utils \
  libgtk-3-bin
```

Fedora prerequisites:

```
sudo dnf install -y rust cargo make gcc pkgconf-pkg-config \
  libX11-devel libxcb-devel libXcursor-devel libXrandr-devel libXi-devel \
  libxkbcommon-devel mesa-libGL-devel wayland-devel desktop-file-utils gtk3
```

openSUSE prerequisites:

```
sudo zypper refresh
sudo zypper install -y rust cargo make gcc pkgconf \
  libX11-devel libxcb-devel libXcursor-devel libXrandr-devel libXi-devel \
  libxkbcommon-devel Mesa-libGL-devel wayland-devel desktop-file-utils \
  gtk3-tools
```

Clone and enter the repo:

```
git clone https://github.com/Bryforge/Latticra.git
cd Latticra
```

Keep the user-local command path available:

```
export PATH=&quot;$HOME/.local/bin:$PATH&quot;
```

Preview first:

```
make -C installer dry-run
```

Install and verify:

```
make -C installer local-example
make -C installer verify-local
```

Ubuntu no-effect validation:

```
sh scripts/test-ubuntu-build-lane.sh
sh scripts/test-ubuntu-developer-workflow.sh
sh scripts/test-ubuntu-package-notice-inventory.sh
sh scripts/test-ubuntu-doc-payload-license-review-contract.sh
sh scripts/test-ubuntu-third-party-material-review-contract.sh
sh scripts/test-ubuntu-generated-artifact-notice-review-contract.sh
sh scripts/test-ubuntu-notice-file-decision-contract.sh
sh scripts/test-ubuntu-debian-copyright-notice-mapping-contract.sh
sh scripts/test-ubuntu-trademark-notice-boundary-contract.sh
sh scripts/test-ubuntu-release-artifact-notice-requirements-contract.sh
sh scripts/test-ubuntu-package-notice-promotion-gate-contract.sh
sh scripts/test-ubuntu-package-license-promotion-gate-contract.sh
sh scripts/test-ubuntu-lintian-static-metadata-contract.sh
sh scripts/test-ubuntu-local-deb-build-transcript-acceptance-gate-contract.sh
sh scripts/test-ubuntu-local-deb-install-remove-evidence-contract.sh
sh scripts/test-ubuntu-source-package-evidence-contract.sh
sh scripts/test-ubuntu-upload-signing-authority-evidence-contract.sh
sh scripts/test-ubuntu-ppa-archive-publication-gate-contract.sh
```

openSUSE no-effect validation:

```
sh scripts/test-opensuse-developer-workflow.sh
sh scripts/test-opensuse-local-rpm-static-validation.sh
```

openSUSE tool availability validation:

```
sh scripts/test-opensuse-rpmlint-osc-availability.sh
sh scripts/test-opensuse-rpmlint-static-spec-lane.sh
sh scripts/test-opensuse-rpmlint-findings-classification.sh
sh scripts/test-opensuse-source-archive-reproducibility-contract.sh
sh scripts/test-opensuse-source-archive-fixture-lane.sh
sh scripts/test-opensuse-rpm-topdir-handoff-lane.sh
sh scripts/test-opensuse-local-rpm-build-gate-contract.sh
sh scripts/test-opensuse-local-rpm-build-environment-contract.sh
sh scripts/test-opensuse-rpm-artifact-naming-contract.sh
sh scripts/test-opensuse-rpm-payload-inspection-contract.sh
sh scripts/test-opensuse-rpm-install-remove-transcript-contract.sh
sh scripts/test-opensuse-obs-publication-non-claim-review-contract.sh
```

Run

Open the GUI:

```
latticra-panel
```

Launch it from a terminal and keep that terminal usable:

```
tmpdir=&quot;$(mktemp -d &quot;${TMPDIR:-/tmp}/latticra-panel.XXXXXX&quot;)&quot;
latticra-panel &gt;&quot;$tmpdir/latticra-panel.log&quot; 2&gt;&amp;1 &amp;
```

Useful commands:

```
latticra status
latticra path
latticra seal report
latticra lc status
```

Update

From the source checkout:

```
git pull
latticra-panel
```

Use the Updater workspace in Latticra Panel. Preview the update first, then apply the guarded user-local update from the current checkout. The installer migrates old Latticra-owned user-local wrappers when it can prove they are legacy Latticra files. Unrelated user files are still preserved or refused.

```
latticra updater status
```

This prints the Panel-owned updater policy, including the dry-run/apply commands, guarded apply mode, receipt setting, and disabled network/root/system mutation authority.

Normal Reset Or Uninstall

Preview removal:

```
make -C installer uninstall-dry-run
make -C installer reset-dry-run
```

Remove the managed local install:

```
make -C installer uninstall-local
```

Or, from an installed wrapper:

```
latticra uninstall
```

Use reset when you plan to reinstall from new specs:

```
latticra reset
```

Clean Full User-Local Uninstall

Use this only when normal uninstall/reset cannot clean up an old or broken user-local install.

These commands are intentionally exact. Do not replace them with broad paths such as ~/.local, /usr, /, or unreviewed wildcards.

If LC was installed with a custom lc.install.command_wrapper, set LC_WRAPPER to that command name; the default is latticra-lc.

```
LATTICRA_PREFIX=&quot;${LATTICRA_PREFIX:-$HOME/.local/share/latticra}&quot;
LC_WRAPPER=&quot;${LC_WRAPPER:-latticra-lc}&quot;

rm -rf -- \
  &quot;$LATTICRA_PREFIX&quot; \
  &quot;$HOME/.local/share/latticra-validation&quot; \
  &quot;$HOME/.local/share/latticra-reset-receipts&quot;

rm -f -- \
  &quot;$HOME/.local/bin/latticra&quot; \
  &quot;$HOME/.local/bin/$LC_WRAPPER&quot; \
```

```
    &quot;$HOME/.local/bin/lat&quot; \
    &quot;$HOME/.local/bin/latticra-seal&quot; \
    &quot;$HOME/.local/bin/latticra-nadia&quot; \
    &quot;$HOME/.local/bin/latticra-panel&quot; \
    &quot;$HOME/.local/bin/latticra-installer&quot; \
    &quot;$HOME/.local/share/applications/latticra-panel.desktop&quot; \
    &quot;$HOME/.local/share/applications/latticra-installer.desktop&quot; \
    &quot;$HOME/.local/share/icons/hicolor/256x256/apps/latticra-panel.png&quot; \
    &quot;$HOME/.local/share/icons/hicolor/256x256/apps/latticra-installer.png&quot; \
    &quot;$HOME/.local/share/icons/hicolor/256x256/apps/latticra-seal.png&quot;
```

If those paths are root-owned because an earlier command was run with sudo, repeat the same exact cleanup with sudo:

```
  LATTICRA_PREFIX=&quot;${LATTICRA_PREFIX:-$HOME/.local/share/latticra}&quot;
  LC_WRAPPER=&quot;${LC_WRAPPER:-latticra-lc}&quot;

  sudo rm -rf -- \
    &quot;$LATTICRA_PREFIX&quot; \
    &quot;$HOME/.local/share/latticra-validation&quot; \
    &quot;$HOME/.local/share/latticra-reset-receipts&quot;

  sudo rm -f -- \
    &quot;$HOME/.local/bin/latticra&quot; \
    &quot;$HOME/.local/bin/$LC_WRAPPER&quot; \
    &quot;$HOME/.local/bin/lat&quot; \
    &quot;$HOME/.local/bin/latticra-seal&quot; \
    &quot;$HOME/.local/bin/latticra-nadia&quot; \
    &quot;$HOME/.local/bin/latticra-panel&quot; \
    &quot;$HOME/.local/bin/latticra-installer&quot; \
    &quot;$HOME/.local/share/applications/latticra-panel.desktop&quot; \
    &quot;$HOME/.local/share/applications/latticra-installer.desktop&quot; \
    &quot;$HOME/.local/share/icons/hicolor/256x256/apps/latticra-panel.png&quot; \
    &quot;$HOME/.local/share/icons/hicolor/256x256/apps/latticra-installer.png&quot; \
    &quot;$HOME/.local/share/icons/hicolor/256x256/apps/latticra-seal.png&quot;
```

Refresh the shell command cache after cleanup:

```
  hash -r 2&gt;/dev/null || true
```

Important Limits

- Current install scope is user-local under ~/.local.
- Dry-run first, then install.
- Latticra currently remains early-stage and evidence-bound.
- No production security boundary, root installer, system service, kernel integration, Ubuntu archive/PPA readiness, or network authority is claimed.

docs/DOCUMENTATION_READER_JOURNEY_MAP.md

Source title: Documentation Reader Journey Map

Lines: 66 | Words: 717 | SHA-256: 1b11c0107ef23710cf7402773e378f5826b0edfb1cd0e37f29376c33f8bbfbc5

Documentation Reader Journey Map

Status: active reader journey map Last updated: 2026-05-26 CDT Scope: user, operator, reviewer, contributor, packager, security reviewer, subsystem implementer, public-site reader, and handbook reader routes.

Purpose

This map keeps Latticra documentation usable for different readers without weakening the evidence boundary.

Use it with README.md, PRODUCT_DOCUMENTATION_COHESION.md, DOCUMENTATION_TRACEABILITY_MATRIX.md, and PUBLIC_CLAIMS_LEDGER.md.

The goal is simple: each reader should know where to start, what they can safely conclude, where to find proof, and which claims remain blocked.

Journey Matrix

Reader	Start	Continue to	Success criteria	Stop signals
New local user	[`../README.md`](../README.md), [`QUICK_START_CHEATSHEET.md`](QUICK_START_CHEATSHEET.md), [`start.html`](start.html)	[`../installer/README.md`](../installer/README.md), [`NON_CLAIMS.md`](NON_CLAIMS.md)	Reader can identify guarded user-local paths and cleanup/reset expectations.	Any expectation of root install, daily-driver install, production runtime, or broad host management.
Operator	[`../STATUS.md`](../STATUS.md), [`status/CURRENT_STATUS.md`](status/CURRENT_STATUS.md), [`validation.html`](validation.html)	Relevant installer, platform, or subsystem source record	Operator can identify current posture, runnable checks, denied effects, and required evidence.	Any unclear effect boundary, missing reset path, or missing non-claim near a runnable path.
Reviewer	[`status/CURRENT_STATUS.md`](status/CURRENT_STATUS.md), [`PUBLIC_CLAIMS_LEDGER.md`](PUBLIC_CLAIMS_LEDGER.md), [`NON_CLAIMS.md`](NON_CLAIMS.md)	[`DOCUMENTATION_TRACEABILITY_MATRIX.md`](DOCUMENTATION_TRACEABILITY_MATRIX.md), [`EVIDENCE_LADDER.md`](EVIDENCE_LADDER.md)	Reviewer can trace public wording to source evidence and blocked adjacent claims.	Public wording lacks a source record, validation path, or non-claim boundary.
Contributor	[`README.md`](README.md), [`FOUNDATION_INDEX.md`](FOUNDATION_INDEX.md), [`DOCUMENTATION_MAINTENANCE.md`](DOCUMENTATION_MAINTENANCE.md)	[`DOCUMENTATION_CHANGE_REVIEW_PACKET.md`](DOCUMENTATION_CHANGE_REVIEW_PACKET.md), [`DOCUMENTATION_VALIDATION_PLAYBOOK.md`](DOCUMENTATION_VALIDATION_PLAYBOOK.md)	Contributor can change docs without broadening claims or breaking mirrors.	Change would require implementation evidence, guard changes, or stronger public wording.
Packager or platform reviewer	[`validation.html`](validation.html), platform README or workflow record	[`PRODUCTION_INSTALLER_READINESS_CONTRACT.md`](PRODUCTION_INSTALLER_READINESS_CONTRACT.md), [`DOCUMENTATION_TRACEABILITY_MATRIX.md`](DOCUMENTATION_TRACEABILITY_MATRIX.md)	Reviewer can identify local-only package posture and platform-specific blockers.	Any implied Fedora approval, Ubuntu archive readiness, Debian archive readiness, FreeBSD official port, OpenBSD official port, openSUSE official package, or production installability.
Security reviewer	[`../SECURITY.md`](../SECURITY.md), [`security.html`](security.html), [`PUBLIC_CLAIMS_LEDGER.md`](PUBLIC_CLAIMS_LEDGER.md)	[`DEFENSIVE_THREAT_MODEL_CONTRACT.md`](DEFENSIVE_THREAT_MODEL_CONTRACT.md), [`HIGH_ASSURANCE_SECURITY_BASELINE.md`](HIGH_ASSURANCE_SECURITY_BASELINE.md), [`ZERO_TRUST_RUNTIME_AUTHORITY_BASELINE.md`](ZERO_TRUST_RUNTIME_AUTHORITY_BASELINE.md)	Reviewer can separate defensive planning from security guarantees.	Any claim of malware prevention, ransomware prevention, hardened sandboxing, certification, or production protection.
Subsystem implementer	[`FOUNDATION_INDEX.md`](FOUNDATION_INDEX.md)	Relevant contract, implementation plan, implementation record, status record, and guard	Implementer can find the exact boundary and validation path before editing.	Missing contract, missing guard, or implementation language that outruns status.
Public-site reader	[`index.html`](index.html), [`map.html`](map.html), [`status.html`](status.html)	Source Markdown records linked from the public page	Reader can scan posture quickly and reach exact source records.	Public HTML implies stronger claims than source Markdown.
Handbook reader	[`latticra-system-substrate/README.md`](latticra-system-substrate/README.md)	[`FOUNDATION_INDEX.md`](FOUNDATION_INDEX.md), project notes, status records	Reader can connect long-form narrative to current status and source records.	Handbook narrative outruns current status or omits current non-claims.

Journey Rules

1. A fast route may be short, but it must not hide non-claims.
2. A product route may be readable, but it must not replace source records.
3. A reviewer route must reach source records, validation, and blocked adjacent claims.
4. A platform route must keep local-only or no-effect status visible until official evidence exists.
5. A security route must keep security non-claims visible near security-adjacent wording.
6. A contributor route must include validation and drift-response docs before public wording changes.

Success Criteria

A reader journey is healthy when:

- the first page tells the reader what Latticra currently is and is not;
- the path to current status is visible;
- runnable commands have guarded or no-effect expectations;
- broad claims have source-record links;
- non-claims are near the claims they constrain;
- validation commands are named where evidence matters;
- the route does not require reading the full repository before making a narrow safe decision.

Friction Signals

Treat these as documentation-product friction:

- a new reader cannot find the current status within two clicks or two source links;
- an operator sees commands before effect boundaries;
- a reviewer sees a claim before evidence;
- a packager sees package shape before local-only status;
- a security reader sees protection language before non-claims;
- a contributor sees mirrors before source-of-truth rules;
- a public site page has no route back to source Markdown.

Boundary

This map optimizes documentation navigation only.

It does not change implementation behavior, installer authority, package authority, runtime authority, workflow permissions, security posture, public estimates, or product readiness.

docs/DOCUMENTATION_GLOSSARY.md

Source title: Documentation Glossary

Lines: 101 | Words: 1255 | SHA-256: 21fd20e3481451c8a10b22bccc7932fece9ba30c4e57cf209e2b30c9d88cf3b4

Documentation Glossary

Status: active documentation glossary Last updated: 2026-05-26 CDT Scope: public documentation terms, claim posture, evidence wording, validation wording, package posture, installer posture, runtime posture, and reader-route terminology.

Purpose

This glossary defines common documentation terms used across Latticra public and source records.

Use it with DOCUMENTATION_STYLE_GUIDE.md, PUBLIC_CLAIMS_LEDGER.md, PRODUCT_DOCUMENTATION_COHESION.md, and DOCUMENTATION_TRACEABILITY_MATRIX.md.

This glossary is not a source of capability. It defines wording only.

Core Terms

Term	Meaning	Do not imply
evidence-bound	A claim is limited by source records, tests, validation, status, and non-claims.	Production readiness or safety guarantees.
contract-first	A boundary, behavior, failure mode, and non-claim are documented before implementation expands.	That the implementation already exists.
source record	The contract, implementation note, status record, transcript, or guard-backed document that supports a public statement.	That a public summary is authoritative by itself.
public surface	A reader-facing file or page such as README, public HTML, docs hub, package README, installer README, or subsystem landing page.	That public wording can outrun source records.
mirror	A second location repeating source posture for reader convenience.	That duplicate wording can become a new source of truth.
public-entry alignment	Updating public entry points so they match current source records and status.	Capability promotion.
traceability	A visible path from public wording to source record, validation, mirror, and non-claim boundary.	Proof of runtime behavior by itself.
validation	A check, test, guard, transcript, or review that supports a narrow claim.	General correctness, safety, or release readiness.
guard script	A deterministic local script that checks a narrow documentation, status, package, source, or behavior expectation.	Broad security or product certification.
review packet	A structured review record for documentation wording, mirrors, validation, non-claims, and rollback or demotion path.	Implementation evidence.

Capability Posture

Term	Meaning	Do not imply
no-effect	The path is intended to report, classify, validate, or model without performing host, network, runtime, package, installer, or security effects.	Harmlessness, safety guarantee, or production approval.
report-only	The path produces metadata or reports without enforcing policy, granting authority, or performing effects.	Enforcement, protection, containment, or runtime authority.
denied by default	The current classification blocks behavior unless later evidence and gates explicitly allow a narrow path.	A production sandbox or full policy engine.
guarded	A path has explicit checks, prerequisites, or review gates before a narrow operation can proceed.	Broad permission or unattended operation.
guarded user-local	A user-scoped path with documented boundaries and no broad root/system authority claim.	Root install, daily-driver install, production install, or host-management product.
local-only	A package, validation, or workflow lane is limited to local records and checks.	Official distribution, archive, store, or vendor approval.
static validation	A check of files, metadata, shape, wording, or configuration without proving full build/install/runtime behavior.	Publication readiness or install safety.
disposable validation	Validation intended for a throwaway VM or controlled environment.	Daily-driver safety or broad host compatibility.
runtime authority	Permission or capability to execute effects at runtime.	Present capability unless a source record explicitly proves it.
host behavior	Reading, writing, mutating, installing, deleting, managing, or otherwise affecting the host.	Allowed behavior unless explicitly proven and gated.
network behavior	Network access, server interaction, update fetching, remote trust lookup, or internet-facing behavior.	Present capability unless explicitly proven and bounded.

Product And Status Terms

Term	Meaning	Do not imply
public status	Reader-facing current posture, estimates, and next blockers.	Release status, readiness guarantee, or support commitment.
planning estimate	A rough posture marker for project planning.	Release promise, completion guarantee, or product-readiness metric.
product readiness	A future state requiring implementation, validation, support boundaries, non-claims, and public-entry alignment.	Current Latticra status.
current posture	The narrowest currently supported description of a topic.	Future ambition or roadmap completion.
next valid work	The next work that can proceed without overclaiming or skipping evidence.	A commitment to ship or release.
blocked adjacent claim	A tempting broader claim that must remain explicitly unsupported.	Hidden future capability.

| demotion | Narrowing public wording when evidence is stale, contradicted, missing, or too weak. | Failure of the project; it is claim hygiene. |
| drift | A disagreement between public pages, source records, status mirrors, estimates, validation, or non-claims. | An implementation change by itself. |

Platform Terms

Term	Meaning	Do not imply
Fedora lane	Fedora-specific local package, workflow, transcript, or validation work.	Fedora approval or distribution readiness.
Ubuntu lane	Ubuntu-specific local deb, workflow, package, notice, or validation work.	Ubuntu archive readiness, PPA readiness, or Canonical endorsement.
Debian lane	Debian-specific local package or archive-preparation work.	Debian archive upload, sponsorship, or official package status.
FreeBSD lane	FreeBSD-specific local port-shape or validation work.	FreeBSD ports-tree readiness or official port status.
OpenBSD lane	OpenBSD-specific local port-shape or validation work.	OpenBSD ports-tree readiness or official package status.
openSUSE lane	openSUSE-specific local RPM, rpmlint, osc, spec, or validation work.	Open Build Service publication, official package status, or SUSE endorsement.
macOS lane	macOS-specific no-effect or user-local planning, probing, dry-run, app-bundle, reset/uninstall, or verification work.	Signed app, notarized app, production installer, privileged helper, or broad host authority.

Reader Terms

Term	Meaning	Do not imply
new local user	A reader trying the guarded local path or understanding basic commands.	Production operator.
operator	A reader evaluating runnable paths, local checks, denied effects, and evidence requirements.	Someone granted hidden authority.
reviewer	A reader checking public claims against source evidence and non-claims.	Product approver.
contributor	A reader changing docs or source records under existing guardrails.	Someone authorized to broaden public claims without evidence.
packager	A reader reviewing platform package shape, static validation, and local-only boundaries.	Distribution maintainer approval.
security reviewer	A reader checking defensive posture, threat-model records, safe-testing rules, and security non-claims.	Certification authority.

Replacement Rule

When a term could be read as a stronger claim, replace it with the narrowest glossary term.

Examples:

Replace	With
safe	no-effect, guarded, or validated by local guard
ready	current posture or local-only draft
secure	documented defensive boundary with security non-claims
official	local-only unless official evidence exists
enforcement	report-only or denied-by-default classification
installer	guarded user-local Panel path unless production installer evidence exists

Boundary

This glossary standardizes documentation wording only.

It does not change implementation behavior, installer authority, package authority, runtime authority, workflow permissions, security posture, public estimates, or product readiness.

docs/PRODUCT_DOCUMENTATION_COHESION.md

Source title: Product Documentation Cohesion

Lines: 178 | Words: 1038 | SHA-256: f6276e3990c89107e14b1bfe07e3306d419ecbdeffdc67d02e2f3c031381b77c

Product Documentation Cohesion

Status: active product-documentation cohesion guide Last updated: 2026-05-26 CDT Scope: public README, documentation hub, static site pages, installer docs, package docs, security docs, status records, subsystem maps, and reader routes.

Purpose

This guide keeps Latticra's product-facing documentation coherent without implying that Latticra is already a production product.

In this file, "product documentation" means the reader-facing surface of the project: what a user, operator, reviewer, packager, or contributor sees before they understand the full evidence trail.

The product surface should always make four things easy to find:

1. what exists now;
2. what a reader can safely run or inspect;
3. what remains intentionally blocked;
4. what evidence would be required before the claim can become stronger.

Use DOCUMENTATION_READER_JOURNEY_MAP.md to keep audience-specific reader paths practical, bounded, and explicit about stop signals.

Use DOCUMENTATION_GLOSSARY.md when product copy depends on shared terms such as no-effect, report-only, guarded user-local, local-only, public status, drift, demotion, or product readiness.

Cohesion Promise

All product-facing documentation should describe Latticra as:

```
early-stage
evidence-bound
contract-first
local-first where runnable
no-effect or guarded by default
explicit about non-claims
```

Do not let a shorter product summary outgrow the evidence in status records, contracts, guard scripts, or the PUBLIC_CLAIMS_LEDGER.md.

Use DOCUMENTATION_TRACEABILITY_MATRIX.md to connect public surfaces to source records, validation checks, and non-claim boundaries.

Use DOCUMENTATION_VALIDATION_PLAYBOOK.md to choose documentation validation commands and failure-handling paths.

Use DOCUMENTATION_DRIFT_RESPONSE_PLAYBOOK.md when product-facing wording, source records, status mirrors, non-claims, or platform posture disagree.

Use DOCUMENTATION_STYLE_GUIDE.md for canonical terminology, status/date style, heading shape, link style, and replacement wording.

Product Surface Matrix

```
| Surface | Reader job | Must say | Must not imply |
| --- | --- | --- | --- |
| [`../README.md`](../README.md) | Understand identity, posture, quick start, and non-claims. |
Early-stage, evidence-bound, current estimates, guarded local routes, and explicit non-claims. |
 Production platform, certified security, OS replacement, package approval, or broad installer
readiness. |
```

[`README.md`](README.md)	Choose the right documentation depth.	First reading paths, status sources, claim boundaries, platform lanes, and maintenance rules.	That every doc is equally authoritative or that public summaries override status records.
[`index.html`](index.html)	Scan the public site quickly.	Current posture, no-effect default, major records, and resource routes.	That GitHub Pages content is stronger than source Markdown records.
[`start.html`](start.html) and [`QUICK_START_CHEATSHEET.md`](QUICK_START_CHEATSHEET.md)	Try safe local entry points.	Guarded user-local commands, reset/cleanup paths, and expected no-effect posture.	Root installation, daily-driver readiness, boot readiness, or broad host management.
[`validation.html`](validation.html)	Understand local evidence lanes.	Local-only validation, transcripts, static checks, and disposable/guarded boundaries.	Distribution approval, production installability, update safety, or recovery safety.
[`security.html`](security.html) and [`../SECURITY.md`](../SECURITY.md)	Report issues and understand security posture.	Safe testing, threat-model work, security non-claims, and evidence boundaries.	Malware prevention, ransomware prevention, certified security, or hardened sandboxing.
[`../installer/README.md`](../installer/README.md)	Use Panel and installer lanes.	User-local guarded behavior, configuration boundaries, and platform-specific prerequisites.	Root installer authority, unattended host mutation, production installer readiness, or OS-base installation.
Platform package docs	Review package shape and platform readiness.	Local-only drafts, static checks, prerequisites, and non-approval boundaries.	Fedora, Ubuntu, Debian, FreeBSD, OpenBSD, openSUSE, or vendor endorsement.
Subsystem maps	Enter a technical lane.	Contract, implementation, status, and guard path for the subsystem.	That subsystem progress changes overall product readiness automatically.
Status records	Verify current posture.	Current evidence, estimate posture, next blockers, and non-claims.	Release commitments, guarantees, or broad public claims.

Reader Routes

New User

Use this route for someone trying Latticra locally. The fuller audience matrix is DOCUMENTATION_READER_JOURNEY_MAP.md.

1. ../README.md
2. QUICK_START_CHEATSHEET.md
3. start.html
4. ../installer/README.md
5. NON_CLAIMS.md

The route must stay practical and bounded. It should not require reading every architecture record before a guarded user-local check, but it must keep current non-claims visible.

Reviewer

Use this route for posture or due-diligence review:

1. status/CURRENT_STATUS.md
2. PUBLIC_CLAIMS_LEDGER.md
3. NON_CLAIMS.md
4. EVIDENCE_LADDER.md
5. DOCUMENTATION_MAINTENANCE.md

The route should make it easy to reject overbroad wording before it reaches public summaries.

Contributor

Use this route for someone changing documentation or product posture:

1. README.md
2. FOUNDATION_INDEX.md
3. DOCUMENTATION_MAINTENANCE.md
4. DOCUMENTATION_GLOSSARY.md
5. DOCUMENTATION_TRACEABILITY_MATRIX.md
6. DOCUMENTATION_VALIDATION_PLAYBOOK.md
7. DOCUMENTATION_DRIFT_RESPONSE_PLAYBOOK.md
8. DOCUMENTATION_STYLE_GUIDE.md
9. DOCUMENTATION_CHANGE_REVIEW_PACKET.md
10. The relevant subsystem contract and status record
11. The exact guard named by that record

The route should prevent documentation from getting ahead of implementation or validation evidence.

Packager Or Platform Reviewer

Use this route for platform-specific work:

1. validation.html
2. The platform workflow document or package README
3. PRODUCTION_INSTALLER_READINESS_CONTRACT.md
4. PUBLIC_CLAIMS_LEDGER.md
5. status/CURRENT_STATUS.md

The route should keep every package and platform lane local-only unless official publication or distribution evidence exists.

Product Copy Rules

Use product copy that is specific, inspectable, and bounded.

Prefer:

```
guarded user-local workbench
no-effect report surface
local-only package draft
static validation lane
contract-first runtime boundary
report-only Seal evidence
early-stage public status
```

Avoid:

```
secure product
agent security platform
production installer
official package
Linux replacement
OS distribution
runtime enforcement
host protection
```

Cross-Link Requirements

Every product-facing page that describes a capability should have a path to:

1. current status;

2. non-claims;
3. relevant contract or implementation record;
4. validation or guard evidence;
5. safe user route, if the capability can be run locally;
6. blocked-claim language, if adjacent unsupported claims are likely.

Drift Review

Run this review when public wording changes:

1. Does the public wording match PUBLIC_CLAIMS_LEDGER.md?
2. Does the route from README.md or index.html reach the exact source record?
3. Does the status record use the same posture words?
4. Does the page say what is blocked?
5. Does the validation path prove the narrow claim?
6. Does DOCUMENTATION_TRACEABILITY_MATRIX.md identify the source record, mirror, validation, and non-claim boundary?
7. Does DOCUMENTATION_VALIDATION_PLAYBOOK.md identify the narrowest relevant checks?
8. Does DOCUMENTATION_DRIFT_RESPONSE_PLAYBOOK.md identify the correct narrowing or demotion path if records disagree?
9. Does the change preserve the documentation-only boundary if no implementation changed?
10. Does the wording follow DOCUMENTATION_STYLE_GUIDE.md?
11. Does the change need a DOCUMENTATION_CHANGE_REVIEW_PACKET.md outcome label?

Maintenance Boundary

Use DOCUMENTATION_MAINTENANCE.md for update process, source-of-truth mirrors, estimate handling, and validation commands.

Use this file for product-facing coherence: audience route, product wording, surface responsibilities, and cross-link expectations.

docs/PUBLIC_CLAIMS_LEDGER.md

Source title: Latticra Public Claims Ledger

Lines: 120 | Words: 1111 | SHA-256: 36c8a89bac30f64e77b2f3afdb205aa990ab13b3d0a874a89bbe9a24f14b3bd2

Latticra Public Claims Ledger

Status: active documentation guard Last updated: 2026-05-26 Scope: README surfaces, public site pages, status records, subsystem summaries, installer/package documentation, release notes, and external-facing project descriptions.

Purpose

This ledger keeps public Latticra wording aligned with current evidence.

It does not promote any capability by itself. It translates the current status records, evidence ladder, non-claims, contracts, and implementation notes into safe wording that can be reused without implying production readiness, security guarantees, operating-system completeness, or distribution approval.

When two records disagree, use the narrowest current claim until a later contract, implementation record, validation record, status update, and public-entry alignment all support a stronger statement.

Source of Truth Order

Use this order when public wording needs a decision:

1. STATUS.md and status/CURRENT_STATUS.md
2. NON_CLAIMS.md
3. EVIDENCE_LADDER.md
4. REAL_SYSTEM_CONTRACT.md
5. Specific subsystem contracts, implementation records, status records, and guard scripts
6. This ledger as the wording guide for public summaries

Allowed Public Wording

Area	Allowed wording	Required boundary
Project identity	Latticra is an early-stage, evidence-bound systems architecture repository.	Do not call it a deployed product, production platform, daily-driver system, or operating-system replacement.
Documentation posture	Latticra uses contract-first documentation, status records, non-claims, and validation guards to keep claims evidence-bound.	Do not imply that documentation maturity equals implementation maturity.
Evidence model	Latticra has an evidence ladder for promoting concepts, fixtures, tested models, reports, guarded experiments, and later real-system capabilities.	Do not skip evidence levels or treat a lower-level record as a real-system claim.
Runtime Boundary	Latticra has denied-by-default runtime-boundary classification and report surfaces.	Do not claim runtime authority, live enforcement, process isolation, or effect-performing runtime behavior.
Nucleus	Nucleus task records and reports are report-only and denied by default.	Do not claim effect-performing task execution.
Latticra Seal	Latticra Seal has report-only dry-run, metadata, policy-denial, request-boundary, and negative-test evidence for AI-era tool-boundary planning.	Do not claim active AI-agent control, host protection, network blocking, hardened sandboxing, or production enforcement.
Lat, LIR, and L-UI	Lat, LIR, and L-UI have no-effect parse, validate, lower, metadata, and report paths.	Do not claim production language execution, LIR execution, or an interactive terminal-control renderer.
Panel and installer	Latticra Panel is a guarded local workbench and installer/control surface in active development.	Do not claim a daily-driver installer, root installer, distribution installer, or broad host-management product.
Fedora, Ubuntu, and openSUSE	The repo has local-only packaging drafts, workflow records, and validation lanes.	Do not claim Fedora approval, Ubuntu archive readiness, PPA availability, Open Build Service publication, or distribution support.
macOS lane	The macOS lane currently centers on no-effect probes, dry-run planning, app-bundle contracts, reset/uninstall contracts, and evidence gates.	Do not claim a signed, notarized, written, installed, or verified macOS app bundle unless later evidence says so.
Nadia offline AI	Nadia has staged offline AI foundation and prompt-evaluation planning contracts.	Do not claim model loading, inference, token generation, dialogue generation, prompt evaluation, or tool execution.
Security posture	Latticra documents defensive boundaries, safe-testing rules, and security non-claims.	Do not claim malware prevention, ransomware prevention, secure boot, verified boot, sandbox escape resistance, or certified security.

Blocked Public Wording

Blocked wording	Safer replacement
production-ready	early-stage, evidence-bound, or planning-stage
secure platform	documented defensive boundary with explicit security non-claims
hardened sandbox	report-only or no-effect boundary, depending on the record
AI-agent security system	AI-era tool-boundary planning with report-only evidence
runtime enforcement	denied-by-default classification and reporting

cryptographic enforcement layer	metadata, signing, key, or verification planning record, unless a specific verified implementation record says otherwise
operating system	systems architecture repository or operating-system-universe direction
OS replacement	no-effect architecture and validation research
daily-driver installer	guarded local workbench or local-only installer lane
official Fedora package	local Fedora RPM draft or validation lane
Ubuntu archive-ready package	local Ubuntu deb draft or validation lane
openSUSE package	local openSUSE RPM draft, spec lane, or validation lane
malware prevention	defensive threat-model planning and non-claims
ransomware prevention	defensive threat-model planning and non-claims
active model runtime	offline AI foundation or prompt-evaluation contract lane
tool execution authority	report-only guarded tool-authority preflight
root authority	no root authority claimed
host protection	host-facing boundary planning with non-claims

Promotion Requirements

Any stronger public claim needs all of the following before the wording is promoted:

Requirement	Minimum proof
Contract	A specific contract names the capability, effect boundary, failure behavior, operator boundary, and non-claims.
Implementation	A bounded implementation record names the exact files, behaviors, disabled paths, and report output.
Validation	Tests, guard scripts, transcripts, or reproducible reports prove the narrow behavior and denied behavior.
Status	Root and detailed status records describe the new posture without overstating it.
Public-entry alignment	README, public HTML pages, indexes, and subsystem summaries use the same wording.
Non-claim update	Unsupported adjacent claims remain explicit.
Rollback or demotion path	If evidence becomes stale, contradicted, or unsafe, the claim can be narrowed quickly.

Review Checklist

Before adding or changing public wording, confirm:

1. The wording names the exact evidence level or status surface.
2. The wording does not imply production, security, OS, installer, package, AI-runtime, network, host, root, or cryptographic authority beyond the evidence.
3. The linked source record exists and says the same thing.
4. Adjacent non-claims remain visible.
5. Denied effects are stated when the topic involves runtime, installer, package, AI, host, network, signing, or security behavior.
6. The public entry point and the detailed status record do not drift.
7. Shared terms match DOCUMENTATION_GLOSSARY.md.
8. Source, mirror, validation, and non-claim traceability follows DOCUMENTATION_TRACEABILITY_MATRIX.md.
9. Validation selection follows DOCUMENTATION_VALIDATION_PLAYBOOK.md.
10. Drift, stale evidence, and demotion handling follows DOCUMENTATION_DRIFT_RESPONSE_PLAYBOOK.md.
11. Terminology follows DOCUMENTATION_STYLE_GUIDE.md.
12. Broad public wording changes have a DOCUMENTATION_CHANGE_REVIEW_PACKET.md outcome.

docs/NON_CLAIMS.md

Source title: Latticra Non-Claims

Lines: 129 | Words: 401 | SHA-256: 2944f7021d67285088a4e4985b0b89a1b58002c55c4a251ba394f808e921216f

Latticra Non-Claims

Status: initial non-claims boundary Scope: claims Latticra does not currently make.

Purpose

This document protects Latticra from premature, confusing, or unsafe claims.

Latticra is an implementation track, but it is not automatically a finished implementation.

For public wording that is currently allowed, blocked, or promotion-gated, see the PUBLIC_CLAIMS_LEDGER.md.

Current non-claims

Latticra does not currently claim to be:

- a finished operating system;
- a daily-driver platform;

- a bootable release image;
- an installer;
- a recovery system;
- a hardened sandbox;
- a security boundary;
- a cryptographic enforcement layer;
- a kernel;
- a hypervisor;
- a virtual machine monitor;
- a container runtime;
- a firmware replacement;
- a production language runtime;
- a production systems platform.

Hardware non-claims

Latticra does not currently claim:

- hardware boot success;
- disk safety;
- firmware safety;
- device compatibility;
- driver support;
- recovery success;
- rollback success;
- network safety;
- system integrity guarantees.

Security non-claims

Latticra does not currently claim:

- malware prevention;
- ransomware prevention;
- exploit mitigation;
- secure boot enforcement;
- verified boot enforcement;
- process isolation;
- memory isolation;
- privilege isolation;
- sandbox escape resistance;
- tamper resistance;
- cryptographic correctness.

Preview boundary

Preview and modeled behavior must not be described as real-world capability unless the evidence ladder supports that claim.

Examples:

```
Allowed: Latticra has an L1 fixture for a lattice state model.
Blocked: Latticra has a real executable software universe.

Allowed: Latticra has an L2 tested transition model.
Blocked: Latticra can safely move a live system between domains.

Allowed: Latticra has L7 real-device read-only evidence.
Blocked: Latticra is hardware-ready for general use.
```

Promotion language

Use narrow evidence language.

Prefer:

```
contracted
documented
fixture-backed
tested
preview-only
read-only validated
virtual-target evidenced
real-device read-only evidenced
gated experimental
```

Avoid:

```
finished
secure
production-ready
unbreakable
hardened
fully bootable
daily-driver ready
a complete OS
```

Review rule

Every future claim should answer:

1. What evidence level supports this?
2. What tests or reports support this?
3. What does this still not prove?
4. What can fail?
5. What effects are possible?
6. What effects are impossible?
7. Is the user/operator boundary clear?
8. Does the public claims ledger allow this wording?

Current project status

Latticra currently claims only a repository identity, documentation seed, and real-system contract direction.

No real-system execution capability is claimed yet.

docs/REAL_SYSTEM_CONTRACT.md

Source title: Latticra Real-System Contract

Lines: 66 | Words: 298 | SHA-256: 0bd11748d0a8cc7caf5171a5f2db1ec56901b9f94a3b70061e517ba47e178b3b

Latticra Real-System Contract

Status: initial contract Scope: project identity, implementation boundary, evidence rules, and non-claims.

Purpose

Latticra is a contract-first real-system implementation track for lattice-oriented computing architecture and the Latticra Programming Language.

It exists to separate formal implementation from exploratory research, informal prototypes, and premature real-system claims.

Latticra may learn from precursor work, but public Latticra capability must be proven inside this repository through contracts, tests, evidence, and explicit boundaries.

Identity

Latticra means a lattice-oriented real-system architecture: a computing environment built from explicit state spaces, grids, matrices, transition rules, safety gates, and evidence-backed promotion.

The name should communicate:

- structured state;
- software universes;
- embedded real-system direction;
- formal implementation;
- evidence-bound promotion;
- professional computer-science grounding.

Project boundary

Latticra is its own public project identity.

Public documentation should describe Latticra by its own architecture, contracts, language direction, tests, and implementation evidence.

Precursor research and prototypes may inform private design decisions or documented promotion packets, but they are not public dependencies and are not public capability claims.

Required rule

No capability may enter Latticra as a real-system feature unless it has:

1. a written contract;
2. a non-claims section;
3. tests or validation evidence;
4. a direct Latticra purpose or documented precursor-promotion packet;
5. a failure model;
6. a rollback or recovery boundary when mutation is involved;
7. an operator-visible status surface.

Current non-execution boundary

This contract does not authorize:

- kernel implementation;
- boot image generation;
- installer behavior;
- disk mutation;
- recovery execution;
- network mutation;
- hardware mutation;
- production runtime claims;
- sandbox claims;
- security boundary claims.

Development mode

Latticra starts in contract-first mode.

The first implementation work should be models, fixtures, tests, validation reports, and promotion rules. Live or mutating work comes later.

docs/EVIDENCE_LADDER.md

Source title: Latticra Evidence Ladder

Lines: 175 | Words: 514 | SHA-256: 6b6b5b693ffaa4b5c2515441c4de9f897f769dcfb9177180b8a77afac3850742

Latticra Evidence Ladder

Status: initial evidence ladder Scope: promotion levels for concepts, components, hardware paths, and real-system claims.

Purpose

The evidence ladder defines how an idea moves from simulation to real implementation.

Latticra must not treat concepts as real-system capabilities until evidence supports them.

Ladder

L0: Concept

The idea has a name and a written description.

Allowed outputs:

- notes;
- diagrams;
- design vocabulary;
- non-claims.

Not allowed:

- implementation claims;
- hardware claims;

- security claims.

L1: Simulation fixture

The idea exists as deterministic simulation data or a static fixture.

Required evidence:

- fixture file;
- expected output;
- no mutation;
- no host effect;
- no external effect.

L2: Tested model

The idea has tests that preserve required behavior and forbidden behavior.

Required evidence:

- unit tests, docs tests, or validation scripts;
- denied-behavior tests;
- explicit non-claims.

L3: Read-only command surface

The idea is inspectable through a command or report.

Required evidence:

- command output;
- status labels;
- deterministic behavior;
- no mutation;
- no host or external effect.

L4: Runtime preview

The idea is wired into a runtime model but remains preview-only.

Required evidence:

- runtime state model;
- invariant tests;
- failure state;
- rollback visibility when relevant;
- operator-facing status.

L5: Guarded local experiment

The idea performs a narrow local operation under explicit gates.

Required evidence:

- opt-in command;
- confirmation path;

- audit output;
- rollback or reset path;
- failure handling;
- no hidden effects.

L6: VM or emulator evidence

The idea runs inside a VM, emulator, or controlled local virtual target.

Required evidence:

- launch command;
- logs;
- validation report;
- reproducibility notes;
- no real-device claim.

L7: Real-device read-only evidence

The idea observes or validates real hardware without changing it.

Required evidence:

- hardware target identity;
- read-only operator checklist;
- captured logs or report;
- redaction review;
- non-mutation proof.

L8: Real-device gated execution

The idea performs a narrow real-world action on real hardware.

Required evidence:

- explicit operator approval;
- device identity;
- preflight checks;
- backup/recovery plan;
- rollback or failure behavior;
- post-run validation.

L9: Promoted real-system capability

The capability is part of the Latticra implementation contract.

Required evidence:

- repeated successful evidence;
- tests;
- documentation;
- release note;

- support boundary;
- safety review.

Promotion rule

A concept may move up one level only when the evidence for the next level exists.

No concept may skip directly from simulation to real-device execution.

Demotion rule

A promoted concept must be demoted when evidence becomes stale, contradicted, unreproducible, unsafe, or ambiguous.

Claim language

Use exact level labels when describing capability.

Good:

```
This is an L2 tested model.
This is an L4 runtime preview.
This has L7 real-device read-only evidence.
```

Bad:

```
This is production-ready.
This is secure.
This is a finished operating system.
This can recover systems safely.
```

Current project level

Latticra currently begins at L0/L1 contract and fixture planning.

No real-system execution level is claimed yet.

docs/PRECURSOR_PROMOTION_RULE.md

Source title: Latticra Precursor Promotion Rule

Lines: 157 | Words: 419 | SHA-256: adfe5f7ac9e40f18e74851c09836db8a4fda59b8ed42bbd51ff106c224cd2cc7

Latticra Precursor Promotion Rule

Status: initial promotion rule Scope: how prior research, prototypes, experiments, and external lessons may become Latticra work.

Purpose

Latticra should not absorb every prior idea automatically.

Precursor work may inform Latticra, but Latticra should only promote an idea after it has evidence, boundaries, tests, and a clear implementation purpose.

This document keeps the project self-contained while still allowing useful lessons from earlier research and prototypes to be formalized.

Promotion rule

A concept may enter Latticra only when it has:

1. a clear technical purpose;
2. a documented non-claim boundary;
3. at least one fixture, test, or validation artifact;

4. a clear Latticra destination;
5. a failure or denial model;
6. an effect boundary;
7. a reviewable implementation path.

Promotion packet

Every promoted concept should start with a promotion packet:

```
name:
origin type: research|prototype|direct-design|external-standard|test-result
source evidence level:
Latticra target:
status:
operator-visible state:
mutation allowed: no|yes
host-effect: none|planned|gated|executed
external-effect: none|planned|gated|executed
rollback state:
non-claims:
required next evidence:
```

Early promotion candidates

State lattice model

Initial Latticra target:

```
lattice state fixture
state labels
invariant tests
read-only reports
```

Boundary:

```
no live movement
no origin mutation
no recovery execution
no host effect
no external effect
```

Tri-plane transition model

Initial Latticra target:

```
pure transition model
spatial plane
state plane
safety plane
denial reasons
```

Boundary:

```
preview-only
pure function
no hardware effect
no hidden state mutation
```

Lat language path

Initial Latticra target:

```
read-only source declarations
state inspection candidate
assertion language candidate
future controlled programming language
```

Boundary:

```
no production runtime claim
no live system mutation
no privileged execution
no automatic promotion
```

Hardware evidence path

Initial Latticra target:

```
hardware target profiles
evidence templates
read-only validation reports
VM evidence gates
real-device read-only gates
```

Boundary:

```
no installer claim
no bootable release claim
no recovery execution claim
no disk mutation claim
```

Rejection rules

Do not promote a concept when:

- it is only a name;
- it has no non-claims;
- it depends on hidden mutation;
- it implies hardware readiness without hardware evidence;
- it would confuse research with implementation;
- it bypasses the evidence ladder;
- it expands claims beyond what tests support.

Naming rule

Promoted concepts should use Latticra implementation-level names once they become public architecture.

Example:

```
research concept: multi-plane movement check
Latticra component candidate: tri-plane transition model
```

Current status

No precursor concept is automatically a real-system capability.

This document only defines the promotion gate.

docs/FOUNDATION_INDEX.md

Source title: Latticra Foundation Index

Lines: 631 | Words: 7821 | SHA-256: 79a91b94c6007e7712a1ff669da3a5622bf3e0c4ac994ba3eeb19e6aa897e366

Latticra Foundation Index

Status: active planning index Scope: foundation documents, project operations records, implementation documents, guard scripts, and current next-slice direction.

Purpose

This index collects the first architecture, policy, language, operations, strategy, status, and implementation documents for Latticra.

Latticra should refine its language model, supervisor model, effect gates, source model, update model, target architectures, strategy records, status records, C/C++ foundation direction, constrained C++ authority-layer policy, L-UI rendering path, Nucleus task execution boundary, runtime boundary, defensive threat model, and precursor-promotion rules before expanding real implementation work.

Foundation documents

- REAL_SYSTEM_CONTRACT.md — project identity, real-system boundary, evidence rules, and non-claims.
- EVIDENCE_LADDER.md — promotion levels from concept to real-system capability.
- PRECURSOR_PROMOTION_RULE.md — rules for promoting precursor research, prototypes, experiments, and external lessons into Latticra.
- NON_CLAIMS.md — claims Latticra does not currently make.
- ARCHITECTURE_SEED.md — initial state-lattice and software-universe vocabulary.
- C_CPP_FOUNDATION_DIRECTION.md — active constrained C/C++ foundation direction: C is the metal, C++ is the disciplined structure, Latticra is the contract.
- CONSTRAINED_CPP_AUTHORITY_LAYER_CONTRACT.md — governed C++ policy, validator, effect-gate, audit, ownership, lifetime, allocation, exception, and boundary contract before implementation.
- CONSTRAINED_CPP_AUTHORITY_LAYER_IMPLEMENTATION_PLAN.md — Constrained C++ authority layer implementation plan for exact API, namespace, file path, build, exception, RTTI, allocation, ownership, C ABI, validator, audit report, and test planning before implementation code.
- CONSTRAINED_CPP_AUTHORITY_LAYER_IMPLEMENTATION.md — first no-effect constrained C++ authority implementation.
- CPP_AUTHORITY_IMPLEMENTATION_REVIEW.md — review confirming the constrained C++ authority implementation remains no-effect, metadata-only, fixed-capacity, and denied-by-default.
- LANGUAGE_STRATEGY.md — role of C, constrained C++, Lat, L-UI, and LIR.
- LANGUAGE_NAMING_POLICY.md — Lat / Latticra Language naming and extension policy; forbids plain L and .l as public identifiers.
- NAMING_SYSTEM.md — formal naming rules for professional Latticra terminology.
- FEATURE_TRANSLATION_LEDGER.md — vocabulary ledger for translating exploratory labels into Latticra architecture terms.
- SUPERVISOR_ARCHITECTURE.md — Nucleus supervisor model and orchestration responsibilities.
- EFFECT_GATES.md — effect categories, gating rules, and visibility requirements.
- UI_TERMINAL_LANGUAGE.md — L-UI terminal/operator interface language direction.
- LATTICRA_CONSOLE_FOUNDATION.md — Latticra Console Stage-0 foundation, standalone dry-run/local installer presets, Panel installability, profile presets, standalone contract, host-embedding contract, read-only host inventory contract, host-adapter contract, receipt contract, Seal receipt-request contract, receipt payload schema, receipt payload artifact draft, receipt payload artifact review gate, receipt payload artifact review receipt contract, receipt payload artifact review receipt draft contract, receipt payload materialization plan, signature-request binding contract, OS-base planning contract, VM evidence contract, command registry, Runtime Boundary binding, and future host/OS-base posture.
- SERVER_INTERACTION_MODEL.md — signed, optional, inspectable server interaction model.

- NADIA_OFFLINE_AI_FOUNDATION.md — Stage-0 foundation contract for Latticra Nadia Witness Foundation, the planned offline AI companion for Latticra software development, systems engineering, AI development, and community-awareness principles.
- NADIA_LOCAL_CONTEXT_ENGINE_STAGE_1.md — Stage-1 no-network local context-pack engine for Nadia.
- NADIA_RUNTIME_PROFILE_STAGE_2.md — Stage-2 offline runtime-profile boundary for Nadia before inference.
- NADIA_DEVELOPER_WORKBENCH_STAGE_3.md — Stage-3 developer-workbench prompt-plan generation for Nadia before prompt evaluation.
- NADIA_SYSTEMS_ENGINEERING_MODE_STAGE_4.md — Stage-4 systems-engineering mode validation for Nadia prompt plans before prompt evaluation.
- NADIA_PRODUCTIVITY_LOOP_STAGE_5.md — Stage-5 operator-reviewed productivity ledger for Nadia local learning evidence before training or tool authority.
- NADIA_PROTECTIVE_SAFETY_BOUNDARY_STAGE_6.md — Stage-6 protective-safety boundary for Nadia non-sexual-use, anti-manipulation, and namesake-cause awareness restrictions.
- NADIA_GUARDED_TOOL_AUTHORITY_STAGE_7.md — Stage-7 report-only guarded tool-authority preflight for Nadia before any tool execution.
- NADIA_PROMPT_EVALUATION_CONTRACT_STAGE_8.md — Stage-8 prompt-evaluation contract for Nadia before prompt materialization, prompt evaluation, inference, or tool execution.
- NADIA_LOCAL_MODEL_REGISTRY_CONTRACT_STAGE_9.md — Stage-9 local model-registry contract for Nadia before model selection, model installation, prompt evaluation, inference, or tool execution.
- NADIA_INFERENCE_READINESS_CONTRACT_STAGE_10.md — Stage-10 inference-readiness contract for Nadia before runtime invocation, model loading, prompt evaluation, inference, or tool execution.
- NADIA_RUNTIME_INVOCATION_CONTRACT_STAGE_11.md — Stage-11 runtime-invocation contract for Nadia before runtime process spawning, model session creation, model loading, token generation, inference, or tool execution.
- NADIA_MODEL_LOAD_CONTRACT_STAGE_12.md — Stage-12 model-load contract for Nadia before model file opening, weight mapping, weight loading, token generation, inference, or tool execution.
- NADIA_PROMPT_RECEIPT_CONTRACT_STAGE_13.md — Stage-13 prompt-receipt contract for Nadia before prompt source opening, prompt text receipt, prompt materialization, prompt evaluation, token generation, inference, or tool execution.
- NADIA_PROMPT_MATERIALIZATION_CONTRACT_STAGE_14.md — Stage-14 prompt-materialization contract for Nadia before prompt buffer allocation, prompt text materialization, prompt tokenization, prompt evaluation, token generation, inference, or tool execution.
- NADIA_AWARENESS_DIALOGUE_CONTRACT_STAGE_15.md — Stage-15 awareness-dialogue contract for Nadia Initiative Q&A scope before dialogue generation, prompt evaluation, token generation, inference, or tool execution.
- NADIA_PROMPT_EVALUATION_HANDOFF_CONTRACT_STAGE_16.md — Stage-16 prompt-evaluation handoff contract for Nadia before prompt tokenization, prompt evaluation, dialogue generation, token generation, inference, or tool execution.
- NADIA_TOKENIZATION_BOUNDARY_CONTRACT_STAGE_17.md — Stage-17 tokenization-boundary contract for Nadia before tokenizer file access, tokenizer vocabulary loading, prompt tokenization, prompt evaluation, token generation, inference, or tool execution.

- NADIA_TOKENIZER_SPECIFICATION_CONTRACT_STAGE_18.md — Stage-18 tokenizer-specification contract for Nadia before tokenizer manifest loading, tokenizer file access, tokenizer vocabulary loading, prompt tokenization, prompt evaluation, token generation, inference, or tool execution.
- NADIA_TOKENIZER_MANIFEST_CONTRACT_STAGE_19.md — Stage-19 tokenizer-manifest contract for Nadia before tokenizer manifest loading, tokenizer manifest parsing, tokenizer file access, tokenizer vocabulary loading, prompt tokenization, prompt evaluation, token generation, inference, or tool execution.
- NADIA_TOKENIZER_ARTIFACT_INVENTORY_CONTRACT_STAGE_20.md — Stage-20 tokenizer-artifact-inventory contract for Nadia before tokenizer artifact path resolution, artifact scanning, artifact hashing, tokenizer manifest loading, tokenizer file access, tokenizer vocabulary loading, prompt tokenization, prompt evaluation, token generation, inference, or tool execution.
- NADIA_TOKENIZER_ARTIFACT_MEASUREMENT_CONTRACT_STAGE_21.md — Stage-21 tokenizer-artifact-measurement contract for Nadia before tokenizer artifact opening, artifact reading, artifact hashing, artifact digest recording, artifact size recording, tokenizer manifest loading, tokenizer file access, tokenizer vocabulary loading, prompt tokenization, prompt evaluation, token generation, inference, or tool execution.
- NADIA_TOKENIZER_ARTIFACT_VERIFICATION_CONTRACT_STAGE_22.md — Stage-22 tokenizer-artifact-verification contract for Nadia before tokenizer artifact opening, artifact reading, artifact hashing, artifact digest comparison, artifact size comparison, artifact verification, artifact binding, tokenizer manifest loading, tokenizer file access, tokenizer vocabulary loading, prompt tokenization, prompt evaluation, token generation, inference, or tool execution.
- NADIA_TOKENIZER_ARTIFACT_BINDING_CONTRACT_STAGE_23.md — Stage-23 tokenizer-artifact-binding contract for Nadia before tokenizer artifact opening, artifact reading, artifact hashing, artifact verification, artifact binding, tokenizer runtime attachment, tokenizer manifest loading, tokenizer file access, tokenizer vocabulary loading, prompt tokenization, prompt evaluation, token generation, inference, or tool execution.
- NADIA_TOKENIZER_RUNTIME_ATTACHMENT_CONTRACT_STAGE_24.md — Stage-24 tokenizer-runtime-attachment contract for Nadia before tokenizer artifact opening, artifact reading, artifact hashing, tokenizer artifact binding, tokenizer runtime attachment, runtime session creation, tokenizer manifest loading, tokenizer file access, tokenizer vocabulary loading, prompt tokenization, prompt evaluation, token generation, inference, or tool execution.
- NADIA_PROMPT_TOKENIZATION_CONTRACT_STAGE_25.md — Stage-25 prompt-tokenization contract for Nadia before prompt text reading, prompt token creation, prompt token sequence recording, tokenizer runtime attachment, prompt evaluation, dialogue generation, token generation, inference, or tool execution.
- NADIA_PROMPT_TOKEN_SEQUENCE_CONTRACT_STAGE_26.md — Stage-26 prompt-token-sequence contract for Nadia before prompt token ID recording, token order recording, token offset recording, context window assembly, prompt evaluation input creation, runtime invocation, prompt evaluation, dialogue generation, token generation, inference, or tool execution.
- NADIA_CONTEXT_WINDOW_ASSEMBLY_CONTRACT_STAGE_27.md — Stage-27 context-window assembly contract for Nadia before context window assembly, prompt evaluation input creation, runtime invocation, prompt evaluation, dialogue generation, token generation, inference, or tool execution.

- NADIA_PROMPT_EVALUATION_INPUT_CONTRACT_STAGE_28.md — Stage-28 prompt-evaluation-input contract for Nadia before prompt evaluation input creation, runtime invocation, prompt evaluation, dialogue generation, token generation, inference, or tool execution.
- NADIA_PROMPT_EVALUATION_RUNTIME_HANDOFF_CONTRACT_STAGE_29.md — Stage-29 prompt-evaluation runtime handoff contract for Nadia before runtime handoff, runtime invocation, prompt evaluation, dialogue generation, token generation, inference, or tool execution.
- NADIA_PROMPT_EVALUATION_INVOCATION_CONTRACT_STAGE_30.md — Stage-30 prompt-evaluation invocation contract for Nadia before invocation requests, runtime invocation, prompt evaluation, dialogue generation, token generation, inference, or tool execution.
- NADIA_PROMPT_EVALUATION_RESULT_CONTRACT_STAGE_31.md — Stage-31 prompt-evaluation result contract for Nadia before result records, model-output recording, runtime invocation, prompt evaluation, dialogue generation, token generation, inference, or tool execution.
- NADIA_PROMPT_EVALUATION_RESULT_REVIEW_CONTRACT_STAGE_32.md — Stage-32 prompt-evaluation result review contract for Nadia before result-review records, result records, model-output recording, runtime invocation, prompt evaluation, dialogue generation, token generation, inference, or tool execution.
- NADIA_PROMPT_EVALUATION_RESULT_DISPOSITION_CONTRACT_STAGE_33.md — Stage-33 prompt-evaluation result disposition contract for Nadia before disposition records, release records, result-review records, result records, model-output recording, runtime invocation, prompt evaluation, dialogue generation, token generation, inference, or tool execution.
- NADIA_PROMPT_EVALUATION_RESULT_RELEASE_CONTRACT_STAGE_34.md — Stage-34 prompt-evaluation result release contract for Nadia before release records, release decisions, release publication, release receipts, disposition records, result-review records, result records, model-output recording, runtime invocation, prompt evaluation, dialogue generation, token generation, inference, or tool execution.
- NADIA_PROMPT_EVALUATION_RESULT_RELEASE_RECEIPT_CONTRACT_STAGE_35.md — Stage-35 prompt-evaluation result release receipt contract for Nadia before receipt records, receipt signing, receipt publication, release records, release decisions, release publication, disposition records, result-review records, result records, model-output recording, runtime invocation, prompt evaluation, dialogue generation, token generation, inference, or tool execution.
- NADIA_PROMPT_EVALUATION_RESULT_RELEASE_RECEIPT_REVIEW_CONTRACT_STAGE_36.md — Stage-36 prompt-evaluation result release receipt review contract for Nadia before review records, review decisions, review findings, receipt records, receipt signing, receipt publication, release records, result records, model-output recording, runtime invocation, prompt evaluation, dialogue generation, token generation, inference, or tool execution.
- NADIA_PROMPT_EVALUATION_RESULT_RELEASE_RECEIPT_REVIEW_DISPOSITION_CONTRACT_STAGE_37.md — Stage-37 prompt-evaluation result release receipt review disposition contract for Nadia before disposition records, disposition decisions, disposition findings, review records, review decisions, review findings, receipt records, receipt signing, receipt publication, release records, result records, model-output recording, runtime invocation, prompt evaluation, dialogue generation, token generation, inference, or tool execution.
- NADIA_PROMPT_EVALUATION_RESULT_RELEASE_RECEIPT_REVIEW_DISPOSITION_RELEASE_CONTRACT_STAGE_38.md — Stage-38 prompt-evaluation result release receipt review disposition release contract for Nadia before disposition-release records, release decisions, release

publication, release packaging, release receipts, disposition records, review records, receipt records, result records, model-output recording, runtime invocation, prompt evaluation, dialogue generation, token generation, inference, or tool execution.

- NADIA_PROMPT_EVALUATION_RESULT_RELEASE_RECEIPT_REVIEW_DISPOSITION_RELEASE_RECEIPT_CONTRACT_STAGE_39.md — Stage-39 prompt-evaluation result release receipt review disposition release receipt contract for Nadia before release-receipt records, receipt signing, receipt publication, disposition-release records, release publication, model-output recording, runtime invocation, prompt evaluation, dialogue generation, token generation, inference, or tool execution.
- NADIA_PROMPT_EVALUATION_RESULT_RELEASE_RECEIPT_REVIEW_DISPOSITION_RELEASE_RECEIPT_REVIEW_CONTRACT_STAGE_40.md — Stage-40 prompt-evaluation result release receipt review disposition release receipt review contract for Nadia before release-receipt-review records, review decisions, review findings, release-receipt records, receipt signing, receipt publication, model-output recording, runtime invocation, prompt evaluation, dialogue generation, token generation, inference, or tool execution.
- NADIA_PROMPT_EVALUATION_RESULT_RELEASE_RECEIPT_REVIEW_DISPOSITION_RELEASE_RECEIPT_REVIEW_DISPOSITION_CONTRACT_STAGE_41.md — Stage-41 prompt-evaluation result release receipt review disposition release receipt review disposition contract for Nadia before release-receipt-review-disposition records, review decisions, review findings, receipt signing, receipt publication, receipt packaging, model-output recording, runtime invocation, prompt evaluation, dialogue generation, token generation, inference, or tool execution.
- NADIA_PROMPT_EVALUATION_RESULT_RELEASE_RECEIPT_REVIEW_DISPOSITION_RELEASE_RECEIPT_REVIEW_DISPOSITION_RELEASE_CONTRACT_STAGE_42.md — Stage-42 prompt-evaluation result release receipt review disposition release receipt review disposition release contract for Nadia before disposition-release recording, release decisions, release publication, release packaging, release receipt creation, disposition recording, review recording, receipt recording, model-output recording, runtime invocation, prompt evaluation, dialogue generation, token generation, inference, or tool execution.
- NADIA_PROMPT_EVALUATION_RESULT_RELEASE_RECEIPT_REVIEW_DISPOSITION_RELEASE_RECEIPT_REVIEW_DISPOSITION_RELEASE_RECEIPT_CONTRACT_STAGE_43.md — Stage-43 prompt-evaluation result release receipt review disposition release receipt review disposition release receipt contract for Nadia before release-receipt records, receipt emission, receipt signing, receipt publication, release records, review records, model-output recording, runtime invocation, prompt evaluation, dialogue generation, token generation, inference, or tool execution.
- NADIA_PROMPT_EVALUATION_RESULT_RELEASE_RECEIPT_REVIEW_DISPOSITION_RELEASE_RECEIPT_REVIEW_DISPOSITION_RELEASE_RECEIPT_REVIEW_CONTRACT_STAGE_44.md — Nadia prompt evaluation result release receipt review disposition release receipt review disposition release receipt review contract Stage-44 + guardrails before release-receipt-review records, review decisions, review findings, receipt signing, receipt publication, receipt packaging, disposition recording, model-output recording, runtime invocation, prompt evaluation, dialogue generation, token generation, inference, or tool execution.
- NADIA_PROMPT_EVALUATION_RESULT_RELEASE_RECEIPT_REVIEW_DISPOSITION_RELEASE_RECEIPT_REVIEW_DISPOSITION_RELEASE_RECEIPT_REVIEW_DISPOSITION_CONTRACT_STAGE_45.md — Nadia prompt evaluation result release receipt review disposition release receipt review disposition release receipt review disposition contract Stage-45 + guardrails before release-receipt-review-disposition records, disposition decisions, disposition findings, receipt signing, receipt publication, model-output recording, runtime invocation, prompt evaluation, dialogue generation, token generation, inference, or tool execution.

- NADIA_PROMPT_EVALUATION_RESULT_RELEASE_RECEIPT_REVIEW_DISPOSITION_RELEASE_RECEIPT_REVIEW_DISPOSITION_RELEASE_RECEIPT_REVIEW_DISPOSITION_RELEASE_CONTRACT_STAGE_46.md — Nadia prompt evaluation result release receipt review disposition release receipt review disposition release receipt review disposition release contract Stage-46 + guardrails before disposition-release recording, release decisions, release publication, release packaging, release receipt creation, disposition recording, review recording, receipt recording, model-output recording, runtime invocation, prompt evaluation, dialogue generation, token generation, inference, or tool execution.
- NADIA_PROMPT_EVALUATION_RESULT_RELEASE_RECEIPT_REVIEW_DISPOSITION_RELEASE_RECEIPT_REVIEW_DISPOSITION_RELEASE_RECEIPT_REVIEW_DISPOSITION_RELEASE_CONTRACT_STAGE_46.md — Nadia prompt evaluation result release receipt review disposition release receipt review disposition release receipt review disposition release contract Stage-46 + guardrails before disposition-release recording, release decisions, release publication, release packaging, release receipt creation, model-output recording, runtime invocation, prompt evaluation, dialogue generation, token generation, inference, or tool execution.
- SELF_UPDATE_MODEL.md — staged signed update and rollback design.
- HOST_ARCHITECTURE_TARGETS.md — x86_64 and ARM64 target policy.
- ROADMAP.md — design-first roadmap before implementation.
- LICENSE_POLICY.md — hybrid project licensing, contributions, branding, and future notice rules.
- DOCUMENTATION_LICENSE.md — CC-BY-4.0 documentation and handbook license decision.

Project operations documents

- README.md — reader-facing documentation hub for choosing the right documentation level before using the full foundation index.
- DOCUMENTATION_GLOSSARY.md — shared documentation glossary for public terms, claim posture, validation, platform posture, and reader-route terminology.
- DOCUMENTATION_READER_JOURNEY_MAP.md — reader journey map for user, operator, reviewer, contributor, packager, security, subsystem, public-site, and handbook routes.
- DOCUMENTATION_MAINTENANCE.md — maintenance guide for public entry points, estimate mirrors, status docs, platform docs, static HTML summaries, and documentation-only validation.
- DOCUMENTATION_CHANGE_REVIEW_PACKET.md — reusable documentation review packet for public wording, reader routes, mirrors, non-claims, validation, and rollback checks.
- DOCUMENTATION_STYLE_GUIDE.md — documentation style guide for canonical terms, status/date style, claim wording, headings, links, tables, and replacement phrasing.
- DOCUMENTATION_TRACEABILITY_MATRIX.md — traceability matrix mapping public surfaces to source records, validation, mirrors, and non-claim boundaries.
- DOCUMENTATION_VALIDATION_PLAYBOOK.md — documentation validation playbook for hygiene, link, public-entry, estimate, platform, subsystem, and claim-promotion checks.
- DOCUMENTATION_DRIFT_RESPONSE_PLAYBOOK.md — documentation drift-response playbook for mirror drift, stale evidence, non-claim drift, and claim demotion.
- PRODUCT_DOCUMENTATION_COHESION.md — product-facing documentation cohesion guide for reader routes, public copy, surface responsibilities, and cross-link expectations.
- QUICK_START_CHEATSHEET.md — short user-facing install, run, update, reset/uninstall, and clean full user-local uninstall command sheet.

- ../STATUS.md — root status shortcut with completion estimates and next step.
- ../SECURITY.md — vulnerability reporting, safe testing rules, and security non-claims.
- HIGH_ASSURANCE_SECURITY_BASELINE.md — high-assurance security baseline for current NSA, CISA, FBI, and NIST source-tracked allocations.
- MEMORY_SAFETY_ROADMAP.md — memory-safety roadmap for current C/C++ component mitigation, memory-safe-language preference, and promotion blockers.
- SUPPLY_CHAIN_SECURITY_BASELINE.md — supply-chain security baseline for CI, dependency, SBOM, KEV/NVD, package, installer, release, and update-lane blockers.
- ZERO_TRUST_RUNTIME_AUTHORITY_BASELINE.md — zero-trust runtime authority baseline for per-request authorization, identity/resource visibility, policy decisions, denial reasons, audit records, and no implicit runtime trust.
- CYBER_INCIDENT_REPORTING_RESPONSE_BASELINE.md — cyber incident reporting and response baseline for CISA/FBI/IC3 path awareness, ransomware response planning, evidence preservation, communications routing, and no service claims.
- VULNERABILITY_MANAGEMENT_RELEASE_GATE_BASELINE.md — vulnerability management release gate baseline for CISA KEV review, NVD/CVE review, disclosure handling, release blocking, and no product-security claims.
- CRYPTOGRAPHIC_ASSURANCE_KEY_MANAGEMENT_BASELINE.md — cryptographic assurance and key-management baseline for FIPS/CMVP claim gates, algorithm inventory, key lifecycle, randomness, post-quantum planning, and no production crypto claims.
- IDENTITY_CREDENTIAL_ACCESS_MANAGEMENT_BASELINE.md — identity, credential, and access management baseline for privileged access, phishing-resistant MFA planning, account lifecycle, service identity, identity logging, and no hosted access claims.
- SECURITY_LOGGING_MONITORING_BASELINE.md — security logging, monitoring, and detection baseline for event-source inventory, audit events, redaction, retention, triage, incident handoff, and no monitoring-service claims.
- BACKUP_RECOVERY_RESILIENCE_BASELINE.md — backup, recovery, and cyber resilience baseline for backup scope, restore testing, recovery prioritization, rollback planning, RTO/RPO, and no recovery-service claims.
- SECURE_CONFIGURATION_CHANGE_MANAGEMENT_BASELINE.md — secure configuration and change management baseline for configuration inventory, secure baselines, checklist evidence, approved changes, rollback planning, drift detection, and no hardening claims.
- DEFENSIVE_THREAT_MODEL_CONTRACT.md — defensive threat model contract for protected assets, trust boundaries, abuse cases, evidence expectations, and non-claims.
- DEFENSIVE_THREAT_MODEL_IMPLEMENTATION_PLAN.md — documentation-and-guard implementation plan for defensive threat model validation.
- DEFENSIVE_THREAT_MODEL_VALIDATION.md — defensive threat model validation ledger.
- DEFENSIVE_THREAT_MODEL_VALIDATION_REFINEMENT.md — defensive threat model validation refinement and next-gap triage.
- strategy/README.md — strategy index and dated strategy-record rules.
- strategy/2026-05-15-2249-cdt-national-security-open-system-strategy.md — active national-security open-system strategy record.
- strategy/2026-05-19-1845-cdt-strategy-estimate-review.md — latest strategy estimate review.
- status/README.md — status index and update rules.

- status/CURRENT_STATUS.md — current progress, completion estimates, and next priorities.
- status/NADIA_OFFLINE_AI_STAGE_0_STATUS.md — status record for Nadia offline AI Stage-0 foundation, Panel installability, Console interoperability, and awareness principles.
- status/NADIA_LOCAL_CONTEXT_ENGINE_STAGE_1_STATUS.md — status record for Nadia Stage-1 local context-pack generation.
- status/NADIA_RUNTIME_PROFILE_STAGE_2_STATUS.md — status record for Nadia Stage-2 runtime-profile metadata before inference.
- status/NADIA_DEVELOPER_WORKBENCH_STAGE_3_STATUS.md — status record for Nadia Stage-3 prompt-plan generation before prompt evaluation.
- status/NADIA_SYSTEMS_ENGINEERING_MODE_STAGE_4_STATUS.md — status record for Nadia Stage-4 systems-engineering mode validation before prompt evaluation.
- status/NADIA_PRODUCTIVITY_LOOP_STAGE_5_STATUS.md — status record for Nadia Stage-5 productivity ledger before training or tool authority.
- status/NADIA_PROTECTIVE_SAFETY_BOUNDARY_STAGE_6_STATUS.md — status record for Nadia Stage-6 protective-safety boundary before prompt evaluation, model runtime, or tool authority.
- status/NADIA_GUARDED_TOOL_AUTHORITY_STAGE_7_STATUS.md — status record for Nadia Stage-7 guarded tool-authority preflight before any tool execution.
- status/NADIA_PROMPT_EVALUATION_CONTRACT_STAGE_8_STATUS.md — status record for Nadia Stage-8 prompt-evaluation contract before prompt materialization, prompt evaluation, inference, or tool execution.
- status/NADIA_LOCAL_MODEL_REGISTRY_CONTRACT_STAGE_9_STATUS.md — status record for Nadia Stage-9 local model-registry contract before model selection, model installation, prompt evaluation, inference, or tool execution.
- status/NADIA_INFERENCE_READINESS_CONTRACT_STAGE_10_STATUS.md — status record for Nadia Stage-10 inference-readiness contract before runtime invocation, model loading, prompt evaluation, inference, or tool execution.
- status/NADIA_RUNTIME_INVOCATION_CONTRACT_STAGE_11_STATUS.md — status record for Nadia Stage-11 runtime-invocation contract before runtime process spawning, model session creation, model loading, token generation, inference, or tool execution.
- status/NADIA_MODEL_LOAD_CONTRACT_STAGE_12_STATUS.md — status record for Nadia Stage-12 model-load contract before model file opening, weight mapping, weight loading, token generation, inference, or tool execution.
- status/NADIA_PROMPT_RECEIPT_CONTRACT_STAGE_13_STATUS.md — status record for Nadia Stage-13 prompt-receipt contract before prompt source opening, prompt text receipt, prompt materialization, prompt evaluation, token generation, inference, or tool execution.
- status/NADIA_PROMPT_MATERIALIZATION_CONTRACT_STAGE_14_STATUS.md — status record for Nadia Stage-14 prompt-materialization contract before prompt buffer allocation, prompt text materialization, prompt tokenization, prompt evaluation, token generation, inference, or tool execution.
- status/NADIA_AWARENESS_DIALOGUE_CONTRACT_STAGE_15_STATUS.md — status record for Nadia Stage-15 awareness-dialogue contract for Nadia Initiative Q&A scope before dialogue generation, prompt evaluation, token generation, inference, or tool execution.
- status/NADIA_PROMPT_EVALUATION_HANDOFF_CONTRACT_STAGE_16_STATUS.md — status record for Nadia Stage-16 prompt-evaluation handoff contract before prompt tokenization, prompt evaluation, dialogue generation, token generation, inference, or tool execution.

- status/NADIA_TOKENIZATION_BOUNDARY_CONTRACT_STAGE_17_STATUS.md — status record for Nadia Stage-17 tokenization-boundary contract before tokenizer file access, tokenizer vocabulary loading, prompt tokenization, prompt evaluation, token generation, inference, or tool execution.
- status/NADIA_TOKENIZER_SPECIFICATION_CONTRACT_STAGE_18_STATUS.md — status record for Nadia Stage-18 tokenizer-specification contract before tokenizer manifest loading, tokenizer file access, tokenizer vocabulary loading, prompt tokenization, prompt evaluation, token generation, inference, or tool execution.
- status/NADIA_TOKENIZER_MANIFEST_CONTRACT_STAGE_19_STATUS.md — status record for Nadia Stage-19 tokenizer-manifest contract before tokenizer manifest loading, tokenizer manifest parsing, tokenizer file access, tokenizer vocabulary loading, prompt tokenization, prompt evaluation, token generation, inference, or tool execution.
- status/NADIA_TOKENIZER_ARTIFACT_INVENTORY_CONTRACT_STAGE_20_STATUS.md — status record for Nadia Stage-20 tokenizer-artifact-inventory contract before tokenizer artifact path resolution, artifact scanning, artifact hashing, tokenizer manifest loading, tokenizer file access, tokenizer vocabulary loading, prompt tokenization, prompt evaluation, token generation, inference, or tool execution.
- status/NADIA_TOKENIZER_ARTIFACT_MEASUREMENT_CONTRACT_STAGE_21_STATUS.md — status record for Nadia Stage-21 tokenizer-artifact-measurement contract before tokenizer artifact opening, artifact reading, artifact hashing, artifact digest recording, artifact size recording, tokenizer manifest loading, tokenizer file access, tokenizer vocabulary loading, prompt tokenization, prompt evaluation, token generation, inference, or tool execution.
- status/NADIA_TOKENIZER_ARTIFACT_VERIFICATION_CONTRACT_STAGE_22_STATUS.md — status record for Nadia Stage-22 tokenizer-artifact-verification contract before tokenizer artifact opening, artifact reading, artifact hashing, artifact digest comparison, artifact size comparison, artifact verification, artifact binding, tokenizer manifest loading, tokenizer file access, tokenizer vocabulary loading, prompt tokenization, prompt evaluation, token generation, inference, or tool execution.
- status/NADIA_TOKENIZER_ARTIFACT_BINDING_CONTRACT_STAGE_23_STATUS.md — status record for Nadia Stage-23 tokenizer-artifact-binding contract before tokenizer artifact opening, artifact reading, artifact hashing, artifact verification, artifact binding, tokenizer runtime attachment, tokenizer manifest loading, tokenizer file access, tokenizer vocabulary loading, prompt tokenization, prompt evaluation, token generation, inference, or tool execution.
- status/NADIA_TOKENIZER_RUNTIME_ATTACHMENT_CONTRACT_STAGE_24_STATUS.md — status record for Nadia Stage-24 tokenizer-runtime-attachment contract before tokenizer artifact opening, artifact reading, artifact hashing, tokenizer artifact binding, tokenizer runtime attachment, runtime session creation, tokenizer manifest loading, tokenizer file access, tokenizer vocabulary loading, prompt tokenization, prompt evaluation, token generation, inference, or tool execution.
- status/NADIA_PROMPT_TOKENIZATION_CONTRACT_STAGE_25_STATUS.md — status record for Nadia Stage-25 prompt-tokenization contract before prompt text reading, prompt token creation, prompt token sequence recording, tokenizer runtime attachment, prompt evaluation, dialogue generation, token generation, inference, or tool execution.
- status/NADIA_PROMPT_TOKEN_SEQUENCE_CONTRACT_STAGE_26_STATUS.md — status record for Nadia Stage-26 prompt-token-sequence contract before prompt token ID recording, token order recording, token offset recording, context window assembly, prompt evaluation input creation, runtime invocation, prompt evaluation, dialogue generation, token generation, inference, or tool execution.

- status/NADIA_CONTEXT_WINDOW_ASSEMBLY_CONTRACT_STAGE_27_STATUS.md — status record for Nadia Stage-27 context-window assembly contract before context window assembly, prompt evaluation input creation, runtime invocation, prompt evaluation, dialogue generation, token generation, inference, or tool execution.
- status/NADIA_PROMPT_EVALUATION_INPUT_CONTRACT_STAGE_28_STATUS.md — status record for Nadia Stage-28 prompt-evaluation-input contract before prompt evaluation input creation, runtime invocation, prompt evaluation, dialogue generation, token generation, inference, or tool execution.
- status/NADIA_PROMPT_EVALUATION_RUNTIME_HANDOFF_CONTRACT_STAGE_29_STATUS.md — status record for Nadia Stage-29 prompt-evaluation runtime handoff contract before runtime handoff, runtime invocation, prompt evaluation, dialogue generation, token generation, inference, or tool execution.
- status/NADIA_PROMPT_EVALUATION_INVOCATION_CONTRACT_STAGE_30_STATUS.md — status record for Nadia Stage-30 prompt-evaluation invocation contract before invocation requests, runtime invocation, prompt evaluation, dialogue generation, token generation, inference, or tool execution.
- status/NADIA_PROMPT_EVALUATION_RESULT_CONTRACT_STAGE_31_STATUS.md — status record for Nadia Stage-31 prompt-evaluation result contract before result records, model-output recording, runtime invocation, prompt evaluation, dialogue generation, token generation, inference, or tool execution.
- status/NADIA_PROMPT_EVALUATION_RESULT_REVIEW_CONTRACT_STAGE_32_STATUS.md — status record for Nadia Stage-32 prompt-evaluation result review contract before result-review records, result records, model-output recording, runtime invocation, prompt evaluation, dialogue generation, token generation, inference, or tool execution.
- status/NADIA_PROMPT_EVALUATION_RESULT_DISPOSITION_CONTRACT_STAGE_33_STATUS.md — status record for Nadia Stage-33 prompt-evaluation result disposition contract before disposition records, release records, result-review records, result records, model-output recording, runtime invocation, prompt evaluation, dialogue generation, token generation, inference, or tool execution.
- status/NADIA_PROMPT_EVALUATION_RESULT_RELEASE_CONTRACT_STAGE_34_STATUS.md — status record for Nadia Stage-34 prompt-evaluation result release contract before release records, release decisions, release publication, release receipts, disposition records, result-review records, result records, model-output recording, runtime invocation, prompt evaluation, dialogue generation, token generation, inference, or tool execution.
- status/NADIA_PROMPT_EVALUATION_RESULT_RELEASE_RECEIPT_CONTRACT_STAGE_35_STATUS.md — status record for Nadia Stage-35 prompt-evaluation result release receipt contract before receipt records, receipt signing, receipt publication, release records, release decisions, release publication, disposition records, result-review records, result records, model-output recording, runtime invocation, prompt evaluation, dialogue generation, token generation, inference, or tool execution.
- status/NADIA_PROMPT_EVALUATION_RESULT_RELEASE_RECEIPT_REVIEW_CONTRACT_STAGE_36_STATUS.md — status record for Nadia Stage-36 prompt-evaluation result release receipt review contract before review records, review decisions, review findings, receipt records, receipt signing, receipt publication, release records, result records, model-output recording, runtime invocation, prompt evaluation, dialogue generation, token generation, inference, or tool execution.
- status/ANNOUNCEMENTS.md — public announcement log and milestone notes.
- status/AUTHORITY_STATUS_ANNOUNCEMENT_REVIEW.md — no-new-announcement authority status review.

- status/CPP_AUTHORITY_EXPANSION_CONTRACT_REVIEW.md — no-expansion-contract C++ authority review.
- status/CPP_AUTHORITY_IMPLEMENTATION_REVIEW_STATUS.md — status record for the constrained C++ authority implementation review.
- status/LANGUAGE_REPRESENTATION_REVIEW.md — language representation review before no-effect Nucleus refinement.
- status/L_UI_RENDERING_DETAILED_REPORT_REFINEMENT_STATUS.md — status record for the L-UI rendering detailed report refinement.
- status/NUCLEUS_REPORT_ONLY_ANNOUNCEMENT_REVIEW.md — no-new-announcement review after the Nucleus report-only and project-notes alignment slices.
- status/NUCLEUS_REPORT_ONLY_ANNOUNCEMENT_README_ALIGNMENT.md — README/project-notes alignment after the Nucleus report-only announcement review.
- status/NUCLEUS_TASK_NO_EFFECT_REPORT_ALIGNMENT_STATUS.md — status record for the Nucleus task no-effect report alignment refinement.
- status/NUCLEUS_TASK_REPORT_ONLY_EXECUTION_REFINEMENT_STATUS.md — status record for the Nucleus task report-only execution refinement.
- status/NUCLEUS_TASK_REPORT_ONLY_EXECUTION_README_STATUS_ALIGNMENT.md — README/status alignment for the Nucleus task report-only execution refinement.
- status/PROJECT_NOTES_NUCLEUS_ANNOUNCEMENT_README_ALIGNMENT_STATUS_CHECK.md — status/index check for the project-notes Nucleus announcement README alignment.
- status/PROJECT_NOTES_NUCLEUS_REPORT_ONLY_ALIGNMENT_STATUS_INDEX_CHECK.md — status/index check for the project-notes Nucleus report-only alignment.
- status/LAT_PIPELINE_DIAGNOSTIC_INTEGRATION_STATUS.md — status record for the Lat pipeline diagnostic integration slice.
- status/LAT_PIPELINE_DIAGNOSTIC_MAIN_TEST_AUDIT_STATUS.md — status record for the Lat pipeline diagnostic main test audit slice.
- status/RBDM_REPORT_INTEGRATION_STATUS.md — status record for the runtime-boundary domain matrix report integration slice.
- status/KERNEL_LIFECYCLE_EVIDENCE_STATUS.md — current kernel lifecycle evidence status for no-effect kernel table, process/syscall table, scheduler tick, run queue, context-switch, time-accounting, preemption, lifecycle report, subsystem summary, and rollback-plan guardrails.
- status/CURRENT_ESTIMATE_TABLE_SOURCE_ALIGNMENT.md — Current estimate table source alignment for the live public estimate table and its README/status mirrors.
- status/CURRENT_ESTIMATE_MATHEMATICAL_REBASE_2026_05_26.md — Current estimate mathematical rebase for the live public estimate table.
- status/COMPLETION_ESTIMATE_REVIEW_README_STATUS_ALIGNMENT.md — README/status alignment for the completion-estimate hold review after runtime-boundary abuse-case fixtures.
- status/COMPLETION_ESTIMATE_REVIEW_AFTER_RUNTIME_BOUNDARY_ABUSE_CASE_FIXTURES.md — completion-estimate hold review after runtime-boundary abuse-case fixtures.
- status/COMPLETION_PERCENTAGE_REVIEW.md — completion-percentage planning review.
- status/PUBLIC_ENTRY_POINT_CONSISTENCY_SCAN.md — public entry-point consistency scan.
- status/PROJECT_NOTES_FOLLOWUP_STATUS_INDEX_CHECK.md — project-notes follow-up status/index check.

- status/STATUS_ANNOUNCEMENT_REVIEW.md — status announcement review.
- status/STATUS_ANNOUNCEMENT_CONSISTENCY_REVIEW.md — status/announcement consistency review.
- project_notes/README.md — short project notes index.
- project_notes/CURRENT_DIRECTION.md — current direction, target users, and technical lane.
- project_notes/UPCOMING_WORK.md — recommended next slices and near-term queue.

Initial implementation and design documents

- STATE_LATTICE.md — first C state lattice fixture, invariant tests, report surface, and no-effect boundary.
- TRI_PLANE_TRANSITION.md — pure preview transition model, denial reasons, and no-effect invariants.
- NUCLEUS_PREVIEW.md — Nucleus request/effect classification, report surface, and no-execution invariants.
- NUCLEUS_TASK_EXECUTION_CONTRACT.md — future task execution boundary, prerequisites, authority checks, effect gates, task records, reports, and non-claims before execution code.
- NUCLEUS_TASK_EXECUTION_IMPLEMENTATION_PLAN.md — exact future Nucleus task API, structs, enums, reports, buffers, tests, and non-claims before task execution code.
- NUCLEUS_TASK_EXECUTION_IMPLEMENTATION.md — first no-effect task classification, denied-by-default policy, authority prerequisites, deterministic reports, and invariants.
- NUCLEUS_TASK_REPORT_REFINEMENT.md — Nucleus task report refinement metadata, tests, guard, and workflow.
- NUCLEUS_TASK_NO_EFFECT_REPORT_ALIGNMENT.md — explicit no-effect report alignment labels for Nucleus task records and reports.
- NUCLEUS_TASK_REPORT_ONLY_EXECUTION_REFINEMENT.md — explicit report-only execution, effect, and runtime status labels for Nucleus task records and reports.
- RUNTIME_BOUNDARY_CONTRACT.md — first runtime boundary, disabled-by-default posture, denied effects, prerequisites, report surface, and non-claims before runtime code.
- RUNTIME_BOUNDARY_IMPLEMENTATION_PLAN.md — exact future runtime API, structs, enums, reports, buffers, tests, task usage, authority usage, and non-claims before runtime boundary code.
- RUNTIME_BOUNDARY_IMPLEMENTATION.md — first runtime boundary public API, source surface, smoke invariants, dedicated runner, and dedicated workflow record.
- RUNTIME_BOUNDARY_REFINEMENT_PLAN.md — runtime-boundary refinement plan.
- RUNTIME_BOUNDARY_REFINEMENT_IMPLEMENTATION.md — runtime-boundary Lat pipeline first-clause, first-declaration, module/count, stage-summary, line-comment, Lat-specific LIR module-summary, Lat-specific LIR source-span, Lat-specific LIR node-kind, Lat-specific LIR first-node, Lat-specific LIR first-node span, Lat-specific LIR first transition-node, Lat-specific LIR first transition-node span, Lat-specific LIR first-edge, Lat-specific LIR first-edge span, Lat-specific LIR first transition-source edge, Lat-specific LIR first transition-source edge endpoint, Lat-specific LIR first transition-source edge span, Lat-specific LIR no-effect, and Lat-specific LIR edge-kind evidence refinement implementation.

- RUNTIME_BOUNDARY_REPORT_REFINEMENT.md — runtime-boundary report refinement implementation.
- RUNTIME_BOUNDARY_POLICY_MATRIX_REFINEMENT.md — runtime-boundary policy matrix refinement implementation.
- RUNTIME_BOUNDARY_POLICY_EXPANSION_AFTER_THREAT_MODEL.md — runtime-boundary policy expansion after defensive threat-model validation.
- RUNTIME_BOUNDARY_ABUSE_CASE_FIXTURES_AFTER_POLICY_EXPANSION.md — deterministic runtime-boundary abuse-case fixtures after policy expansion.
- RUNTIME_BOUNDARY_DOMAIN_MATRIX_REFINEMENT.md — runtime-boundary domain matrix refinement record.
- RUNTIME_BOUNDARY_DOMAIN_MATRIX_REPORT_INTEGRATION.md — runtime-boundary domain matrix report integration record.
- KERNEL_LIFECYCLE_SEED.md — no-effect kernel lifecycle seed.
- KERNEL_SCHEDULER_TICK_SEED.md — no-effect scheduler tick metadata seed.
- KERNEL_RUN_QUEUE_SEED.md — no-effect run queue metadata seed.
- KERNEL_CONTEXT_SWITCH_SEED.md — no-effect context switch metadata seed.
- KERNEL_TIME_ACCOUNTING_SEED.md — no-effect time-accounting metadata seed.
- KERNEL_PREEMPTION_SEED.md — no-effect preemption metadata seed.
- KERNEL_SCHEDULER_CREDIT_SEED.md — no-effect scheduler credit metadata seed.
- KERNEL_SCHEDULER_SELECTION_SEED.md — no-effect scheduler selection metadata seed.
- KERNEL_SCHEDULER_DISPATCH_SEED.md — no-effect scheduler dispatch metadata seed.
- KERNEL_SCHEDULER_HANDOFF_SEED.md — no-effect scheduler handoff metadata seed.
- KERNEL_SCHEDULER_ACTIVATION_SEED.md — no-effect scheduler activation metadata seed.
- KERNEL_SCHEDULER_RUN_ENTRY_SEED.md — no-effect scheduler run-entry metadata seed.
- KERNEL_LIFECYCLE_SUBSYSTEM_SUMMARY.md — kernel lifecycle subsystem summary.
- KERNEL_LIFECYCLE_ROLLBACK_PLAN.md — no-effect kernel lifecycle rollback plan.
- LATTICRA_SEAL_CONTRACT.md — Latticra Seal evidence-boundary, capability-boundary, promotion-gate, and non-claim contract.
- LATTICRA_SEAL_REPORT_ENVELOPE_CONTRACT.md — report envelope boundary after ready runtime handoff report metadata.
- LATTICRA_SEAL_REPORT_ENVELOPE_IMPLEMENTATION.md — first no-effect sealed report-envelope metadata implementation.
- status/SEAL_REPORT_ENVELOPE_STATUS.md — status/public-entry checkpoint for sealed report-envelope metadata.
- LATTICRA_SEAL_SIGNATURE_REQUEST_CONTRACT.md — metadata-only signature request boundary after sealed report-envelope metadata.
- LATTICRA_SEAL_SIGNATURE_REQUEST_IMPLEMENTATION.md — first no-effect signature request metadata implementation.
- LATTICRA_SEAL_SIGNING_AUTHORIZATION_CONTRACT.md — metadata-only signing authorization boundary after signature request readiness.
- LATTICRA_SEAL_SIGNING_AUTHORIZATION_IMPLEMENTATION.md — first no-effect signing authorization metadata implementation.

- LATTICRA_SEAL_SIGNER_HANDOFF_CONTRACT.md — metadata-only signer handoff boundary after signing authorization readiness.
- LATTICRA_SEAL_SIGNER_HANDOFF_IMPLEMENTATION.md — first no-effect signer handoff metadata implementation.
- LATTICRA_SEAL_SIGNER_INVOCATION_CONTRACT.md — metadata-only signer invocation boundary after signer handoff readiness.
- LATTICRA_SEAL_SIGNER_INVOCATION_IMPLEMENTATION.md — first no-effect signer invocation metadata implementation.
- LATTICRA_SEAL_SIGNING_OPERATION_CONTRACT.md — metadata-only signing operation boundary after signer invocation readiness.
- LATTICRA_SEAL_SIGNING_OPERATION_IMPLEMENTATION.md — first no-effect signing operation metadata implementation.
- status/SEAL_SIGNING_OPERATION_STATUS.md — status/public-entry checkpoint for metadata-only Seal signing operation implementation.
- LATTICRA_SEAL_KEY_HANDLING_CONTRACT.md — metadata-only key-handling boundary after signing operation readiness.
- LATTICRA_SEAL_KEY_HANDLING_IMPLEMENTATION.md — first no-effect key-handling metadata implementation.
- status/SEAL_KEY_HANDLING_STATUS.md — status/public-entry checkpoint for metadata-only Seal key-handling implementation.
- LATTICRA_SEAL_KEY_MATERIAL_CONTRACT.md — metadata-only key-material boundary after key-handling readiness.
- LATTICRA_SEAL_KEY_MATERIAL_IMPLEMENTATION.md — first no-effect key-material metadata implementation.
- status/SEAL_KEY_MATERIAL_STATUS.md — status/public-entry checkpoint for metadata-only Seal key-material implementation.
- LATTICRA_SEAL_PUBLIC_KEY_PARSING_CONTRACT.md — metadata-only public-key parsing boundary after key-material status readiness.
- LATTICRA_SEAL_PUBLIC_KEY_PARSING_IMPLEMENTATION.md — first no-effect public-key parsing metadata implementation.
- status/SEAL_PUBLIC_KEY_PARSING_STATUS.md — status/public-entry checkpoint for metadata-only Seal public-key parsing implementation.
- LATTICRA_SEAL_FUTURE_KEY_PARSING_IMPLEMENTATION_CONTRACT.md — future key parsing implementation contract after public-key parsing status readiness.
- LATTICRA_SEAL_FUTURE_KEY_PARSING_IMPLEMENTATION_PLAN.md — exact future bounded no-effect key parsing implementation plan.
- LATTICRA_SEAL_FUTURE_KEY_PARSING_IMPLEMENTATION.md — first bounded key parsing metadata implementation for caller-provided public-key bytes.
- status/SEAL_KEY_PARSING_STATUS.md — status/public-entry checkpoint for bounded Seal key parsing metadata.
- LATTICRA_SEAL_VERIFICATION_POLICY_CONTRACT.md — verification policy boundary after signature metadata.
- LATTICRA_SEAL_VERIFICATION_POLICY_IMPLEMENTATION.md — first no-effect verification policy metadata implementation.

- status/SEAL_VERIFICATION_POLICY_STATUS.md — status/public-entry checkpoint for metadata-only Seal verification policy implementation.
- LATTICRA_SEAL_CRYPTO_VERIFY_BACKEND_CONTRACT.md — crypto verify backend boundary after verification policy metadata.
- LATTICRA_SEAL_CRYPTO_VERIFY_BACKEND_IMPLEMENTATION.md — first metadata-only crypto verify backend implementation with unsupported verification state.
- status/SEAL_CRYPTO_VERIFY_BACKEND_STATUS.md — status/public-entry checkpoint for metadata-only Seal crypto verify backend implementation.
- LATTICRA_SEAL_ED25519_VERIFY_ONLY_CONTRACT.md — Ed25519 verify-only implementation contract after crypto verify backend metadata.
- LATTICRA_SEAL_ED25519_VERIFY_IMPLEMENTATION.md — local provider-backed Ed25519 verify-only result implementation.
- status/SEAL_ED25519_VERIFY_STATUS.md — status/public-entry checkpoint for authority-neutral Seal Ed25519 verify-only results.
- LATTICRA_SEAL_CRYPTO_GRADUATION_GATE_IMPLEMENTATION.md — authority-neutral crypto graduation gate over local Ed25519 verification, verified receipt promotion, and cryptographic assurance baseline expectations.
- status/SEAL_CRYPTO_GRADUATION_GATE_STATUS.md — status checkpoint for the Seal crypto graduation gate.
- LATTICRA_SEAL_VERIFIED_RECEIPT_PROMOTION_CONTRACT.md — verified receipt promotion boundary after successful Ed25519 verify-only results.
- LATTICRA_SEAL_VERIFIED_RECEIPT_PROMOTION_IMPLEMENTATION.md — first authority-neutral verified receipt promotion metadata implementation.
- status/SEAL_VERIFIED_RECEIPT_PROMOTION_STATUS.md — status/public-entry checkpoint for verified receipt promotion metadata.
- LATTICRA_SEAL_VERIFIED_CAPABILITY_GATE_CONTRACT.md — verified capability gate boundary after verified receipt promotion metadata.
- LATTICRA_SEAL_VERIFIED_CAPABILITY_GATE_IMPLEMENTATION.md — metadata-only verified capability gate implementation with a stricter crypto-graduation-gated entry point.
- status/SEAL_VERIFIED_CAPABILITY_GATE_STATUS.md — status/public-entry checkpoint for verified capability gate metadata.
- LATTICRA_SEAL_VERIFIED_EFFECT_DECISION_CONTRACT.md — verified effect decision boundary after verified capability gate metadata.
- LATTICRA_SEAL_VERIFIED_EFFECT_DECISION_IMPLEMENTATION.md — metadata-only verified effect decision implementation that carries crypto graduation evidence forward when present.
- status/SEAL_VERIFIED_EFFECT_DECISION_STATUS.md — status/public-entry checkpoint for crypto-bound verified effect decision metadata.
- LATTICRA_SEAL_RUNTIME_HANDOFF_EVALUATION_CONTRACT.md — runtime handoff evaluation boundary after verified effect decision metadata.
- LATTICRA_SEAL_RUNTIME_HANDOFF_EVALUATION_IMPLEMENTATION.md — metadata-only runtime handoff evaluation implementation that carries crypto graduation evidence forward when present.
- status/SEAL_RUNTIME_HANDOFF_EVALUATION_STATUS.md — status/public-entry checkpoint for crypto-bound runtime handoff evaluation metadata.

- LATTICRA_SEAL_RUNTIME_HANDOFF_REPORT_CONTRACT.md — runtime handoff report boundary after runtime handoff evaluation metadata.
- LATTICRA_SEAL_RUNTIME_HANDOFF_REPORT_IMPLEMENTATION.md — first metadata-only runtime handoff report implementation.
- status/SEAL_RUNTIME_HANDOFF_REPORT_STATUS.md — status/public-entry checkpoint for runtime handoff report metadata.
- LATTICRA_SEAL_VERIFICATION_RECEIPT_CONTRACT.md — verification receipt boundary after verification policy metadata.
- LATTICRA_SEAL_VERIFICATION_RECEIPT_IMPLEMENTATION.md — first no-effect verification receipt metadata implementation.
- status/SEAL_VERIFICATION_RECEIPT_STATUS.md — status/public-entry checkpoint for metadata-only Seal verification receipt implementation.
- LATTICRA_SEAL_CAPABILITY_GATE_CONTRACT.md — capability gate boundary after verification receipt metadata.
- LATTICRA_SEAL_CAPABILITY_GATE_IMPLEMENTATION.md — first no-effect denied capability gate metadata implementation.
- status/SEAL_CAPABILITY_GATE_STATUS.md — status/public-entry checkpoint for metadata-only Seal capability gate implementation.
- LATTICRA_SEAL_EFFECT_DECISION_CONTRACT.md — effect decision boundary after capability gate metadata.
- LATTICRA_SEAL_EFFECT_DECISION_IMPLEMENTATION.md — first no-effect denied effect decision metadata implementation.
- status/SEAL_EFFECT_DECISION_STATUS.md — status/public-entry checkpoint for metadata-only Seal effect decision implementation.
- LATTICRA_SEAL_RUNTIME_HANDOFF_CONTRACT.md — runtime handoff boundary after effect decision metadata.
- LATTICRA_SEAL_RUNTIME_HANDOFF_IMPLEMENTATION.md — first no-effect inactive runtime handoff metadata implementation.
- status/SEAL_RUNTIME_HANDOFF_STATUS.md — status/public-entry checkpoint for metadata-only Seal runtime handoff implementation.
- LATTICRA_SEAL_RUNTIME_HANDOFF_EVALUATION_CONTRACT.md — runtime handoff evaluation boundary after verified effect decision metadata.
- LATTICRA_SEAL_RUNTIME_HANDOFF_EVALUATION_IMPLEMENTATION.md — metadata-only runtime handoff evaluation implementation that carries crypto graduation evidence forward when present.
- status/SEAL_RUNTIME_HANDOFF_EVALUATION_STATUS.md — status checkpoint for crypto-bound Seal runtime handoff evaluation.
- LATTICRA_SEAL_RUNTIME_HANDOFF_REPORT_CONTRACT.md — runtime handoff report boundary after runtime handoff evaluation metadata.
- LATTICRA_SEAL_RUNTIME_HANDOFF_REPORT_IMPLEMENTATION.md — metadata-only runtime handoff report implementation.
- status/SEAL_RUNTIME_HANDOFF_REPORT_STATUS.md — Latticra Seal runtime handoff report status/public-entry alignment.
- LATTICRA_SEAL_STATUS_ROLLUP_CONTRACT.md — status rollup boundary after runtime handoff metadata.

- LATTICRA_SEAL_STATUS_ROLLUP_IMPLEMENTATION.md — first metadata-only status rollup implementation.
- status/SEAL_STATUS_ROLLUP_STATUS.md — status/public-entry checkpoint for metadata-only Seal status rollup implementation.
- LATTICRA_SEAL_AGENTIC_AUTOMATION_SECURITY_CONTRACT.md — report-only agentic automation security boundary after status rollup metadata.
- LATTICRA_SEAL_MCP_ALIGNMENT_PLAN.md — MCP-style tool invocation alignment plan without MCP implementation.
- LATTICRA_SEAL_AGENTIC_AUTOMATION_SECURITY_IMPLEMENTATION.md — first report-only agentic automation security metadata implementation.
- status/SEAL_AGENTIC_AUTOMATION_SECURITY_STATUS.md — status checkpoint for report-only Seal agentic automation security metadata.
- status/SEAL_AGENTIC_AUTOMATION_SECURITY_INDEX_ALIGNMENT.md — index alignment for report-only Seal agentic automation security metadata.
- LATTICRA_SEAL_AGENTIC_AUTOMATION_SECURITY_REPORT_SURFACE.md — deterministic local report surface for Seal agentic automation security metadata.
- status/SEAL_AGENTIC_AUTOMATION_SECURITY_REPORT_SURFACE_STATUS.md — status checkpoint for the Seal agentic automation security report surface.
- status/SEAL_AGENTIC_AUTOMATION_SECURITY_PUBLIC_ENTRYPOINT_ALIGNMENT.md — public-entrypoint alignment for report-only Seal agentic automation security.
- LATTICRA_SEAL_PARAMETER_SCHEMA_CONTRACT.md — report-only parameter schema boundary after agentic automation security.
- LATTICRA_SEAL_PARAMETER_SCHEMA_IMPLEMENTATION.md — first report-only parameter schema metadata implementation.
- LATTICRA_SEAL_PARAMETER_SCHEMA_REPORT_SURFACE.md — deterministic local report surface for Seal parameter schema metadata.
- status/SEAL_PARAMETER_SCHEMA_STATUS.md — status/public-entry checkpoint for report-only Seal parameter schema metadata.
- LATTICRA_SEAL_REQUEST_FRESHNESS_CONTRACT.md — report-only request freshness/replay boundary after parameter schema metadata.
- LATTICRA_SEAL_REQUEST_FRESHNESS_IMPLEMENTATION.md — first report-only request freshness metadata implementation.
- LATTICRA_SEAL_REQUEST_FRESHNESS_REPORT_SURFACE.md — deterministic local report surface for Seal request freshness metadata.
- status/SEAL_REQUEST_FRESHNESS_STATUS.md — status/public-entry checkpoint for report-only Seal request freshness metadata.
- LATTICRA_SEAL_SIGNED_REQUEST_CONTRACT.md — report-only signed request boundary after request freshness metadata.
- LATTICRA_SEAL_SIGNED_REQUEST_IMPLEMENTATION.md — first report-only signed request metadata implementation.
- status/SEAL_SIGNED_REQUEST_STATUS.md — status/public-entry checkpoint for report-only Seal signed request metadata.
- LATTICRA_SEAL_POLICY_DECISION_CONTRACT.md — report-only policy decision boundary after signed request metadata.

- LATTICRA_SEAL_POLICY_DECISION_IMPLEMENTATION.md — first report-only default-deny policy decision metadata implementation.
- LATTICRA_SEAL_POLICY_DECISION_REPORT_SURFACE.md — deterministic local report surface for Seal policy decision metadata.
- status/SEAL_POLICY_DECISION_STATUS.md — status/public-entry checkpoint for report-only Seal policy decision metadata.
- status/SEAL_POLICY_DECISION_REPORT_SURFACE_STATUS.md — status checkpoint for the Seal policy decision report surface.
- status/SEAL_POLICY_DECISION_PUBLIC_ENTRYPOINT_ALIGNMENT.md — public-entrypoint alignment for report-only Seal policy decision metadata.
- LATTICRA_SEAL_CAPABILITY_METADATA_CONTRACT.md — planning contract for the no-effect Seal capability metadata surface.
- LATTICRA_SEAL_CAPABILITY_METADATA_IMPLEMENTATION_PLAN.md — exact no-effect capability metadata implementation plan.
- LATTICRA_SEAL_CAPABILITY_METADATA_IMPLEMENTATION.md — deterministic local capability metadata implementation.
- LATTICRA_SEAL_CAPABILITY_METADATA_REPORT_SURFACE.md — deterministic local report surface for Seal capability metadata.
- status/SEAL_CAPABILITY_METADATA_REPORT_SURFACE_STATUS.md — status checkpoint for the Seal capability metadata report surface.
- latticra-seal/PRODUCT.md — product spine for earned Latticra Seal security-product capability.
- status/SEAL_PRODUCT_SPINE_STATUS.md — status checkpoint for the Seal product spine.
- LATTICRA_SEAL_OPERATOR_RECEIPT_REPORT_CONTRACT.md — contract for a future bundled local Seal operator receipt report.
- LATTICRA_SEAL_OPERATOR_RECEIPT_REPORT_IMPLEMENTATION_PLAN.md — exact no-effect Seal operator receipt report implementation plan.
- LATTICRA_SEAL_OPERATOR_RECEIPT_REPORT_IMPLEMENTATION.md — no-effect Seal operator receipt report implementation.
- LATTICRA_SEAL_OPERATOR_RECEIPT_REPORT_SURFACE.md — deterministic local report surface for the Seal operator receipt report.
- status/SEAL_OPERATOR_RECEIPT_REPORT_STATUS.md — status checkpoint for the Seal operator receipt report surface.
- LATTICRA_SEAL_LOCAL_CAPABILITY_REGISTRY_SCHEMA_CONTRACT.md — contract for a future no-effect local Seal capability registry schema.
- LATTICRA_SEAL_LOCAL_CAPABILITY_REGISTRY_SCHEMA_IMPLEMENTATION_PLAN.md — exact no-effect Seal local capability registry schema implementation plan.
- LATTICRA_SEAL_LOCAL_CAPABILITY_REGISTRY_SCHEMA_IMPLEMENTATION.md — no-effect Seal local capability registry schema implementation.
- status/SEAL_README_STATUS_ROW_ALIGNMENT.md — README status row alignment with the current Latticra Seal public status checkpoint.
- status/SEAL_POLICY_DECISION_REPORT_SURFACE_STATUS.md — status checkpoint for the Seal policy decision report surface.

- status/SEAL_SIGNER_INVOCATION_STATUS.md — status/public-entry checkpoint for metadata-only Seal signer invocation implementation.
- status/SEAL_SIGNER_HANDOFF_STATUS.md — status/public-entry checkpoint for metadata-only Seal signer handoff implementation.
- status/SEAL_SIGNING_AUTHORIZATION_STATUS.md — status/public-entry checkpoint for metadata-only Seal signing authorization implementation.
- status/SEAL_SIGNATURE_REQUEST_STATUS.md — status/public-entry checkpoint for metadata-only Seal signature request implementation.
- L_UI_STATIC_REPORT.md — terminal-facing L-UI static report fixture for Nucleus/state rails.
- L_UI_SOURCE_GRAMMAR.md — L-UI source grammar draft and .lui fixture guardrails.
- L_UI_PARSER_DESIGN.md — parser design contract, error categories, no-effect constraints, and implementation gate.
- L_UI_PARSER_IMPLEMENTATION_PLAN.md — parser implementation language, module shape, API, source-size limit, and exact test list before parser code.
- L_UI_PARSER.md — initial no-effect C parser, summary result, error labels, and parser invariants.
- L_UI_SEMANTIC_VALIDATION_CONTRACT.md — semantic validation layer after structural parsing, AST construction, source policies, and string handling.
- L_UI_SEMANTIC_VALIDATION_IMPLEMENTATION_PLAN.md — public API, semantic result, diagnostic mapping, reports, semantic checks, and exact tests before semantic validation code.
- L_UI_SEMANTIC_VALIDATION_IMPLEMENTATION.md — no-effect semantic validation API, reports, checks, and invariants for L-UI ASTs.
- LIR_SHAPE_CONTRACT.md — first Latticra Intermediate Representation shape before semantic lowering, Lat integration, rendering, or execution.
- LIR_SHAPE_IMPLEMENTATION_PLAN.md — exact public API, structs, capacities, node kinds, edge kinds, errors, report format, source-span mapping, and tests before LIR code.
- LIR_SHAPE_IMPLEMENTATION.md — bounded no-effect LIR shape API, lowering, reports, and invariants for semantically valid L-UI ASTs.
- LIR_REPORT_REFINEMENT.md — LIR report classification, graph shape, edge summary, no-effect-chain, and evidence fields.
- LAT_LANGUAGE_GRAMMAR_CONTRACT.md — first Lat / Latticra Language grammar contract for Lat-Core before parser implementation.
- LAT_LANGUAGE_GRAMMAR_IMPLEMENTATION_PLAN.md — exact public API, parser result structs, AST structs, capacities, error labels, reports, fixture paths, string handling, source-span mapping, and tests before Lat parser code.
- LAT_LANGUAGE_GRAMMAR_IMPLEMENTATION.md — bounded no-effect Lat / Latticra Language grammar parser, AST metadata, line-comment metadata, unsupported block-comment rejection, first declaration/clause report metadata, fixture, and invariants.
- LAT_SEMANTIC_VALIDATION_CONTRACT.md — Lat semantic validation contract.
- LAT_SEMANTIC_VALIDATION_IMPLEMENTATION_PLAN.md — Lat semantic validation implementation plan.
- LAT_SEMANTIC_DIAGNOSTICS_REFINEMENT.md — Lat semantic diagnostic classes, counters, first-diagnostic indices, and report fields.

- LAT_MODEL_NORMALIZATION_IMPLEMENTATION.md — Lat model normalization tables and first-declaration/first-clause report metadata.
- LAT_TO_LIR_LOWERING_CONTRACT.md — Lat-to-LIR lowering contract.
- LAT_TO_LIR_LOWERING_IMPLEMENTATION_PLAN.md — Lat-to-LIR lowering implementation plan.
- LAT_TO_LIR_LOWERING_IMPLEMENTATION.md — Lat-to-LIR lowering implementation with first-declaration report metadata.
- LAT_TO_LIR_CLAUSE_METADATA_REFINEMENT.md — Lat-to-LIR clause operator/value metadata refinement.
- LAT_TO_LIR_DIAGNOSTIC_REFINEMENT.md — Lat-to-LIR diagnostic classification and first-declaration/first-clause metadata report surface.
- LAT_PIPELINE_CONTRACT.md — bounded no-effect Lat pipeline contract after parser, semantic validation, and Lat-to-LIR lowering.
- LAT_PIPELINE_IMPLEMENTATION_PLAN.md — exact Lat pipeline API, result struct, report, tests, workflow, compatibility expectations, and non-claims.
- LAT_PIPELINE_IMPLEMENTATION.md — first bounded no-effect Lat pipeline implementation.
- LAT_PIPELINE_REPORT_REFINEMENT.md — Lat pipeline stage-summary, parser line-comment metadata, first-declaration/first-clause metadata, and report refinement.
- LAT_PIPELINE_DIAGNOSTIC_INTEGRATION_REFINEMENT.md — companion Lat pipeline diagnostic integration API, parser line-comment metadata, first-declaration/first-clause metadata, and report.
- LAT_PIPELINE_DIAGNOSTIC_MAIN_TEST_INTEGRATION_AUDIT.md — main Lat pipeline runner audit for diagnostic integration coverage.
- LAT_SPECIFIC_LIR_REFINEMENT_CONTRACT.md — explicit Lat declaration node and transition-source edge refinement contract.
- LAT_SPECIFIC_LIR_REFINEMENT_IMPLEMENTATION_PLAN.md — exact Lat-specific LIR enum, label, lowering, test, workflow, and compatibility plan.
- LAT_SPECIFIC_LIR_REFINEMENT_IMPLEMENTATION.md — first no-effect Lat-specific LIR refinement implementation.
- L_UI_RENDERING_CONTRACT.md — first operator-visible L-UI rendering contract before renderer implementation.
- L_UI_RENDERING_IMPLEMENTATION_PLAN.md — exact L-UI renderer API, structures, modes, errors, capacities, output rules, report format, and tests before renderer code.
- L_UI_RENDERING_IMPLEMENTATION.md — first no-effect C L-UI renderer implementation.
- L_UI_RENDERING_DETAILED_REPORT_REFINEMENT.md — explicit detailed-render report metadata refinement for no-effect L-UI reports.

Implementation rule

No implementation code should be added until the relevant contract document exists and names:

1. purpose;
2. evidence level;
3. effect boundary;
4. failure behavior;

5. non-claims;
6. tests or validation path.

Current priority

```

The next status review target should be:

```
Continue small guarded report/status alignment only when drift appears
```

Current runtime boundary policy expansion status:

```
runtime_boundary_policy_expansion_after_threat_model_present=1
runtime_boundary_abuse_case_fixture_expansion_present=1
seal_readme_status_row_alignment_present=1
completion_estimate_review_readme_status_alignment_present=1
completion_estimate_after_runtime_boundary_abuse_case_fixtures_present=1
current_estimate_table_source_alignment_present=1
current_estimate_mathematical_rebase_present=1
source_alignment_estimate_changed=0
mathematical_rebase_estimate_changed=1
estimate_adjustment_required=0
request_family_policy_map_present=1
effect_policy_map_present=1
authority_prerequisite_map_present=1
future_gate_policy_map_present=1
abuse_case_runtime_policy_map_present=1
evidence_gap_map_present=1
runtime_execution_added=0
runtime_authority_granted=0
```

Completion-estimate review should be skipped unless a future slice changes capability posture, implementation scope, or public readiness rather than only aligning documentation/status surfaces.

docs/latticra-seal/ROADMAP.md

Source title: Latticra Seal Roadmap

Lines: 104 | Words: 307 | SHA-256: 43c0b52c503982387a256e54f530df194d09725943d5706c39b07ff87d108c6e

Latticra Seal Roadmap

Latticra Seal should grow in disciplined layers.

Phase 1: Documentation baseline

Goal: make Seal understandable.

Tasks:

- create documentation handbook
- define status
- define architecture
- define command usage
- define policy behavior
- define report behavior
- define non-claims

Phase 2: CLI clarity

Goal: make commands predictable.

Tasks:

- document every command
- document read/write behavior
- document exit codes
- document report schema
- document policy-denial reasons

Phase 3: Manifest and lock hardening

Goal: make local verification reproducible.

Tasks:

- stabilize manifest schema
- stabilize lock format
- define baseline update rules
- define ignored paths
- define changed-file output
- test malformed manifest behavior

Phase 4: Report schema

Goal: make reports machine-readable and human-readable.

Tasks:

- define required fields

- define optional fields
- define status values
- define warning classes
- define failure classes
- preserve report-only authority limits

Phase 5: Panel integration

Goal: make Seal visible in Latticra Panel.

Tasks:

- expose report-only scan
- expose policy-denial status
- expose report path
- expose manifest/lock status
- avoid runtime/root/network authority

Phase 6: Cryptographic strengthening

Goal: move from hash baseline toward stronger signed evidence.

Tasks:

- define signing model
- define key handling
- define trust root boundaries
- define verification receipt format
- test invalid signature behavior
- test missing key behavior

Phase 7: Runtime-boundary handoff

Goal: prepare metadata for future enforcement without claiming enforcement early.

Tasks:

- define runtime handoff metadata
- define capability gate contract
- define denial behavior
- define no-effect dry-run behavior
- test handoff reports

Phase 8: Fedora/Linux integration research

Goal: explore host integration carefully.

Tasks:

- document user-local install evidence
- document no-root assumptions
- document future RPM boundaries

- document SELinux/systemd non-claims
- document what would be required before host-level trust claims

docs/LATTICRA_LAT_SEAL_ROADMAP.md

Source title: Latticra / Lat / Latticra Seal Roadmap

Lines: 340 | Words: 980 | SHA-256: 479fbab26344bb9b9e669151c05db6844a7b82d07eddca01cedbaa0ecfa1fd08

Latticra / Lat / Latticra Seal Roadmap

Status: active strategy roadmap Scope: coordinated planning for Latticra, Lat, LIR, Latticra Seal, C, constrained C++, Rust, Fedora/Linux integration, and AI-era tool-boundary work. This roadmap does not implement runtime execution, operating-system replacement behavior, cryptographic verification, MCP behavior, production enforcement, or production readiness.

Strategic position

Latticra should advance as an evidence-bound systems substrate and secure computing architecture. Fedora/Linux remains the proving lane. Lat is the native language direction. LIR is the bounded intermediate representation. Latticra Seal is the trust-boundary, request-boundary, capability-boundary, and tool-boundary subsystem.

The roadmap principle is:

```
evidence first
declarations before execution
reports before authority
allowlist candidates before allow grants
verification before enforcement
Fedora/Linux validation before deeper host claims
```

Project pillars

```
Latticra
  Secure systems substrate architecture, runtime-boundary model, Fedora/Linux validation lane,
Nucleus coordination, and evidence posture.

Lat
  Latticra-native declaration language for system intent, capability shape, policy-aware
declarations, and no-effect lowering into LIR.

LIR
  Bounded intermediate representation with graph shape, metadata, and report evidence before
execution.

Latticra Seal
  Trust-boundary and tool-boundary subsystem for signed request planning, freshness metadata,
guarded allowlists, capability planning, runtime gates, and evidence receipts.
```

Language architecture

```
C
  substrate, ABI, fixtures, state records, LIR/Lat lowering foundations, runtime-boundary
records, Seal metadata records, no-effect invariants.

Constrained C++
  architecture and policy modeling, capability graphs, Seal decisions, authority planning,
validation engines, bounded audit reports.

Rust
  safe CLI tools, manifest parsing, evidence report generation, signature and verification
tooling, serialization, untrusted input handling, future network-facing tools.

Lat
  system declaration and Latticra-native intent.

LIR
  bounded evidence-bearing representation.
```

Architecture lane

```
Lat source
  -&gt; parser
  -&gt; semantic validation
  -&gt; diagnostics
  -&gt; LIR metadata lowering
  -&gt; runtime-boundary classification
  -&gt; Seal policy / allowlist / gate metadata
  -&gt; operator-visible evidence report
```

The current valid posture is no-effect and report-oriented. Future execution must be gated by stronger evidence, verification, authority contracts, and explicit promotion rules.

Phase 1: Integration documentation and guardrails

Goal:

```
make the roadmap explicit and testable without changing runtime behavior
```

Deliverables:

```
docs/POLYMORPHIC_LANGUAGE_STRATEGY.md
docs/LATTICRA_LAT_SEAL_ROADMAP.md
docs/LATTICRA_ARCHITECTURE_TARGETS.md
scripts/test-latticra-lat-seal-roadmap.sh
```

Exit criteria:

```
strategy docs exist
language roles are explicit
non-claims remain explicit
roadmap guard passes
README/foundation links are aligned in a future slice
no runtime authority added
no effect behavior added
```

Phase 2: Lat and LIR strengthening

Goal:

```
mature Lat as declaration and no-effect system-intent language
```

Priority work:

```
Lat grammar refinement
Lat semantic diagnostics refinement
Lat-to-LIR lowering refinement
Lat-to-LIR clause metadata refinement
Lat-specific LIR nodes and edges
LIR report clarity
operator-visible Lat pipeline reports
negative fixtures for invalid declarations
```

C should continue to own the bounded parser/lowering/report substrate. C++ may be introduced for semantic architecture experiments only after contracts exist. Rust may be introduced for future tooling such as latfmt or latcheck after CLI contracts exist.

Non-claims:

```
lat_execution=0
lir_execution=0
compiler_product=0
interpreter_product=0
production_language=0
```

Phase 3: Seal guarded allowlist maturation

Goal:

```
move from blocked-request metadata toward guarded allowlist planning while preserving no-effect
behavior
```

Priority work:

```
guarded allowlist status alignment
guarded allowlist public entry-point alignment
capability metadata contract
```

```
manifest metadata contract
evidence receipt contract
negative allowlist cases
operator-visible denial report refinement
```

Valid posture:

```
allow_candidate_grants_authority=0
allow_candidate_executes_tool=0
allow_candidate_reads_host=0
allow_candidate_writes_host=0
allow_candidate_uses_network=0
runtime_authority_granted=0
effect_performed=0
```

Phase 4: Rust tooling lane

Goal:

```
introduce Rust only where it improves safety and tooling clarity
```

Candidate tools:

```
tools/seal-report
tools/seal-verify
tools/latcheck
tools/latfmt
tools/latticra-status
```

Valid Rust first slice:

```
parse a deterministic local fixture
produce a report
perform no host mutation beyond temporary test output
perform no network behavior
make no verification claim unless real verification is implemented
```

Phase 5: Constrained C++ policy model lane

Goal:

```
use C++ where policy and graph structure need stronger architecture
```

Candidate components:

```
CapabilityGraph
SealDecision
ToolBoundaryPlanner
PolicyGraph
LatSemanticModel
AuthorityAuditModel
```

C++ must remain constrained:

```
no unrestricted authority
no hidden effects
no exception crossing C boundary
no implicit allocation at ABI boundary
no runtime authority grant
no tool execution
```

Phase 6: Cryptographic verification planning

Goal:

```
separate metadata signature policy from real cryptographic verification
```

Planned distinction:

```
signature_metadata_present
signature_policy_evaluated
signature_verification_implemented
trusted_key_store_present
revocation_policy_present
hardware_identity_present
post_quantum_transition_present
```

Do not promote metadata to verification. Verification requires real primitives, real test vectors, negative tests, key handling rules, and clear non-claims.

Phase 7: Fedora/Linux integration lane

Goal:

```
keep Fedora/Linux as the practical validation lane without claiming OS replacement
```

Priority work:

```
local RPM documentation lane
Fedora disposable VM validation
host-facing validation transcripts
packaging boundary records
Fedora integration docs
no daily-driver claim
no Fedora approval claim
no immutable Fedora claim until evidence exists
```

Phase 8: Limited enforcement research

Goal:

```
consider narrow enforcement only after reports, allowlists, verification, and evidence receipts
mature
```

Earliest possible enforcement candidates:

```
deny unknown tool
deny unsigned request
deny stale request
deny replayed request
deny missing capability
deny manifest mismatch
```

This phase is future research. It is not current production behavior.

Priority queue

Near-term implementation queue:

1. Add roadmap and polymorphic language strategy guardrails.
2. Align README and foundation index entry points.
3. Add Seal guarded allowlist status alignment.
4. Add capability metadata contract.
5. Add evidence receipt contract.
6. Add Rust tooling contract before Rust code.
7. Add C++ policy graph contract before C++ expansion.

Promotion rule

A feature can move forward only when it has:

```
contract
implementation plan
bounded implementation or fixture
negative tests
operator-visible report or status surface
non-claims
README/status alignment when public-facing
```

Public claim boundary

The careful public position is:

```
Latticra is building an evidence-bound systems substrate for Linux-era and AI-era computing.
Lat provides the native declaration direction.
Latticra Seal provides report-only trust-boundary and tool-boundary planning today.
Fedora/Linux is the current validation lane.
```

Do not claim:

```
production runtime
operating-system replacement
security product
sandbox
malware prevention
MCP implementation
AI-agent security enforcement
cryptographic verification
```

```
runtime enforcement
Fedora approval
daily-driver readiness
```

docs/ROADMAP.md

Source title: Latticra Roadmap

Lines: 274 | Words: 618 | SHA-256: d174b6fd3627c4e2ce46f696304c99a036aebd6712a6f338dd2c9d35f4950fc9

Latticra Roadmap

Status: initial roadmap Scope: design-first planning, implementation order, and promotion rules.

Purpose

Latticra should be planned, refined, and documented before broad implementation work begins.

This roadmap keeps the project disciplined while preserving the ambition of building a real, evidence-bound systems architecture and programming-language stack.

Roadmap principle

```
contracts before code
fixtures before runtime
read-only before mutation
local before server
hosted before hardware
virtual target before real device
read-only device evidence before real execution
```

Stage 0: Foundation planning

Goal:

```
define the system before expanding implementation
```

Required documents:

- real-system contract;
- evidence ladder;
- precursor promotion rule;
- non-claims;
- architecture seed;
- naming system;
- language naming policy;
- language strategy;
- supervisor architecture;
- feature vocabulary ledger;
- effect gates;
- L-UI direction;
- server interaction model;
- self-update model;
- host architecture targets;
- license policy.

Exit criteria:

- documents linked from README and foundation index;
- no implementation claim beyond tested repository evidence;
- first implementation target named.

Stage 1: State lattice fixture

Goal:

```
create the first real Latticra implementation unit
```

Scope:

- C header for state shape;
- deterministic fixture;
- no-effect invariant tests;
- report fixture;
- x86_64/ARM64-neutral structure policy.

Required labels:

```
origin
route
axis
path
breadcrumb
trace
safe_portal
rollback
health
risk
lock
dark_phase
host_effect
external_effect
```

Non-claims:

- no live movement;
- no host mutation;
- no hardware interaction;
- no update behavior;
- no server interaction.

Stage 2: Tri-plane transition model

Goal:

```
model transitions safely before implementing live movement
```

Scope:

- pure transition function;
- spatial plane;
- state plane;
- safety plane;
- denial reasons;
- no-effect guarantee.

Exit criteria:

- accepted transition tests;
- denied transition tests;
- lock/risk/rollback tests;
- host/external effect remains none.

Stage 3: Nucleus preview supervisor

Goal:

```
introduce supervisor classification without real mutation
```

Scope:

- request classification;
- policy classification;
- effect classification;
- no-effect reports;
- evidence record fixture.

Non-claims:

- no task execution beyond preview/report;
- no server activity;
- no updates;
- no recovery behavior.

Stage 4: Lat-Core draft

Goal:

```
define native language contracts for state, policy, and assertions
```

Scope:

- grammar draft;
- example files;
- parser design;
- LIR draft;
- no execution beyond validation fixtures.

Stage 5: L-UI report fixtures

Goal:

```
declare terminal/operator surfaces before rendering engine work
```

Scope:

- state cards;
- operator rails;
- effect reports;
- denial reports;
- no-color and narrow-terminal constraints.

Stage 6: Server and update fixtures

Goal:

```
model network/update behavior without performing it
```

Scope:

- server request fixture;
- signed manifest fixture;
- update state fixture;
- rollback visibility fixture;
- denied network by default.

Stage 7: Hosted reference implementation

Goal:

```
run Latticra as a hosted reference process
```

Targets:

```
x86_64-hosted
aarch64-hosted
```

Scope:

- local-only execution;
- no server by default;
- no hardware effects;
- no boot effects.

Stage 8: Virtual-target evidence profiles

Goal:

```
validate controlled profiles in QEMU or similar environments
```

Targets:

```
x86_64-qemu
aarch64-qemu
```

Scope:

- reproducible commands;
- validation reports;
- evidence bundles;
- no real-device claim.

Stage 9: Real-device read-only evidence

Goal:

```
observe real targets without changing them
```

Scope:

- device identity;
- read-only checklists;
- reports;
- non-mutation evidence.

Stage 10: Gated real-system experiments

Goal:

```
consider narrow real-world actions after evidence supports them
```

Scope:

- explicit operator approval;
- preflight checks;
- audit output;
- rollback/failure plan;
- no hidden effects.

Non-claims

This roadmap does not implement any stage by itself.

It defines sequencing and boundaries so Latticra can advance through evidence-backed implementation slices.

docs/status/ANNOUNCEMENTS.md

Source title: Latticra Announcements

Lines: 279 | Words: 1137 | SHA-256: 05efbe8fbcf52ed4bf2d7555e2fa0d6552fd0def81708b833c173f4b55fc6770

Latticra Announcements

Status: public announcement log Last updated: 2026-05-26 04:12 CDT Latest Fedora VM CLI payload validation milestone note: 2026-05-26 04:12 CDT Latest Fedora VM RPM validation milestone note: 2026-05-21 03:20 CDT Latest status announcement review note: 2026-05-19 19:25 CDT Latest authority foundation index alignment note: 2026-05-19 19:15 CDT Latest current status detail rollup note: 2026-05-19 19:05 CDT Latest Lat pipeline diagnostic status announcement note: 2026-05-19 17:45 CDT Latest status and announcement consistency review note: 2026-05-19 18:35 CDT Latest announcement rollup note: 2026-05-19 15:05 CDT Latest RBDM report status announcement note: 2026-05-19 16:45 CDT Scope: dated public updates, status notes, and milestone announcements.

Purpose

This file records public-facing Latticra updates in a controlled, evidence-bound way.

Announcements should be factual, dated, and careful not to overstate current security or operating-system capability.

Announcement rules

Each announcement should include:

```
date/time
status
what changed
why it matters
validation
non-claims
next step
```

2026-05-26 04:12 CDT — Disposable Fedora VM CLI payload validation milestone

Status: evidence-backed CLI payload validation milestone recorded

Latticra completed and recorded a successful disposable Fedora VM CLI payload validation path for the current no-effect local RPM payload.

What changed:

```
disposable_vm_cli_validation_completed=1
host_install_ready_for_cli_payload=1
validated_package=latticra-0.0.0-0.1.local.fc44.x86_64.rpm
validated_payload=/usr/bin/latticra
validated_payload=/usr/share/doc/latticra/README.md
evidence_level=9
```

Why it matters:

The Fedora validation path now has accepted disposable VM evidence for the compiled no-effect latticra CLI payload. The transcript records local RPM build, package installation, CLI --status, --version, --report, invalid-command validation, RPM removal, and post-removal absence verification.

Validation:

```
sh scripts/test-fedora-vm-cli-payload-validation-evidence-status.sh
sh scripts/test-fedora-vm-cli-payload-readme-alignment.sh
```

Non-claims:

This milestone does not claim production readiness, Fedora approval, Fedora distribution readiness, daily-driver safety, immutable Fedora readiness, security capability, update safety, recovery safety, sandboxing, malware prevention, ransomware prevention, bootable OS replacement behavior, kernel runtime readiness, or a production installer.

Next step:

```
Plan the next Fedora CLI payload validation lane without widening README or announcement claims
beyond disposable Fedora VM evidence.
```

2026-05-21 03:20 CDT — Disposable Fedora VM local RPM validation milestone

Status: evidence-backed validation milestone recorded

Latticra completed and recorded a successful disposable Fedora VM local RPM validation path for the current documentation-only local RPM.

What changed:

```
disposable_vm_validation_completed=1
live_host_validation_completed=1
host_install_ready=1
validated_package=latticra-0.0.0-0.1.local.fc44.noarch.rpm
validated_payload=/usr/share/doc/latticra/README.md
evidence_level=9
```

Why it matters:

This is the first evidence-backed host-facing validation milestone for Latticra. The project now has a real disposable Fedora VM transcript showing package build, RPM install, RPM verification, RPM removal, and post-removal absence verification for the local documentation-only RPM.

Validation:

```
sh scripts/test-fedora-disposable-vm-local-rpm-validation-evidence-status.sh
sh scripts/test-fedora-disposable-vm-rpm-readme-alignment.sh
```

Non-claims:

This milestone does not claim production readiness, Fedora approval, Fedora distribution readiness, daily-driver safety, immutable Fedora readiness, security capability, update safety, recovery safety, sandboxing, malware prevention, ransomware prevention, bootable OS replacement behavior, kernel runtime readiness, or a production installer.

Next step:

```
Plan the next Fedora validation lane without widening README or announcement claims beyond
disposable Fedora VM local RPM evidence.
```

2026-05-19 19:25 CDT — Status announcement review

Status: announcement surface reviewed

Latticra reviewed the public announcement log after the authority implementation review, authority status/docs alignment, current status detail rollup, and authority foundation index alignment.

What changed:

```
status announcement review record added
authority review sequence reflected in the announcement log
root queue prepared for announcement-index follow-up
```

Why it matters:

The announcement surface now reflects the recent authority review and documentation alignment work without implying new runtime authority or operational behavior.

Validation:

```
sh scripts/test-project-strategy-status-framework.sh
```

Non-claims:

This update does not implement runtime behavior, command execution, Lat execution, LIR execution, state mutation, file I/O, network I/O, server interaction, recovery behavior, hardware behavior, sandboxing, malware prevention, ransomware prevention, certification, accreditation, or operating-system behavior.

Next step:

```
Status announcement review index alignment
```

2026-05-19 18:35 CDT — Current status and announcement consistency review

Status: consistency review added

Latticra completed a status-surface consistency review after the recent Lat pipeline diagnostic, RBDM report, and project-notes alignment slices.

Validation:

```
sh scripts/test-project-strategy-status-framework.sh
```

Non-claims:

This update does not implement runtime behavior, command execution, Lat execution, LIR execution, state mutation, file I/O, network I/O, server interaction, recovery behavior, hardware behavior, sandboxing, malware prevention, ransomware prevention, certification, accreditation, or operating-system behavior.

2026-05-19 17:45 CDT — Lat pipeline diagnostic main test audit

Status: audit coverage added

Latticra added an audit guard proving that the Lat pipeline diagnostic integration is covered by the main Lat pipeline test runner.

Validation:

```
sh scripts/test-lat-pipeline-diagnostic-main-test-integration-audit.sh
sh scripts/test-lat-pipeline.sh
```

Non-claims:

This update does not implement Lat execution, Lat compilation, Lat interpretation, LIR execution, runtime behavior, command execution, state mutation, file I/O, network I/O, server interaction, recovery behavior, hardware behavior, sandboxing, malware prevention, ransomware prevention, certification, accreditation, or operating-system behavior.

2026-05-19 16:45 CDT — Runtime boundary domain matrix report integration

Status: report integration added

Latticra added deterministic report rendering for the Runtime Boundary Domain Matrix companion surface.

Validation:

```
sh scripts/test-runtime-boundary-domain-matrix-report-integration.sh
sh scripts/test-runtime-boundary-domain-matrix-refinement.sh
sh scripts/test-runtime-boundary.sh
```

Non-claims:

This update does not implement runtime behavior, command execution, Lat execution, LIR execution, task effect execution, state mutation, file I/O, network I/O, server interaction, recovery behavior, hardware behavior, sandboxing, malware prevention, ransomware prevention, certification, accreditation, or operating-system behavior.

2026-05-19 15:05 CDT — Recent no-effect refinement rollup

Status: public rollup added

Latticra completed a sequence of no-effect refinement slices that strengthen reporting, diagnostics, and evidence visibility across Lat, LIR, Nucleus, and the runtime boundary.

Validation:

```
sh scripts/test-runtime-boundary.sh
sh scripts/test-runtime-boundary-domain-matrix-refinement.sh
sh scripts/test-nucleus-task-execution.sh
sh scripts/test-lat-semantic-validation.sh
sh scripts/test-lir-shape.sh
sh scripts/test-lat-pipeline.sh
```

Non-claims:

This rollup does not implement runtime behavior, command execution, Lat execution, LIR execution, task effect execution, state mutation, file I/O, network I/O, server interaction, recovery behavior, hardware behavior, sandboxing, malware prevention, ransomware prevention, certification, accreditation, or operating-system behavior.

2026-05-18 21:30 CDT — Lat-specific LIR refinement implementation

Status: implementation added

Latticra added the first Lat-specific LIR refinement implementation.

Validation:

```
sh scripts/test-lat-specific-lir-refinement.sh
```

Non-claims:

This update does not implement Lat execution, LIR execution, runtime behavior, command behavior, mutation, file I/O, network I/O, recovery behavior, hardware behavior, sandboxing, malware prevention, ransomware prevention, certification, accreditation, or operating-system behavior.

2026-05-18 19:40 CDT — Lat pipeline implementation

Status: implementation added

Latticra added the first bounded no-effect Lat pipeline implementation.

Validation:

```
sh scripts/test-lat-pipeline.sh
```

Non-claims:

This update does not implement Lat execution, Lat compilation, Lat interpretation, LIR execution, command behavior, runtime behavior, mutation, file I/O, network I/O, recovery behavior, hardware behavior, malware prevention, ransomware prevention, sandboxing, certification, accreditation, or operating-system behavior.

2026-05-16 16:15 CDT — Constrained C++ authority layer contract

Status: contract added

Latticra added the first constrained C++ authority layer contract.

This announcement also preserves the historical Constrained C++ authority layer implementation plan reference as the next planning step from that milestone.

Validation:

```
sh scripts/test-constrained-cpp-authority-layer-contract.sh
```

Non-claims:

This update does not implement C++ infrastructure, policy code, validators, effect gates, audit logic, orchestration, Lat execution, LIR execution, L-UI rendering, malware prevention, ransomware prevention, or operating-system behavior.

Announcement quality bar

Announcements should be:

```
specific
dated
honest
non-hype
evidence-bound
clear about non-claims
```

Project status

Latticra is an early-stage, contract-first systems architecture and language project.

The repository currently emphasizes:

- public project identity;
- strategy and status documentation;
- security-policy documentation;
- constrained C/C++ foundation direction;
- governed C++ authority-layer planning;
- Constrained C++ authority layer contract;
- Constrained C++ authority layer implementation plan;
- initial no-effect constrained C++ authority-layer implementation;
- C++ authority expansion contract review;
- authority implementation review;
- authority status/docs alignment;

- authority announcement review;
- current status detail rollup;
- authority foundation index alignment;
- status announcement review;
- public entry-point consistency scan;
- project notes follow-up alignment;
- project notes follow-up status/index check;
- project notes Nucleus report-only alignment;
- project notes Nucleus report-only status/index check;
- Nucleus report-only announcement review;
- Nucleus report-only announcement README alignment;
- project notes Nucleus announcement README status/index check;
- language representation review;
- Nadia offline AI Stage-0 foundation for Panel installability, Console interoperability, and awareness principles;
- Latticra Console profile presets, standalone dry-run/local installer presets, and standalone contract for hosted reference, standalone, Panel embedded, host-embedded planning, and OS-base planning under no-effect authority;
- Latticra Console host-embedding contract for pre-integration host adapter gates, read-only inventory prerequisites, and explicit denial of host process/file authority;
- Latticra Console read-only host inventory contract for future host evidence scope while current LC performs no inventory, host probing, file reads, process launches, or mutation;
- Latticra Console receipt contract for profile, host-contract, host-inventory, and Runtime Boundary evidence while current LC performs no signing or receipt writes;
- Nadia local context engine Stage-1 for no-network context-pack generation;
- Nadia runtime profile Stage-2 for offline model-readiness metadata before inference;
- Nadia developer workbench Stage-3 for prompt-plan generation without prompt evaluation;
- Nadia systems engineering mode Stage-4 for prompt-plan mode validation before prompt evaluation;
- Nadia productivity loop Stage-5 for operator-reviewed local productivity ledger entries before training or tool authority;
- Nadia protective safety boundary Stage-6 for non-sexual-use, anti-manipulation, and namesake-cause awareness restrictions;
- Nadia guarded tool authority Stage-7 for report-only tool preflight without tool execution;
- Nadia prompt evaluation contract Stage-8 before prompt materialization, prompt evaluation, inference, or tool execution;
- Nadia local model registry contract Stage-9 before model selection, model installation, prompt evaluation, inference, or tool execution;
- Nadia inference readiness contract Stage-10 before runtime invocation, model loading, prompt evaluation, inference, or tool execution;

- Nadia runtime invocation contract Stage-11 before runtime process spawning, model session creation, model loading, token generation, inference, or tool execution;
- Nadia model load contract Stage-12 before model file opening, weight mapping, weight loading, token generation, inference, or tool execution;
- Nadia prompt receipt contract Stage-13 before prompt source opening, prompt text receipt, prompt materialization, prompt evaluation, token generation, inference, or tool execution;
- Nadia prompt materialization contract Stage-14 before prompt buffer allocation, prompt text materialization, prompt tokenization, prompt evaluation, token generation, inference, or tool execution;
- Nadia awareness dialogue contract Stage-15 for future official Nadia Initiative Q&A scope before dialogue generation, prompt evaluation, token generation, inference, or tool execution;
- Nadia prompt evaluation handoff contract Stage-16 before prompt evaluation, dialogue generation, token generation, inference, or tool execution;
- Nadia tokenization boundary contract Stage-17 before tokenizer file access, tokenizer vocabulary loading, prompt tokenization, prompt evaluation, token generation, inference, or tool execution;
- Nadia tokenizer specification contract Stage-18 before tokenizer manifest loading, tokenizer file access, tokenizer vocabulary loading, prompt tokenization, prompt evaluation, token generation, inference, or tool execution;
- Nadia tokenizer manifest contract Stage-19 before tokenizer manifest loading, tokenizer manifest parsing, tokenizer file access, tokenizer vocabulary loading, prompt tokenization, prompt evaluation, token generation, inference, or tool execution;
- Nadia tokenizer artifact inventory contract Stage-20 before tokenizer artifact path resolution, artifact scanning, artifact hashing, tokenizer manifest loading, tokenizer file access, tokenizer vocabulary loading, prompt tokenization, prompt evaluation, token generation, inference, or tool execution;
- Nadia tokenizer artifact measurement contract Stage-21 before tokenizer artifact opening, artifact reading, artifact hashing, artifact digest recording, artifact size recording, tokenizer manifest loading, tokenizer file access, tokenizer vocabulary loading, prompt tokenization, prompt evaluation, token generation, inference, or tool execution;
- Nadia tokenizer artifact verification contract Stage-22 before tokenizer artifact opening, artifact reading, artifact hashing, artifact digest comparison, artifact size comparison, artifact verification, artifact binding, tokenizer manifest loading, tokenizer file access, tokenizer vocabulary loading, prompt tokenization, prompt evaluation, token generation, inference, or tool execution;
- Nadia tokenizer artifact binding contract Stage-23 before tokenizer artifact opening, artifact reading, artifact hashing, artifact verification, artifact binding, tokenizer runtime attachment, tokenizer manifest loading, tokenizer file access, tokenizer vocabulary loading, prompt tokenization, prompt evaluation, token generation, inference, or tool execution;
- Nadia tokenizer runtime attachment contract Stage-24 before tokenizer artifact opening, artifact reading, artifact hashing, tokenizer artifact binding, tokenizer runtime attachment, runtime session creation, tokenizer manifest loading, tokenizer file access, tokenizer vocabulary loading, prompt tokenization, prompt evaluation, token generation, inference, or tool execution;

- Nadia prompt tokenization contract Stage-25 before prompt text reading, prompt token creation, prompt token sequence recording, tokenizer runtime attachment, prompt evaluation, dialogue generation, token generation, inference, or tool execution;
- Nadia prompt token sequence contract Stage-26 before prompt token ID recording, token order recording, token offset recording, context window assembly, prompt evaluation input creation, runtime invocation, prompt evaluation, dialogue generation, token generation, inference, or tool execution;
- Nadia context window assembly contract Stage-27 before context window assembly, prompt evaluation input creation, runtime invocation, prompt evaluation, dialogue generation, token generation, inference, or tool execution;

Lat now has a bounded no-effect path from grammar parsing to semantic validation to model normalization to LIR metadata lowering. The grammar report preserves first declaration, first clause, and line-comment metadata from successful AST parses, and block-comment openers outside strings/line comments now fail with unsupported_block_comment; the current pipeline report also carries parser line-comment count and first-comment span metadata. The current lowering implementation consumes normalized Lat model metadata directly, creates a lat_module LIR module shape, preserves source spans, no-effect flags, model counts, first lowered declaration metadata, and transition source indices, and emits deterministic lowering reports. The older parser-plus-semantic lowering entry point remains available as a compatibility wrapper.

The Lat model normalization implementation builds typed declaration and clause index tables for states, policies, transitions, assertions, and effect declarations after semantic validation. It preserves first normalized declaration metadata, first normalized clause role/effect/name/operator/value report metadata, source spans, and no-effect flags without reading source bytes, executing Lat, or changing lowering behavior.

The Lat-to-LIR diagnostic refinement classifies lowering outcomes as valid, parse, semantic, model, effect-check, capacity, LIR, or internal. It copies model errors, lowering errors, optional LIR errors, model counts, transition source metadata, first lowered declaration metadata, first-clause metadata, no-effect flags, and evidence level into deterministic diagnostic reports without changing lowering behavior.

The Lat-to-LIR clause metadata refinement preserves clause operators in LIR node metadata and exposes first lowered clause role, effect, name, operator, value, and node index in deterministic lowering reports without evaluating operators or adding execution.

The Lat semantic diagnostics refinement adds deterministic diagnostic classes, category counters, first-diagnostic declaration/clause indices, and report fields. This makes semantic failures easier to audit without changing validation outcomes or adding execution.

The Lat pipeline composes source parsing, semantic validation, Lat model normalization, model-driven Lat-to-LIR lowering, LIR metadata, and deterministic pipeline reporting into one no-effect integration boundary. It preserves metadata visibility without executing Lat, executing LIR, mutating state, or providing runtime behavior.

The Lat pipeline lowering diagnostic integration extends the companion pipeline diagnostic surface with parser line-comment count and first-comment span metadata, optional Lat-to-LIR diagnostic class, lowering error, model error, LIR error, model counts, transition source metadata, first lowered declaration metadata, first lowered clause metadata, and failure flags while preserving the older evaluator for existing callers.

The Lat pipeline report refinement adds deterministic stage-summary metadata for last completed stage, failed stage, per-stage OK flags, model normalization status, no-effect-chain status, evidence level, parser line-comment count plus first-comment span metadata, first lowered declaration kind/name/source/index/clause metadata, and first lowered clause role/effect/name/operator/value/node metadata. The current runtime-boundary Lat LIR first transition-node span, Lat LIR first transition-node, Lat LIR first transition-source edge endpoint, Lat LIR first transition-source edge span, Lat LIR first transition-source edge, Lat LIR first-edge span, Lat LIR first-edge, Lat LIR first-node span, Lat LIR first-node, Lat LIR node-kind, Lat LIR source-span, Lat LIR module-summary, Lat LIR no-effect, Lat LIR edge-kind, first-clause, first-declaration, module/count, and stage-summary evidence propagation copies LIR first Lat-derived transition node source span, LIR first Lat-derived transition node identity, LIR first Lat-derived transition-source endpoint node kinds and names, LIR first Lat-derived transition-source edge source span, LIR first Lat-derived transition-source edge identity, LIR first Lat-derived edge source span, LIR first Lat-derived edge identity, LIR first Lat-derived node source span, LIR first Lat-derived node identity, LIR node-kind counts, LIR source span, LIR module name, report classification, shape kind, core LIR counts, LIR no-effect flags, LIR contains/binds/annotates/orders-before/transition edge counts, first lowered clause metadata, first lowered declaration metadata, module identity, parser counts, model counts, and stage-summary metadata into runtime-boundary Lat pipeline records/reports so boundary denials and approvals preserve the same audit shape without changing no-effect behavior.

The Lat pipeline diagnostic integration refinement adds a companion diagnostic integration surface that combines pipeline error/stage state with parser line-comment count and first-comment span metadata, Lat semantic diagnostic class, semantic error, diagnostic count, first-diagnostic indices, model-stage classification, optional Lat-to-LIR diagnostic metadata, first lowered declaration metadata, and first lowered clause role/effect/name/operator/value/node metadata while preserving no-execution behavior.

The Lat pipeline diagnostic main test audit verifies that the companion diagnostic integration is covered by both the focused guard and the main Lat pipeline test runner.

The Lat-specific LIR refinement gives Lat declarations explicit LIR node kinds and a transition-source edge kind. This improves inspectability of Lat-derived LIR without changing no-effect behavior or adding execution.

The language representation review confirms that the Lat, LIR, and L-UI representation stack is stable enough for a bounded no-effect Nucleus report/refinement slice, while still forbidding Lat execution, LIR execution, runtime behavior, command execution, mutation, file I/O, network I/O, recovery behavior, and hardware behavior.

The LIR report refinement adds deterministic report classification, graph-shape labels, edge-kind summary counts, no-effect-chain status, and evidence level while preserving lowering outcomes and non-execution behavior.

The L-UI rendering detailed report refinement adds explicit report classification, detail level, detailed-report availability, detailed section count, deterministic section sequence, no-effect-chain status, and evidence level to the no-effect renderer report surface.

The L-UI rendering README/status alignment makes that detailed-report refinement discoverable from the README and status index without changing implementation behavior.

The L-UI completion estimate review conservatively updates planning estimates after the no-effect renderer report metadata and validation work. It does not change runtime, security-hardening, authority, or product-readiness estimates.

The C++ authority expansion contract review records that no new expansion contract is needed because no new authority behavior has been proposed.

The authority implementation review confirms the constrained C++ authority layer remains no-effect, metadata-only, fixed-capacity, and denied-by-default.

The authority status/docs alignment makes the authority review status discoverable from the status index and detailed status surface.

The authority announcement review confirms that no separate public authority announcement is needed because no authority behavior or messaging posture changed beyond the already-recorded no-effect review sequence.

The authority foundation index alignment makes the authority review and review status visible from the main foundation index.

The public entry-point consistency scan refreshes README and status-index references after the recent authority/status/foundation/announcement slices.

The project notes follow-up alignment refreshes the current-direction note, upcoming-work queue, and project-notes index after the public entry-point consistency scan.

The project notes follow-up status/index check verifies that the project-notes refresh is represented from the status index and detailed status surface.

The Nucleus task report refinement adds deterministic report classification, task-domain labeling, authorization-state labeling, prerequisite status, and no-effect-chain status. This makes Nucleus task reports easier to audit while preserving no-effect behavior.

The Nucleus task no-effect report alignment adds explicit report-alignment, no-effect-policy, and representation-gate labels to Nucleus task records and deterministic reports while preserving non-execution behavior.

The Nucleus task README/status alignment makes that no-effect report alignment discoverable from README and the status index without changing implementation behavior.

The Nucleus task report-only execution refinement adds explicit execution-status, effect-status, and runtime-status labels to Nucleus task records and deterministic reports while preserving no-effect, non-executing behavior.

The Nucleus task report-only execution README/status alignment makes the report-only execution refinement discoverable from README, root status, current status, status index, and foundation index without changing implementation behavior.

The project notes Nucleus report-only alignment refreshes current direction, upcoming work, and the project-notes index after the Nucleus task report-only execution README/status alignment.

The project notes Nucleus report-only status/index check verifies that the project-notes Nucleus report-only alignment is represented from root status, detailed current status, the status index, and the foundation index without changing implementation behavior or completion estimates.

The Nucleus report-only announcement review confirms that no separate public announcement entry is needed because the recent Nucleus report-only and project-notes slices were documentation/status alignment only, with no capability posture or public-product-readiness change.

The Nucleus report-only announcement README alignment makes the no-new-announcement review discoverable from README and the project-notes index without adding a public announcement entry or changing implementation behavior.

The project notes Nucleus announcement README status/index check verifies that the project-note body alignment after the Nucleus announcement README alignment is represented from root status, detailed current status, the status index, and the foundation index without changing implementation behavior or completion estimates.

The Runtime boundary refinement implementation reports Lat pipeline evidence, Lat pipeline line-comment count and first-comment span evidence, Lat-specific LIR source-span evidence, Lat-specific LIR module-summary evidence, Lat-specific LIR node-kind evidence, Lat-specific LIR first-node evidence, Lat-specific LIR first-node span evidence, Lat-specific LIR first transition-node evidence, Lat-specific LIR first transition-node span evidence, Lat-specific LIR first-edge evidence, Lat-specific LIR first-edge span evidence, Lat-specific LIR first transition-source edge evidence, Lat-specific LIR first transition-source edge endpoint evidence, Lat-specific LIR first transition-source edge span evidence, Lat-specific LIR no-effect evidence, and Lat-specific LIR edge-kind evidence at the runtime boundary while preserving disabled-by-default, no-effect classification behavior.

The Runtime boundary report refinement adds explicit report classification, boundary-domain labeling, authorization-state labeling, and evidence-level reporting so boundary intent is visible without granting runtime authority.

The Runtime boundary policy matrix refinement adds explicit policy-matrix cell labels plus effect, mode, authority, and future-gate report fields so the runtime-boundary decision shape is easier to audit without changing denied-by-default behavior.

The Runtime boundary domain matrix refinement adds a companion domain matrix evaluator for classifying resolved boundary domains as declarative, operational, future-gated, blocked, invalid, or unknown.

The Runtime boundary domain matrix report integration adds deterministic report rendering for domain-matrix cell, domain label, domain flags, effect-allowed state, authority-available state, and evidence level.

The Latticra Seal report envelope implementation adds bounded C metadata for classifying ready runtime handoff report metadata into sealed-report-only or sealed-evaluate-only envelope states while preserving no signing, no runtime handoff, no host behavior, no network behavior, no capability enforcement, and no runtime authority.

The Latticra Seal report envelope status record makes the existing metadata-only envelope readiness classification visible from public entry points while preserving no signing, no object sealing, no runtime handoff execution, no effect execution, no capability enforcement, no runtime authority, no host behavior, no network behavior, and no production cryptography claim.

Current report envelope fields:

The Latticra Seal signature request contract defines the next metadata-only request boundary after sealed report-envelope metadata. It permits only a future signature request metadata implementation and does not add signing, verification, private-key handling, host behavior, network behavior, capability enforcement, or runtime authority.

The Latticra Seal signature request implementation adds bounded C metadata for classifying allowed future signing requests after sealed report-envelope metadata while preserving no signing, no verification, no private-key handling, no host behavior, no network behavior, no capability enforcement, and no runtime authority.

The Latticra Seal signature request status record makes the metadata-only implementation visible from public entry points while preserving no signing, no verification, no private-key handling, no host behavior, no network behavior, no capability enforcement, and no runtime authority.

The Latticra Seal signature request predecessor status alignment ties that metadata-only status record to the guarded report-envelope status predecessor while preserving no signing, no signature verification, no object sealing, no runtime handoff execution, no capability enforcement, no runtime authority, no key generation, no private-key handling, no trust-store behavior, no revocation lookup, no host behavior, no network behavior, and no production cryptography claim.

Current signature request predecessor status fields:

```
seal_report_envelope_status_present=1

```

The Latticra Seal signing authorization contract defines the next metadata-only classification boundary after signature-request readiness while preserving no signing, no verification, no private-key handling, no host behavior, no network behavior, no capability enforcement, and no runtime authority.

The Latticra Seal signing authorization implementation adds bounded C metadata for classifying ready signature requests as authorized-metadata-only for a future signing path while preserving no signing, no verification, no private-key handling, no key generation, no trust-store loading, no revocation lookup, no host behavior, no network behavior, no capability enforcement, and no runtime authority.

The Latticra Seal signing authorization status record makes the metadata-only implementation visible from public entry points while preserving no signing, no verification, no private-key handling, no key generation, no trust-store loading, no revocation lookup, no host behavior, no network behavior, no capability enforcement, and no runtime authority.

The Latticra Seal signing authorization predecessor status alignment ties that metadata-only status record to the guarded signature-request status predecessor while preserving no signing, no signature verification, no object sealing, no runtime handoff execution, no capability enforcement, no runtime authority, no key generation, no private-key handling, no trust-store behavior, no revocation lookup, no host behavior, no network behavior, and no production cryptography claim.

Current signing authorization predecessor status fields:

```

The Latticra Seal signer handoff contract defines the next metadata-only classification boundary after signing authorization readiness while preserving no signing, no verification, no signer invocation, no private-key handling, no key generation, no trust-store loading, no revocation lookup, no host behavior, no network behavior, no capability enforcement, and no runtime authority.

The Latticra Seal signer handoff implementation adds bounded C metadata for classifying ready signing authorizations as handoff-metadata-only for a future signer path while preserving no signing, no verification, no signer invocation, no private-key handling, no key generation, no trust-store loading, no revocation lookup, no host behavior, no network behavior, no capability enforcement, and no runtime authority.

The Latticra Seal signer handoff status record makes the metadata-only implementation visible from public entry points while preserving no signing, no verification, no signer invocation, no private-key handling, no key generation, no trust-store loading, no revocation lookup, no host behavior, no network behavior, no capability enforcement, and no runtime authority.

The Latticra Seal signer handoff predecessor status alignment ties that metadata-only status record to the guarded signing-authorization status predecessor while preserving no signing, no signature verification, no signer invocation behavior, no object sealing, no runtime handoff execution, no capability enforcement, no runtime authority, no key generation, no private-key handling, no trust-store behavior, no revocation lookup, no host behavior, no network behavior, and no production cryptography claim.

Current signer handoff predecessor status fields:

```
seal_signing_authorization_status_present=1

```

The Latticra Seal signer invocation contract defines the next metadata-only classification boundary after signer handoff readiness while preserving no signing, no verification, no signer invocation behavior, no private-key handling, no key generation, no trust-store loading, no revocation lookup, no host behavior, no network behavior, no capability enforcement, and no runtime authority.

The Latticra Seal signer invocation implementation adds bounded C metadata for classifying ready signer handoffs as invocation-metadata-only for a future signer path while preserving no signing, no verification, no signer invocation behavior, no private-key handling, no key generation, no trust-store loading, no revocation lookup, no host behavior, no network behavior, no capability enforcement, and no runtime authority.

The Latticra Seal signer invocation status record makes the metadata-only implementation visible from public entry points while preserving no signing, no verification, no signer invocation behavior, no private-key handling, no key generation, no trust-store loading, no revocation lookup, no host behavior, no network behavior, no capability enforcement, and no runtime authority.

The Latticra Seal signer invocation predecessor status alignment ties that metadata-only status record to the guarded signer-handoff status predecessor while preserving no signing, no signature verification, no signer invocation behavior, no signer process execution, no object sealing, no runtime handoff execution, no capability enforcement, no runtime authority, no key generation, no private-key handling, no trust-store behavior, no revocation lookup, no host behavior, no network behavior, and no production cryptography claim.

Current signer invocation predecessor status fields:

```

The Latticra Seal signing operation contract defines the next metadata-only classification boundary after signer invocation readiness while preserving no signing, no verification, no signer invocation behavior, no private-key handling, no key generation, no trust-store loading, no revocation lookup, no host behavior, no network behavior, no capability enforcement, and no runtime authority.

The Latticra Seal signing operation implementation adds bounded C metadata for classifying ready signer invocation metadata as operation-metadata-only for a future signing operation path while preserving no signing, no verification, no signer invocation behavior, no private-key handling, no key generation, no trust-store loading, no revocation lookup, no host behavior, no network behavior, no capability enforcement, and no runtime authority.

The Latticra Seal signing operation status record makes the metadata-only implementation visible from public entry points while preserving no signing, no verification, no signer invocation behavior, no private-key handling, no key generation, no trust-store loading, no revocation lookup, no host behavior, no network behavior, no capability enforcement, and no runtime authority.

The Latticra Seal signing operation predecessor status alignment ties that metadata-only status record to the guarded signer-invocation status predecessor while preserving no signing, no signature verification, no signer invocation behavior, no signer process execution, no object sealing, no runtime handoff execution, no capability enforcement, no runtime authority, no key generation, no private-key handling, no trust-store behavior, no revocation lookup, no host behavior, no network behavior, and no production cryptography claim.

Current signing operation predecessor status fields:

```
seal_signer_invocation_status_present=1
seal_signing_operation_status_present=1
signing_operation_predecessor_signer_invocation_status_present=1
signer_invocation_ready=1
signer_invocation_state=invocation-metadata-only

```

The Latticra Seal future key parsing implementation contract defines the next planning boundary after public-key parsing status readiness while preserving no public-key parsing implementation, no key material loading, no private-key handling, no key generation, no hardware-key use, no trust-store loading, no revocation lookup, no signing, no verification, no signer invocation behavior, no host behavior, no network behavior, no capability enforcement, and no runtime authority.

The Latticra Seal future key parsing implementation plan defines the exact future bounded no-effect key parsing API, file paths, record fields, accepted public-key byte formats, failure behavior, report shape, and tests while still adding no parser code, no key material loading, no private-key handling, no signing, no verification, no host behavior, no network behavior, and no runtime authority in this slice.

The Latticra Seal bounded key parsing implementation adds fixed-size caller-provided Ed25519 public-key byte metadata after public-key parsing status readiness while preserving no key material loading, no private-key handling, no key generation, no hardware-key use, no trust-store behavior, no signing, no verification, no signer invocation behavior, no host behavior, no network behavior, no capability enforcement, and no runtime authority.

The Latticra Seal key parsing status record makes the bounded public-key byte metadata implementation visible from public entry points while preserving no key material loading, no private-key handling, no key generation, no hardware-key use, no trust-store behavior, no signing, no verification, no signer invocation behavior, no host behavior, no network behavior, no capability enforcement, and no runtime authority.

The Latticra Seal key parsing predecessor status alignment ties that bounded status record to the guarded public-key parsing status predecessor while preserving the existing caller-provided public-key byte metadata behavior, no key material loading, no private-key handling, no key generation, no hardware-key use, no trust-store behavior, no revocation lookup, no signing, no signature verification, no signer invocation behavior, no signer process execution, no object sealing, no runtime handoff execution, no capability enforcement, no runtime authority, no host behavior, no network behavior, and no production cryptography claim.

Current key parsing predecessor status fields:

```
seal_public_key_parsing_status_present=1
seal_key_parsing_status_present=1
key_parsing_predecessor_public_key_parsing_status_present=1

```

The Latticra Seal capability gate status record makes the existing metadata-only denied capability gate implementation visible from public entry points while preserving no capability enforcement, no effect execution, no cryptographic verification, no verified receipt authority, no signing, no host behavior, no network behavior, and no runtime authority.

The Latticra Seal capability gate predecessor status alignment ties that metadata-only denied capability gate status record to the guarded verification receipt status predecessor while preserving no capability enforcement, no effect execution, no runtime handoff execution, no cryptographic verification, no verified receipt authority, no public-key byte verification, no key material loading, no private-key handling, no key generation, no hardware-key use, no trust-store behavior, no revocation lookup, no signing, no signature verification, no signer invocation behavior, no signer process execution, no object sealing, no runtime authority, no host behavior, no network behavior, and no production enforcement claim.

Current capability gate predecessor status fields:

```
seal_verification_receipt_status_present=1

```

The Latticra Seal effect decision status record makes the existing metadata-only denied effect decision implementation visible from public entry points while preserving no effect execution, no capability enforcement, no runtime handoff execution, no cryptographic verification, no verified receipt authority, no signing, no host behavior, no network behavior, and no runtime authority.

Latticra Seal effect decision predecessor status alignment records that the denied metadata-only effect decision remains tied to the guarded capability gate status predecessor.

```
effect_decision_predecessor_capability_gate_status_present=1
```

The Latticra Seal runtime handoff status record makes the existing inactive metadata-only runtime handoff implementation visible from public entry points while preserving no runtime execution, no effect execution, no capability enforcement, no cryptographic verification, no verified receipt authority, no signing, no host behavior, no network behavior, and no runtime authority.

Latticra Seal runtime handoff predecessor status alignment records that the inactive metadata-only runtime handoff remains tied to the guarded effect decision status predecessor.

```
runtime_handoff_predecessor_effect_decision_status_present=1
runtime_handoff_execution_added=0
effect_execution_added=0
capability_enforcement_added=0

key_material_loading_added=0
private_key_handling_added=0
object_sealing_added=0
policy_persistence_added=0
network_behavior_changed=0
host_behavior_changed=0
```

The Latticra Seal runtime handoff report status/public-entry alignment makes the existing metadata-only runtime handoff report implementation visible from public entry points while preserving no runtime handoff execution, no effect execution, no capability enforcement, no signing, no host behavior, no network behavior, and no runtime authority.

```
seal_runtime_handoff_report_status_present=1
runtime_handoff_report_ready=1
runtime_handoff_report_state=ready-report-only
runtime_handoff_report_handoff_performed=0
runtime_handoff_report_runtime_authority_granted=0
```

The Latticra Seal status rollup status record makes the existing metadata-only status rollup implementation visible from public entry points while preserving no runtime execution, no effect execution, no capability enforcement, no cryptographic verification, no verified receipt authority, no signing, no host behavior, no network behavior, and no runtime authority.

The Latticra Seal status rollup predecessor status alignment ties that metadata-only status rollup record to the guarded runtime handoff status predecessor while preserving no runtime execution, no runtime authority, no effect execution, no capability enforcement, no cryptographic verification, no verified receipt authority, no public-key byte verification, no key material loading, no private-key handling, no key generation, no hardware-key use, no trust-store behavior, no revocation lookup, no signing, no signature verification, no signer invocation behavior, no signer process execution, no object sealing, no policy persistence, no host behavior, no network behavior, and no production enforcement claim.

Current status rollup predecessor status fields:

```
seal_runtime_handoff_status_present=1

```

The Latticra Seal agentic automation security public-entrypoint alignment makes the existing report-only agentic automation security metadata, status/index alignment, and deterministic report surface visible from public entry points while preserving no runtime execution, no effect execution, no capability enforcement, no cryptographic verification, no verified receipt authority, no signing, no host behavior, no network behavior, no MCP behavior, no AI agent execution, no model execution, no tool execution, no shell execution, and no runtime authority.

The Latticra Seal agentic automation security predecessor status alignment ties that report-only automation status record to the guarded status rollup status predecessor while preserving no MCP behavior, no AI-agent execution, no model execution, no tool execution, no shell execution, no runtime execution, no runtime authority, no effect execution, no capability enforcement, no cryptographic verification, no verified receipt authority, no public-key byte verification, no key material loading, no private-key handling, no object sealing, no policy persistence, no host behavior, no network behavior, and no production enforcement claim.

Current agentic automation security predecessor status fields:

```
seal_status_rollup_status_present=1

```

The Latticra Seal README status row alignment keeps the compact README Seal row and Seal current-posture summary aligned with the current public status checkpoint while preserving no runtime execution, no effect execution, no capability enforcement, no cryptographic verification, no signing, no host behavior, no network behavior, no MCP behavior, no AI agent execution, no model execution, no tool execution, no shell execution, no production enforcement, no public-readiness promotion, no security-hardening implementation, and no runtime authority.

Alignment record:

```
docs/status/SEAL_README_STATUS_ROW_ALIGNMENT.md
seal_readme_status_row_alignment_present=1
```

The defensive threat model validation refinement records the current evidence-mapping, external-source checkpoint, manual-review requirement, and next-gap triage while preserving no security controls, no runtime execution, no effect execution, no capability enforcement, no cryptographic verification, no signing, no host behavior, no network behavior, no MCP behavior, no AI agent execution, no model execution, no tool execution, no shell execution, no production protection claim, and no runtime authority.

The project notes are now aligned across current direction, upcoming work, and project-notes index surfaces.

The current status and announcement consistency review confirms the public status and announcement surfaces now point to the same next review lane.

The completion percentage review conservatively updates planning estimates after the recent report, diagnostic, audit, README, foundation-index, project-notes, and status-consistency slices.

The completion estimate review after runtime-boundary abuse-case fixtures keeps the runtime-boundary fixture-slice estimate decision unchanged because the latest fixture slice improves denied-case evidence without changing capability posture, implementation behavior, public readiness, security hardening, product readiness, or runtime authority.

The completion estimate review README/status alignment makes the latest hold review visible from README and status entry points without changing capability posture, implementation behavior, public readiness, security hardening, product readiness, completion estimates, or runtime authority.

Current estimate table source alignment records that the rough completion estimate table below is the live reader-facing estimate source. The current estimate mathematical rebase records the live table as a weighted planning estimate after recent guarded Seal, Ubuntu, macOS, Nadia, Lat/LIR, kernel lifecycle, and public-entry alignment work. Dated review records remain slice-specific evidence records and may preserve the estimate snapshot that applied when that review was written.

Alignment records:

```
docs/status/CURRENT_ESTIMATE_TABLE_SOURCE_ALIGNMENT.md
docs/status/CURRENT_ESTIMATE_MATHEMATICAL_REBASE_2026_05_26.md
current_estimate_table_source_alignment_present=1
current_estimate_mathematical_rebase_present=1
source_alignment_estimate_changed=0
mathematical_rebase_estimate_changed=1
estimate_adjustment_required=0
docs/status/COMPLETION_ESTIMATE_REVIEW_README_STATUS_ALIGNMENT.md
```

The strategy estimate review records the current planning estimate posture in the strategy layer while preserving the original dated strategy record as historical context.

Direction checkpoint

```
C is the metal.
C++ is the disciplined structure.
Latticra is the contract.
```

The C/C++ foundation direction is guarded as an active language strategy. It means C owns the secure substrate, constrained C++ owns governed policy/validator/effect-gate/audit layers, and Lat / Latticra Language remains the contract/declaration layer.

Rough completion estimates

These percentages are planning estimates only.

Area	Estimated completion
Overall Latticra system	45%
Latticra Seal / local evidence layer	39%
Latticra Panel / local control surface	31%
Nadia offline AI foundation	75%
L-UI parser / AST / string foundation	87%
Foundation documents and contracts	94%
Public documentation posture	91%
Strategy/status/funding framework	63%
Lat / Latticra Programming Language	27%
LIR / Intermediate Representation	24%
C/C++ foundation direction	22%
Constrained C++ authority layer	5%
Nucleus real task execution	12%
Runtime / operating-system-universe direction	26%
Security-hardening implementation	10%
Public product readiness	10%

These percentages are planning estimates only. They are not release promises, production-readiness metrics, security guarantees, Fedora approval claims, Debian archive claims, FreeBSD ports-tree claims, OpenBSD ports-tree claims, runtime-enforcement claims, or operating-system completeness claims.

Current implemented evidence areas

Implemented or guarded areas include:

Current non-claims

Latticra does not currently provide:

- a kernel;
- a bootable image;
- a production or daily-driver installer;
- a production language runtime;
- effect-performing runtime behavior;
- command execution;
- unrestricted C++ authority;
- effect-performing implemented C++ authority layer;
- effect-performing Nucleus task execution;
- interactive L-UI rendering;

- terminal-control L-UI rendering;
- LIR execution;
- Lat execution;
- Lat compiler;
- Lat interpreter;
- live movement;
- operating-system replacement.

Current mission alignment

Latticra is being built toward a defensive, auditable, open systems architecture.

The long-term goal is to make unsafe behavior harder to hide and easier to inspect through contract-driven source handling, explicit effects, deterministic diagnostics, operator-visible state, constrained substrate behavior, governed authority layers, deterministic rendering surfaces, denied-by-default task boundaries, Nucleus task report refinement, Nucleus task no-effect report alignment, Nucleus task report-only execution refinement, explicit runtime boundaries, runtime boundary domain matrix refinement, runtime boundary domain matrix report integration, Lat semantic validation, Lat semantic diagnostics refinement, Lat grammar report metadata integration, Lat grammar line-comment metadata refinement, Lat grammar unsupported block-comment rejection refinement, Lat model normalization, Lat model report declaration metadata integration, Lat model report clause metadata integration, Lat-to-LIR declaration metadata refinement, Lat-to-LIR metadata lowering, Lat-to-LIR diagnostic refinement, Lat-to-LIR diagnostic declaration metadata integration, LIR report refinement, Lat pipeline reporting, Lat pipeline lowering diagnostic integration, Lat pipeline diagnostic declaration metadata integration, Lat pipeline diagnostic clause metadata integration, Lat pipeline report declaration metadata integration, Lat pipeline report clause metadata integration, Lat pipeline comment metadata integration, Lat pipeline diagnostic comment metadata integration, Lat parse-failure comment evidence propagation, Lat pipeline failure span evidence propagation, Lat pipeline parse-error evidence propagation, Lat pipeline semantic-error evidence propagation, Lat pipeline downstream stage-error evidence propagation, Lat pipeline stage-summary evidence propagation, Lat pipeline module/count evidence propagation, Lat pipeline first-declaration evidence propagation, Lat pipeline first-clause evidence propagation, Lat LIR edge-kind evidence propagation, Lat LIR no-effect evidence propagation, Lat LIR module-summary evidence propagation, Lat LIR source-span evidence propagation, Lat LIR node-kind evidence propagation, Lat LIR first-node evidence propagation, Lat LIR first-node span evidence propagation, Lat LIR first transition-node evidence propagation, Lat LIR first transition-node span evidence propagation, Lat LIR first-edge evidence propagation, Lat LIR first-edge span evidence propagation, Lat LIR first transition-source edge evidence propagation, Lat LIR first transition-source edge endpoint evidence propagation, Lat LIR first transition-source edge span evidence propagation, Runtime boundary Lat pipeline comment evidence integration, Lat pipeline report refinement, Lat pipeline diagnostic integration refinement, Lat pipeline diagnostic main test audit, Lat-specific LIR refinement, runtime boundary evidence reporting, runtime boundary report refinement, and runtime boundary policy matrix refinement.

This is a mission direction, not a current security guarantee.

Latest completed review slice:

```
Completion estimate review README/status alignment
```

Current completion estimate review fields:

```
current_estimate_table_source_alignment_present=1
current_estimate_mathematical_rebase_present=1
completion_estimate_review_readme_status_alignment_present=1
completion_estimate_after_runtime_boundary_abuse_case_fixtures_present=1
source_alignment_estimate_changed=0
mathematical_rebase_estimate_changed=1
runtime_boundary_abuse_case_fixture_expansion_present=1
runtime_boundary_abuse_case_fixture_count=8
source_alignment_estimate_changed=0
runtime_execution_added=0
effect_execution_added=0
capability_enforcement_added=0
security_hardening_changed=0
public_readiness_changed=0
estimate_adjustment_required=0
runtime_authority_granted=0
completion_estimate_review_required=0
```

Recommended next work:

```
Continue small guarded report/status alignment only when drift appears
```

Completion estimate review only if capability posture changes remains the estimate rule after this non-change review.

After that:

```
Runtime behavior expansion only after separate contract, plan, tests, and explicit non-claim
review
```

Update rule

Update this file when major milestones merge, especially when completion estimates or next priorities change.

docs/status/README.md

Source title: Latticra Status Index

Lines: 1428 | Words: 7667 | SHA-256: a88ab1fd29fd9134628bce7457f11bc8271348da769a4490235b744da8bac6ba

Latticra Status Index

Status: active status index Last updated: 2026-05-26 Scope: public status, milestone estimates, announcements, and completion percentages.

For reader-facing documentation navigation, start with ../README.md. This file remains the detailed status index.

Purpose

This folder records public-facing Latticra status information.

Status records should separate:

```
current evidence
rough completion estimates
public announcements
future ambition
non-claims
```

Current documents

- CURRENT_STATUS.md — current project status, completion estimates, and next priorities.

- CURRENT_ESTIMATE_REFRESH_2026_05_24.md - current planning-estimate refresh after Panel, Seal, documentation, and local evidence work.
- CURRENT_ESTIMATE_TABLE_SOURCE_ALIGNMENT.md - current public estimate table source alignment for README, root status, detailed status, foundation index, and project notes.
- CURRENT_ESTIMATE_MATHEMATICAL_REBASE_2026_05_26.md - current mathematical planning-estimate rebase after recent guarded status, packaging, macOS, Nadia, Lat/LIR, and public-entry alignment slices.
- HIGH_ASSURANCE_SECURITY_BASELINE_STATUS.md - High-assurance security baseline status for official-source review requirements before runtime execution, effect execution, host behavior, network behavior, cryptographic enforcement, compliance claims, certification claims, production protection claims, or runtime authority.
- CYBER_INCIDENT_REPORTING_RESPONSE_BASELINE_STATUS.md - Cyber incident reporting and response baseline status for vulnerability reports, suspected compromise triage, reporting paths, evidence preservation, communications routing, and incident-response non-claims. Field: cyber_incident_reporting_response_baseline_present=1.
- VULNERABILITY_MANAGEMENT_RELEASE_GATE_BASELINE_STATUS.md - Vulnerability management release gate baseline status for CISA KEV review, NVD/CVE review, disclosure handling, release blocking, and no product-security claims. Field: vulnerability_management_release_gate_baseline_present=1.
- CRYPTOGRAPHIC_ASSURANCE_KEY_MANAGEMENT_BASELINE_STATUS.md - Cryptographic assurance and key-management baseline status for FIPS/CMVP claim gates, algorithm inventory, key lifecycle, randomness, post-quantum planning, and no production crypto claims. Field: cryptographic_assurance_key_management_baseline_present=1.
- IDENTITY_CREDENTIAL_ACCESS_MANAGEMENT_BASELINE_STATUS.md - Identity, credential, and access management baseline status for privileged access, phishing-resistant MFA planning, account lifecycle, service identity, identity logging, and no hosted identity/access claims. Field: identity_credential_access_management_baseline_present=1.
- SECURITY_LOGGING_MONITORING_BASELINE_STATUS.md - Security logging, monitoring, and detection baseline status for event source inventory, audit event selection, runtime-authority decision logs, log redaction, retention, detection triage, incident handoff, and monitoring non-claims. Field: security_logging_monitoring_baseline_present=1.
- BACKUP_RECOVERY_RESILIENCE_BASELINE_STATUS.md - Backup, recovery, and cyber resilience baseline status for backup scope, offline backup posture, restore testing, recovery prioritization, rollback planning, recovery communications, and recovery non-claims. Field: backup_recovery_resilience_baseline_present=1.
- SECURE_CONFIGURATION_CHANGE_MANAGEMENT_BASELINE_STATUS.md - Secure configuration and change management baseline status for configuration inventories, secure baselines, approved change records, rollback evidence, drift detection, exception ownership, and configuration non-claims. Field: secure_configuration_change_management_baseline_present=1.
- SUPPLY_CHAIN_SECURITY_BASELINE_STATUS.md - Supply-chain security baseline status for repository, CI, dependency, package, installer, artifact, SBOM, release, and update-lane posture before release publishing, signing authority, production installer claims, compliance claims, or certification claims.
- ZERO_TRUST_RUNTIME_AUTHORITY_BASELINE_STATUS.md - zero-trust runtime authority baseline status for future runtime, tool, host I/O, network, server/MCP, update,

recovery, boot, hardware, agentic automation, and authority-bearing request paths.

- MEMORY_SAFETY_ROADMAP_STATUS.md - Memory-safety roadmap status for component inventory, restricted C/C++ profile requirements, fuzzing prerequisites, and no current production protection claims.
- LATTICRA_CONSOLE_FOUNDATION_STATUS.md - Latticra Console foundation status for the LC C report surface, standalone dry-run/local installer presets, Panel installability, metadata-only standalone/host/OS/VM contracts, receipt payload artifact draft, receipt payload artifact review gate, receipt payload artifact review receipt contract, receipt payload artifact review receipt draft contract, receipt payload materialization plan, and no-effect authority baseline.
- LATTICRA_SEAL_FOUNDATION_STATUS.md - Latticra Seal foundation status for the first Seal contract and implementation plan.
- SEAL_PRODUCT_SPINE_STATUS.md - Latticra Seal product spine status for the report-only path toward future verify, decide, handoff, and enforcement modes without current authority expansion.
- LATTICRA_NO_EFFECT_CLI_RPM_SPEC_UPDATE_STATUS.md - Latticra no-effect CLI RPM spec update status for adding the CLI payload to the local Fedora RPM spec.
- LATTICRA_PANEL_LOCAL_INSTALL_EVIDENCE_STATUS.md - Latticra Panel local install evidence status for the Fedora Workstation user-local install verification transcript.
- LATTICRA_PANEL_LOCAL_INSTALL_PUBLIC_ENTRYPOINT_ALIGNMENT.md - Latticra Panel local install public-entrypoint alignment after the Fedora Workstation user-local install evidence milestone.
- LATTICRA_PANEL_SIGNED_UPDATER_DELIVERY_GATE_STATUS.md - Latticra Panel closed signed updater delivery gate status for future update delivery work without network fetch, remote repository trust, or signed update apply authority.
- LATTICRA_PANEL_SIGNED_UPDATER_DENIAL_TRANSCRIPT_STATUS.md - Latticra Panel no-effect signed updater denial transcript status for the closed signed-updater delivery gate.
- LATTICRA_PANEL_SIGNED_UPDATER_MANIFEST_FIXTURE_CONTRACT_STATUS.md - Latticra Panel local no-effect signed updater manifest fixture contract status for future validation work without trusted update delivery or apply authority.
- LATTICRA_PANEL_SIGNED_UPDATER_MANIFEST_FIXTURE_VALIDATION_STATUS.md - Latticra Panel local no-effect signed updater manifest fixture validation status for shape and closed-authority field checks without trusted update delivery or apply authority.
- LATTICRA_PANEL_SIGNED_UPDATER_STATE_FIXTURE_CONTRACT_STATUS.md - Latticra Panel local no-effect signed updater state fixture contract status for future state naming without transition execution, staging, activation, rollback execution, receipt writes, or host mutation.
- LATTICRA_PANEL_SIGNED_UPDATER_STATE_FIXTURE_VALIDATION_STATUS.md - Latticra Panel local no-effect signed updater state fixture validation status for shape, state catalog, blocked-state posture, and closed transition fields without transition execution, staging, activation, rollback execution, receipt writes, or host mutation.
- LATTICRA_PANEL_SIGNED_UPDATER_STATE_TRANSITION_DENIAL_TRANSCRIPT_STATUS.md - Latticra Panel no-effect signed updater state transition denial transcript status for blocked state-transition evidence without transition execution, staging, activation, rollback execution, receipt writes, transcript file writes, or host mutation.
- LATTICRA_PANEL_SIGNED_UPDATER_STATE_TRANSITION_DENIAL_REVIEW_STATUS.md - Latticra Panel no-effect signed updater state transition denial review status for upholding the blocked state transition without transition execution, staging, activation, rollback

execution, receipt writes, review file writes, or host mutation.

- LATTICRA_PANEL_UI_DESIGN_CHECKPOINT.md - Latticra Panel UI design checkpoint for the current product surface review.
- MACOS_INTEGRATION_TRANSFERABILITY_STATUS.md - macOS integration transferability status for adapting current no-effect, receipt-first, user-local Latticra surfaces into a future macOS lane.
- MACOS_BUILD_PLATFORM_PROBE_STATUS.md - macOS build/platform probe status for no-effect toolchain, architecture, Panel-readiness, and C-test-readiness reporting.
- MACOS_DRY_RUN_PLAN_ADAPTER_STATUS.md - macOS dry-run plan adapter status for rendering user-local Application Support, app bundle, CLI-wrapper, receipt, and verification intent without writing artifacts.
- MACOS_USER_LOCAL_APP_BUNDLE_CONTRACT_STATUS.md - macOS user-local app bundle contract status for exact files, managed markers, reset/uninstall behavior, and verification transcript requirements.
- MACOS_USER_LOCAL_APP_BUNDLE_IMPLEMENTATION_PLAN_STATUS.md - macOS user-local app bundle implementation plan status for no-effect writer phases, failure behavior, reset/uninstall sequencing, and guard tests.
- MACOS_APP_BUNDLE_WRITER_DRY_RUN_STATUS.md - macOS app bundle writer dry-run status for phase-report output, unsafe-path validation, marker inspection, and disabled commit behavior.
- MACOS_APP_BUNDLE_WRITER_ALIGNMENT_STATUS.md - macOS app bundle writer alignment status separating the no-effect dry-run writer prototype from any future commit-capable writer.
- MACOS_LOCAL_CANDIDATE_ASSET_PROBE_STATUS.md - macOS local candidate asset probe status for caller-supplied Panel executable and icon readiness checks without build, copy, signing, notarization, or writes.
- MACOS_DRY_RUN_WRITER_CANDIDATE_INTEGRATION_STATUS.md - macOS dry-run writer candidate integration status for proving accepted local candidates can move the writer dry-run to its future commit-gate decision without writes.
- MACOS_COMMIT_GATE_CONTRACT_STATUS.md - macOS commit gate contract status for keeping future user-local managed app bundle writes closed until implementation and verification evidence exist.
- MACOS_VERIFICATION_TRANSCRIPT_CONTRACT_STATUS.md - macOS verification transcript contract status for exact post-write evidence required before any user-local install can be called verified.
- MACOS_RESET_UNINSTALL_DRY_RUN_CONTRACT_STATUS.md - macOS reset/uninstall dry-run contract status for managed-target removal order and preservation rules without deleting files.
- MACOS_RESET_UNINSTALL_LIVE_TARGET_CLASSIFIER_STATUS.md - macOS reset/uninstall live-target classifier status for read-only managed, unmanaged, and absent target reports.
- MACOS_RESET_UNINSTALL_DRY_RUN_PLANNER_STATUS.md - macOS reset/uninstall dry-run planner status for converting live target classifications into an ordered no-effect transcript.
- MACOS_RESET_UNINSTALL_ABSENCE_REPORT_CONTRACT_STATUS.md - macOS reset/uninstall absence-report contract status for future post-removal verification evidence.

- MACOS_RESET_UNINSTALL_RECEIPT_SCHEMA_CONTRACT_STATUS.md - macOS reset/uninstall receipt-schema contract status for future reset/uninstall receipt fields and path constraints.
- MACOS_RESET_UNINSTALL_IMPLEMENTATION_GATE_CONTRACT_STATUS.md - macOS reset/uninstall implementation-gate contract status for keeping live reset/uninstall execution closed until required evidence exists.
- MACOS_RESET_UNINSTALL_OPERATOR_INTENT_CONTRACT_STATUS.md - macOS reset/uninstall operator-intent contract status for future explicit live reset/uninstall approval evidence.
- MACOS_RESET_UNINSTALL_EFFECT_AUTHORIZATION_CONTRACT_STATUS.md - macOS reset/uninstall effect-authorization contract status for keeping live reset/uninstall effects gated by explicit authorization evidence.
- MACOS_RESET_UNINSTALL_EVIDENCE_BUNDLE_CONTRACT_STATUS.md - macOS reset/uninstall evidence-bundle contract status for binding required reset/uninstall evidence before any live implementation can be considered.
- MACOS_RESET_UNINSTALL_LIVE_IMPLEMENTATION_PLAN_CONTRACT_STATUS.md - macOS reset/uninstall live-implementation plan contract status for mapping future effect-authorized phases while deletion remains disabled.
- MACOS_RESET_UNINSTALL_LIVE_EXECUTION_PREFLIGHT_CONTRACT_STATUS.md - macOS reset/uninstall live-execution preflight contract status for keeping live deletion blocked until evidence bundle, authorization, implementation gate, and operator intent requirements are satisfied.
- MACOS_RESET_UNINSTALL_LIVE_DENIAL_TRANSCRIPT_CONTRACT_STATUS.md - macOS reset/uninstall live-denial transcript contract status for recording failed live-execution preflight decisions without persistent writes or deletion.
- MACOS_RESET_UNINSTALL_LIVE_RUNNER_INTERFACE_CONTRACT_STATUS.md - macOS reset/uninstall live-runner interface contract status for keeping future runner dispatch denied until live-execution preflight evidence passes.
- MACOS_RESET_UNINSTALL_LIVE_RUNNER_NOOP_PROTOTYPE_CONTRACT_STATUS.md - macOS reset/uninstall live-runner no-op prototype contract status for exercising the denied interface path without dispatch or deletion.
- MACOS_RESET_UNINSTALL_LIVE_RUNNER_DENIED_DISPATCH_TRANSCRIPT_CONTRACT_STATUS.md - macOS reset/uninstall live-runner denied-dispatch transcript contract status for recording the denied no-op runner path without dispatch, deletion, writes, or authority.
- MACOS_RESET_UNINSTALL_LIVE_RUNNER_DENIED_DISPATCH_REVIEW_CONTRACT_STATUS.md - macOS reset/uninstall live-runner denied-dispatch review contract status for reviewing the denied no-op runner path while preserving zero dispatch and zero deletion.
- MACOS_RESET_UNINSTALL_LIVE_RUNNER_ACCEPTANCE_GATE_CONTRACT_STATUS.md - macOS reset/uninstall live-runner acceptance-gate contract status for keeping dispatch closed until preflight, evidence, authorization, operator intent, and implementation evidence are present.
- MACOS_RESET_UNINSTALL_LIVE_RUNNER_ACCEPTANCE_DENIAL_TRANSCRIPT_CONTRACT_STATUS.md - macOS reset/uninstall live-runner acceptance-denial transcript contract status for recording the closed acceptance gate without dispatch, deletion, receipts, absence reports, host mutation, network access, root authority, or runtime authority.
- MACOS_RESET_UNINSTALL_LIVE_RUNNER_ACCEPTANCE_DENIAL_REVIEW_CONTRACT_STATUS.md - macOS reset/uninstall live-runner acceptance-denial review contract status for reviewing the

closed acceptance gate while preserving zero dispatch, deletion, receipts, mutation, network, root, and runtime authority.

- MACOS_RESET_UNINSTALL_LIVE_RUNNER_ACCEPTANCE_DENIAL_DISPOSITION_CONTRACT_STATUS.md - macOS reset/uninstall live-runner acceptance-denial disposition contract status for recording the reviewed closed-gate denial without dispatch, deletion, receipts, mutation, network, root, or runtime authority.
- MACOS_RESET_UNINSTALL_LIVE_RUNNER_ACCEPTANCE_DENIAL_DISPOSITION_REVIEW_CONTRACT_STATUS.md - macOS reset/uninstall live-runner acceptance-denial disposition review contract status for reviewing the no-effect disposition while preserving zero dispatch, deletion, receipts, mutation, network, root, runtime authority, disposition application, and runner release.
- MACOS_RESET_UNINSTALL_LIVE_RUNNER_ACCEPTANCE_DENIAL_DISPOSITION_CLOSEOUT_CONTRACT_STATUS.md - macOS reset/uninstall live-runner acceptance-denial disposition closeout contract status for closing the no-effect disposition while preserving zero dispatch, deletion, receipts, mutation, network, root, runtime authority, runner release, and audit opening.
- MACOS_RESET_UNINSTALL_LIVE_RUNNER_ACCEPTANCE_DENIAL_DISPOSITION_CLOSEOUT_AUDIT_CONTRACT_STATUS.md - macOS reset/uninstall live-runner acceptance-denial disposition closeout audit contract status for auditing the no-effect closeout while preserving zero dispatch, deletion, receipts, absence reports, mutation, network, root, runtime authority, audit review opening, and implementation claims.
- MACOS_RESET_UNINSTALL_LIVE_RUNNER_ACCEPTANCE_DENIAL_DISPOSITION_CLOSEOUT_AUDIT_REVIEW_CONTRACT_STATUS.md - macOS reset/uninstall live-runner acceptance-denial disposition closeout audit review contract status for reviewing the no-effect closeout audit while preserving zero dispatch, deletion, receipts, absence reports, mutation, network, root, runtime authority, next disposition, and implementation claims.
- MACOS_RESET_UNINSTALL_LIVE_RUNNER_ACCEPTANCE_DENIAL_DISPOSITION_CLOSEOUT_AUDIT_REVIEW_DISPOSITION_CONTRACT_STATUS.md - macOS reset/uninstall live-runner acceptance-denial disposition closeout audit review disposition contract status for recording the reviewed no-effect closeout audit as a no-effect disposition while preserving zero dispatch, deletion, receipts, mutation, network, root, runtime authority, future review opening, and implementation claims.
- MACOS_RESET_UNINSTALL_LIVE_RUNNER_ACCEPTANCE_DENIAL_DISPOSITION_CLOSEOUT_AUDIT_REVIEW_DISPOSITION_REVIEW_CONTRACT_STATUS.md - macOS reset/uninstall live-runner acceptance-denial disposition closeout audit review disposition review contract status for reviewing the no-effect closeout audit review disposition while preserving zero dispatch, deletion, receipts, mutation, network, root, runtime authority, future closeout opening, and implementation claims.
- MACOS_README_INSTALLER_USAGE_STATUS.md - macOS README installer usage status for documenting current Mac-specific no-effect installer commands, target paths, and closed commit-gate posture.
- NADIA_OFFLINE_AI_STAGE_0_STATUS.md - Nadia offline AI Stage-0 foundation status for Panel installability, Console interoperability, and awareness principles.
- NADIA_LOCAL_CONTEXT_ENGINE_STAGE_1_STATUS.md - Nadia Stage-1 local context-engine status for no-network context-pack generation.
- NADIA_RUNTIME_PROFILE_STAGE_2_STATUS.md - Nadia Stage-2 runtime-profile status for offline model-readiness metadata before inference.
- NADIA_DEVELOPER_WORKBENCH_STAGE_3_STATUS.md - Nadia Stage-3 developer-workbench status for prompt-plan generation without prompt evaluation.

- NADIA_SYSTEMS_ENGINEERING_MODE_STAGE_4_STATUS.md - Nadia Stage-4 systems-engineering mode status for prompt-plan validation before prompt evaluation.
- NADIA_PRODUCTIVITY_LOOP_STAGE_5_STATUS.md - Nadia Stage-5 productivity-loop status for operator-reviewed local productivity ledger entries.
- NADIA_PROTECTIVE_SAFETY_BOUNDARY_STAGE_6_STATUS.md - Nadia Stage-6 protective-safety boundary status for non-sexual-use and anti-manipulation restrictions.
- NADIA_GUARDED_TOOL_AUTHORITY_STAGE_7_STATUS.md - Nadia Stage-7 guarded tool-authority status for report-only preflight after protective-safety validation.
- NADIA_PROMPT_EVALUATION_CONTRACT_STAGE_8_STATUS.md - Nadia Stage-8 prompt-evaluation contract status before prompt materialization, prompt evaluation, inference, or tool execution.
- NADIA_LOCAL_MODEL_REGISTRY_CONTRACT_STAGE_9_STATUS.md - Nadia Stage-9 local model-registry contract status before model selection, model installation, prompt evaluation, inference, or tool execution.
- NADIA_INFERENCE_READINESS_CONTRACT_STAGE_10_STATUS.md - Nadia Stage-10 inference-readiness contract status before runtime invocation, model loading, prompt evaluation, inference, or tool execution.
- NADIA_RUNTIME_INVOCATION_CONTRACT_STAGE_11_STATUS.md - Nadia Stage-11 runtime-invocation contract status before runtime process spawning, model session creation, model loading, token generation, inference, or tool execution.
- NADIA_MODEL_LOAD_CONTRACT_STAGE_12_STATUS.md - Nadia Stage-12 model-load contract status before model file opening, weight mapping, weight loading, token generation, inference, or tool execution.
- NADIA_PROMPT_RECEIPT_CONTRACT_STAGE_13_STATUS.md - Nadia Stage-13 prompt-receipt contract status before prompt source opening, prompt text receipt, prompt materialization, prompt evaluation, token generation, inference, or tool execution.
- NADIA_PROMPT_MATERIALIZATION_CONTRACT_STAGE_14_STATUS.md - Nadia Stage-14 prompt-materialization contract status before prompt buffer allocation, prompt text materialization, prompt tokenization, prompt evaluation, token generation, inference, or tool execution.
- NADIA_AWARENESS_DIALOGUE_CONTRACT_STAGE_15_STATUS.md - Nadia Stage-15 awareness-dialogue contract status for Nadia Initiative Q&A scope before dialogue generation, prompt evaluation, token generation, inference, or tool execution.
- NADIA_PROMPT_EVALUATION_HANDOFF_CONTRACT_STAGE_16_STATUS.md - Nadia Stage-16 prompt-evaluation handoff contract status before prompt tokenization, prompt evaluation, dialogue generation, token generation, inference, or tool execution.
- NADIA_TOKENIZATION_BOUNDARY_CONTRACT_STAGE_17_STATUS.md - Nadia Stage-17 tokenization-boundary contract status before tokenizer file access, tokenizer vocabulary loading, prompt tokenization, prompt evaluation, token generation, inference, or tool execution.
- NADIA_TOKENIZER_SPECIFICATION_CONTRACT_STAGE_18_STATUS.md - Nadia Stage-18 tokenizer-specification contract status before tokenizer manifest loading, tokenizer file access, tokenizer vocabulary loading, prompt tokenization, prompt evaluation, token generation, inference, or tool execution.
- NADIA_TOKENIZER_MANIFEST_CONTRACT_STAGE_19_STATUS.md - Nadia Stage-19 tokenizer-manifest contract status before tokenizer manifest loading, tokenizer manifest parsing, tokenizer file access, tokenizer vocabulary loading, prompt tokenization, prompt evaluation, token generation, inference, or tool execution.

- NADIA_TOKENIZER_ARTIFACT_INVENTORY_CONTRACT_STAGE_20_STATUS.md - Nadia Stage-20 tokenizer-artifact-inventory contract status before tokenizer artifact path resolution, artifact scanning, artifact hashing, tokenizer manifest loading, tokenizer file access, tokenizer vocabulary loading, prompt tokenization, prompt evaluation, token generation, inference, or tool execution.
- NADIA_TOKENIZER_ARTIFACT_MEASUREMENT_CONTRACT_STAGE_21_STATUS.md - Nadia Stage-21 tokenizer-artifact-measurement contract status before tokenizer artifact opening, artifact reading, artifact hashing, artifact digest recording, artifact size recording, tokenizer manifest loading, tokenizer file access, tokenizer vocabulary loading, prompt tokenization, prompt evaluation, token generation, inference, or tool execution.
- NADIA_TOKENIZER_ARTIFACT_VERIFICATION_CONTRACT_STAGE_22_STATUS.md - Nadia Stage-22 tokenizer-artifact-verification contract status before tokenizer artifact opening, artifact reading, artifact hashing, artifact digest comparison, artifact size comparison, artifact verification, artifact binding, tokenizer manifest loading, tokenizer file access, tokenizer vocabulary loading, prompt tokenization, prompt evaluation, token generation, inference, or tool execution.
- NADIA_TOKENIZER_ARTIFACT_BINDING_CONTRACT_STAGE_23_STATUS.md - Nadia Stage-23 tokenizer-artifact-binding contract status before tokenizer artifact opening, artifact reading, artifact hashing, artifact verification, artifact binding, tokenizer runtime attachment, tokenizer manifest loading, tokenizer file access, tokenizer vocabulary loading, prompt tokenization, prompt evaluation, token generation, inference, or tool execution.
- NADIA_TOKENIZER_RUNTIME_ATTACHMENT_CONTRACT_STAGE_24_STATUS.md - Nadia Stage-24 tokenizer-runtime-attachment contract status before tokenizer artifact opening, artifact reading, artifact hashing, tokenizer artifact binding, tokenizer runtime attachment, runtime session creation, tokenizer manifest loading, tokenizer file access, tokenizer vocabulary loading, prompt tokenization, prompt evaluation, token generation, inference, or tool execution.
- NADIA_PROMPT_TOKENIZATION_CONTRACT_STAGE_25_STATUS.md - Nadia Stage-25 prompt-tokenization contract status before prompt text reading, prompt token creation, prompt token sequence recording, tokenizer runtime attachment, prompt evaluation, dialogue generation, token generation, inference, or tool execution.
- NADIA_PROMPT_TOKEN_SEQUENCE_CONTRACT_STAGE_26_STATUS.md - Nadia Stage-26 prompt-token-sequence contract status before prompt token ID recording, token order recording, token offset recording, context window assembly, prompt evaluation input creation, runtime invocation, prompt evaluation, dialogue generation, token generation, inference, or tool execution.
- NADIA_CONTEXT_WINDOW_ASSEMBLY_CONTRACT_STAGE_27_STATUS.md - Nadia Stage-27 context-window assembly contract status before context window assembly, prompt evaluation input creation, runtime invocation, prompt evaluation, dialogue generation, token generation, inference, or tool execution.
- NADIA_PROMPT_EVALUATION_INPUT_CONTRACT_STAGE_28_STATUS.md - Nadia Stage-28 prompt-evaluation-input contract status before prompt evaluation input creation, runtime invocation, prompt evaluation, dialogue generation, token generation, inference, or tool execution.
- NADIA_PROMPT_EVALUATION_RUNTIME_HANDOFF_CONTRACT_STAGE_29_STATUS.md - Nadia Stage-29 prompt-evaluation runtime handoff contract status before runtime handoff, runtime invocation, prompt evaluation, dialogue generation, token generation, inference, or tool execution.

- NADIA_PROMPT_EVALUATION_INVOCATION_CONTRACT_STAGE_30_STATUS.md - Nadia Stage-30 prompt-evaluation invocation contract status before invocation requests, runtime invocation, prompt evaluation, dialogue generation, token generation, inference, or tool execution.
- NADIA_PROMPT_EVALUATION_RESULT_CONTRACT_STAGE_31_STATUS.md - Nadia Stage-31 prompt-evaluation result contract status before result records, model-output recording, runtime invocation, prompt evaluation, dialogue generation, token generation, inference, or tool execution.
- NADIA_PROMPT_EVALUATION_RESULT_REVIEW_CONTRACT_STAGE_32_STATUS.md - Nadia Stage-32 prompt-evaluation result review contract status before result-review records, result records, model-output recording, runtime invocation, prompt evaluation, dialogue generation, token generation, inference, or tool execution.
- NADIA_PROMPT_EVALUATION_RESULT_DISPOSITION_CONTRACT_STAGE_33_STATUS.md - Nadia Stage-33 prompt-evaluation result disposition contract status before disposition records, release records, result-review records, result records, model-output recording, runtime invocation, prompt evaluation, dialogue generation, token generation, inference, or tool execution.
- NADIA_PROMPT_EVALUATION_RESULT_RELEASE_CONTRACT_STAGE_34_STATUS.md - Nadia Stage-34 prompt-evaluation result release contract status before release recording, release publication, release packaging, release receipts, model-output recording, runtime invocation, prompt evaluation, dialogue generation, token generation, inference, or tool execution.
- NADIA_PROMPT_EVALUATION_RESULT_RELEASE_RECEIPT_CONTRACT_STAGE_35_STATUS.md - Nadia Stage-35 prompt-evaluation result release receipt contract status before receipt recording, receipt signing, receipt publication, release recording, release publication, release packaging, model-output recording, runtime invocation, prompt evaluation, dialogue generation, token generation, inference, or tool execution.
- NADIA_PROMPT_EVALUATION_RESULT_RELEASE_RECEIPT_REVIEW_CONTRACT_STAGE_36_STATUS.md - Nadia Stage-36 prompt-evaluation result release receipt review contract status before review recording, review decisions, review findings, receipt recording, receipt signing, receipt publication, release recording, model-output recording, runtime invocation, prompt evaluation, dialogue generation, token generation, inference, or tool execution.
- NADIA_PROMPT_EVALUATION_RESULT_RELEASE_RECEIPT_REVIEW_DISPOSITION_CONTRACT_STAGE_37_STATUS.md - Nadia Stage-37 prompt-evaluation result release receipt review disposition contract status before disposition recording, disposition decisions, disposition findings, review recording, receipt recording, model-output recording, runtime invocation, prompt evaluation, dialogue generation, token generation, inference, or tool execution.
- NADIA_PROMPT_EVALUATION_RESULT_RELEASE_RECEIPT_REVIEW_DISPOSITION_RELEASE_CONTRACT_STAGE_38_STATUS.md - Nadia Stage-38 prompt-evaluation result release receipt review disposition release contract status before disposition-release recording, release decisions, release publication, release receipts, disposition recording, model-output recording, runtime invocation, prompt evaluation, dialogue generation, token generation, inference, or tool execution.
- NADIA_PROMPT_EVALUATION_RESULT_RELEASE_RECEIPT_REVIEW_DISPOSITION_RELEASE_RECEIPT_CONTRACT_STAGE_39_STATUS.md - Nadia Stage-39 prompt-evaluation result release receipt review disposition release receipt contract status before release-receipt recording, receipt signing, receipt publication, disposition-release recording, release publication, model-output recording, runtime invocation, prompt evaluation, dialogue generation, token generation, inference, or tool execution.

- NADIA_PROMPT_EVALUATION_RESULT_RELEASE_RECEIPT_REVIEW_DISPOSITION_RELEASE_RECEIPT_REVIEW_CONTRACT_STAGE_40_STATUS.md - Nadia Stage-40 prompt-evaluation result release receipt review disposition release receipt review contract status before review-disposition-release receipt recording, receipt emission, receipt signing, receipt publication, review recording, model-output recording, runtime invocation, prompt evaluation, dialogue generation, token generation, inference, or tool execution.
- NADIA_PROMPT_EVALUATION_RESULT_RELEASE_RECEIPT_REVIEW_DISPOSITION_RELEASE_RECEIPT_REVIEW_DISPOSITION_CONTRACT_STAGE_41_STATUS.md - Nadia Stage-41 prompt-evaluation result release receipt review disposition release receipt review disposition contract status before release-receipt-review-disposition records, review decisions, review findings, receipt signing, receipt publication, receipt packaging, model-output recording, runtime invocation, prompt evaluation, dialogue generation, token generation, inference, or tool execution.
- NADIA_PROMPT_EVALUATION_RESULT_RELEASE_RECEIPT_REVIEW_DISPOSITION_RELEASE_RECEIPT_REVIEW_DISPOSITION_RELEASE_CONTRACT_STAGE_42_STATUS.md - Nadia Stage-42 prompt-evaluation result release receipt review disposition release receipt review disposition release contract status before disposition-release recording, release decisions, release publication, release packaging, release receipt creation, disposition recording, review recording, receipt recording, model-output recording, runtime invocation, prompt evaluation, dialogue generation, token generation, inference, or tool execution.
- NADIA_PROMPT_EVALUATION_RESULT_RELEASE_RECEIPT_REVIEW_DISPOSITION_RELEASE_RECEIPT_REVIEW_DISPOSITION_RELEASE_RECEIPT_CONTRACT_STAGE_43_STATUS.md - Nadia Stage-43 prompt-evaluation result release receipt review disposition release receipt review disposition release receipt contract status before release-receipt records, receipt emission, receipt signing, receipt publication, release records, review records, model-output recording, runtime invocation, prompt evaluation, dialogue generation, token generation, inference, or tool execution.
- NADIA_PROMPT_EVALUATION_RESULT_RELEASE_RECEIPT_REVIEW_DISPOSITION_RELEASE_RECEIPT_REVIEW_DISPOSITION_RELEASE_RECEIPT_REVIEW_CONTRACT_STAGE_44_STATUS.md - Nadia Stage-44 prompt-evaluation result release receipt review disposition release receipt review disposition release receipt review contract status before release-receipt-review records, review decisions, review findings, receipt signing, receipt publication, receipt packaging, disposition recording, model-output recording, runtime invocation, prompt evaluation, dialogue generation, token generation, inference, or tool execution.
- NADIA_PROMPT_EVALUATION_RESULT_RELEASE_RECEIPT_REVIEW_DISPOSITION_RELEASE_RECEIPT_REVIEW_DISPOSITION_RELEASE_RECEIPT_REVIEW_DISPOSITION_CONTRACT_STAGE_45_STATUS.md - Nadia Stage-45 prompt-evaluation result release receipt review disposition release receipt review disposition release receipt review disposition contract status before release-receipt-review-disposition records, disposition decisions, disposition findings, receipt signing, receipt publication, receipt packaging, model-output recording, runtime invocation, prompt evaluation, dialogue generation, token generation, inference, or tool execution.
- NADIA_PROMPT_EVALUATION_RESULT_RELEASE_RECEIPT_REVIEW_DISPOSITION_RELEASE_RECEIPT_REVIEW_DISPOSITION_RELEASE_RECEIPT_REVIEW_DISPOSITION_RELEASE_CONTRACT_STAGE_46_STATUS.md - Nadia Stage-46 prompt-evaluation result release receipt review disposition release receipt review disposition release receipt review disposition release contract status before disposition-release recording, release decisions, release publication, release packaging, release receipt creation, disposition recording, review recording, receipt recording, model-output recording, runtime invocation, prompt evaluation, dialogue generation, token generation, inference, or tool execution.
- ANNOUNCEMENTS.md — public update log and announcement notes.

- ../DEFENSIVE_THREAT_MODEL_VALIDATION_REFINEMENT.md — defensive threat model validation refinement.
- ../RUNTIME_BOUNDARY_POLICY_EXPANSION_AFTER_THREAT_MODEL.md — runtime boundary policy expansion after threat-model validation.
- SEAL_README_STATUS_ROW_ALIGNMENT.md — Latticra Seal README status row alignment with the current public status checkpoint.
- SEAL_POLICY_DECISION_PUBLIC_ENTRYPOINT_ALIGNMENT.md — Latticra Seal policy decision public-entrypoint alignment.
- SEAL_POLICY_DECISION_STATUS.md — Latticra Seal policy decision status/public-entry alignment.
- SEAL_POLICY_DECISION_REPORT_SURFACE_STATUS.md — Latticra Seal policy decision report surface status.
- SEAL_SIGNED_REQUEST_STATUS.md — Latticra Seal signed request status/public-entry alignment.
- SEAL_REQUEST_FRESHNESS_STATUS.md — Latticra Seal request freshness status/public-entry alignment.
- SEAL_PARAMETER_SCHEMA_STATUS.md — Latticra Seal parameter schema status/public-entry alignment.
- SEAL_AGENTIC_AUTOMATION_SECURITY_PUBLIC_ENTRYPOINT_ALIGNMENT.md — Latticra Seal agentic automation security public-entrypoint alignment.
- SEAL_AGENTIC_AUTOMATION_SECURITY_REPORT_SURFACE_STATUS.md — Latticra Seal agentic automation security report surface status.
- SEAL_AGENTIC_AUTOMATION_SECURITY_INDEX_ALIGNMENT.md — Latticra Seal agentic automation security index alignment.
- SEAL_AGENTIC_AUTOMATION_SECURITY_STATUS.md — Latticra Seal agentic automation security metadata status.
- SEAL_PRODUCT_SPINE_STATUS.md — Latticra Seal product-spine status for the current observe, verify, decide, handoff, and future-closed enforce posture.
- ../LATTICRA_SEAL_OPERATOR_RECEIPT_REPORT_CONTRACT.md — Latticra Seal operator receipt report contract.
- ../LATTICRA_SEAL_OPERATOR_RECEIPT_REPORT_IMPLEMENTATION_PLAN.md — Latticra Seal operator receipt report implementation plan.
- ../LATTICRA_SEAL_OPERATOR_RECEIPT_REPORT_IMPLEMENTATION.md — Latticra Seal operator receipt report implementation.
- ../LATTICRA_SEAL_OPERATOR_RECEIPT_REPORT_SURFACE.md — Latticra Seal operator receipt report surface.
- SEAL_OPERATOR_RECEIPT_REPORT_STATUS.md — Latticra Seal operator receipt report status.
- ../LATTICRA_SEAL_LOCAL_CAPABILITY_REGISTRY_SCHEMA_CONTRACT.md — Latticra Seal local capability registry schema contract.
- ../LATTICRA_SEAL_LOCAL_CAPABILITY_REGISTRY_SCHEMA_IMPLEMENTATION_PLAN.md — Latticra Seal local capability registry schema implementation plan.
- ../LATTICRA_SEAL_LOCAL_CAPABILITY_REGISTRY_SCHEMA_IMPLEMENTATION.md — Latticra Seal local capability registry schema implementation.

- SEAL_STATUS_ROLLUP_STATUS.md — Latticra Seal status rollup metadata status and public-entry checkpoint.
- SEAL_RUNTIME_HANDOFF_STATUS.md — Latticra Seal runtime handoff metadata status and public-entry checkpoint.
- SEAL_EFFECT_DECISION_STATUS.md — Latticra Seal effect decision metadata status and public-entry checkpoint.
- SEAL_CAPABILITY_GATE_STATUS.md — Latticra Seal capability gate metadata status and public-entry checkpoint.
- SEAL_CAPABILITY_METADATA_REPORT_SURFACE_STATUS.md — Latticra Seal capability metadata report surface status for the deterministic local report-only capability metadata fixture.
- SEAL_VERIFICATION_RECEIPT_STATUS.md — Latticra Seal verification receipt metadata status and public-entry checkpoint.
- SEAL_CRYPTO_VERIFY_BACKEND_STATUS.md — Latticra Seal crypto verify backend metadata status and public-entry checkpoint.
- SEAL_ED25519_VERIFY_STATUS.md — Latticra Seal Ed25519 verify-only result status and public-entry checkpoint.
- SEAL_CRYPTO_GRADUATION_GATE_STATUS.md — Latticra Seal authority-neutral crypto graduation gate status for standards-gated local verification and receipt promotion. Field: seal_crypto_graduation_gate_present=1.
- SEAL_VERIFIED_RECEIPT_PROMOTION_STATUS.md — Latticra Seal verified receipt promotion metadata status and public-entry checkpoint.
- SEAL_CRYPTO_GRADUATION_GATE_STATUS.md — Latticra Seal crypto graduation gate status for authority-neutral Ed25519 verify-only and verified receipt promotion metadata without signing, key handling, network lookup, production crypto claims, capability enforcement, effect execution, host behavior, or runtime authority.
- SEAL_VERIFIED_CAPABILITY_GATE_STATUS.md — Latticra Seal verified capability gate metadata status and crypto-graduation-gated public-entry checkpoint.
- SEAL_VERIFIED_EFFECT_DECISION_STATUS.md — Latticra Seal verified effect decision metadata status and public-entry checkpoint.
- SEAL_RUNTIME_HANDOFF_EVALUATION_STATUS.md — Latticra Seal runtime handoff evaluation metadata status and public-entry checkpoint.
- SEAL_RUNTIME_HANDOFF_REPORT_STATUS.md — Latticra Seal runtime handoff report metadata status and public-entry checkpoint.
- SEAL_REPORT_ENVELOPE_STATUS.md — Latticra Seal sealed report-envelope metadata status and public-entry checkpoint.
- SEAL_VERIFICATION_POLICY_STATUS.md — Latticra Seal verification policy metadata status and public-entry checkpoint.
- SEAL_KEY_PARSING_STATUS.md — Latticra Seal key parsing metadata status and public-entry checkpoint.
- SEAL_PUBLIC_KEY_PARSING_STATUS.md — Latticra Seal public-key parsing metadata status and public-entry checkpoint.
- SEAL_KEY_MATERIAL_STATUS.md — Latticra Seal key-material metadata status and public-entry checkpoint.

- SEAL_KEY_HANDLING_STATUS.md — Latticra Seal key-handling metadata status and public-entry checkpoint.
- SEAL_SIGNING_OPERATION_STATUS.md — Latticra Seal signing operation metadata status and public-entry checkpoint.
- SEAL_SIGNER_INVOCATION_STATUS.md — Latticra Seal signer invocation metadata status and public-entry checkpoint.
- SEAL_SIGNER_HANDOFF_STATUS.md — Latticra Seal signer handoff metadata status and public-entry checkpoint.
- SEAL_SIGNING_AUTHORIZATION_STATUS.md — Latticra Seal signing authorization metadata status and public-entry checkpoint.
- SEAL_SIGNATURE_REQUEST_STATUS.md — Latticra Seal signature request metadata status and public-entry checkpoint.
- SEAL_CORE_EVIDENCE_STATUS.md — Latticra Seal core evidence status surface after the completed report-only runtime gate evidence milestone.
- SEAL_CORE_EVIDENCE_INDEX_ALIGNMENT.md — Latticra Seal core evidence index alignment after the status surface.
- SEAL_CORE_BLOCKED_CASES_STATUS.md — Latticra Seal core blocked cases status after the unknown-tool, unsigned-request, stale-request, and replayed-request fixtures.
- SEAL_CORE_EVIDENCE_PUBLIC_STATUS_UPDATE.md — Latticra Seal core evidence public status update language for the report-only runtime gate milestone.
- SEAL_CORE_EVIDENCE_PUBLIC_ENTRYPOINT_ALIGNMENT.md — Latticra Seal core evidence public-entrypoint alignment after the core evidence status surface.
- SEAL_GUARDED_ALLOWLIST_REPORT_SURFACE_STATUS.md — Latticra Seal guarded allowlist report surface status.
- SEAL_GUARDED_ALLOWLIST_STATUS_INDEX_ALIGNMENT.md — Latticra Seal guarded allowlist status-index alignment.
- SEAL_GUARDED_ALLOWLIST_PUBLIC_ENTRYPOINT_ALIGNMENT.md — Latticra Seal guarded allowlist public-entrypoint alignment.
- SEAL_RUNTIME_DRY_RUN_REPORT_SURFACE_STATUS.md — Latticra Seal runtime dry-run report surface status.
- SEAL_RUNTIME_DRY_RUN_STATUS_INDEX_ALIGNMENT.md — Latticra Seal runtime dry-run status-index alignment.
- SEAL_RUNTIME_DRY_RUN_PUBLIC_ENTRYPOINT_ALIGNMENT.md — Latticra Seal runtime dry-run public-entrypoint alignment.
- KERNEL_LIFECYCLE_EVIDENCE_STATUS.md — status alignment after the kernel IPC, VFS namespace, process table, syscall table, interrupt table, timer source, scheduler tick, run queue, context-switch, time-accounting, preemption, scheduler credit, scheduler selection, scheduler dispatch, scheduler handoff, scheduler activation, and scheduler run-entry guards plus the lifecycle report runner, subsystem summary, and rollback plan.
- FEDORA_HOST_INSTALL_PREFLIGHT_STATUS.md — status record for the no-effect Fedora host install preflight classifier.
- FEDORA_INSTALL_PREFLIGHT_SNAPSHOT_CAPTURE_STATUS.md — status record for the no-effect Fedora install preflight snapshot capture implementation.

- FEDORA_LIVE_READONLY_SNAPSHOT_ADAPTER_STATUS.md — status record for the live read-only Fedora snapshot adapter implementation.
- FEDORA_RPM_GATE_CLASSIFIER_STATUS.md — status record for the Fedora RPM gate classifier implementation.
- FEDORA_INSTALLROOT_RPM_LIFECYCLE_STATUS.md — status record for the controlled Fedora installroot RPM lifecycle lane.
- FEDORA_MANUAL_HOST_RC_CHECKLIST_STATUS.md — status record for the manual Fedora host release-candidate checklist.
- FEDORA_MANUAL_HOST_RC_DECISION_CLASSIFIER_STATUS.md — status record for the no-effect Fedora manual host RC decision classifier.
- FEDORA_DISPOSABLE_VM_EFFECT_GATE_CLASSIFIER_STATUS.md — status record for the Fedora disposable VM effect gate classifier.
- FEDORA_DISPOSABLE_VM_LOCAL_RPM_VALIDATION_STATUS.md — status record for the gated disposable Fedora VM local RPM validation lane.
- FEDORA_DISPOSABLE_VM_LOCAL_RPM_VALIDATION_EVIDENCE_STATUS.md — evidence status record for the successful disposable Fedora VM local RPM validation transcript.
- FEDORA_DISPOSABLE_VM_RPM_README_ALIGNMENT_STATUS.md — Fedora disposable VM RPM README alignment.
- FEDORA_VM_CLI_PAYLOAD_VALIDATION_STATUS.md — status record for the manually gated disposable Fedora VM CLI payload validation lane runner.
- FEDORA_VM_CLI_PAYLOAD_VALIDATION_EVIDENCE_STATUS.md — evidence status record after a disposable Fedora VM CLI payload validation transcript reached the expected validation report.
- FEDORA_VM_CLI_PAYLOAD_README_ALIGNMENT_STATUS.md — Fedora VM CLI payload README alignment.
- FEDORA_VM_CLI_PAYLOAD_VALIDATION_ANNOUNCEMENT_STATUS.md — announcement/status alignment for the disposable Fedora VM CLI payload validation milestone.
- FEDORA_VM_CLI_PAYLOAD_NEXT_VALIDATION_LANE_PLAN_STATUS.md — status record for the Fedora VM CLI payload next-validation lane plan.
- FEDORA_VM_CLI_PAYLOAD_REPEATABILITY_TRANSCRIPT_CONTRACT_STATUS.md — status record for the future second disposable Fedora VM CLI payload validation transcript contract.
- FEDORA_VM_CLI_PAYLOAD_REPEATABILITY_TRANSCRIPT_CAPTURE_TEMPLATE_STATUS.md — status record for the Fedora VM CLI payload repeatability transcript capture template.
- FEDORA_VM_CLI_PAYLOAD_REPEATABILITY_TRANSCRIPT_REVIEW_VALIDATOR_STATUS.md — status record for the Fedora VM CLI payload repeatability transcript review validator.
- FEDORA_VM_CLI_PAYLOAD_REPEATABILITY_RUNNER_PLAN_STATUS.md — status record for the manual disposable Fedora VM CLI payload repeatability runner plan.
- FEDORA_VM_CLI_PAYLOAD_REPEATABILITY_RUNNER_STATUS.md — status record for the manually gated Fedora VM CLI payload repeatability runner.
- FEDORA_VM_CLI_PAYLOAD_REPEATABILITY_EVIDENCE_REVIEW_GATE_STATUS.md — status record for the Fedora VM CLI payload repeatability evidence review gate.
- FEDORA_VM_CLI_PAYLOAD_REPEATABILITY_TRANSCRIPT_CAPTURE_TEMPLATE_STATUS.md — status record for the no-effect Fedora VM CLI payload repeatability transcript capture template.

- FEDORA_VM_CLI_PAYLOAD_REPEATABILITY_TRANSCRIPT_REVIEW_VALIDATOR_STATUS.md — status record for the no-effect Fedora VM CLI payload repeatability transcript review validator.
- FEDORA_VM_CLI_PAYLOAD_REPEATABILITY_EVIDENCE_ACCEPTANCE_CONTRACT_STATUS.md — status record for the Fedora VM CLI payload repeatability evidence acceptance contract.
- FEDORA_VM_CLI_PAYLOAD_REPEATABILITY_EVIDENCE_STATUS_TEMPLATE_STATUS.md — status record for the no-effect Fedora VM CLI payload repeatability evidence status template.
- FEDORA_VM_CLI_PAYLOAD_REPEATABILITY_EVIDENCE_STATUS_REVIEW_VALIDATOR_STATUS.md — status record for the no-effect Fedora VM CLI payload repeatability evidence status review validator.
- FEDORA_VM_CLI_PAYLOAD_REPEATABILITY_EVIDENCE_PUBLICATION_GATE_STATUS.md — status record for the Fedora VM CLI payload repeatability evidence publication gate.
- FEDORA_VM_RPM_VALIDATION_ANNOUNCEMENT_STATUS.md — announcement/status alignment for the disposable Fedora VM local RPM validation milestone.
- UBUNTU_ECOSYSTEM_INTEGRATION_STATUS.md — status record for the Ubuntu build lane, Panel apt prerequisites, and local-only deb packaging draft.
- DEBIAN_ECOSYSTEM_INTEGRATION_STATUS.md — status record for the local-only Debian deb packaging draft and static validation lane.
- FREEBSD_ECOSYSTEM_INTEGRATION_STATUS.md — status record for the local-only FreeBSD ports metadata draft and static validation lane.
- OPENBSD_ECOSYSTEM_INTEGRATION_STATUS.md — status record for the local-only OpenBSD ports metadata draft and static validation lane.
- ../DEBIAN_FREEBSD_OPENBSD_SOURCE_ARCHIVE_CONTRACT.md — source archive and checksum contract for Debian, FreeBSD, and OpenBSD package/port draft promotion blockers.
- ../DEBIAN_FREEBSD_OPENBSD_PACKAGE_INPUT_HANDOFF_LANE.md — temporary package input handoff lane for Debian, FreeBSD, and OpenBSD source and distfile staging without package builds.
- ../DEBIAN_FREEBSD_OPENBSD_PACKAGE_BUILD_GATE_CONTRACT.md — closed package-build evidence gate for Debian, FreeBSD, and OpenBSD package build commands.
- ../DEBIAN_FREEBSD_OPENBSD_PACKAGE_BUILD_ENVIRONMENT_CONTRACT.md — package-build environment contract for disposable Debian, FreeBSD, and OpenBSD validation environments without package builds.
- ../DEBIAN_FREEBSD_OPENBSD_PACKAGE_ARTIFACT_NAMING_CONTRACT.md — package artifact naming contract for future Debian, FreeBSD, and OpenBSD package files without creating artifacts.
- ../DEBIAN_FREEBSD_OPENBSD_PACKAGE_PAYLOAD_INSPECTION_CONTRACT.md — package payload inspection contract for future Debian, FreeBSD, and OpenBSD package files without inspecting artifacts.
- ../DEBIAN_FREEBSD_OPENBSD_PACKAGE_INSTALL_REMOVE_TRANSCRIPT_CONTRACT.md — package install/remove transcript contract for future disposable Debian, FreeBSD, and OpenBSD validation without installing packages.
- ../DEBIAN_FREEBSD_OPENBSD_PACKAGE_PUBLICATION_NON_CLAIM_REVIEW_CONTRACT.md — package publication non-claim review contract for local-only Debian, FreeBSD, and OpenBSD validation without publishing packages.
- ../DEBIAN_FREEBSD_OPENBSD_PACKAGE_VALIDATION_PROMOTION_BLOCKER_MATRIX_CONTRACT.md — package validation promotion blocker matrix for Debian, FreeBSD, and OpenBSD local

validation evidence without accepting build evidence.

- OPENSUSE_ECOSYSTEM_INTEGRATION_STATUS.md — status record for the openSUSE compatibility lane, Panel zypper prerequisites, local-only RPM maintenance draft, rpmlint/osc availability lane, static spec lint lane, findings classification record, source archive reproducibility contract, source archive fixture lane, temporary RPM topdir handoff lane, local RPM build gate contract, local RPM build environment contract, RPM payload inspection, RPM install/remove transcript contract, and OBS publication non-claim review.
- ../OPENSUSE_LOCAL_RPM_BUILD_GATE_CONTRACT.md — closed openSUSE local RPM build evidence gate contract before any rpmbuild or osc build command can run.
- ../OPENSUSE_LOCAL_RPM_BUILD_ENVIRONMENT_CONTRACT.md — openSUSE local RPM build environment contract for disposable validation environments without rpmbuild or osc build.
- ../OPENSUSE_RPM_ARTIFACT_NAMING_CONTRACT.md — openSUSE RPM artifact naming contract for future source RPM and binary RPM files without creating artifacts.
- ../OPENSUSE_RPM_PAYLOAD_INSPECTION_CONTRACT.md — openSUSE RPM payload inspection contract for future source RPM and binary RPM files without inspecting artifacts.
- ../OPENSUSE_RPM_INSTALL_REMOVE_TRANSCRIPT_CONTRACT.md — openSUSE RPM install/remove transcript contract for future disposable package install and remove evidence without installing RPMs.
- ../OPENSUSE_OBS_PUBLICATION_NON_CLAIM_REVIEW_CONTRACT.md — openSUSE OBS publication non-claim review contract for future local package validation without OBS, submit-request, official-package, or SUSE endorsement claims.
- AUTHORITY_STATUS_ANNOUNCEMENT_REVIEW.md — no-new-announcement authority status review.
- CURRENT_ESTIMATE_TABLE_SOURCE_ALIGNMENT.md — current public estimate table source alignment across README, root status, and detailed current status.
- CURRENT_ESTIMATE_MATHEMATICAL_REBASE_2026_05_26.md — current mathematical planning-estimate rebase for the live public estimate table.
- COMPLETION_ESTIMATE_L_UI_RENDERING_REVIEW.md — completion-estimate review after the L-UI detailed report refinement.
- COMPLETION_ESTIMATE_REVIEW_README_STATUS_ALIGNMENT.md — README/status alignment for the completion-estimate review after runtime-boundary abuse-case fixtures.
- COMPLETION_ESTIMATE_REVIEW_AFTER_RUNTIME_BOUNDARY_ABUSE_CASE_FIXTURES.md — completion-estimate hold review after runtime-boundary abuse-case fixtures.
- COMPLETION_PERCENTAGE_REVIEW.md — latest completion-percentage planning review.
- CPP_AUTHORITY_EXPANSION_CONTRACT_REVIEW.md — no-expansion-contract C++ authority review.
- CPP_AUTHORITY_IMPLEMENTATION_REVIEW_STATUS.md — constrained C++ authority implementation review status.
- LANGUAGE_REPRESENTATION_REVIEW.md — language representation review before Nucleus refinement.
- L_UI_RENDERING_DETAILED_REPORT_REFINEMENT_STATUS.md — L-UI rendering detailed report refinement status.
- L_UI_RENDERING_README_STATUS_ALIGNMENT.md — L-UI rendering README/status alignment.

- NUCLEUS_REPORT_ONLY_ANNOUNCEMENT_REVIEW.md — no-new-announcement review after Nucleus report-only alignment slices.
- NUCLEUS_REPORT_ONLY_ANNOUNCEMENT_README_ALIGNMENT.md — README/project-notes alignment after the Nucleus report-only announcement review.
- NUCLEUS_TASK_NO_EFFECT_REPORT_ALIGNMENT_STATUS.md — Nucleus task no-effect report alignment status.
- NUCLEUS_TASK_README_STATUS_ALIGNMENT.md — Nucleus task README/status alignment.
- NUCLEUS_TASK_REPORT_ONLY_EXECUTION_REFINEMENT_STATUS.md — Nucleus task report-only execution refinement status.
- NUCLEUS_TASK_REPORT_ONLY_EXECUTION_README_STATUS_ALIGNMENT.md — Nucleus task report-only execution README/status alignment.
- PROJECT_NOTES_NUCLEUS_ANNOUNCEMENT_README_ALIGNMENT_STATUS_CHECK.md — project-notes Nucleus announcement README alignment status/index check.
- PROJECT_NOTES_NUCLEUS_REPORT_ONLY_ALIGNMENT_STATUS_INDEX_CHECK.md — project-notes Nucleus report-only alignment status/index check.
- PUBLIC_ENTRY_POINT_CONSISTENCY_SCAN.md — public entry-point consistency scan.
- PROJECT_NOTES_FOLLOWUP_STATUS_INDEX_CHECK.md — project-notes follow-up status/index check.
- STATUS_ANNOUNCEMENT_REVIEW.md — status announcement review.
- STATUS_ANNOUNCEMENT_CONSISTENCY_REVIEW.md — status/announcement consistency review.
- LAT_PIPELINE_DIAGNOSTIC_INTEGRATION_STATUS.md — Lat pipeline diagnostic integration status.
- LAT_PIPELINE_DIAGNOSTIC_MAIN_TEST_AUDIT_STATUS.md — Lat pipeline diagnostic main-test audit status.
- RBDM_REPORT_INTEGRATION_STATUS.md — runtime-boundary domain matrix report integration status.
- ../RUNTIME_BOUNDARY_ABUSE_CASE_FIXTURES_AFTER_POLICY_EXPANSION.md — runtime-boundary abuse-case fixture expansion after policy expansion.

Current Latticra Seal core evidence checkpoint

Current runtime boundary policy expansion checkpoint

The runtime boundary policy expansion after threat-model validation is documentation/status/guard work only.

It records:

```
runtime_boundary_policy_expansion_after_threat_model_present=1
request_family_policy_map_present=1
effect_policy_map_present=1
authority_prerequisite_map_present=1
future_gate_policy_map_present=1

runtime_handoff_report_state=ready-report-only
runtime_handoff_report_handoff_performed=0
runtime_handoff_report_runtime_authority_granted=0
```

The careful current public claim is:

```
Latticra Seal now has a report-only runtime gate path, sealed report-envelope metadata/status,
signature-request metadata/status, signing authorization metadata/status, signer
handoff/invocation/operation metadata/status, key-handling and key-material metadata/status,
public-key parsing metadata/status, a future key parsing implementation contract/plan, bounded
key parsing metadata/status for caller-provided public-key bytes, metadata-only verification
policy/status, metadata-only crypto verify backend/status, local Ed25519 verify-only
implementation/status, verified receipt promotion metadata/status, authority-neutral crypto
graduation gate/status, verified capability gate metadata/status, verified effect decision
metadata/status, runtime handoff evaluation metadata/status, runtime handoff report
metadata/status, metadata-only unverified receipt/status, metadata-only denied capability
gate/status, metadata-only denied effect decision/status, inactive metadata-only runtime
handoff/status tied to its guarded effect decision predecessor, metadata-only status
rollup/status, report-only agentic automation security metadata/status tied to its guarded
status rollup predecessor, report surface/public-entrypoint alignment, report-only parameter
schema metadata/report surface/status-public-entry alignment, report-only request freshness
metadata/report surface/status-public-entry alignment, report-only signed request
metadata/status-public-entry alignment, report-only policy decision
metadata/status/report-surface public-entry alignment, and core negative-test evidence for
AI-era tool-boundary planning.
```

The current next recommended Seal lane is:

```
Continue small guarded report/status alignment only when drift appears
```

Current Fedora VM CLI payload README alignment checkpoint

The latest Fedora VM CLI payload README alignment records:

```
fedora_vm_cli_payload_validation_status=evidence-recorded
disposable_vm_cli_validation_transcript_present=1
disposable_vm_cli_validation_completed=1
host_install_ready_for_cli_payload=1
production_installer_ready=0
fedora_distribution_ready=0
fedora_approval_claimed=0
daily_driver_install_ready=0
immutable_fedora_ready=0
```

The README wording is limited to the no-effect CLI payload validated in a disposable Fedora VM and does not claim production, Fedora distribution, immutable Fedora, daily-driver, security, recovery, update-safety, sandboxing, or OS-replacement readiness.

The current next recommended Fedora CLI payload lane is:

```
Plan the next Fedora CLI payload validation lane without widening README or announcement claims
beyond disposable Fedora VM evidence
```

Current Fedora VM CLI payload announcement checkpoint

The latest Fedora VM CLI payload announcement alignment records:

```
disposable_vm_cli_validation_completed=1
host_install_ready_for_cli_payload=1
validated_package=latticra-0.0.0-0.1.local.fc44.x86_64.rpm
validated_payload=/usr/bin/latticra
validated_payload=/usr/share/doc/latticra/README.md
evidence_level=9
```

The announcement wording is evidence-bound and does not claim production, Fedora distribution, immutable Fedora, daily-driver, security, recovery, update-safety, sandboxing, or OS-replacement readiness.

The current next recommended Fedora CLI payload lane remains:

```
Plan the next Fedora CLI payload validation lane without widening README or announcement claims
beyond disposable Fedora VM evidence
```

Current Fedora VM CLI payload next-validation plan checkpoint

The latest Fedora VM CLI payload next-validation plan records:

```
second_disposable_vm_cli_validation_completed=1
cli_payload_repeatability_evidence_present=1
host_install_ready_for_cli_payload=1
production_installer_ready=0
fedora_distribution_ready=0
fedora_approval_claimed=0
daily_driver_install_ready=0
immutable_fedora_ready=0
```

The plan is no-effect and defines repeatability evidence for a future second disposable Fedora VM CLI payload validation run. It does not add a runner, run RPM tooling, mutate a host, or widen readiness claims.

The current next recommended Fedora CLI payload lane is:

```
Add Fedora VM CLI payload repeatability transcript contract
```

Current Fedora VM CLI payload repeatability runner plan checkpoint

The latest Fedora VM CLI payload repeatability runner plan records:

```
fedora_vm_cli_payload_repeatability_transcript_contract_present=1
fedora_vm_cli_payload_repeatability_runner_plan_present=1
fedora_vm_cli_payload_repeatability_runner_present=1
repeatability_runner_manual_only=1
ci_auto_repeatability_validation_allowed=0
second_disposable_vm_cli_validation_completed=0
cli_payload_repeatability_evidence_present=0
host_install_ready_for_cli_payload=1
```

```
production_installer_ready=0
fedora_distribution_ready=0
fedora_approval_claimed=0
daily_driver_install_ready=0
immutable_fedora_ready=0
```

The plan records the manual-only repeatability runner shape for a future second disposable Fedora VM CLI payload validation run. The plan checkpoint does not run RPM tooling, mutate a host, or widen readiness claims.

The current next recommended Fedora CLI payload lane is:

```
Capture reviewed Fedora VM CLI payload repeatability transcript evidence
```

Current Fedora VM CLI payload repeatability runner checkpoint

The latest Fedora VM CLI payload repeatability runner status records:

```
fedora_vm_cli_payload_repeatability_transcript_contract_present=1
fedora_vm_cli_payload_repeatability_runner_plan_present=1
fedora_vm_cli_payload_repeatability_runner_present=1
repeatability_runner_manual_only=1
ci_auto_repeatability_validation_allowed=0
second_disposable_vm_cli_validation_completed=0
cli_payload_repeatability_evidence_present=0
host_install_ready_for_cli_payload=1
production_installer_ready=0
fedora_distribution_ready=0
fedora_approval_claimed=0
daily_driver_install_ready=0
immutable_fedora_ready=0
```

The runner is present but manually gated. Normal CI only runs the static repeatability runner guard and does not execute RPM build, install, or removal commands.

The current next recommended Fedora CLI payload lane is:

```
Capture reviewed Fedora VM CLI payload repeatability transcript evidence
```

Current Fedora VM CLI payload repeatability transcript capture template checkpoint

The latest Fedora VM CLI payload repeatability transcript capture template status records:

```
fedora_vm_cli_payload_repeatability_transcript_contract_present=1
fedora_vm_cli_payload_repeatability_runner_present=1
fedora_vm_cli_payload_repeatability_evidence_review_gate_present=1
fedora_vm_cli_payload_repeatability_transcript_capture_template_present=1
fedora_vm_cli_payload_repeatability_transcript_review_validator_present=1
repeatability_transcript_template_mode=no-effect-template
repeatability_transcript_template_complete=0
repeatability_transcript_candidate_valid=0
repeatability_transcript_attached=0
repeatability_transcript_reviewed=0
repeatability_transcript_accepted=0
second_disposable_vm_cli_validation_completed=0
cli_payload_repeatability_evidence_present=0
host_install_ready_for_cli_payload=1
production_installer_ready=0
fedora_distribution_ready=0
fedora_approval_claimed=0
daily_driver_install_ready=0
immutable_fedora_ready=0
```

The template prints the future transcript shape to stdout. It does not run the manual repeatability runner, build RPMs, install packages, remove packages, mutate a host, attach a transcript, or accept evidence.

The current next recommended Fedora CLI payload lane is:

```
Run manual disposable Fedora VM CLI payload repeatability lane, validate the transcript
candidate, and then add reviewed evidence status
```

Current Fedora VM CLI payload repeatability transcript review validator checkpoint

The latest Fedora VM CLI payload repeatability transcript review validator status records:

```
fedora_vm_cli_payload_repeatability_transcript_contract_present=1
fedora_vm_cli_payload_repeatability_transcript_capture_template_present=1
fedora_vm_cli_payload_repeatability_evidence_review_gate_present=1
fedora_vm_cli_payload_repeatability_transcript_review_validator_present=1
repeatability_transcript_review_mode=no-effect-validation
repeatability_transcript_candidate_valid=0
repeatability_transcript_reviewed=0
repeatability_transcript_accepted=0
evidence_status_written=0
promotion_allowed_by_validator_alone=0
second_disposable_vm_cli_validation_completed=0
cli_payload_repeatability_evidence_present=0
host_install_ready_for_cli_payload=1
production_installer_ready=0
fedora_distribution_ready=0
fedora_approval_claimed=0
daily_driver_install_ready=0
immutable_fedora_ready=0
```

The validator checks a supplied transcript candidate and rejects placeholders. It does not run the repeatability runner, write evidence status, or promote repeatability evidence by itself.

The current next recommended Fedora CLI payload lane is:

```
Run manual disposable Fedora VM CLI payload repeatability lane, validate the transcript
candidate, and then add reviewed evidence status
```

Current Fedora VM CLI payload repeatability evidence review gate checkpoint

The latest Fedora VM CLI payload repeatability evidence review gate status records:

```
fedora_vm_cli_payload_repeatability_transcript_contract_present=1
fedora_vm_cli_payload_repeatability_runner_present=1
fedora_vm_cli_payload_repeatability_evidence_review_gate_present=1
fedora_vm_cli_payload_repeatability_transcript_capture_template_present=1
fedora_vm_cli_payload_repeatability_transcript_review_validator_present=1
repeatability_transcript_template_mode=no-effect-template
repeatability_transcript_template_complete=0
repeatability_transcript_candidate_valid=0
repeatability_transcript_review_required=1
repeatability_transcript_attached=0
repeatability_transcript_reviewed=0
repeatability_transcript_accepted=0
second_disposable_vm_cli_validation_completed=0
cli_payload_repeatability_evidence_present=0
host_install_ready_for_cli_payload=1
production_installer_ready=0
fedora_distribution_ready=0
fedora_approval_claimed=0
daily_driver_install_ready=0
immutable_fedora_ready=0
```

The gate is present but does not attach or accept evidence. It blocks repeatability promotion until a complete operator-reviewed transcript from a real disposable Fedora VM run is attached.

The current next recommended Fedora CLI payload lane is:

```
Run manual disposable Fedora VM CLI payload repeatability lane, validate the transcript
candidate, and then add reviewed evidence status
```

Current Fedora VM CLI payload repeatability evidence acceptance contract checkpoint

The latest Fedora VM CLI payload repeatability evidence acceptance contract status records:

```
fedora_vm_cli_payload_repeatability_evidence_acceptance_contract_present=1
```

```
repeatability_transcript_attached=0
repeatability_transcript_reviewed=0
repeatability_transcript_candidate_valid=0
repeatability_transcript_accepted=0
evidence_status_written=0
second_disposable_vm_cli_validation_completed=0
cli_payload_repeatability_evidence_present=0
host_install_ready_for_cli_payload=1
production_installer_ready=0
fedora_distribution_ready=0
fedora_approval_claimed=0
daily_driver_install_ready=0
immutable_fedora_ready=0
```

The acceptance contract is present but does not attach, accept, or write repeatability evidence. It only defines the future accepted status record after a real disposable Fedora VM repeatability transcript is validated and reviewed.

The current next recommended Fedora CLI payload lane is:

```
Run manual disposable Fedora VM CLI payload repeatability lane, validate transcript candidate,
and write accepted repeatability evidence status
```

Current Fedora VM CLI payload repeatability evidence status template checkpoint

The latest Fedora VM CLI payload repeatability evidence status template records:

```
fedora_vm_cli_payload_repeatability_evidence_acceptance_contract_present=1
fedora_vm_cli_payload_repeatability_evidence_status_template_present=1
repeatability_evidence_status_template_mode=no-effect-template
repeatability_evidence_status_template_complete=0
repeatability_transcript_attached=0
repeatability_transcript_reviewed=0
repeatability_transcript_candidate_valid=0
repeatability_transcript_accepted=0
evidence_status_written=0
second_disposable_vm_cli_validation_completed=0
cli_payload_repeatability_evidence_present=0
host_install_ready_for_cli_payload=1
production_installer_ready=0
fedora_distribution_ready=0
fedora_approval_claimed=0
daily_driver_install_ready=0
immutable_fedora_ready=0
```

The evidence status template is present but does not attach, accept, or write repeatability evidence. It only prints the future accepted status shape after a real disposable Fedora VM repeatability transcript is validated and reviewed.

The current next recommended Fedora CLI payload lane is:

```
Run manual disposable Fedora VM CLI payload repeatability lane, validate transcript candidate,
and use the evidence status template to write accepted repeatability evidence status
```

Current Fedora VM CLI payload repeatability evidence status review validator checkpoint

The latest Fedora VM CLI payload repeatability evidence status review validator status records:

```
fedora_vm_cli_payload_repeatability_evidence_status_template_present=1
fedora_vm_cli_payload_repeatability_evidence_status_review_validator_present=1
repeatability_evidence_status_review_mode=no-effect-validation
repeatability_evidence_status_candidate_valid=0
repeatability_evidence_status_reviewed=0
repeatability_evidence_status_accepted_by_validator=0
evidence_status_written_by_validator=0
promotion_allowed_by_status_validator_alone=0
repeatability_transcript_accepted=0
evidence_status_written=0
second_disposable_vm_cli_validation_completed=0
cli_payload_repeatability_evidence_present=0
host_install_ready_for_cli_payload=1
production_installer_ready=0
fedora_distribution_ready=0
```

```
fedora_approval_claimed=0
daily_driver_install_ready=0
immutable_fedora_ready=0
```

The evidence status review validator is present but does not write or accept repeatability evidence. It only checks a supplied future status candidate for required markers and non-placeholder values.

The current next recommended Fedora CLI payload lane is:

```
Run manual disposable Fedora VM CLI payload repeatability lane, validate transcript candidate,
fill evidence status template, and review the evidence status candidate
```

Current Fedora VM CLI payload repeatability evidence publication gate checkpoint

The latest Fedora VM CLI payload repeatability evidence publication gate status records:

```
fedora_vm_cli_payload_repeatability_evidence_publication_gate_present=1
fedora_vm_cli_payload_repeatability_evidence_status_review_validator_present=1
repeatability_evidence_status_candidate_valid=0
repeatability_evidence_status_reviewed=0
repeatability_evidence_status_accepted_by_validator=0
evidence_status_written_by_validator=0
promotion_allowed_by_status_validator_alone=0
repeatability_evidence_publication_requested=0
operator_publication_review_completed=0
repeatability_evidence_publication_approved=0
repeatability_evidence_status_published=0
repeatability_transcript_accepted=0
evidence_status_written=0
second_disposable_vm_cli_validation_completed=0
cli_payload_repeatability_evidence_present=0
host_install_ready_for_cli_payload=1
production_installer_ready=0
fedora_distribution_ready=0
fedora_approval_claimed=0
daily_driver_install_ready=0
immutable_fedora_ready=0
```

The publication gate is present but does not publish repeatability evidence. It keeps a valid evidence status candidate review separate from a future operator-approved evidence status write.

The current next recommended Fedora CLI payload lane is:

```
Run manual disposable Fedora VM CLI payload repeatability lane, validate transcript and evidence
 status candidates, then complete operator publication review
```

Current Fedora VM CLI payload validation lane checkpoint

The latest Fedora VM CLI payload validation status alignment records:

```
Fedora VM CLI payload validation lane runner

host_install_ready_for_cli_payload=0
production_installer_ready=0
fedora_distribution_ready=0
fedora_approval_claimed=0
daily_driver_install_ready=0
immutable_fedora_ready=0
```

The current next recommended Fedora lane is:

```
Capture real disposable Fedora VM CLI payload validation transcript evidence
```

Current Fedora disposable VM RPM README alignment checkpoint

The latest Fedora disposable VM RPM README alignment records:

```
disposable_vm_local_rpm_validation_completed=1
host_install_ready=1
production_installer_ready=0
fedora_distribution_ready=0
fedora_approval_claimed=0
daily_driver_install_ready=0
immutable_fedora_ready=0
```

The README wording is now limited to disposable Fedora VM local RPM validation and does not claim production, Fedora distribution, immutable Fedora, daily-driver, security, recovery, or OS-replacement readiness.

The current next recommended Fedora lane is:

```
Add public announcement wording for disposable Fedora VM RPM validation milestone
```

Current Fedora disposable VM local RPM validation evidence checkpoint

The latest Fedora disposable VM local RPM validation evidence status records:

```
source=operator disposable Fedora VM transcript
repo_branch=pr-226
followup_fix_pr=PR #226

The current next recommended kernel lane is:

```
Add no-effect runtime entry admission classifier
```

Status update rules

Status updates should be:

- dated;
- evidence-bound;
- concise enough to read quickly;
- honest about non-claims;
- updated when major merged PRs change the current checkpoint;
- preserve older checkpoint headings while older guard workflows still validate them;
- careful not to claim security capability before implementation and testing prove it.

Completion percentage rule

Completion percentages are planning estimates only.

They are not release promises, security certifications, or production-readiness metrics.

Review cadence

Update status after:

- major merged PRs;
- new foundation sections;
- parser/AST milestones;
- security-policy changes;
- strategy changes;
- public-positioning changes;
- release or milestone planning.

Non-claims

This folder does not implement features, security controls, operating-system behavior, malware prevention, ransomware prevention, sandboxing, update safety, recovery safety, or production readiness.

Source title: Latticra Architecture Seed

Lines: 182 | Words: 435 | SHA-256: 2cd71e8f62c8c70003f11514fe5adcdbd6e46fc67b128b2282b9799103ed9c41

Latticra Architecture Seed

Status: initial architecture seed Scope: vocabulary, first system layers, and implementation direction.

Purpose

This document defines the initial architecture vocabulary for Latticra.

It is not a complete architecture specification. It is the seed from which implementation contracts, tests, models, and components can grow.

Core metaphor

Latticra models real software systems as structured computational universes.

Those universes are composed of:

- lattices;
- grids;
- matrices;
- state planes;
- transition rules;
- execution domains;
- visibility rails;
- evidence gates;
- rollback surfaces;
- embedded system boundaries.

Initial layers

```
L0 Contract Layer
  Real-system contract, non-claims, evidence ladder, promotion rules.

L1 State Lattice Layer
  Explicit state cells, paths, axes, routes, origins, traces, breadcrumbs.

L2 Transition Layer
  Pure transition models and denial rules before live movement.

L3 Visibility Layer
  Operator-readable state reports, visibility rails, health/risk/lock surfaces.

L4 Language Layer
  Lat declarations, read-only source forms, and assertion candidates.

L5 Evidence Layer
  Validation reports, virtual-target evidence, read-only hardware evidence, promotion records.

L6 Embedded Implementation Layer
  Narrow real-system implementation candidates after evidence gates.
```

Initial state vocabulary

Latticra begins with a compact state vocabulary but does not claim live movement yet.

```
origin
route
```

```
axis
path
breadcrumb
trace
safe_portal
rollback
health
risk
lock
dark_phase
host_effect
external_effect
```

First implementation candidate

The first implementation candidate should be a state lattice fixture.

Required properties:

```
deterministic
serializable
read-only by default
effect-free
operator-visible
traceable
testable
```

Forbidden properties in the first implementation:

```
live movement
origin mutation
recovery execution
host filesystem mutation
network mutation
hardware mutation
hidden state mutation
security claims
boot claims
```

Lattice transition direction

A future transition engine should accept:

```
current_state
transition_request
operator_intent
policy_context
```

and return:

```
next_state
result
reason
effects
rollback_visibility
trace
```

The first transition engine must be pure and preview-only.

Software universe direction

A Latticra software universe is not a fantasy world or game map.

It is a structured execution and state environment where every coordinate, route, transition, effect, and recovery surface has an inspectable contract.

The long-term goal is to make complex system behavior visible, navigable, testable, and eventually implementable on real machines.

Early component candidates

```
lattice-state
lattice-transition
lattice-report
promotion-packet
lat-assertion-candidate
hardware-profile-contract
evidence-record
promotion-record
```

Near-term repository structure

Recommended future structure:

```
docs/
  contracts/
  evidence/
  architecture/
  promotion/
  hardware/

src/
  lattice/
  transition/
  reports/

tests/
  docs/
  lattice/
  transition/

examples/
  fixtures/
```

Do not add this full structure until the first implementation slice requires it.

North star

Latticra should become a formal, evidence-bound implementation of a lattice-oriented computing architecture.

It should remain academically serious, implementation-focused, evidence-bound, and safe to reason about.

docs/C_CPP_FOUNDATION_DIRECTION.md

Source title: Latticra C/C++ Foundation Direction

Lines: 196 | Words: 645 | SHA-256: 3318060220f144e614c2dbd80a8672d33f03a13661c546c8af2f37acac9b9d1d

Latticra C/C++ Foundation Direction

Status: active language direction Scope: C/C++ foundation policy for Latticra systems implementation and public direction.

Purpose

This document records the current implementation direction for Latticra:

```
C is the metal.
C++ is the disciplined structure.
Latticra is the contract.
```

Latticra should use a constrained C/C++ foundation for security-conscious system work.

This direction does not claim unrestricted C++, broad runtime behavior, operating-system completeness, sandboxing, malware prevention, ransomware prevention, or production security guarantees.

Layer model

The intended public model is:

```
Lat / Latticra Language: contract layer
C++: governed authority layer
C: secure substrate
```

C secure substrate

C owns the lowest software boundary.

Primary C responsibilities:

```
boot paths
ABI boundaries
platform shims
fixed-size data structures
freestanding-adjacent boundaries
minimal substrate behavior
no-hidden-allocation early core
portable test fixtures
```

C must remain disciplined:

- no unsafe string APIs;
- no unchecked pointer mutation;
- no undefined behavior tolerated;
- no implicit effects without explicit gates;
- no global mutable state unless named in a contract;
- all transitions return status codes;
- all source/input behavior remains bounded and testable.

C++ governed authority layer

C++ is allowed above the C substrate as a governed authority layer.

Primary C++ responsibilities:

```
policy logic
validators
effect gates
audit logic
bounded orchestration structures
operator-visible reports
higher-level state coordination
safe wrappers around C substrate APIs
```

C++ must be constrained.

It is not:

```
unrestricted C++
exception-heavy C++
reflection-heavy C++
template metaprogramming as architecture
hidden allocation by default
implicit authority
unchecked host execution
```

Latticra contract language layer

Lat / Latticra Language is the contract and declaration layer.

Primary Lat responsibilities:

```
state declarations
policy declarations
transition declarations
assertions
effect requirements
```

```
operator-visible contract surfaces
future validated input to LIR
```

Lat is not currently a parser, compiler, interpreter, runtime, package manager, or execution surface.

Not unrestricted C++

The direction explicitly rejects unrestricted C++.

C++ may be used only when it is:

```
bounded
reviewable
effect-aware
policy-oriented
audit-friendly
compatible with C substrate boundaries
covered by tests or guards
clear about ownership and lifetime
```

Trust and evidence rules

All C/C++ work should preserve:

```
explicit trust boundaries
evidence-bound validation
source-aware diagnostics
bounded reports
no-effect defaults
operator-visible state
contract before capability
```

Relationship to LIR

The current LIR implementation is metadata-only.

LIR remains a representation target and must not become an execution surface without a separate contract.

C/C++ implementation work must not use LIR to bypass semantic validation, source-span preservation, no-effect flags, or effect gates.

Relationship to Rust

Rust is not the current public foundation direction for Latticra.

Rust may appear only as optional external tooling or historical comparison if separately justified, but it is not the default public implementation lane and should not be presented as a primary foundation layer.

Public wording

Approved public wording:

```
A constrained C/C++ foundation for a security-conscious system.
C is the metal.
C++ is the disciplined structure.
Latticra is the contract.
```

Avoid wording that implies:

```
unrestricted C++
finished operating system
finished language runtime
production security boundary
malware prevention guarantee
ransomware prevention guarantee
```

Implementation ordering

Recommended ordering:

1. C substrate fixtures and ABI-safe data structures.
2. C parser, AST, semantic validation, and LIR metadata foundations.
3. C++ policy, validation, effect-gate, and audit layers after C substrate contracts are stable.
4. Lat grammar and parser contracts before any Lat parser implementation.
5. LIR/Lat lowering only after separate contracts.
6. Execution only after explicit runtime/effect/security contracts.

Current validation command

This direction is guarded by:

```
sh scripts/test-c-cpp-foundation-direction.sh
```

The guard is static. It does not implement C++ policy code.

Non-claims

This document does not implement C++ infrastructure, Lat parsing, LIR execution, L-UI rendering, Nucleus task execution, live movement, state mutation, server interaction, recovery behavior, hardware behavior, boot readiness, security isolation, sandboxing, malware prevention, ransomware prevention, or operating-system completeness.

docs/CONSTRAINED_CPP_AUTHORITY_LAYER_CONTRACT.md

Source title: Latticra Constrained C++ Authority Layer Contract

Lines: 488 | Words: 1423 | SHA-256: 197f00cd7bcc1360044a9a55096de992c60a0550d872604d6e8f591b0d4b5648

Latticra Constrained C++ Authority Layer Contract

Status: constrained C++ authority layer contract Scope: governed C++ policy, validator, effect-gate, audit, ownership, lifetime, allocation, exception, boundary, and non-claim rules before any C++ authority-layer implementation.

Purpose

This document defines the first contract for the constrained C++ authority layer in Latticra.

It preserves the active direction:

```
C is the metal.
C++ is the disciplined structure.
Latticra is the contract.
```

C++ is permitted only as a governed authority layer above the C substrate.

This document does not implement C++ infrastructure, policy code, validators, effect gates, audit logic, orchestration, LIR lowering, Lat execution, L-UI rendering, runtime behavior, operating-system behavior, sandboxing, malware prevention, ransomware prevention, or production security guarantees.

Relationship to previous work

This contract depends on:

```
docs/C_CPP_FOUNDATION_DIRECTION.md
docs/LANGUAGE_STRATEGY.md
docs/LAT_LANGUAGE_GRAMMAR_IMPLEMENTATION.md
docs/LIR_SHAPE_IMPLEMENTATION.md
docs/EFFECT_GATES.md
docs/STATE_LATTICE.md
docs/TRI_PLANE_TRANSITION.md
```

```
docs/NUCLEUS_PREVIEW.md
include/latticra/lat_parser.h
include/latticra/lir.h
include/latticra/state_lattice.h
```

Those files remain the source of truth for the C substrate, Lat metadata parsing, LIR shape, effect vocabulary, state-lattice vocabulary, no-effect flags, and preview boundaries.

Layer placement

The C++ authority layer sits above the C substrate and below future operator/runtime orchestration.

Layer model:

```
Lat / Latticra Language: contract and declaration layer
C++: governed authority layer
C: secure substrate
```

C++ must not bypass the C substrate contracts.

Allowed C++ responsibilities

C++ may be used for:

```
policy logic
validators
effect gates
audit logic
bounded orchestration structures
operator-visible reports
higher-level state coordination
safe wrappers around C substrate APIs
```

These are authority responsibilities, not unchecked execution rights.

Forbidden C++ posture

The C++ authority layer must not become:

```
unrestricted C++
exception-heavy C++
reflection-heavy C++
template metaprogramming as architecture
hidden allocation by default
implicit authority
unchecked host execution
```

Initial C++ standard policy

The first C++ authority-layer implementation should target:

```
C++20 or later only if the implementation plan justifies it
```

Required subset posture:

```
explicit ownership
explicit lifetimes
no ambient authority
no hidden execution
no implicit network behavior
no implicit hardware behavior
no implicit file-system behavior
no global mutable authority
```

Ownership policy

Ownership must be explicit.

Allowed default patterns:

```
value types
references for non-owning views
span-like bounded views
unique ownership only where necessary
```

```
RAII wrappers for explicit resources
```

Restricted patterns:

```
shared ownership by default
raw owning pointers
unbounded containers in authority paths
implicit lifetime extension
long-lived global singletons
```

Any future use of std::shared_ptr, raw owning pointers, or global singletons must be justified in an implementation plan and guarded by tests or review rules.

Allocation policy

C++ authority-layer code should avoid hidden allocation in core paths.

Preferred patterns:

```
fixed-capacity containers
caller-provided buffers
bounded vectors with explicit capacity
arena-like allocation only if separately contracted
no allocation in no-effect report paths unless justified
```

Forbidden by default:

```
unbounded allocation in validators
unbounded allocation in effect gates
allocation hidden behind policy decisions
allocation hidden in report generation
allocation during no-effect validation without explicit contract
```

Exception policy

The first authority layer should not use exceptions for control flow.

Default policy:

```
no exceptions across C ABI boundaries
no exceptions through effect gates
no exceptions through report generation
no exceptions for expected validation failures
```

Expected failures should use explicit result/status types.

A future implementation plan must decide whether the C++ build uses:

```
-fno-exceptions
```

or a documented restricted exception boundary.

RTTI and reflection policy

RTTI and reflection-like behavior are forbidden by default in the authority layer.

Default policy:

```
no dynamic_cast in authority paths
no typeid-based authority decisions
no reflection-like dispatch as policy architecture
```

A future implementation plan must justify any exception.

Template policy

Templates may support small generic utilities but must not become architecture.

Allowed:

```
small fixed-capacity helpers
strong type wrappers
bounded view utilities
compile-time constants
```

Forbidden by default:

```
template metaprogramming as policy engine
type-level authority decisions without readable reports
compile-time tricks that hide behavior
large framework-style abstractions
```

C ABI boundary policy

C++ code must interact with the C substrate through explicit C-compatible boundaries.

Rules:

```
no C++ exceptions crossing C ABI
no C++ ownership crossing C ABI without wrappers
no raw C++ object lifetime exposed to C callers
no hidden allocation behind C ABI functions
status/result returns for boundary failures
```

Effect gate policy

C++ effect gates must start as no-effect validators.

They may classify or deny effects but must not perform effects.

Initial preserved flags:

```
no_effect=1
execution_allowed=0
mutation_allowed=0
server_allowed=0
network_allowed=0
recovery_allowed=0
hardware_allowed=0
```

Any transition from classification to allowed behavior requires a separate execution/effect contract.

Audit policy

Audit logic must be deterministic, bounded, and operator-visible.

Audit records should preserve:

```
input source identity if available
source spans if available
policy name
validator name
requested effect
allowed or denied result
denial reason
no-effect flags
```

Audit reports must not leak secrets, read files, open network connections, or mutate state.

Validator policy

Validators should be small and named.

Initial validator categories:

```
naming validators
source-span validators
no-effect validators
effect validators
boundary validators
state-shape validators
LIR-shape validators
Lat-parse-result validators
```

Validators must return explicit result values and stable labels.

Error/result policy

A future C++ implementation should define a small result type.

Recommended labels:

```
ok
null_argument
invalid_input
capacity_exceeded
policy_denied
unsupported_effect
unsupported_boundary
not_authorized
internal_error
```

The implementation plan must define exact names before code.

Namespace and file policy

Recommended namespace:

```
latticra
```

Recommended future file roots:

```
include/latticra/cpp/authority.hpp
src/cpp/authority.cpp
tests/cpp_authority_layer_invariants.cpp
scripts/test-cpp-authority-layer.sh
```

Exact paths must be named by a separate implementation plan.

Build policy

The future implementation plan must define:

```
compiler flags
C++ standard version
warnings-as-errors policy
exception policy
RTTI policy
allocation policy
sanitizer or static-analysis path if available
CI test runner
```

No C++ source files should be added before that implementation plan exists.

Relationship to Lat

The current Lat parser is metadata-only.

C++ authority-layer work may validate Lat parser results in the future but must not execute Lat, compile Lat, interpret Lat, or lower Lat to LIR without separate contracts.

Relationship to LIR

The current LIR shape implementation is metadata-only.

C++ authority-layer work may validate LIR shape metadata in the future but must not execute LIR or convert LIR into behavior without separate contracts.

Relationship to Nucleus

Nucleus preview work remains no-effect.

C++ authority-layer planning may define future Nucleus policy validation, but must not call task execution or alter runtime behavior without separate contracts.

No-effect rule

The constrained C++ authority layer starts as policy metadata and validation planning only.

It must preserve:

```
no_effect=1
execution_allowed=0
```

```
mutation_allowed=0
server_allowed=0
recovery_allowed=0
hardware_allowed=0
```

Compatibility expectations

This contract must not change:

```
C substrate behavior
Lat parser behavior
LIR shape behavior
L-UI parser behavior
L-UI semantic validation behavior
state lattice behavior
Nucleus preview behavior
C/C++ foundation direction
language naming policy
no-effect flags
```

Future implementation gate

C++ authority-layer implementation must not begin until a separate implementation plan defines:

1. public API shape;
2. namespace and file paths;
3. C++ standard version;
4. compiler flags;
5. exception policy;
6. RTTI policy;
7. allocation policy;
8. ownership/lifetime rules;
9. result/error labels;
10. C ABI boundary rules;
11. validator categories;
12. audit report format;
13. exact tests;
14. compatibility expectations;
15. non-claims.

Future test list

A future implementation plan should include tests for:

```
cpp_authority_layer_preserves_no_effect_flags
cpp_authority_layer_rejects_unrestricted_cpp_claims
cpp_authority_layer_has_no_execution_path
cpp_authority_layer_has_no_network_path
cpp_authority_layer_has_no_hardware_path
cpp_authority_layer_uses_explicit_result_labels
cpp_authority_layer_does_not_throw_across_c_boundary
cpp_authority_layer_does_not_allocate_in_report_path
cpp_authority_layer_preserves_source_identity_in_audit
cpp_authority_layer_accepts_max_source_identity
cpp_authority_layer_rejects_oversized_source_identity
cpp_authority_layer_bounds_source_identity_before_audit_copy
cpp_authority_layer_rejects_nul_source_identity
cpp_authority_layer_rejects_line_break_source_identity
cpp_authority_layer_validates_lat_parse_result_metadata
cpp_authority_layer_validates_lir_shape_metadata
```

```
cpp_authority_layer_audit_report_is_deterministic
cpp_authority_layer_rejects_small_report_buffer
cpp_authority_layer_rejects_unterminated_audit_text
cpp_authority_layer_is_deterministic
cpp_authority_layer_rejects_mutation_flags
cpp_authority_layer_rejects_network_flags
cpp_authority_layer_rejects_lat_network_flags
cpp_authority_layer_rejects_lir_network_flags
cpp_authority_layer_rejects_request_lat_network_flags
cpp_authority_layer_rejects_request_lir_network_flags
cpp_authority_layer_classifies_effects_without_performing_them
cpp_authority_layer_builds_with_fno_exceptions_and_fno_rtti
```

Forbidden behavior

The C++ authority layer must not:

- become unrestricted C++;
- add C++ implementation before an implementation plan;
- execute Lat;
- execute LIR;
- render L-UI;
- call Nucleus task execution;
- mutate state;
- read files;
- write files;
- open network connections;
- call server code;
- call update code;
- call recovery code;
- call hardware code;
- hide allocation in authority paths;
- throw exceptions across C ABI boundaries;
- use RTTI as policy architecture;
- use template metaprogramming as policy architecture;
- weaken C substrate boundaries;
- weaken no-effect flags;
- imply a sandbox, runtime, malware prevention, ransomware prevention, or operating-system surface.

Current validation command

This contract is guarded by:

```
sh scripts/test-constrained-cpp-authority-layer-contract.sh
```

The guard is static. It does not implement C++ authority-layer code.

Non-claims

This document does not implement C++ infrastructure, policy code, validators, effect gates, audit logic, orchestration, Lat execution, Lat compilation, Lat interpretation, LIR execution, LIR lowering, L-UI rendering, command behavior, Nucleus task execution, live movement, state mutation, recovery behavior, server interaction, self-update, hardware support, boot readiness, security isolation, sandboxing, malware prevention, ransomware prevention, or operating-system completeness.

docs/CONSTRAINED_CPP_AUTHORITY_LAYER_IMPLEMENTATION.md

Source title: Latticra Constrained C++ Authority Layer Implementation

Lines: 361 | Words: 782 | SHA-256: 90acfe4b753e17eabc49d005661b73a4c0337fb59b36fb8b73abd77c0cb0d19c

Latticra Constrained C++ Authority Layer Implementation

Status: initial implementation contract Scope: first no-effect constrained C++ authority-layer API, fixed-capacity audit structures, Lat metadata validation, LIR metadata validation, effect classification, deterministic report rendering, build policy, invariant tests, compatibility expectations, and non-claims.

Purpose

This document records the first constrained C++ authority-layer implementation in Latticra.

It follows:

```
docs/C_CPP_FOUNDATION_DIRECTION.md
docs/CONSTRAINED_CPP_AUTHORITY_LAYER_CONTRACT.md
docs/CONSTRAINED_CPP_AUTHORITY_LAYER_IMPLEMENTATION_PLAN.md
```

The implementation keeps the active direction:

```
C is the metal.
C++ is the disciplined structure.
Latticra is the contract.
```

Implementation files

This slice adds:

```
include/latticra/cpp/authority.hpp
src/cpp/authority.cpp
tests/cpp_authority_layer_invariants.cpp
scripts/test-cpp-authority-layer.sh
```

The implementation is intentionally small and no-effect.

Public API

The public API is:

```
latticra::authority_status
latticra::authority_effect
latticra::authority_validator
latticra::authority_flags
latticra::authority_source_span
latticra::authority_request
latticra::authority_audit_record
latticra::authority_audit_report
latticra::authority_status_label
latticra::authority_effect_label
latticra::authority_validator_label
latticra::validate_lat_parse_result
latticra::validate_lir_shape
latticra::classify_effect_request
latticra::render_authority_audit_report
```

All public functions return explicit status values and are declared noexcept.

Capacity constants

The implementation defines:

```
LATTICRA_AUTHORITY_POLICY_NAME_MAX 64u
LATTICRA_AUTHORITY_VALIDATOR_NAME_MAX 64u
LATTICRA_AUTHORITY_DENIAL_REASON_MAX 128u
LATTICRA_AUTHORITY_SOURCE_IDENTITY_MAX 128u
LATTICRA_AUTHORITY_AUDIT_RECORD_MAX 32u
LATTICRA_AUTHORITY_REPORT_MAX 4096u
```

The authority layer uses fixed-capacity structures and caller-provided output buffers.

Result labels

Stable authority status labels:

```
ok
null_argument
invalid_input
capacity_exceeded
policy_denied
unsupported_effect
unsupported_boundary
not_authorized
internal_error
```

Effect labels

Stable authority effect labels:

```
none
read
local_mutation
host_mutation
network
hardware
boot
recovery
external
unknown
```

Effects are metadata only. Classification does not perform effects.

Validator labels

Stable authority validator labels:

```
naming
source_span
no_effect
effect
boundary
state_shape
lir_shape
lat_parse_result
```

No-effect flags

The authority layer preserves:

```
no_effect=1
execution_allowed=0
mutation_allowed=0
server_allowed=0
network_allowed=0
recovery_allowed=0
hardware_allowed=0
```

Any mutation, execution, server, network, recovery, or hardware flag is denied.

Lat metadata validation

latticra::validate_lat_parse_result validates Lat parser metadata only.

It checks:

```
Lat parse result status
Lat parse error value
Lat no-effect flags
Lat network_allowed flag denial
Lat declaration capacity
Lat clause capacity
Lat module declaration capacity
Lat source-span ordering
Lat declaration source-span ordering
Lat clause source-span ordering
```

It does not execute, compile, interpret, lower, read files, write files, open network connections, or mutate state.

LIR metadata validation

latticra::validate_lir_shape validates LIR shape metadata only.

It checks:

```
LIR module status
LIR error value
LIR no-effect flags
LIR network_allowed flag denial
LIR node capacity
LIR edge capacity
LIR binding capacity
LIR text capacity
LIR source-span ordering
LIR text length bounds
```

It does not execute LIR, render L-UI, execute Lat, call Nucleus task execution, read files, write files, open network connections, or mutate state.

Effect classification

latticra::classify_effect_request classifies requested effects without performing them. If a request carries linked Lat or LIR metadata, classification also validates that linked metadata before allowing even a no-effect request. Bounded request source identity is copied into fixed audit storage and rendered in the report; oversized source identity is denied before any audit copy. Source identity containing an embedded NUL is rejected so report text cannot silently truncate the identity. Source identity containing line breaks is rejected so report text cannot inject additional report lines.

Initial behavior:

```
none -&gt; ok
read -&gt; policy_denied
local_mutation -&gt; policy_denied
host_mutation -&gt; policy_denied
network -&gt; policy_denied
hardware -&gt; policy_denied
boot -&gt; policy_denied
recovery -&gt; policy_denied
external -&gt; policy_denied
unknown -&gt; unsupported_effect
```

Audit report format

latticra::render_authority_audit_report emits a deterministic bounded report:

```
CPP AUTHORITY REPORT
status=&lt;authority-status-label&gt;
record_count=&lt;count&gt;
no_effect=&lt;0|1&gt;
execution_allowed=&lt;0|1&gt;
mutation_allowed=&lt;0|1&gt;
server_allowed=&lt;0|1&gt;
network_allowed=&lt;0|1&gt;
recovery_allowed=&lt;0|1&gt;
hardware_allowed=&lt;0|1&gt;
record[0].policy=&lt;policy-name&gt;
record[0].source_identity=&lt;source-identity&gt;
record[0].validator=&lt;validator-label&gt;
record[0].requested_effect=&lt;effect-label&gt;
```

```
record[0].result=&lt;authority-status-label&gt;
record[0].denial_reason=&lt;reason&gt;
record[0].span_start_offset=&lt;offset&gt;
record[0].span_end_offset=&lt;offset&gt;
```

Small output buffers return capacity_exceeded and clear the buffer. Unterminated fixed audit text fields return invalid_input and clear the buffer.

Build policy

The test runner uses:

```
CFLAGS=&quot;-std=c99 -Wall -Wextra -Werror -pedantic&quot;
CXXFLAGS=&quot;-std=c++20 -Wall -Wextra -Werror -pedantic -fno-exceptions -fno-rtti&quot;
```

The guard rejects forbidden authority-path headers and constructs including:

```
&lt;iostream&gt;
&lt;fstream&gt;
&lt;filesystem&gt;
&lt;thread&gt;
&lt;future&gt;
&lt;regex&gt;
&lt;exception&gt;
&lt;stdexcept&gt;
&lt;vector&gt;
&lt;map&gt;
&lt;unordered_map&gt;
throw
try
catch
dynamic_cast
typeid
std::vector
std::shared_ptr
```

Validation

Run:

```
sh scripts/test-cpp-authority-layer.sh
```

The test suite covers:

```
cpp_authority_layer_preserves_no_effect_flags
cpp_authority_layer_rejects_unrestricted_cpp_claims
cpp_authority_layer_has_no_execution_path
cpp_authority_layer_has_no_network_path
cpp_authority_layer_has_no_hardware_path
cpp_authority_layer_uses_explicit_result_labels
cpp_authority_layer_does_not_throw_across_c_boundary
cpp_authority_layer_does_not_allocate_in_report_path
cpp_authority_layer_preserves_source_identity_in_audit
cpp_authority_layer_accepts_max_source_identity
cpp_authority_layer_rejects_oversized_source_identity
cpp_authority_layer_bounds_source_identity_before_audit_copy
cpp_authority_layer_rejects_nul_source_identity
cpp_authority_layer_rejects_line_break_source_identity
cpp_authority_layer_validates_lat_parse_result_metadata
cpp_authority_layer_validates_lir_shape_metadata
cpp_authority_layer_audit_report_is_deterministic
cpp_authority_layer_rejects_small_report_buffer
cpp_authority_layer_rejects_unterminated_audit_text
cpp_authority_layer_is_deterministic
cpp_authority_layer_rejects_mutation_flags
cpp_authority_layer_rejects_network_flags
cpp_authority_layer_rejects_lat_network_flags
cpp_authority_layer_rejects_lir_network_flags
cpp_authority_layer_rejects_request_lat_network_flags
cpp_authority_layer_rejects_request_lir_network_flags
cpp_authority_layer_classifies_effects_without_performing_them
cpp_authority_layer_builds_with_fno_exceptions_and_fno_rtti
```

Compatibility expectations

This implementation must not change:

```
C substrate behavior
Lat parser behavior
```

```
LIR shape behavior
L-UI parser behavior
L-UI semantic validation behavior
state lattice behavior
Nucleus preview behavior
C/C++ foundation direction
language naming policy
no-effect flags
Lat grammar reports
LIR shape reports
```

Current boundary

This implementation does not provide:

```
unrestricted C++ authority
Lat execution
Lat compilation
Lat interpretation
LIR execution
LIR lowering
L-UI rendering
Nucleus task execution
file I/O
network I/O
state mutation
server interaction
self-update
recovery behavior
hardware behavior
sandboxing
malware prevention
ransomware prevention
operating-system completeness
```

Non-claims

This document and implementation do not claim a finished operating system, hardened sandbox, production runtime, production security boundary, malware prevention, ransomware prevention, recovery system, update system, bootable image, or public release readiness.

docs/CONSTRAINED_CPP_AUTHORITY_LAYER_IMPLEMENTATION_PLAN.md

Source title: Latticra Constrained C++ Authority Layer Implementation Plan

Lines: 770 | Words: 2122 | SHA-256: 0fb1f646989824f470e7a18a70e6f983a78629fde500f688c20d0f4d58a7e153

Latticra Constrained C++ Authority Layer Implementation Plan

Status: implementation planning contract Scope: exact public API, namespace, file paths, C++ standard, compiler flags, exception policy, RTTI policy, allocation policy, ownership/lifetime rules, result labels, C ABI boundaries, validators, audit reports, tests, compatibility expectations, and non-claims before any C++ authority-layer code.

Purpose

This document defines the implementation plan for the first constrained C++ authority layer in Latticra.

The constrained C++ authority-layer contract is already merged and guarded. This plan turns that contract into exact API, namespace, file path, build, exception, RTTI, allocation, ownership, C ABI, validator, audit report, and test expectations before implementation code is added.

This document does not implement C++ infrastructure, policy code, validators, effect gates, audit logic, orchestration, Lat execution, LIR execution, L-UI rendering, runtime behavior, operating-system behavior, sandboxing, malware prevention, ransomware prevention, or production security guarantees.

Direction checkpoint

```
C is the metal.
C++ is the disciplined structure.
Latticra is the contract.
```

The implementation must preserve this relationship:

```
Lat / Latticra Language: contract and declaration layer
C++: governed authority layer
C: secure substrate
```

C++ must remain disciplined structure above the C substrate. It must not become unrestricted authority.

Relationship to previous work

This plan depends on:

```
docs/C_CPP_FOUNDATION_DIRECTION.md
docs/CONSTRAINED_CPP_AUTHORITY_LAYER_CONTRACT.md
docs/LANGUAGE_STRATEGY.md
docs/LAT_LANGUAGE_GRAMMAR_IMPLEMENTATION.md
docs/LIR_SHAPE_IMPLEMENTATION.md
docs/EFFECT_GATES.md
docs/STATE_LATTICE.md
docs/TRI_PLANE_TRANSITION.md
docs/NUCLEUS_PREVIEW.md
include/latticra/lat_parser.h
include/latticra/lir.h
include/latticra/state_lattice.h
```

Those files remain the source of truth for the C substrate, Lat metadata parsing, LIR shape, effect vocabulary, state-lattice vocabulary, transition vocabulary, Nucleus preview boundaries, no-effect flags, and current non-claims.

Implementation language decision

The first authority-layer implementation should be implemented in constrained C++20.

Reason:

- std::span and std::string_view are C++20-era tools that fit explicit bounded views;
- constrained C++ gives RAII, value types, scoped ownership, enum class, and namespace hygiene;
- the existing C substrate remains the source of truth for parsed Lat and LIR metadata;
- the C++ layer should validate and report over C-owned metadata, not replace the C substrate;
- C++ implementation must remain no-effect and must not add execution, mutation, network, recovery, hardware, or server behavior.

This decision does not permit unrestricted C++.

Implementation files

The implementation PR should add or modify:

```
include/latticra/cpp/authority.hpp
src/cpp/authority.cpp
tests/cpp_authority_layer_invariants.cpp
scripts/test-cpp-authority-layer.sh
.github/workflows/c.yml
docs/CONSTRAINED_CPP_AUTHORITY_LAYER_IMPLEMENTATION.md
```

The implementation PR should not add Lat execution, LIR execution, L-UI rendering, Nucleus task execution, file I/O, network I/O, state mutation, recovery behavior, update behavior, server interaction, hardware behavior, or security guarantees.

Public namespace

Use the namespace:

```
latticra
```

The first implementation must not create nested framework-style namespaces such as:

```
latticra::runtime
latticra::kernel
latticra::server
latticra::recovery
```

Those names imply capabilities that do not exist yet.

Public API shape

Add public C++ API names:

```
latticra::authority_status
latticra::authority_effect
latticra::authority_validator
latticra::authority_flags
latticra::authority_source_span
latticra::authority_request
latticra::authority_audit_record
latticra::authority_audit_report
latticra::authority_status_label
latticra::authority_effect_label
latticra::authority_validator_label
latticra::validate_lat_parse_result
latticra::validate_lir_shape
latticra::classify_effect_request
latticra::render_authority_audit_report
```

Recommended function signatures:

```
const char *authority_status_label(authority_status status) noexcept;
const char *authority_effect_label(authority_effect effect) noexcept;
const char *authority_validator_label(authority_validator validator) noexcept;

authority_status validate_lat_parse_result(
    const latticra_lat_parse_result_t &amp;lat_result,
    authority_audit_report &amp;report) noexcept;

authority_status validate_lir_shape(
    const latticra_lir_module_t &amp;lir_module,
    authority_audit_report &amp;report) noexcept;

authority_status classify_effect_request(
    const authority_request &amp;request,
    authority_audit_report &amp;report) noexcept;

authority_status render_authority_audit_report(
    const authority_audit_report &amp;report,
    char *buffer,
    std::size_t buffer_len) noexcept;
```

All public functions in the first implementation should be noexcept and return explicit status values.

Capacity constants

Add exact bounded constants:

```
LATTICRA_AUTHORITY_POLICY_NAME_MAX 64u
LATTICRA_AUTHORITY_VALIDATOR_NAME_MAX 64u
LATTICRA_AUTHORITY_DENIAL_REASON_MAX 128u
LATTICRA_AUTHORITY_SOURCE_IDENTITY_MAX 128u
LATTICRA_AUTHORITY_AUDIT_RECORD_MAX 32u
LATTICRA_AUTHORITY_REPORT_MAX 4096u
```

Recommended declaration style:

```
inline constexpr std::size_t LATTICRA_AUTHORITY_POLICY_NAME_MAX = 64u;
```

The first implementation should reject or truncate nothing silently. Capacity failures must return capacity_exceeded and preserve deterministic audit state.

Authority status enum

Add status enum values:

```
authority_status::ok
authority_status::null_argument
authority_status::invalid_input
authority_status::capacity_exceeded
authority_status::policy_denied
authority_status::unsupported_effect
authority_status::unsupported_boundary
authority_status::not_authorized
authority_status::internal_error
```

Stable labels:

```
ok
null_argument
invalid_input
capacity_exceeded
policy_denied
unsupported_effect
unsupported_boundary
not_authorized
internal_error
```

Authority effect enum

Add effect enum values:

```
authority_effect::none
authority_effect::read
authority_effect::local_mutation
authority_effect::host_mutation
authority_effect::network
authority_effect::hardware
authority_effect::boot
authority_effect::recovery
authority_effect::external
authority_effect::unknown
```

Stable labels:

```
none
read
local_mutation
host_mutation
network
hardware
boot
recovery
external
unknown
```

Effects remain metadata only. Classification must not perform effects.

Authority validator enum

Add validator enum values:

```
authority_validator::naming
authority_validator::source_span
authority_validator::no_effect
authority_validator::effect
authority_validator::boundary
authority_validator::state_shape
authority_validator::lir_shape
authority_validator::lat_parse_result
```

Stable labels:

```
naming
source_span
no_effect
effect
boundary
state_shape
lir_shape
lat_parse_result
```

Validators should be small, named, deterministic, and report-visible.

Authority flags struct

Add no-effect flag fields:

```
bool no_effect;
bool execution_allowed;
bool mutation_allowed;
bool server_allowed;
bool network_allowed;
bool recovery_allowed;
bool hardware_allowed;
```

The default valid authority-layer state is:

```
no_effect=1
execution_allowed=0
mutation_allowed=0
server_allowed=0
network_allowed=0
recovery_allowed=0
hardware_allowed=0
```

Any deviation must be denied by the first implementation.

Authority source span struct

Use a C++ source-span struct compatible with existing C source-span conventions:

```
std::size_t start_offset;
std::size_t end_offset;
std::size_t start_line;
std::size_t start_column;
std::size_t end_line;
std::size_t end_column;
```

The implementation may copy spans from Lat or LIR metadata. It must not invent byte offsets.

Authority request struct

Add request metadata fields:

```
authority_effect requested_effect;
authority_flags flags;
std::string_view source_identity;
const latticra_lat_parse_result_t *lat_result;
const latticra_lir_module_t *lir_module;
```

The first implementation must treat source_identity as a non-owning bounded view and must not retain it after the call returns. When present and within bounds, the implementation should copy it into fixed audit storage. The bound check must run before any audit record copies caller-provided source identity. Source identity containing an embedded NUL must be rejected before report rendering. Source identity containing line breaks must be rejected before report rendering.

Authority audit record struct

Add audit record fields:

```
authority_status status;
authority_validator validator;
authority_effect requested_effect;
authority_flags flags;
std::array&lt;char, LATTICRA_AUTHORITY_POLICY_NAME_MAX&gt; policy_name;
std::array&lt;char, LATTICRA_AUTHORITY_SOURCE_IDENTITY_MAX + 1u&gt; source_identity;
std::array&lt;char, LATTICRA_AUTHORITY_VALIDATOR_NAME_MAX&gt; validator_name;
std::array&lt;char, LATTICRA_AUTHORITY_DENIAL_REASON_MAX&gt; denial_reason;
authority_source_span span;
```

Audit records must be deterministic and must not contain secrets, file contents, environment values, or host-specific data.

Authority audit report struct

Add audit report fields:

```
authority_status status;
authority_flags flags;
std::array&lt;authority_audit_record, LATTICRA_AUTHORITY_AUDIT_RECORD_MAX&gt; records;
std::size_t record_count;
```

The report must be fully initialized on success and failure.

Ownership and lifetime rules

The first implementation should use:

```
value types
references for required non-owning inputs
std::span for bounded views when needed
std::string_view for non-owning text views
std::array for fixed storage
std::unique_ptr only if separately justified
RAII wrappers only for explicit local resources
```

The first implementation must not use:

```
raw owning pointers
raw new/delete
std::shared_ptr
hidden global mutable state
long-lived singletons
unbounded std::vector in authority paths
unbounded std::string in authority paths
stored references into caller-owned buffers
implicit lifetime extension
```

Allocation policy

The first implementation should avoid heap allocation in authority paths.

Required posture:

```
fixed-capacity containers
caller-provided output buffers
no allocation in validators
no allocation in effect gates
no allocation in audit report rendering
no hidden allocation behind policy decisions
```

A later arena or allocator policy requires a separate contract.

Exception policy

The first implementation should build with:

```
-fno-exceptions
```

Rules:

```
no throw expressions
no try/catch in authority paths
no exceptions across C ABI boundaries
no exceptions through effect gates
no exceptions through report generation
no exceptions for expected validation failures
```

Expected failures must use authority_status.

RTTI and reflection policy

The first implementation should build with:

```
-fno-rtti
```

Rules:

```
no dynamic_cast in authority paths
no typeid-based authority decisions
no RTTI as policy architecture
```

```
no reflection-like dispatch
```

Template policy

Allowed:

```
small fixed-capacity helpers
strong type wrappers
constexpr constants
simple label helpers
std::array-based utility functions
```

Forbidden by default:

```
template metaprogramming as policy engine
type-level authority decisions without readable reports
compile-time tricks that hide behavior
large framework-style abstractions
unreviewable generic dispatch
```

Allowed standard library subset

The first implementation may use:

```
&lt;array&gt;
&lt;cstddef&gt;
&lt;cstdint&gt;
&lt;span&gt;
&lt;string_view&gt;
&lt;type_traits&gt;
```

The first implementation must not use in authority paths:

```
&lt;iostream&gt;
&lt;fstream&gt;
&lt;filesystem&gt;
&lt;thread&gt;
&lt;future&gt;
&lt;regex&gt;
&lt;exception&gt;
&lt;stdexcept&gt;
&lt;vector&gt;
&lt;string&gt;
&lt;map&gt;
&lt;unordered_map&gt;
```

Any exception requires a later implementation note and guard update.

C ABI boundary plan

The first implementation should consume existing C substrate structs through included C headers only.

Rules:

```
wrap C includes with extern &quot;C&quot; when included from C++
do not expose C++ object lifetimes to C callers
do not export raw C++ objects through a C ABI
do not let C++ exceptions cross C ABI boundaries
return explicit authority_status values for boundary failures
copy C metadata into fixed C++ report structures when needed
```

The first implementation should not add a public C ABI wrapper unless a follow-up plan requires C callers to invoke the C++ authority layer directly.

Lat validation plan

validate_lat_parse_result should validate metadata only.

Required checks:

```
Lat parse result status is successful before metadata validation succeeds
Lat no-effect flags are preserved
Lat execution_allowed is zero
Lat mutation_allowed is zero
Lat server_allowed is zero
Lat network_allowed is zero
```

```
Lat recovery_allowed is zero
Lat hardware_allowed is zero
Lat declaration and clause counts do not exceed declared capacity
Lat source spans are ordered and bounded
Lat effect metadata remains metadata only
```

The function must not execute Lat, compile Lat, interpret Lat, lower Lat to LIR, read files, write files, open network connections, or mutate state.

LIR validation plan

validate_lir_shape should validate metadata only.

Required checks:

```
LIR module metadata is bounded
LIR node counts do not exceed declared capacity
LIR edge counts do not exceed declared capacity
LIR source spans are ordered and bounded
LIR network_allowed is zero
LIR binding metadata remains metadata only
LIR text references use explicit lengths
LIR report behavior remains no-effect
```

The function must not execute LIR, render L-UI, execute Lat, call Nucleus task execution, read files, write files, open network connections, or mutate state.

Effect classification plan

classify_effect_request should classify requested effects but must not perform them.

Initial behavior:

```
none -&gt; ok
read -&gt; policy_denied
local_mutation -&gt; policy_denied
host_mutation -&gt; policy_denied
network -&gt; policy_denied
hardware -&gt; policy_denied
boot -&gt; policy_denied
recovery -&gt; policy_denied
external -&gt; policy_denied
unknown -&gt; unsupported_effect
```

This preserves the no-effect authority-layer starting point.

Audit report format

render_authority_audit_report should emit a deterministic bounded report:

```
CPP AUTHORITY REPORT
status=&lt;authority-status-label&gt;
record_count=&lt;count&gt;
no_effect=&lt;0|1&gt;
execution_allowed=&lt;0|1&gt;
mutation_allowed=&lt;0|1&gt;
server_allowed=&lt;0|1&gt;
network_allowed=&lt;0|1&gt;
recovery_allowed=&lt;0|1&gt;
hardware_allowed=&lt;0|1&gt;
record[0].policy=&lt;policy-name&gt;
record[0].source_identity=&lt;source-identity&gt;
record[0].validator=&lt;validator-label&gt;
record[0].requested_effect=&lt;effect-label&gt;
record[0].result=&lt;authority-status-label&gt;
record[0].denial_reason=&lt;reason&gt;
record[0].span_start_offset=&lt;offset&gt;
record[0].span_end_offset=&lt;offset&gt;
```

Small output buffers should return authority_status::capacity_exceeded and clear the buffer. Unterminated fixed audit text fields should return authority_status::invalid_input and clear the buffer.

Build policy

The first implementation test runner should use:

```
CFLAGS=&quot;-std=c99 -Wall -Wextra -Werror -pedantic&quot;
CXXFLAGS=&quot;-std=c++20 -Wall -Wextra -Werror -pedantic -fno-exceptions -fno-rtti&quot;
```

The script should compile C substrate objects with cc, compile authority C++ objects with c++, and link with c++.

Recommended command shape:

```
tmpdir=&quot;$(mktemp -d &quot;${TMPDIR:-/tmp}/latticra-cpp-authority.XXXXXX&quot;)&quot;
trap &#x27;rm -rf &quot;$tmpdir&quot;&#x27; EXIT INT HUP TERM
cc $CFLAGS -Iinclude -c src/lat_parser.c -o &quot;$tmpdir/latticra-lat-parser.o&quot;
cc $CFLAGS -Iinclude -c src/lir.c -o &quot;$tmpdir/latticra-lir.o&quot;
c++ $CXXFLAGS -Iinclude -c src/cpp/authority.cpp -o &quot;$tmpdir/latticra-cpp-authority.o&quot;
c++ $CXXFLAGS -Iinclude tests/cpp_authority_layer_invariants.cpp
&quot;$tmpdir/latticra-cpp-authority.o&quot; ... -o &quot;$tmpdir/latticra-cpp-authority-layer-
invariants&quot;
```

The exact object list may include L-UI parser and semantic objects if LIR validation requires them.

Exact implementation test list

The implementation PR should include tests for:

```
cpp_authority_layer_preserves_no_effect_flags
cpp_authority_layer_rejects_unrestricted_cpp_claims
cpp_authority_layer_has_no_execution_path
cpp_authority_layer_has_no_network_path
cpp_authority_layer_has_no_hardware_path
cpp_authority_layer_uses_explicit_result_labels
cpp_authority_layer_does_not_throw_across_c_boundary
cpp_authority_layer_does_not_allocate_in_report_path
cpp_authority_layer_preserves_source_identity_in_audit
cpp_authority_layer_accepts_max_source_identity
cpp_authority_layer_rejects_oversized_source_identity
cpp_authority_layer_bounds_source_identity_before_audit_copy
cpp_authority_layer_rejects_nul_source_identity
cpp_authority_layer_rejects_line_break_source_identity
cpp_authority_layer_validates_lat_parse_result_metadata
cpp_authority_layer_validates_lir_shape_metadata
cpp_authority_layer_audit_report_is_deterministic
cpp_authority_layer_rejects_small_report_buffer
cpp_authority_layer_rejects_unterminated_audit_text
cpp_authority_layer_is_deterministic
cpp_authority_layer_rejects_mutation_flags
cpp_authority_layer_rejects_network_flags
cpp_authority_layer_rejects_lat_network_flags
cpp_authority_layer_rejects_lir_network_flags
cpp_authority_layer_rejects_request_lat_network_flags
cpp_authority_layer_rejects_request_lir_network_flags
cpp_authority_layer_classifies_effects_without_performing_them
cpp_authority_layer_builds_with_fno_exceptions_and_fno_rtti
```

Test file plan

Add:

```
tests/cpp_authority_layer_invariants.cpp
scripts/test-cpp-authority-layer.sh
```

Wire into:

```
.github/workflows/c.yml
```

Run after:

```
sh scripts/test-constrained-cpp-authority-layer-implementation-plan.sh
```

and before:

```
sh scripts/test-lat-language-grammar-contract.sh
```

Documentation update plan

The implementation PR should update:

```
README.md
STATUS.md
docs/FOUNDATION_INDEX.md
docs/status/CURRENT_STATUS.md
docs/status/ANNOUNCEMENTS.md
docs/project_notes/CURRENT_DIRECTION.md
docs/project_notes/UPCOMING_WORK.md
docs/strategy/2026-05-15-2249-cdt-national-security-open-system-strategy.md
docs/CONSTRAINED_CPP_AUTHORITY_LAYER_CONTRACT.md
scripts/test-project-strategy-status-framework.sh
```

and add:

```
docs/CONSTRAINED_CPP_AUTHORITY_LAYER_IMPLEMENTATION.md
```

Compatibility expectations

The implementation must not change:

```
C substrate behavior
Lat parser behavior
LIR shape behavior
L-UI parser behavior
L-UI semantic validation behavior
state lattice behavior
Nucleus preview behavior
C/C++ foundation direction
language naming policy
no-effect flags
Lat grammar reports
LIR shape reports
```

Forbidden implementation behavior

The first C++ authority-layer implementation must not:

- become unrestricted C++;
- execute Lat;
- execute LIR;
- render L-UI;
- call Nucleus task execution;
- mutate state;
- read files;
- write files;
- open network connections;
- call server code;
- call update code;
- call recovery code;
- call hardware code;
- hide allocation in authority paths;
- throw exceptions across C ABI boundaries;
- use RTTI as policy architecture;
- use template metaprogramming as policy architecture;
- weaken C substrate boundaries;

- weaken no-effect flags;
- imply a sandbox, runtime, malware prevention, ransomware prevention, or operating-system surface.

Current validation command

This implementation plan is guarded by:

```
sh scripts/test-constrained-cpp-authority-layer-implementation-plan.sh
```

The guard is static. It does not implement C++ authority-layer code.

Implementation gate

Constrained C++ authority-layer implementation code may be added only after this plan is merged.

Non-claims

This document does not implement C++ infrastructure, policy code, validators, effect gates, audit logic, orchestration, Lat execution, Lat compilation, Lat interpretation, LIR execution, LIR lowering, L-UI rendering, command behavior, Nucleus task execution, live movement, state mutation, recovery behavior, server interaction, self-update, hardware support, boot readiness, security isolation, sandboxing, malware prevention, ransomware prevention, or operating-system completeness.

docs/CPP_AUTHORITY_IMPLEMENTATION_REVIEW.md

Source title: C++ Authority Implementation Review

Lines: 70 | Words: 181 | SHA-256: 690e33ccbe245f1bb7bdd2f36525228b149c5ada3dce70b6b5c852dc5c8bd050

C++ Authority Implementation Review

Status: implementation review

This review covers the initial no-effect constrained C++ authority implementation after the recent Lat/LIR/runtime-boundary report, diagnostic, audit, and project-notes slices.

Reviewed files:

```
include/latticra/cpp/authority.hpp
src/cpp/authority.cpp
tests/cpp_authority_layer_invariants.cpp
scripts/test-cpp-authority-layer.sh
docs/CONSTRAINED_CPP_AUTHORITY_LAYER_IMPLEMENTATION.md
```

Current finding:

```
The constrained C++ authority layer remains a no-effect metadata validation and audit-report
surface.
```

Confirmed boundaries:

```
no unrestricted C++ authority
no Lat execution
no Lat compilation
no Lat interpretation
no LIR execution
no runtime behavior
no command execution
no state mutation
no file I/O
no network I/O
no recovery behavior
no hardware behavior
no production security guarantee
```

Confirmed guard posture:

```
-fno-exceptions
```

```
-fno-rtti
forbidden exception constructs rejected
forbidden RTTI constructs rejected
forbidden dynamic containers rejected
forbidden file/network/system headers rejected
fixed-capacity report buffers
explicit result labels
policy-denied effect classification
Lat parser metadata validation
LIR shape metadata validation
deterministic authority report rendering
```

Current recommendation:

```
Keep the C++ authority layer no-effect and metadata-only until a separate authority expansion
contract exists.
```

Potential next refinement:

```
C++ authority diagnostic/status report alignment
```

Boundary: review/status only. No C++ authority behavior is changed.

docs/EFFECT_GATES.md

Source title: Latticra Effect Gates

Lines: 155 | Words: 555 | SHA-256: d1e7203986d4893fce3711e7f337109fe123f88d6c761d08fbc200ae36c46da7

Latticra Effect Gates

Status: initial effect-gate model Scope: effect classes, gate rules, request classification, and non-claims.

Purpose

Latticra must classify effects before it handles any request.

A system that can update itself, interact with servers, handle hardware targets, or eventually perform recovery work must never hide effects behind friendly names.

Effect classes

Effect class	Meaning	Initial status
`none`	No mutation, no host action, no external action.	Allowed for fixtures and reports.
`read`	Read-only inspection of local approved state.	Allowed after source contract.
`local_mutation`	Changes Latticra-owned local state.	Planned, gated.
`host_mutation`	Changes host files, processes, services, or settings.	Blocked until explicit gates.
`network`	Sends or receives network data.	Blocked until server model and trust policy.
`hardware`	Touches hardware state or device interfaces.	Blocked until hardware profile and evidence.
`boot`	Affects boot path, boot artifacts, or boot configuration.	Blocked until boot contract and evidence.
`recovery`	Performs recovery behavior or rollback beyond local preview.	Blocked until recovery contract and evidence.
`external`	Affects systems outside the local Latticra boundary.	Blocked until explicit deployment policy.

Classification rule

Every request must be classified before handling.

If classification fails, the request is denied.

```
unknown effect -&gt; deny
ambiguous effect -&gt; deny
unclassified effect -&gt; deny
```

Gate states

Each gate may be in one of these states:

```
disabled
planned
available
armed
executed
failed
blocked
```

Only executed may imply a real action happened.

Request record

Every request should eventually produce a record shaped like:

```
request_id:
source:
requested_effect:
allowed_effect:
gate:
policy_result:
reason:
operator_confirmation:
result:
rollback_state:
evidence_level:
```

Default policy

Default policy is conservative:

```
none -&gt; allowed
read -&gt; allowed only for approved local state
local_mutation -&gt; planned, explicit gate required
host_mutation -&gt; blocked
network -&gt; blocked
hardware -&gt; blocked
boot -&gt; blocked
recovery -&gt; blocked
external -&gt; blocked
```

Operator visibility

Effect state must always be visible to the operator.

Reports should show:

```
host_effect
external_effect
network_effect
hardware_effect
boot_effect
recovery_effect
```

Relationship to Nucleus

Nucleus must consult the Effect Gate before any task is carried out.

The Effect Gate does not decide all policy. It decides whether the effect class is known, allowed, gated, blocked, or failed.

Relationship to Lat

Lat documents must declare intended effects.

If a Lat document omits an effect declaration, the default is:

```
effect = none
```

If the document attempts to exceed its declared effect, it must be rejected.

Relationship to L-UI

L-UI should be effect-free by default.

A UI surface may request reports or display state, but it must not perform hidden mutation.

Server and update effects

Server interaction is network plus optional local_mutation when writing downloaded artifacts or evidence records.

Self-update is at least:

```
network
local_mutation
update_stage
```

and may eventually involve boot or recovery effects depending on deployment profile.

First implementation target

The first implementation target should support only:

```
effect = none
```

and possibly read-only report classification.

Non-claims

This document does not implement effect gates.

It defines the gate vocabulary and default-deny policy before implementation begins.

docs/FEATURE_TRANSLATION_LEDGER.md

Source title: Latticra Feature Vocabulary Ledger

Lines: 117 | Words: 738 | SHA-256: 08f22fdb3ee69bff336d119023664aa3907db973158b2d7a620d20fa03677e41

Latticra Feature Vocabulary Ledger

Status: initial vocabulary ledger Scope: mapping exploratory concept labels into professional Latticra architecture terms.

Purpose

Latticra needs stable public vocabulary before broad implementation work expands.

This ledger prevents informal, exploratory, or metaphor-heavy names from becoming unclear implementation contracts.

The public project should describe features by their Latticra purpose, behavior, evidence level, and effect boundary rather than by predecessor-project lore.

Vocabulary table

```
| Exploratory concept | Latticra term | Notes |
| --- | --- | --- |
| General state movement | Lattice transition | General state movement inside a structured
lattice. |
| Multi-plane transition check | Tri-plane transition model | Transition checked across spatial,
 state, and safety planes. |
| Portal-like boundary | Gate | A controlled transition boundary. |
| Safe transition boundary | Recovery gate | A gate associated with recovery visibility or
recovery eligibility. |
| Mirror-like state view | Reflection surface | Read-only view or reflection of state. |
| Modeled entity | Lattice actor | A modeled actor within a state lattice. |
```

Inactive context	Shadow context	An inactive, pending, or non-primary context.
Nested scope	Domain stack	Nested scope or domain stack.
Split/fault boundary	Partition boundary	Split, isolation, or fault boundary.
Recursive structure	Recursive lattice	Recursive state domain or repeated lattice pattern.
Floor/layer concept	Layer / plane / tier	Use the most precise term per context.
Visibility concept	Lens / visibility rail	Operator visibility and state display surface.
Rail display concept	Operator rails	Terminal/state display rails.
Hardware evidence track	Substrate evidence path	Boot, recovery, hardware, and validation evidence path.
Native language path	Lat / Latticra Language	Public native language family and programming-language direction.
Staged candidate work	Staged candidate system	Candidate staging, never automatic system behavior.
Verification and repair work	Verification and repair suite	Defensive validation, maintenance, and repair-oriented checks.
Matrix	State matrix	Structured multi-dimensional state surface.
Universe	Lattice universe	Structured software universe with explicit contracts.
Origin	Origin	Keep term.
Route	Route	Keep term.
Axis	Axis	Keep term.
Path	Path	Keep term.
Trace	Trace	Keep term.

Promotion categories

Each translated feature should be assigned one category:

```
historical-only
concept-candidate
fixture-candidate
tested-model-candidate
read-only-surface-candidate
implementation-candidate
blocked
```

Initial category assignments

Latticra term	Initial category	Reason
State lattice	fixture-candidate	First implementation target.
Tri-plane transition model	tested-model-candidate	Needs pure transition and denial tests before surface work.
Gate	concept-candidate	Needs effect-gate contract first.
Recovery gate	concept-candidate	Must not perform recovery until evidence supports it.
Reflection surface	read-only-surface-candidate	Safe as inspection only.
Lattice actor	concept-candidate	Needs strict non-claim and lifecycle rules.
Shadow context	concept-candidate	Needs visibility rules.
Domain stack	tested-model-candidate	Can derive from nested-domain lessons.
Partition boundary	concept-candidate	Needs failure and isolation vocabulary.
Recursive lattice	concept-candidate	Needs mathematical definition before implementation.
Lens / visibility rail	read-only-surface-candidate	UI/reporting only at first.
Staged candidate system	tested-model-candidate	Must remain approval-gated.
Verification and repair suite	concept-candidate	Must remain defensive and evidence-bound.

Rejected direct public names

Do not directly import these names as formal Latticra public components:

```
black arts
ghost
magic
arena
game
hacker console
simulator OS
```

They may appear in private brainstorming, but not as public Latticra implementation names.

Promotion rule

A feature may enter implementation only after it has:

1. a Latticra name;
2. a direct Latticra purpose;
3. evidence level;
4. non-claims;
5. effect boundary;
6. test plan;
7. failure behavior.

First implementation candidate

The first implementation candidate remains:

```
state lattice fixture
```

It should include labels for origin, route, axis, path, breadcrumb, trace, safe_portal, rollback, health, risk, lock, dark_phase, host_effect, and external_effect.

Non-claims

This ledger does not implement any feature.

It translates and constrains vocabulary before implementation begins.

docs/HOST_ARCHITECTURE_TARGETS.md

Source title: Latticra Host Architecture Targets

Lines: 115 | Words: 382 | SHA-256: d8d2c3865eb9b9e75110cd2ab9fa79e10676386cfa77eb045b0b25af4a7f928c

Latticra Host Architecture Targets

Status: initial target architecture policy Scope: x86_64, ARM64, profiles, portability, and non-claims.

Purpose

Latticra should plan target host architectures from the beginning.

The initial target families are:

```
x86_64
ARM64 / AArch64
```

Architecture rule

No architecture-specific behavior may enter the core without a profile boundary.

Architecture-specific work must declare:

- target family;
- execution mode;
- evidence level;
- effect class;
- fallback behavior;
- non-claims.

Initial target profiles

```
x86_64-hosted
x86_64-qemu
x86_64-uefi-preview
x86_64-seabios-grub-preview
x86_64-grub2-bios-preview
x86_64-grub2-uefi-preview
aarch64-hosted
aarch64-qemu
aarch64-device-readonly
```

Profile meanings

Profile	Meaning	Initial status
`x86_64-hosted`	Runs as a hosted process on an x86_64 OS.	Planning target.
`x86_64-qemu`	Runs or validates in QEMU for x86_64.	Planning target.
`x86_64-uefi-preview`	Boot-adjacent preview profile.	Future target.
`x86_64-seabios-grub-preview`	Future SeaBIOS plus GRUB compatibility evidence profile.	Contract-only target.
`x86_64-grub2-bios-preview`	Future GRUB 2 BIOS boot evidence profile.	Contract-only target.
`x86_64-grub2-uefi-preview`	Future GRUB 2 UEFI boot evidence profile.	Contract-only target.
`aarch64-hosted`	Runs as a hosted process on an ARM64 OS.	Planning target.
`aarch64-qemu`	Runs or validates in QEMU for ARM64.	Planning target.
`aarch64-device-readonly`	Real-device read-only evidence profile.	Future target.

Implementation order

Recommended order:

```
1. hosted reference model
2. portable C state lattice fixture
3. validation tests on host
4. QEMU profile planning
5. read-only real-device evidence planning
6. boot-adjacent profile only after evidence
```

C portability policy

C code intended for architecture-neutral layers should avoid assumptions about:

- pointer width beyond explicit contracts;
- endianness;
- structure packing;
- alignment;
- host OS APIs;
- filesystem layout;
- network availability.

Architecture-specific code policy

Architecture-specific code must live behind named boundaries.

Possible future structure:

```
src/arch/x86_64/
src/arch/aarch64/
include/latticra/arch.h
```

Do not create this structure until implementation requires it.

Hardware evidence policy

Real-device evidence must record:

```
device identity
architecture
firmware/boot context if relevant
operator checklist
read-only or mutating classification
logs or report
non-claims
```

Non-claims

This document does not claim Latticra currently runs on x86_64 or ARM64.

It defines the target architecture policy before implementation begins.

docs/LATTICRA_ARCHITECTURE_TARGETS.md

Source title: Latticra Architecture Targets

Lines: 282 | Words: 647 | SHA-256: 9e0dee5dc1108e509136b2e9720f2f897548910e0e21a77576edccaa5b2193b5

Latticra Architecture Targets

Status: active architecture target plan Scope: target architecture planning for C substrate work, constrained C++ policy work, Rust tooling work, Lat/LIR language work, Seal trust-boundary work, and Fedora/Linux validation. This document does not implement runtime execution, production enforcement, kernel behavior, boot behavior, or operating-system replacement behavior.

Purpose

This document turns the Latticra / Lat / Latticra Seal roadmap into concrete architecture target lanes.

The goal is to keep implementation polymorphic, evidence-bound, and testable.

Top-level architecture

```
User / operator / developer
  -&gt; L-UI reports and CLI tools
  -&gt; Lat declarations
  -&gt; Lat parser and semantic validation
  -&gt; LIR metadata representation
  -&gt; Nucleus coordination and task classification
  -&gt; Runtime Boundary classification
  -&gt; Latticra Seal trust-boundary planning
  -&gt; Fedora/Linux validation lane
```

No layer should imply authority by existing. Authority must be explicit, denied by default, and proven by tests before promotion.

C substrate targets

C targets should remain bounded and deterministic.

Current and near-term C lanes:

```
include/latticra/*.h
src/*.c
tests/*_invariants.c
scripts/test-*.sh
```

Target responsibilities:

```
state fixtures
runtime-boundary structs
Lat parser/lowering substrate
LIR shape and report substrate
Seal request and allowlist metadata
no-effect invariant tests
operator-visible deterministic report fixtures
```

C success criteria:

```
fixed capacities where practical
explicit error values
no hidden host effects
no network effects
no runtime authority grants
shell guard validates reports and non-claims
```

Constrained C++ targets

C++ targets should be introduced only when graph or policy structure requires stronger modeling than C.

Candidate layout:

```
cpp/include/latticra/CapabilityGraph.hpp
cpp/include/latticra/PolicyGraph.hpp
cpp/include/latticra/SealDecision.hpp
cpp/include/latticra/ToolBoundaryPlanner.hpp
cpp/src/CapabilityGraph.cpp
cpp/src/PolicyGraph.cpp
cpp/src/SealDecision.cpp
cpp/src/ToolBoundaryPlanner.cpp
cpp/tests/test_capability_graph.cpp
cpp/tests/test_policy_graph.cpp
```

Initial C++ targets:

```
CapabilityGraph report-only model
PolicyGraph report-only model
SealDecision report-only model
ToolBoundaryPlanner report-only model
```

C++ non-claims:

```
runtime_authority_granted=0
tool_execution=0
host_read=0
host_write=0
network=0
policy_enforcement=0
production_authority_layer=0
```

Rust targets

Rust targets should protect risky input surfaces and developer tooling.

Candidate layout:

```
tools/seal-report/
tools/seal-verify/
tools/latcheck/
tools/latfmt/
tools/latticra-status/
crates/latticra_manifest/
crates/latticra_evidence/
crates/latticra_seal_policy/
```

Initial Rust target:

```
local fixture parser and report generator only
```

Rust success criteria:

```
no network by default
no host mutation beyond temporary test output
no verification claim without real verification
clear CLI output
negative fixtures
```

Lat targets

Lat should remain declaration-first.

Target areas:

```
module declarations
capability annotations
Seal intent annotations
policy-aware function signatures
```

```
runtime-boundary declarations
LIR metadata lowering
```

Lat success criteria:

```
parse deterministically
validate semantically
produce diagnostics
lower into bounded LIR metadata
perform no execution
make no compiler-product claim
```

LIR targets

LIR should preserve evidence-bearing structure between Lat and runtime-boundary planning.

Target areas:

```
node shape
edge shape
Lat-specific node labels
transition-source edges
report fields
no-effect evidence chain
```

LIR success criteria:

```
bounded representation
operator-visible reports
negative tests
no execution
no authority grant
```

Seal targets

Latticra Seal should mature in stages.

Target areas:

```
request metadata
parameter schema metadata
freshness metadata
signed request metadata
policy decision metadata
runtime gate metadata
runtime dry-run report
guarded allowlist metadata
capability metadata
evidence receipt metadata
cryptographic verification planning
```

Seal success criteria:

```
default_action_deny=1
would_deny=1 until all prerequisites exist
would_execute_tool=0
would_read_host=0
would_write_host=0
would_use_network=0
runtime_authority_granted=0
effect_performed=0
```

Fedora/Linux targets

Fedora/Linux is the validation lane.

Target areas:

```
disposable VM validation
local RPM documentation payload
host-facing transcript records
packaging boundary docs
Fedora integration docs
```

Fedora/Linux non-claims:

```
fedora_approval_claimed=0
production_installer_ready=0
daily_driver_install_ready=0
```

```
immutable_fedora_ready=0
operating_system_replacement=0
```

MCP and AI-era tool-boundary targets

Latticra should plan for AI-era tool invocation without claiming production MCP behavior.

Target flow:

```
tool request
  -&gt; declared parameters
  -&gt; freshness metadata
  -&gt; signature metadata
  -&gt; guarded allowlist candidate
  -&gt; policy decision metadata
  -&gt; runtime gate metadata
  -&gt; dry-run denial report
  -&gt; evidence receipt
```

Non-claims:

```
mcp_server=0
mcp_client=0
ai_agent_execution_control=0
tool_execution=0
production_agent_security=0
```

Review rule

Every new target lane must answer:

1. What language owns the substrate?
2. What layer owns the policy?
3. What tool owns the report?
4. What effect is denied?
5. What authority remains absent?
6. What script validates the claim?

docs/LATTICRA_NO_EFFECT_CLI_PACKAGING_CONTRACT_ALIGNMENT.md

Source title: Latticra No-Effect CLI Packaging Contract Alignment

Lines: 172 | Words: 495 | SHA-256: fdf2c0a263b99b6786b7272bbe04ce7733a03ea53789d050dbebfdaebfbe6638

Latticra No-Effect CLI Packaging Contract Alignment

Status: packaging/spec alignment record Evidence level: 7 packaging alignment, local guard only Scope: Fedora RPM spec transition for the no-effect latticra CLI payload.

Purpose

The no-effect CLI status surface now exists as a local guarded C implementation.

This record aligns the Fedora RPM spec transition that adds the no-effect CLI payload to the local RPM draft.

This is packaging/spec alignment only.

It updates packaging/fedora/latticra.spec for the CLI payload.

It does not build a new RPM in CI.

It does not install or remove an RPM.

It does not run disposable Fedora VM validation.

It does not claim host install readiness for the CLI payload.

Alignment header

```
LATTICRA NO-EFFECT CLI PACKAGING CONTRACT ALIGNMENT
packaging_alignment_version=2
cli_payload_contract_present=1
cli_status_surface_implemented=1
cli_packaging_alignment_present=1
fedora_spec_updated_for_cli=1
rpm_payload_expansion_performed=1
rpm_payload_validated=0
```

Historical validated package boundary

The current evidence-backed Fedora validation record still applies only to the earlier documentation-only local RPM:

```
validated_package=latticra-0.0.0-0.1.local.fc44.noarch.rpm
validated_payload=/usr/share/doc/latticra/README.md
validated_payload_remains_documentation_only=1
historical_disposable_vm_rpm_evidence_remains_limited=1
```

That historical evidence does not validate the new CLI payload.

Current spec payload target

The local Fedora spec now targets this payload shape:

```
/usr/bin/latticra
/usr/share/doc/latticra/README.md
```

Because the CLI is a compiled C executable, the spec no longer declares:

```
BuildArch: noarch
```

The spec transition records:

```
rpm_contains_compiled_c_binary=1
buildarch_noarch_removed=1
cli_binary_install_mode=0755
doc_install_mode=0644
```

Required spec properties

The spec must verify the local CLI guard before compiling/installing the binary:

```
sh scripts/test-latticra-no-effect-cli-status-surface.sh
cc %{optflags} -std=c99 -Wall -Wextra -Werror -pedantic src/latticra_cli.c -o build/latticra
install -m 0755 build/latticra %{buildroot}%{_bindir}/latticra
install -m 0644 README.md %{buildroot}%{_docdir}/%{name}/README.md
%{_bindir}/latticra
%doc %{_docdir}/%{name}/README.md
```

Forbidden payload surfaces for this lane

The no-effect CLI packaging lane must not add:

```
/etc/latticra
/usr/lib/systemd/system/latticra.service
/usr/lib/modules
/boot/latticra
/usr/share/selinux
```

The spec must also avoid service activation, package-manager actions, network actions, boot changes, kernel-module installation, and SELinux policy installation.

Future disposable Fedora VM validation requirements

After this spec-update lane, a separate disposable Fedora VM validation transcript must record:

```
expanded_payload_validation_transcript_present=1
cli_binary_present_after_install=1
cli_status_command_recorded=1
cli_version_command_recorded=1
cli_report_command_recorded=1
cli_status_output_matches_contract=1
cli_no_root_required=1
```

```
cli_no_host_mutation_observed=1
cli_no_network_observed=1
rpm_verify_completed=1
removal_validation_performed=1
cli_removed_after_rpm_removal=1
post_removal_cli_absence_verified=1
```

Until that transcript exists, the CLI payload remains unvalidated from a disposable Fedora VM packaging perspective.

Current readiness classification

```
cli_payload_contract_present=1
cli_status_surface_implemented=1
cli_packaging_alignment_present=1
fedora_spec_updated_for_cli=1
rpm_payload_expansion_performed=1
rpm_payload_validated=0
disposable_vm_cli_validation_completed=0
host_install_ready_for_cli_payload=0
production_installer_ready=0
fedora_distribution_ready=0
fedora_approval_claimed=0
daily_driver_install_ready=0
immutable_fedora_ready=0
```

Validation

```
sh scripts/test-latticra-no-effect-cli-packaging-contract-alignment.sh
```

Expected output:

```
latticra_no_effect_cli_packaging_contract_alignment: ok
```

Next recommended lane

```
Add disposable Fedora VM CLI payload validation transcript contract
```

That future lane should define the evidence contract for a real disposable Fedora VM RPM validation run against the expanded /usr/bin/latticra payload.

Non-claims

This alignment is not a completed RPM build transcript.

It is not installation evidence for /usr/bin/latticra.

It is not disposable Fedora VM validation of the CLI payload.

It is not host install readiness for the CLI payload.

It is not production readiness, Fedora approval, Fedora distribution readiness, daily-driver safety, immutable Fedora readiness, runtime behavior, Lat execution, LIR execution, service management, kernel integration, SELinux policy integration, update safety, recovery safety, malware prevention, ransomware prevention, sandboxing, or a production installer claim.

docs/LATTICRA_NO_EFFECT_CLI_PAYLOAD_CONTRACT.md

Source title: Latticra No-Effect CLI Payload Contract

Lines: 207 | Words: 584 | SHA-256: fc9a6d26654d0b05a03f8c96b0f7c9875240b025b1601066669fdf7cc3a96331

Latticra No-Effect CLI Payload Contract

Status: contract record Evidence level: 9 target, contract only Scope: future no-effect /usr/bin/latticra CLI payload for the local Fedora RPM path.

Purpose

Latticra now has an evidence-backed disposable Fedora VM local RPM validation path for the current documentation-only package.

This contract defines the next payload boundary for the first executable Latticra surface.

The intended executable surface is a deterministic, report-only, no-effect CLI.

This is a contract only.

It does not implement /usr/bin/latticra.

It does not update the Fedora RPM spec.

It does not add a binary payload to the RPM.

It does not install, remove, or validate a new RPM.

It does not run the disposable Fedora VM validation lane.

It does not grant runtime authority.

Contract header

```
LATTICRA NO-EFFECT CLI PAYLOAD CONTRACT
cli_payload_contract_version=1
cli_binary_path=/usr/bin/latticra
cli_payload_planned=1
cli_payload_implemented=0
cli_rpm_payload_validated=0
operator_review_required=1
```

Current validated package boundary

The current evidence-backed Fedora package remains the documentation-only local RPM:

```
current_validated_package=latticra-0.0.0-0.1.local.fc44.noarch.rpm
current_validated_payload=/usr/share/doc/latticra/README.md
current_validated_payload_remains_documentation_only=1
current_disposable_vm_rpm_evidence_remains_valid=1
```

The existing Fedora VM validation evidence does not currently validate:

```
/usr/bin/latticra
```

Required CLI behavior contract

A future CLI implementation must remain no-effect and report-only:

```
cli_report_only=1
cli_runtime_behavior_allowed=0
cli_host_mutation_allowed=0
cli_network_allowed=0
cli_root_required=0
cli_file_write_allowed=0
cli_file_read_required=0
cli_service_operation_allowed=0
cli_kernel_operation_allowed=0
cli_package_manager_allowed=0
cli_boot_operation_allowed=0
cli_selinux_policy_operation_allowed=0
cli_effect_authority_default=denied
cli_exit_status_deterministic=1
```

Allowed initial command surface

The first CLI payload may only expose deterministic status/report commands:

```
latticra --status
latticra --version
latticra --report
```

No command may execute Lat, execute LIR, mutate host state, invoke services, invoke package managers, touch the boot path, load kernel modules, change SELinux policy, open network connections, or require root.

Required deterministic status output shape

The future latticra --status output must include a stable report shape equivalent to:

```
LATTICRA STATUS REPORT
project=latticra
mode=no-effect
runtime_behavior=disabled
host_mutation=0
network=0
kernel_operation=0
service_operation=0
package_manager_operation=0
boot_operation=0
selinux_policy_operation=0
effect_authority=denied
```

The exact implementation may add fields only if they preserve the no-effect boundary and are covered by a guard.

Implementation constraints

A future implementation should remain small, auditable, and dependency-light:

```
implementation_language=C
external_runtime_dependencies=0
dynamic_network_dependency=0
privileged_execution_required=0
fixed_output_schema=1
deterministic_report_order=1
```

Future RPM payload contract

Only after the no-effect CLI implementation exists and passes local guards may a future RPM payload expand to:

```
/usr/bin/latticra
/usr/share/doc/latticra/README.md
```

The following payload surfaces remain forbidden for this lane:

```
/etc/latticra
/usr/lib/systemd/system/latticra.service
/usr/lib/modules
/boot/latticra
```

Required future validation evidence

Before the CLI payload can be treated as validated, a future disposable Fedora VM transcript must record:

```
cli_binary_present_after_install=1
cli_status_command_recorded=1
cli_version_command_recorded=1
cli_report_command_recorded=1
cli_status_output_matches_contract=1
cli_no_root_required=1
cli_no_host_mutation_observed=1
cli_no_network_observed=1
cli_removed_after_rpm_removal=1
post_removal_cli_absence_verified=1
```

The future transcript must also continue to record package build, RPM install, RPM verification, RPM removal, and post-removal absence verification.

Current project state until implementation and VM evidence exist

Until the no-effect CLI is implemented, packaged, and validated inside a disposable Fedora VM, the project remains at:

```
cli_payload_contract_present=1
cli_payload_implemented=0
cli_rpm_payload_validated=0
```

```
disposable_vm_cli_validation_completed=0
host_install_ready_for_cli_payload=0
production_installer_ready=0
fedora_distribution_ready=0
fedora_approval_claimed=0
daily_driver_install_ready=0
immutable_fedora_ready=0
```

Validation

```
sh scripts/test-latticra-no-effect-cli-payload-contract.sh
```

Expected output:

```
latticra_no_effect_cli_payload_contract: ok
```

Next recommended lane

```
Implement no-effect Latticra CLI status surface
```

That lane should add the smallest possible report-only executable and should not update Fedora validation status until a real disposable Fedora VM RPM validation transcript exists for the expanded payload.

Non-claims

This contract is not a CLI implementation.

It is not RPM payload expansion.

It is not disposable Fedora VM validation of /usr/bin/latticra.

It is not production readiness, Fedora approval, Fedora distribution readiness, daily-driver safety, immutable Fedora readiness, runtime behavior, Lat execution, LIR execution, service management, kernel integration, update safety, recovery safety, malware prevention, ransomware prevention, sandboxing, or a production installer claim.

docs/LATTICRA_NO_EFFECT_CLI_STATUS_SURFACE_IMPLEMENTATION.md

Source title: Latticra No-Effect CLI Status Surface Implementation

Lines: 151 | Words: 366 | SHA-256: 8d143ccc6a19c688703599c2258e7aac491eb8457ef57900c8ff21296b0ef127

Latticra No-Effect CLI Status Surface Implementation

Status: implementation record Evidence level: 6 local implementation guard Scope: first no-effect latticra CLI status surface implementation.

Summary

This slice implements the first local no-effect Latticra CLI status surface as a small C executable source file.

The implementation is intentionally narrow.

It provides deterministic report-only output for:

```
latticra --status
latticra --version
latticra --report
```

It does not update the Fedora RPM spec.

It does not install /usr/bin/latticra.

It does not add the CLI to the RPM payload.

It does not run disposable Fedora VM validation.

It does not claim host install readiness for the CLI payload.

Files

```
src/latticra_cli.c
scripts/test-latticra-no-effect-cli-status-surface.sh
.github/workflows/latticra-no-effect-cli-status-surface.yml
```

CLI surface

The CLI accepts only the three report-only commands defined by the contract:

```
latticra --status
latticra --version
latticra --report
```

Invalid commands emit usage text to stderr and return exit code 2.

Deterministic status output

The --status and --report commands emit the same fixed report:

```
LATTICRA STATUS REPORT
project=latticra
mode=no-effect
runtime_behavior=disabled
host_mutation=0
network=0
kernel_operation=0
service_operation=0
package_manager_operation=0
boot_operation=0
selinux_policy_operation=0
effect_authority=denied
```

The --version command emits:

```
latticra 0.0.0
mode=no-effect
runtime_behavior=disabled
```

No-effect implementation constraints

The implementation uses only standard C string comparison and output calls.

The guard rejects forbidden implementation patterns including:

```
system(
popen(
fork(
exec
socket(
connect(
open(
fopen(
freopen(
remove(
rename(
unlink(
mkdir(
rmdir(
chmod(
chown(
mount(
setuid(
setgid(
```

Current readiness classification

```
cli_payload_contract_present=1
cli_status_surface_implemented=1
cli_local_guard_present=1
cli_local_guard_pass_expected=1
cli_rpm_payload_validated=0
disposable_vm_cli_validation_completed=0
host_install_ready_for_cli_payload=0
production_installer_ready=0
fedora_distribution_ready=0
fedora_approval_claimed=0
daily_driver_install_ready=0
immutable_fedora_ready=0
```

Validation

```
sh scripts/test-latticra-no-effect-cli-status-surface.sh
```

Expected output:

```
latticra_no_effect_cli_status_surface: ok
```

Next recommended lane

```
Add no-effect CLI payload packaging contract alignment
```

That future lane should still avoid claiming Fedora package validation for /usr/bin/latticra until a real disposable Fedora VM RPM validation transcript exists for the expanded payload.

Non-claims

This implementation record is not RPM payload expansion.

It is not installation evidence for /usr/bin/latticra.

It is not disposable Fedora VM validation of the CLI payload.

It is not production readiness, Fedora approval, Fedora distribution readiness, daily-driver safety, immutable Fedora readiness, runtime behavior, Lat execution, LIR execution, service management, kernel integration, update safety, recovery safety, malware prevention, ransomware prevention, sandboxing, or a production installer claim.

docs/MACOS_RESET_UNINSTALL_EFFECT_AUTHORIZATION_CONTRACT.md

Source title: macOS Reset/Uninstall Effect-Authorization Contract

Lines: 263 | Words: 518 | SHA-256: 7b33b76d7e05121abf6a7842a56617cd255d152419d9beacc43bb93dd2b785bb

macOS Reset/Uninstall Effect-Authorization Contract

Status: no-effect macOS reset/uninstall effect-authorization contract Date: 2026-05-25 CDT Scope: contract for keeping future live macOS reset/uninstall execution disabled until implementation-gate and operator-intent evidence are both present.

Purpose

This contract defines the future effect-authorization boundary for macOS reset/uninstall. It keeps live managed-target removal and receipt writing disabled until both implementation-gate evidence and operator-intent evidence exist.

It is contract-only. It does not authorize effects, delete files, remove directories, write receipts, write absence reports, mutate host state, open the network, or claim reset/uninstall implementation.

Command

```
sh scripts/macos-reset-uninstall-effect-authorization-contract.sh
```

The command writes only a deterministic report to stdout.

Current Decision

The current effect-authorization posture is:

```
macos_reset_uninstall_effect_authorization_contract_present=1
macos_reset_uninstall_evidence_bundle_contract_present=1
macos_reset_uninstall_live_implementation_plan_contract_present=1
macos_reset_uninstall_live_execution_preflight_contract_present=1
macos_reset_uninstall_live_denial_transcript_contract_present=1
macos_reset_uninstall_live_runner_interface_contract_present=1
live_execution_preflight_contract_state=closed-no-effect
live_execution_preflight_passed=0
live_execution_preflight_blocking=1
live_execution_preflight_deletion_enabled=0
live_denial_transcript_contract_state=recorded-no-effect
live_denial_transcript_recorded=1
live_denial_transcript_stdout_only=1
live_denial_transcript_file_write_enabled=0
live_runner_interface_contract_state=defined-no-effect
live_runner_interface_current_preflight_passed=0
live_runner_interface_current_decision=deny
live_runner_interface_dispatch_enabled=0
live_runner_interface_runner_handoff_enabled=0
live_implementation_plan_contract_state=defined-no-effect
live_reset_uninstall_implementation_present=0
evidence_bundle_contract_state=defined-no-effect
evidence_bundle_complete=0
reset_uninstall_evidence_bundle_complete=0
effect_authorization_contract_state=closed-no-effect
effect_authorization_contract_decision=blocked-missing-implementation-gate-and-operator-intent-e
vidence
effect_authorization_contract_required=1
effect_authorization_contract_open=0
effect_authorization_required=1
effect_authorization_open=0
reset_uninstall_effect_authorized=0
reset_uninstall_effect_authorization_evidence_present=0
effect_authorization_record_write_enabled=0
effect_authorization_denial_recorded=1
effect_authorization_denial_reason=missing-implementation-gate-and-operator-intent-evidence
reset_uninstall_live_run_allowed=0
reset_uninstall_deletion_enabled=0
managed_target_removal_allowed=0
managed_target_deletion_enabled=0
reset_uninstall_receipt_write_enabled=0
```

Required Evidence Chain

Future effect authorization must bind to the closed implementation gate, explicit operator-intent contract, and reset/uninstall evidence contracts:

```
macos_reset_uninstall_operator_intent_contract_present=1
macos_reset_uninstall_effect_authorization_contract_present=1
macos_reset_uninstall_evidence_bundle_contract_present=1
macos_reset_uninstall_live_implementation_plan_contract_present=1
macos_reset_uninstall_live_execution_preflight_contract_present=1
macos_reset_uninstall_live_denial_transcript_contract_present=1
macos_reset_uninstall_live_runner_interface_contract_present=1
live_execution_preflight_contract_state=closed-no-effect
live_execution_preflight_passed=0
live_execution_preflight_blocking=1
live_execution_preflight_deletion_enabled=0
live_denial_transcript_contract_state=recorded-no-effect
live_denial_transcript_recorded=1
live_denial_transcript_stdout_only=1
live_denial_transcript_file_write_enabled=0
live_runner_interface_contract_state=defined-no-effect
live_runner_interface_current_preflight_passed=0
live_runner_interface_current_decision=deny
live_runner_interface_dispatch_enabled=0
live_runner_interface_runner_handoff_enabled=0
live_implementation_plan_contract_state=defined-no-effect
live_reset_uninstall_implementation_present=0
evidence_bundle_contract_state=defined-no-effect
evidence_bundle_complete=0
reset_uninstall_evidence_bundle_complete=0
```

```
effect_authorization_contract_state=closed-no-effect
reset_uninstall_effect_authorized=0
operator_intent_contract_state=defined-no-effect
operator_reset_uninstall_intent_evidence_required=1
operator_reset_uninstall_intent_evidence_present=0
operator_explicit_reset_uninstall_intent_observed=0
operator_intent_evidence_written=0
macos_reset_uninstall_implementation_gate_contract_present=1
implementation_gate_contract_state=closed-no-effect
implementation_gate_open=0
implementation_gate_decision=blocked-missing-reset-uninstall-evidence
macos_reset_uninstall_receipt_schema_contract_present=1
macos_reset_uninstall_absence_report_contract_present=1
macos_reset_uninstall_dry_run_planner_present=1
reset_uninstall_dry_run_planner_transcript_present=1
macos_reset_uninstall_live_target_classifier_present=1
macos_reset_uninstall_dry_run_contract_present=1
macos_verification_transcript_contract_present=1
macos_commit_gate_contract_present=1
reset_uninstall_dry_run_evidence_present=0
reset_uninstall_receipt_evidence_present=0
reset_receipt_evidence_present=0
receipt_schema_evidence_present=0
absence_report_evidence_present=0
```

Target Scope

Future effect authorization must stay bound to user-local managed macOS targets and receipt locations:

```
app_support_prefix_target=$HOME/Library/Application Support/Latticra
app_bundle_target=$HOME/Applications/Latticra Panel.app
cli_wrapper_target=$HOME/.local/bin/latticra-panel
reset_receipts_dir_target=$HOME/Library/Application Support/Latticra Reset Receipts
reset_receipt_path_future=$HOME/Library/Application Support/Latticra Reset
Receipts/reset-uninstall-receipt.json
absence_report_path_future=$HOME/Library/Application Support/Latticra Reset
Receipts/absence-report.txt
```

Authorization Requirements

The future authorization boundary requires:

```
effect_authorization_requires_implementation_gate_open=1
effect_authorization_requires_operator_intent_evidence=1
effect_authorization_requires_dry_run_planner_transcript=1
effect_authorization_requires_live_target_classifier=1
effect_authorization_requires_receipt_schema=1
effect_authorization_requires_absence_report_contract=1
effect_authorization_requires_receipt_outside_removed_prefix=1
effect_authorization_requires_no_unmanaged_targets=1
effect_authorization_requires_no_unsafe_paths=1
effect_authorization_requires_no_network=1
effect_authorization_requires_no_root=1
effect_authorization_schema_version=macos-reset-uninstall-effect-authorization/1
effect_authorization_condition_implementation_gate_open=required
effect_authorization_condition_operator_intent_evidence_present=required
effect_authorization_condition_operator_intent_current_session=required
effect_authorization_condition_no_unmanaged_targets=required
effect_authorization_condition_no_network=required
effect_authorization_condition_no_root=required
effect_authorization_must_not_override_missing_operator_intent=1
effect_authorization_must_not_override_closed_implementation_gate=1
effect_authorization_must_not_authorize_unmanaged_target_removal=1
```

The current condition state remains closed:

```
effect_authorization_result_implementation_gate_open=not_met
effect_authorization_result_operator_intent_evidence=not_met
effect_authorization_result_dry_run_planner_transcript=contract-only
effect_authorization_result_live_target_classifier=contract-only
effect_authorization_result_receipt_schema=contract-only
effect_authorization_result_absence_report_contract=contract-only
effect_authorization_result_no_network=met
effect_authorization_result_no_root=met
```

Phases

The future effect-authorization phases are:

```
effect_authorization_phase_1=consume_implementation_gate_contract
effect_authorization_phase_2=consume_operator_intent_contract
effect_authorization_phase_3=validate_reset_uninstall_evidence_chain
effect_authorization_phase_4=compute_effect_authorization_decision
effect_authorization_phase_5=authorize_future_live_reset_uninstall
effect_authorization_phase_6=run_live_reset_uninstall
effect_authorization_phase_1_status=contract-only
effect_authorization_phase_2_status=contract-only
effect_authorization_phase_3_status=contract-only
effect_authorization_phase_4_status=contract-only
effect_authorization_phase_5_status=disabled
effect_authorization_phase_6_status=disabled
```

Authority Boundary

This contract preserves:

```
reset_uninstall_implementation_present=0
macos_reset_uninstall_implemented=0
managed_marker_required=1
unmanaged_target_preservation_required=1
receipt_outside_removed_prefix_required=1
absence_report_required=1
managed_wrapper_removal_performed=0
managed_app_bundle_removal_performed=0
managed_application_support_removal_performed=0
reset_receipt_write_performed=0
absence_report_run_performed=0
absence_report_written=0
file_delete_performed=0
directory_delete_performed=0
application_support_write_performed=0
receipt_write_performed=0
app_bundle_write_performed=0
cli_wrapper_write_performed=0
shell_profile_mutation_performed=0
host_mutation_performed=0
network_performed=0
root_authority=0
launchagent_authority=0
keychain_authority=0
tcc_bypass_authority=0
endpoint_security_authority=0
system_extension_authority=0
network_extension_authority=0
privileged_helper_authority=0
runtime_authority_granted=0
production_installer_ready=0
```

Validation

This contract is guarded by:

```
sh scripts/test-macos-reset-uninstall-effect-authorization-contract.sh
```

Expected output:

```
macos_reset_uninstall_effect_authorization_contract: ok
```

Non-Claims

This contract is not macOS reset evidence, macOS uninstall evidence, macOS install evidence, macOS app bundle evidence, live approval evidence, operator approval evidence, effect approval evidence, receipt evidence, absence verification evidence, signed app evidence, notarization evidence, launchd evidence, Keychain evidence, Secure Enclave evidence, sandbox evidence, TCC approval evidence, Endpoint Security evidence, System Extension evidence, Network Extension evidence, privileged helper evidence, malware prevention, ransomware prevention, production readiness, Apple platform approval, or runtime authority.

Previous Recommended Lane

```
Add a macOS reset/uninstall evidence-bundle contract that groups implementation-gate,
operator-intent, receipt, absence, planner, and classifier evidence before any live execution.
```

Next Recommended Lane

```
Add a macOS reset/uninstall live-runner acceptance-denial disposition closeout audit review
disposition closeout contract that closes the reviewed no-effect closeout audit review
disposition without opening dispatch or deletion.
```

docs/NAMING_SYSTEM.md

Source title: Latticra Naming System

Lines: 158 | Words: 595 | SHA-256: 35b1c46dae143cfcb4cbe3b76edb03324d21345117cd089f515924a88edb4b9f

Latticra Naming System

Status: initial naming system Scope: professional terminology, public architecture naming, and implementation naming rules.

Purpose

Latticra needs a professional naming system before implementation work expands.

Public names should fit academic systems work, embedded software, formal state models, deterministic validation, and real implementation.

Naming principles

1. Use names that describe function before metaphor.
2. Keep exploratory names out of public architecture unless they become formalized.
3. Avoid names that make Latticra sound like a game, fantasy world, or toy operating system.
4. Prefer systems, formal methods, embedded software, and computer-science vocabulary.
5. Preserve strong conceptual meaning through precise implementation terms.
6. Avoid public dependency on predecessor project names.

Primary project names

Name	Meaning
Latticra	Lattice-oriented systems architecture and implementation project.
Lat / Latticra Language	Native Latticra programming language family.
Nucleus	Latticra supervisor and orchestration core.
L-UI	Terminal/operator interface declaration language or dialect.
LIR	Latticra Intermediate Representation.

Preferred implementation vocabulary

Concept	Latticra term
Software universe	Lattice universe
State space	State lattice
Movement	Transition
Multi-plane movement	Tri-plane transition model
Route/origin/axis/path	Route/origin/axis/path
Visibility surface	Lens or visibility rail
Rails	Operator rails or state rails
Portal-like boundary	Gate or transition gate
Safe transition boundary	Recovery gate
Mirror-like view	Reflection surface or state reflection

```
| Entity | Cell actor or lattice actor |
| Inactive context | Shadow context |
| Nested scope | Domain stack or nested domain |
| Split/fault boundary | Partition, split domain, or fault boundary |
| Recursive structure | Recursive lattice or recursive domain |
| Floor/layer concept | Layer, tier, or plane |
| Staged candidate work | Staged candidate system |
| Verification and repair work | Verification and repair suite |
| Hardware evidence path | Substrate evidence path |
| Native language family | Lat / Latticra Language |
```

Names to avoid in formal architecture

Avoid these as official Latticra component names unless a later design explicitly approves them:

```
black arts
ghost
magic
spell
haunt
arena
game
world map
fantasy universe
hacker magic
```

These can remain private brainstorming vocabulary, but Latticra implementation names should be clearer.

Naming levels

Use distinct naming levels:

```
Project name: Latticra
Supervisor name: Nucleus
Language name: Lat / Latticra Language
Interface dialect: L-UI
Intermediate form: LIR
State model: State lattice
Transition model: Tri-plane transition
Gate model: Effect gate
```

File and module naming rules

Use uppercase snake-case for major public docs already in the repository:

```
STATE_LATTICE.md
TRI_PLANE_TRANSITION.md
EFFECT_GATES.md
```

Use lowercase snake_case for C/Rust source:

```
state_lattice.c
tri_plane_transition.rs
effect_gate.h
```

Use lat_ or explicit latticra_ prefixes for native language internals when needed:

```
lat_parser
lat_runtime
latticra_ir
```

Use l_ui_ for existing L-UI parser and report code:

```
l_ui_parser
l_ui_parser_ast
l_ui_parser_diagnostics
```

Review rule

A new Latticra name should answer:

1. What does it do?

2. Is it professional?
3. Is it understandable without project lore?
4. Does it avoid overclaiming?
5. Can a systems engineer understand it from the public docs?

Current decision

The native language name is:

```
Lat / Latticra Language
```

The canonical native source extension is:

```
.lat
```

The supervisor name is:

```
Nucleus
```

The UI language or dialect is:

```
L-UI
```

docs/OPEN_ECOSYSTEM_POLICY.md

Source title: Latticra Open Ecosystem Policy

Lines: 92 | Words: 352 | SHA-256: f03a0ca369e8f91052b81df03457766ceffb62a2931354159f981ded8b987a6e

Latticra Open Ecosystem Policy

Status: active governance policy Scope: project openness, auditability, transparency, contribution posture, hybrid licensing, and license transition planning.

Purpose

Latticra is intended to remain open, auditable, transparent, and community-improvable.

The project should preserve the ability of users, researchers, maintainers, and downstream operators to inspect, modify, rebuild, and improve the system.

Direction

The intended direction is:

```
core software direction: AGPL-3.0-or-later
adoption-facing helper direction: Apache-2.0
documentation direction: CC-BY-4.0
legacy code default: Apache-2.0 until files are intentionally migrated or otherwise marked
kernel/core direction: reciprocal open license coverage
branding: separate trademark and identity policy
```

Transition rule

This policy does not silently relicense every existing file.

Existing files remain under their current license until a later migration PR updates them clearly.

New software source files should declare their license with an SPDX header.

New source file rule

New core software source files should use:

```
SPDX-License-Identifier: AGPL-3.0-or-later
```

New SDK, example, packaging-helper, installer-glue, and integration-helper source files should use:

```
SPDX-License-Identifier: Apache-2.0
```

unless a documented exception exists.

Documentation rule

Documentation and handbooks are licensed under:

```
CC-BY-4.0
```

See:

```
docs/DOCUMENTATION_LICENSE.md
```

Contribution rule

Contributions are accepted under the license declared by the files they modify.

New software contributions should be compatible with the project license direction unless a documented exception is accepted.

Identity rule

The code license does not grant rights to use the Latticra name, logo, marks, or Bryforge identity in a confusing way.

Forks may describe their relationship truthfully, but they must not imply they are the official project unless authorized.

Legal review note

This document is project guidance, not legal advice.

Formal release, relicensing, commercial distribution, or dual-license decisions should receive qualified legal review.

Follow-up work

Recommended follow-up slices:

1. Add SPDX headers to new kernel and core source files.
2. Add a license guard for new source files.
3. Add documentation SPDX headers where path-level notices are not enough.
4. Add or update NOTICE and copyright ownership policy.
5. Review path-by-path migration from Apache-2.0 to AGPL-3.0-or-later.
6. Add a release checklist for license obligations.

docs/roadmap/LATTICRA_C_CPP_FOUNDATION_ROADMAP.md

Source title: Latticra C/C++ Foundation Roadmap

Lines: 252 | Words: 1057 | SHA-256: 5422fe7efe88dc3f1504ea194c80d6c79645b52fcb1714d8fad4398f1fc5c0e3

Latticra C/C++ Foundation Roadmap

Status: Draft Layer: Roadmap Scope: Documentation-first implementation plan for the constrained C/C++ direction.

1. Purpose

This roadmap defines the staged path for turning the Latticra C/C++ direction into an implementation foundation.

The goal is to avoid rushing into code before the architecture, security profile, and validation expectations are clear.

2. Phase 0 — Documentation lock

Objective: Establish the direction before implementation.

Tasks:

- [ ] Add docs/latticra/DOCUMENTATION_MAP.md.
- [ ] Add docs/architecture/LATTICRA_LANGUAGE_FOUNDATION.md.
- [ ] Add docs/security/C_CPP_SECURITY_PROFILE.md.
- [ ] Add docs/security/C_ABI_BOUNDARY_POLICY.md.
- [ ] Add this roadmap.
- [ ] Ensure public wording avoids unsupported security claims.
- [ ] Record the official phrase: C is the metal. C++ is the disciplined structure. Latticra is the contract.

Exit criteria:

- docs are committed;
- docs are internally consistent;
- future implementation can reference these docs.

3. Phase 1 — Repository structure

Objective: Prepare the codebase layout without overbuilding.

Candidate layout:

```
latticra/
■■■ docs/
■   ■■■ architecture/
■   ■■■ security/
■   ■■■ roadmap/
■   ■■■ latticra/
■■■ include/
■   ■■■ latticra/
■       ■■■ latticra.h
■■■ src/
■   ■■■ c_substrate/
■   ■■■ cpp_authority/
■   ■■■ nucleus/
■   ■■■ contract/
■   ■■■ audit/
■   ■■■ platform/
■■■ tests/
■   ■■■ abi/
■   ■■■ contract/
■   ■■■ security/
■   ■■■ docs/
■■■ tools/
```

Tasks:

- [ ] Create minimal include/source directories.
- [ ] Create placeholder C ABI header.
- [ ] Create placeholder C++ authority module.
- [ ] Add build system skeleton.
- [ ] Add documentation integrity tests if project test framework exists.

Exit criteria:

- clean empty build or placeholder build;
- no fake security claims;
- C/C++ boundaries named clearly.

4. Phase 2 — C ABI skeleton

Objective: Create the narrow public C-facing substrate.

Tasks:

- [ ] Define latticra_status.
- [ ] Define opaque latticra_handle.
- [ ] Define latticra_bytes.
- [ ] Define create/destroy lifecycle.
- [ ] Define validation entry point.
- [ ] Add null pointer tests.
- [ ] Add buffer length tests.
- [ ] Add invalid input tests.
- [ ] Document every ABI function.

Exit criteria:

- ABI does not expose internal C++ types;
- no ownership crosses implicitly;
- invalid inputs fail deterministically.

5. Phase 3 — Restricted C++ authority core

Objective: Build the first governed authority objects.

Candidate objects:

```
Nucleus
ContractInput
ValidatedContract
EffectContext
EffectGate
AuditRecord
LatticraError
Result&lt;T, E&gt;
```

Tasks:

- [ ] Add Result<T, E> or equivalent.
- [ ] Add typed error enum.
- [ ] Add immutable validated contract object.
- [ ] Add effect gate stub.
- [ ] Add audit record stub.
- [ ] Add tests for denied, invalid, and accepted paths.
- [ ] Avoid raw owning pointers.
- [ ] Avoid exceptions across ABI.

Exit criteria:

- C ABI wraps C++ authority logic;
- policy decisions live above C substrate;
- audit path exists even if minimal.

6. Phase 4 — Contract language preparation

Objective: Prepare Latticra contract parsing and validation.

Tasks:

- [ ] Define smallest contract syntax or data model.
- [ ] Separate parse from validation.
- [ ] Reject malformed input.
- [ ] Reject unsupported declarations.
- [ ] Convert accepted input into typed validated objects.
- [ ] Add fuzzing target for parser when practical.
- [ ] Add tests for malformed, oversized, and boundary inputs.

Exit criteria:

- raw contract input never directly drives privileged behavior;
- only validated contract objects enter authority logic.

7. Phase 5 — Effect gates and audit trail

Objective: Make privileged mutation visible and governed.

Tasks:

- [ ] Define effect categories.
- [ ] Define authorization context.
- [ ] Define denied behavior.
- [ ] Define audit record format.
- [ ] Add tests for denied effects.
- [ ] Add tests for accepted effects.
- [ ] Add tests confirming audit output exists.

Exit criteria:

- every privileged mutation path has an effect gate;
- every security-relevant gate produces audit evidence.

8. Phase 6 — Tooling and hardening

Objective: Make the security profile enforceable.

Tasks:

- [ ] Add strict compiler warnings.
- [ ] Add sanitizer build mode where supported.
- [ ] Add static analysis target where supported.
- [ ] Add clang-tidy config where supported.
- [ ] Add fuzz target for parsers.
- [ ] Add dependency review notes.
- [ ] Add unsafe exception template to PR/review process.

Exit criteria:

- build/test path catches common C/C++ errors early;
- exceptions are documented rather than hidden.

9. Phase 7 — Public evidence and status

Objective: Align public claims with real evidence.

Tasks:

- [ ] Add public status document.
- [ ] List supported platforms honestly.
- [ ] List unsupported platforms honestly.
- [ ] List security work completed.
- [ ] List security work still planned.
- [ ] Avoid claiming hardened status before validation.

Exit criteria:

- public communication reflects actual implementation state;
- no security marketing outruns the evidence.

10. Initial milestone recommendation

Recommended first milestone:

```
Milestone: latticra-foundation-docs-v0.1
Scope:
  - documentation map
  - language foundation doc
  - C/C++ security profile
  - C ABI boundary policy
  - roadmap
No implementation claims.
```

Recommended commit message:

```
Add Latticra C/C++ foundation documentation
```

11. Risk register

```
| Risk | Mitigation |
|---|---|
| Unrestricted C++ enters trusted core | Enforce C/C++ Security Profile and review labels. |
| C substrate grows too large | Keep C limited to ABI, platform, and boot substrate. |
| ABI carries unsafe lifetime assumptions | Require opaque handles, explicit buffer lengths, and
 status codes. |
| Security claims outrun implementation | Use evidence-bound promotion rule. |
| Dependency graph grows uncontrolled | Require dependency review. |
| Parser becomes attack surface | Separate parse/validate, add fuzzing, reject malformed input.
|
| Platform-specific code contaminates generic core | Isolate platform code under dedicated
directories. |
```

12. Definition of done for the direction

This direction is ready for deeper implementation when:

- the docs are committed;
- the repo structure reflects the layer model;
- the first ABI skeleton exists;
- the first C++ authority object exists;

- security profile rules are visible in review;
- tests exist for invalid input and boundary cases;
- public messaging remains precise and evidence-bound.

docs/SERVER_INTERACTION_MODEL.md

Source title: Latticra Server Interaction Model

Lines: 120 | Words: 397 | SHA-256: cd6e6b6b70cebc0ad78f8aa1c584d2b15aee5f3cf2878fdcf6502c0a3d8974b5

Latticra Server Interaction Model

Status: initial server interaction model Scope: optional server connectivity, signed artifacts, evidence sync, package/update interactions, and boundaries.

Purpose

Latticra should design server interaction from the beginning.

Server connectivity must be explicit, signed where relevant, inspectable, and optional unless a deployment profile requires it.

Core rule

Latticra must remain locally operable by default.

Server interaction is a gated capability, not a hidden dependency.

Server roles

```
| Server role | Purpose | Initial status |
| --- | --- | --- |
| Update server | Signed update manifests and version metadata. | Planned. |
| Evidence server | Validation reports, evidence bundles, hardware profile records. | Planned. |
| Package server | Lat, L-UI, and supervisor module packages. | Planned. |
| Support server | Diagnostic report submission and support guidance. | Planned. |
| Trust metadata server | Keys, revocation metadata, trust roots, and policy bundles. | Planned.
 |
```

Network effect boundary

Any server interaction is at least:

```
effect = network
```

If server interaction writes local artifacts, it is also:

```
effect = local_mutation
```

If it changes boot, recovery, hardware, or supervisor behavior, additional gates are required.

Required server request record

Every server request should eventually record:

```
request_id
server_role
endpoint_identity
method
network_effect
local_write_effect
signature_required
signature_result
operator_confirmation
result
failure_reason
```

Trust requirements

Server-provided artifacts must not be accepted as trusted merely because they downloaded successfully.

Future artifact acceptance should require:

- manifest identity;
- signature verification;
- hash verification;
- channel policy;
- version policy;
- rollback compatibility;
- evidence record.

Local-first operation

The following must work without server access:

- local state reports;
- no-effect fixtures;
- local validation;
- local evidence review;
- local non-claims review;
- local architecture documentation.

Server gateway

Nucleus should eventually route all server interaction through a Server Gateway.

No component should bypass the Server Gateway for network behavior.

Failure behavior

Server failure must be visible and non-destructive by default.

Failure states:

```
unavailable
signature_failed
hash_mismatch
policy_denied
channel_denied
rollback_incompatible
operator_denied
unknown_failure
```

Initial implementation target

No server interaction should be implemented first.

The first server-related implementation should be a static server interaction contract fixture and validation test.

Non-claims

This document does not implement networking, package downloads, update servers, support servers, or trust servers.

It defines the server interaction model before implementation begins.

docs/SUPERVISOR_ARCHITECTURE.md

Source title: Nucleus Supervisor Architecture

Lines: 159 | Words: 512 | SHA-256: 91443ff80d00ecce710073fa0b4158084cc2f4782c38c1464ac8767308bdcf93

Nucleus Supervisor Architecture

Status: initial supervisor architecture Scope: Latticra supervisor, orchestration responsibilities, state ownership, gates, and non-claims.

Purpose

Nucleus is the planned Latticra supervisor and orchestration core.

It should be designed from the beginning as a disciplined system supervisor, not as an experimental shell and not as a simulation loop.

Responsibilities

Nucleus owns or coordinates:

- state lattice identity;
- transition requests;
- policy evaluation;
- effect gates;
- task orchestration;
- update staging;
- rollback visibility;
- server interaction gates;
- operator-visible reports;
- evidence records;
- language boundaries for Lat-family documents.

Initial boundaries

Nucleus does not initially provide:

- hardware boot control;
- disk modification;
- recovery action;
- silent self-update behavior;
- kernel behavior;
- hypervisor behavior;
- security-boundary guarantees;
- general third-party code isolation;
- system integrity guarantees.

Core components

```
Nucleus
  State Lattice
  Policy Engine
  Effect Gate
  Task Engine
  Update Engine
  Server Gateway
  Report Engine
  Lat Boundary
  Evidence Recorder
```

State Lattice

The State Lattice stores explicit state cells, paths, routes, axes, traces, breadcrumbs, and effect labels.

Early state must be read-only and fixture-backed.

Policy Engine

The Policy Engine answers:

```
Is this request allowed?
Why or why not?
What evidence level is required?
What gate is required?
What effect is possible?
```

Effect Gate

The Effect Gate controls whether a request may produce no effect, a read effect, a local mutation, a host mutation, a network effect, a hardware effect, a boot effect, a recovery effect, or an external effect.

Task Engine

The Task Engine handles only approved tasks.

Early implementation should support only dry-run and preview tasks.

Update Engine

The Update Engine handles signed staged updates, channels, verification, rollback slots, and post-update validation.

It must never perform silent updates.

Server Gateway

The Server Gateway handles optional and signed server interaction.

It must keep local operation possible unless a deployment profile explicitly requires server connectivity.

Report Engine

The Report Engine produces operator-visible state, effect, risk, health, lock, update, and evidence reports.

Lat Boundary

The Lat Boundary controls how Lat, L-UI, and future Lat-Orch documents are parsed, validated, and handled.

Early Lat behavior should be assertion/report only.

Evidence Recorder

The Evidence Recorder captures validation level, source, target, effect, result, failure behavior, and promotion status.

Request lifecycle

```
operator request
  -&gt; parse
  -&gt; classify
  -&gt; policy check
  -&gt; effect gate
  -&gt; preview/report
  -&gt; explicit confirmation if required
  -&gt; carry out only if allowed
  -&gt; record evidence
  -&gt; report result
```

Effect-first design

Every Nucleus request must carry an effect label.

If the effect cannot be classified, the request is denied.

Failure-first design

Every mutating or external action must define:

- failure result;
- rollback or recovery boundary;
- operator-visible reason;
- evidence record;
- post-action validation.

Initial Nucleus milestone

The first Nucleus milestone is not a full supervisor.

It is:

```
state lattice fixture
policy classification
no-effect report
invariant tests
```

Non-claims

This document does not claim Nucleus is implemented.

It defines the intended supervisor architecture before implementation begins.

Source title: Latticra Language Foundation

Lines: 201 | Words: 893 | SHA-256: eef8b4d9e4c5d4d9e752b93cbb7d250924530471320503f0f7e9544700a9ed83

Latticra Language Foundation

Status: Draft Layer: Architecture Applies to: Latticra core, trusted runtime design, language substrate, security-facing documentation.

1. Direction

Latticra is moving toward a constrained C/C++ foundation.

The goal is not to use C/C++ casually. The goal is to use C and C++ in a disciplined, security-governed form suitable for a low-level, contract-driven systems project.

The intended stack is:

```
Latticra
■■■ Latticra contract language
■   ■■■ declarations
■   ■■■ policies
■   ■■■ validation forms
■   ■■■ system descriptions
■   ■■■ human-facing control surfaces
■
■■■ Restricted C++ governed authority layer
■   ■■■ Nucleus logic
■   ■■■ state lattice transitions
■   ■■■ policy objects
■   ■■■ validators
■   ■■■ effect gates
■   ■■■ audit records
■   ■■■ typed resource ownership
■
■■■ C secure substrate
■   ■■■ boot paths
■   ■■■ ABI boundaries
■   ■■■ platform shims
■   ■■■ fixed-layout structures
■   ■■■ freestanding runtime support
■   ■■■ hardware-facing interfaces
■
■■■ platform-specific assembly or firmware interfaces
```

Core phrase:

C is the metal. C++ is the disciplined structure. Latticra is the contract.

2. Rationale

Latticra requires:

- deep platform control;
- clear ABI boundaries;
- freestanding and low-level implementation paths;
- audit-visible security transitions;
- explicit trust boundaries;
- long-lived independence from unnecessary dependency churn;
- predictable integration with boot, hardware, runtime, and toolchain surfaces.

C gives Latticra a narrow, stable substrate for platform-facing interfaces.

C++ gives Latticra stronger structure above that substrate when it is constrained by project rules: RAII, typed ownership, value objects, explicit status returns, validators, and policy types.

The Latticra contract language sits above both layers and expresses declarations, authority boundaries, policy intent, and system-visible commitments.

3. Non-goals

This direction does not mean:

- unrestricted C++ is acceptable;
- large dependency graphs are acceptable;
- raw pointer ownership is acceptable in trusted core code;
- unchecked buffer behavior is acceptable;
- undefined behavior is an acceptable engineering cost;
- memory safety concerns are dismissed;
- marketing claims can outrun evidence.

Latticra must remain honest about C/C++ risk. Security must come from architecture, review, tooling, tests, and narrow boundaries.

4. Architectural roles

4.1 C secure substrate

C is limited to substrate responsibilities:

- boot entry and early runtime;
- C ABI exposure;
- platform shims;
- fixed-layout interop structures;
- minimal hardware-facing interfaces;
- freestanding runtime helpers;
- thin wrappers over platform-specific mechanisms.

C should not own high-level policy decisions unless no higher layer exists yet.

4.2 Restricted C++ governed authority layer

Restricted C++ owns the higher structure:

- Nucleus supervision;
- state lattice logic;
- typed security transitions;
- effect gate dispatch;
- validators;
- audit trail assembly;
- resource ownership;
- capability objects;
- policy evaluation;
- deterministic failure handling.

C++ code in this layer must follow the Latticra C/C++ Security Profile.

4.3 Latticra contract language

The Latticra language expresses system intent above the implementation foundation.

It should describe:

- what authority exists;
- what transitions are allowed;
- what validation must occur;
- what evidence is required;
- what effects may be attempted;
- what audit record must be produced;
- what failure state is safe.

The contract language should never hide unsafe behavior. It should make authority visible.

5. Security posture

Latticra treats unsafe power as explicit.

Every privileged action should pass through these conceptual stages:

```
request
  -&gt; parse
  -&gt; validate
  -&gt; authorize
  -&gt; effect gate
  -&gt; execute
  -&gt; audit
  -&gt; report
```

The central design rule:

No privileged mutation without validation, authorization, effect gating, and audit visibility.

6. Layer boundaries

Layer boundaries should be treated as security boundaries.

```
| Boundary | Rule |
|---|---|
| Latticra language -&gt; C++ | Contracts must be parsed, validated, and transformed into typed
policy objects. |
| C++ -&gt; C | No ownership, lifetime, or unchecked mutable buffer may cross implicitly. |
| C -&gt; platform | Platform-specific code must be isolated, documented, and reviewable. |
| Any layer -&gt; privileged effect | Must pass through an effect gate. |
```

7. Naming recommendations

Suggested terms for public/project documentation:

- Secure Substrate for the C layer.
- Governed Authority Layer for the restricted C++ layer.
- Contract Language for the Latticra language layer.
- Effect Gate for controlled privileged action paths.
- Evidence-bound validation for claims that require testable proof.
- Nucleus for the core supervisory authority.

8. Public wording

Preferred:

Latticra uses a minimal C substrate for ABI, boot, and platform-facing interfaces, with a constrained C++ authority layer above it for policy, validation, effect gates, audit logic, and typed security transitions.

Avoid:

C++ makes Latticra secure.

Better:

Latticra uses constrained C/C++ with explicit security contracts, narrow unsafe boundaries, build hardening, static analysis, sanitizer testing, fuzzing, and evidence-bound validation.

9. Current status language

Use this status language until implementation evidence exists:

This direction is architectural and preparatory. It defines the intended foundation and security posture. It is not yet a completed hardened implementation.

10. Acceptance criteria

This architecture can be considered ready for implementation work when:

- the C/C++ Security Profile exists and is checked into the repo;
- ABI boundary rules are documented;
- build flags and analyzer expectations are documented;
- a roadmap exists for staged migration or implementation;
- public wording avoids unsupported security claims;
- early tests enforce at least some documentation invariants.

docs/L_UI_AST_DETAILED_REPORT_CONTRACT.md

Source title: Latticra L-UI AST Detailed Report Contract

Lines: 368 | Words: 879 | SHA-256: f88b2d3b93981e37efc5a88821fccdc6e3590e7a8e2baba5937d2462f4bc32a6

Latticra L-UI AST Detailed Report Contract

Status: detailed report contract Scope: deterministic rail, field, text, source-span, and no-effect reporting for the fixed-size L-UI AST.

Purpose

This document defines the detailed report contract for the L-UI AST.

The AST implementation exposes a compact summary report and a detailed metadata report. The detailed report makes card, rail, field, text, and source-span metadata visible without adding rendering, traversal runtime, command behavior, live movement, mutation, or external effects.

The implementation is documented separately in L_UI_AST_DETAILED_REPORT_IMPLEMENTATION.md.

Current boundary

The current AST implementation provides:

```
fixed-size AST metadata
card summary
rail metadata
field metadata
text metadata
source spans
compact AST summary report
detailed AST metadata report
no-effect flags
```

This contract does not add:

```
interactive UI behavior
renderer integration
command behavior
Nucleus task handling
live movement
state mutation
server interaction
update behavior
recovery behavior
hardware behavior
boot behavior
```

Detailed report purpose

A detailed AST report provides deterministic, inspectable text for validated L-UI metadata.

It supports:

- reviewing the parsed card;
- inspecting rail order and counts;
- inspecting field names and bindings;
- inspecting text nodes;
- inspecting source spans for populated nodes;
- debugging fixture changes;
- future tooling that consumes stable text output.

It remains metadata-only.

Report function

Implemented public function:

```
latticra_l_ui_ast_detailed_report
```

Signature:

```
latticra_status_t latticra_l_ui_ast_detailed_report(
    const latticra_l_ui_ast_result_t *ast,
    char *buffer,
    size_t buffer_len);
```

This is additive and does not change the existing compact AST report.

Report capacity

The bounded capacity is:

```
LATTICRA_L_UI_AST_DETAILED_REPORT_MAX = 16384
```

The detailed report is larger than the compact AST report because it renders all populated rails, fields, text nodes, source spans, and binding spans.

Top-level report shape

The report starts with:

```
L-UI AST DETAILED REPORT
```

```
card=NucleusPreview
purpose=operator-visible Nucleus preview report
effect=none
boundary=preview_only
rail_count=9
field_count=23
text_count=2
no_effect=1
execution_allowed=0
mutation_allowed=0
server_allowed=0
recovery_allowed=0
hardware_allowed=0
```

Span field format

Every node section that includes a span renders:

```
span_start_offset=&lt;n&gt;
span_end_offset=&lt;n&gt;
span_start_line=&lt;n&gt;
span_start_column=&lt;n&gt;
span_end_line=&lt;n&gt;
span_end_column=&lt;n&gt;
```

The span field names match existing parser and diagnostic report span fields.

Card section

The card section renders:

```
[card]
kind=card
name=NucleusPreview
purpose=operator-visible Nucleus preview report
effect=none
boundary=preview_only
rail_count=9
field_count=23
text_count=2
span_start_offset=&lt;n&gt;
span_end_offset=&lt;n&gt;
span_start_line=&lt;n&gt;
span_start_column=&lt;n&gt;
span_end_line=&lt;n&gt;
span_end_column=&lt;n&gt;
```

Rail section

Each rail renders in AST order:

```
[rail &lt;index&gt;]
kind=rail
name=&lt;rail-name&gt;
first_field_index=&lt;n&gt;
field_count=&lt;n&gt;
first_text_index=&lt;n&gt;
text_count=&lt;n&gt;
span_start_offset=&lt;n&gt;
span_end_offset=&lt;n&gt;
span_start_line=&lt;n&gt;
span_start_column=&lt;n&gt;
span_end_line=&lt;n&gt;
span_end_column=&lt;n&gt;
```

Required rail order:

```
top
state
trace
safety
gates
effects
policy
execution
bottom
```

Field section

Each field renders in AST order:

```
[field &lt;index&gt;]
kind=field
name=&lt;field-name&gt;
binding=&lt;binding-path&gt;
span_start_offset=&lt;n&gt;
span_end_offset=&lt;n&gt;
span_start_line=&lt;n&gt;
span_start_column=&lt;n&gt;
span_end_line=&lt;n&gt;
span_end_column=&lt;n&gt;
binding_span_start_offset=&lt;n&gt;
binding_span_end_offset=&lt;n&gt;
binding_span_start_line=&lt;n&gt;
binding_span_start_column=&lt;n&gt;
binding_span_end_line=&lt;n&gt;
binding_span_end_column=&lt;n&gt;
```

Field sections must not treat bindings as executable references.

Text section

Each text node renders in AST order:

```
[text &lt;index&gt;]
kind=text
value=&lt;literal-text&gt;
span_start_offset=&lt;n&gt;
span_end_offset=&lt;n&gt;
span_start_line=&lt;n&gt;
span_start_column=&lt;n&gt;
span_end_line=&lt;n&gt;
span_end_column=&lt;n&gt;
```

Text sections must not treat text values as commands.

Determinism rules

Detailed AST reports must be deterministic.

Rules:

1. Report sections must appear in a fixed order.
2. Rails must appear in AST rail order.
3. Fields must appear in AST field order.
4. Text nodes must appear in AST text order.
5. Missing/unpopulated capacity slots must not be printed.
6. Repeated calls with the same AST must produce identical text.
7. Output must not include memory addresses.
8. Output must not depend on platform locale.

Escaping policy

The first detailed report emits current fixture text literally because the fixture text is controlled.

Before accepting broader L-UI text values, a future escaping contract should define how to render newlines, tabs, quotes, and non-printable bytes.

Failed parse behavior

If AST construction failed due to a parser error, detailed reporting returns a compact failed-parse report:

```
L-UI AST DETAILED REPORT
parse_error=&lt;error-label&gt;
rail_count=0
field_count=0
text_count=0
no_effect=1
execution_allowed=0
mutation_allowed=0
server_allowed=0
recovery_allowed=0
hardware_allowed=0
```

No partial AST nodes are printed for failed parses.

No-effect rule

Detailed reporting is metadata output only.

It preserves:

```
no_effect=1
execution_allowed=0
mutation_allowed=0
server_allowed=0
recovery_allowed=0
hardware_allowed=0
```

Compatibility rule

The detailed report is additive.

It does not change:

```
latticra_l_ui_ast_report
latticra_l_ui_parse_ast
latticra_l_ui_parse_source
latticra_l_ui_parse_result_report
latticra_l_ui_diagnostic_report
```

Implementation gate

Detailed AST report implementation required a separate implementation plan defining:

1. public API addition;
2. report capacity;
3. exact section order;
4. failed-parse behavior;
5. escaping policy for current fixture;
6. test file names;
7. exact invariant tests;
8. compatibility expectations.

That plan is recorded in L_UI_AST_DETAILED_REPORT_IMPLEMENTATION_PLAN.md.

Test list

Detailed report implementation tests verify:

```
detailed_report_contains_title
detailed_report_contains_card_section
detailed_report_contains_all_rails
detailed_report_contains_all_fields
detailed_report_contains_all_text_nodes
detailed_report_preserves_rail_order
detailed_report_preserves_field_order
detailed_report_preserves_text_order
detailed_report_includes_card_span
detailed_report_includes_rail_spans
detailed_report_includes_field_spans
```

```
detailed_report_includes_binding_spans
detailed_report_includes_text_spans
detailed_report_preserves_no_effect_flags
detailed_report_is_deterministic
detailed_report_rejects_bad_arguments
detailed_report_rejects_small_buffers
detailed_report_omits_unused_capacity_slots
detailed_report_handles_failed_parse
```

Forbidden behavior

A detailed report implementation must not:

- add file I/O to parser code;
- write files;
- open network connections;
- call server code;
- call update code;
- call recovery code;
- call hardware code;
- mutate state lattice;
- perform live movement;
- run L-UI behavior;
- render an interactive UI;
- treat text nodes as commands;
- treat bindings as executable references;
- emit memory addresses.

Current validation command

This contract is guarded by:

```
sh scripts/test-l-ui-ast-detailed-report-contract.sh
```

The guard is static. It validates the contract text.

Non-claims

This document does not implement L-UI rendering, command behavior, Nucleus task handling, live movement, origin mutation, recovery behavior, server interaction, self-update, hardware support, boot readiness, security isolation, sandboxing, or operating-system completeness.

docs/L_UI_AST_DETAILED_REPORT_IMPLEMENTATION.md

Source title: Latticra L-UI AST Detailed Report Implementation

Lines: 242 | Words: 632 | SHA-256: a7cb7e01e5282ef7e3cfaee4774cb95c60feea87ba3016b173502597edac1deb

Latticra L-UI AST Detailed Report Implementation

Status: implementation contract Scope: bounded detailed AST reporting for card, rail, field, text, source-span, escaped string, source-backed text, and no-effect metadata.

Purpose

The L-UI AST Detailed Report implementation renders deterministic text for the fixed-size L-UI AST metadata model.

It makes card, rail, field, source-backed text, source-span, binding-span, and escaped string metadata visible without adding rendering, command behavior, Nucleus task handling, live movement, state mutation, server interaction, recovery behavior, self-update behavior, hardware behavior, or boot behavior.

Implementation files

```
include/latticra/l_ui_parser.h
src/l_ui_parser_ast.c
tests/l_ui_parser_ast_detailed_report_invariants.c
tests/l_ui_ast_escaped_string_report_invariants.c
tests/l_ui_ast_source_backed_text_invariants.c
scripts/test-l-ui-ast-detailed-report.sh
scripts/test-l-ui-ast-escaped-string-report.sh
scripts/test-l-ui-ast-source-backed-text.sh
```

Public API

```
latticra_l_ui_ast_detailed_report
```

Report capacity

```
LATTICRA_L_UI_AST_DETAILED_REPORT_MAX = 16384
```

The detailed report is larger than the compact AST report because it prints every populated rail, field, text node, source span, binding span, and escaped string field.

Report shape

The report starts with:

```
L-UI AST DETAILED REPORT
card=NucleusPreview
purpose=operator-visible Nucleus preview report
effect=none
boundary=preview_only
rail_count=9
field_count=23
text_count=2
no_effect=1
execution_allowed=0
mutation_allowed=0
server_allowed=0
recovery_allowed=0
hardware_allowed=0
```

Then it renders sections in deterministic order:

```
[card]
[rail 0] ... [rail 8]
[field 0] ... [field 22]
[text 0] ... [text 1]
```

Unused capacity slots are not printed.

Source-backed report values

The detailed report reflects source-backed AST values for:

```
purpose=&lt;literal-purpose&gt;
value=&lt;literal-text&gt;
```

When validated source purpose/text values change, detailed report literal and escaped fields change with the AST-owned copies.

Escaped string fields

The detailed report keeps existing literal fields and adds escaped variants:

```
purpose=&lt;literal-purpose&gt;
purpose_escaped=&lt;escaped-purpose&gt;
value=&lt;literal-text&gt;
value_escaped=&lt;escaped-text&gt;
```

Escaped fields are additive and appear only in:

```
[card]
[text &lt;index&gt;]
```

Escaped fields do not appear in failed-parse reports.

Span fields

Node spans render as:

```
span_start_offset=&lt;n&gt;
span_end_offset=&lt;n&gt;
span_start_line=&lt;n&gt;
span_start_column=&lt;n&gt;
span_end_line=&lt;n&gt;
span_end_column=&lt;n&gt;
```

Field binding spans render as:

```
binding_span_start_offset=&lt;n&gt;
binding_span_end_offset=&lt;n&gt;
binding_span_start_line=&lt;n&gt;
binding_span_start_column=&lt;n&gt;
binding_span_end_line=&lt;n&gt;
binding_span_end_column=&lt;n&gt;
```

Failed parse behavior

If AST construction contains a parser error, the detailed report renders a compact failed-parse report:

```
L-UI AST DETAILED REPORT
parse_error=&lt;error-label&gt;
rail_count=0
field_count=0
text_count=0
no_effect=1
execution_allowed=0
mutation_allowed=0
server_allowed=0
recovery_allowed=0
hardware_allowed=0
```

No partial AST nodes, source-backed text values, or escaped fields are printed for failed parses.

Escaping policy

Escaped string fields use the byte-oriented escaping model documented in:

```
docs/L_UI_AST_ESCAPED_STRING_REPORT_IMPLEMENTATION.md
```

The implementation renders current literal fields for compatibility while adding escaped fields for fixture-safe comparisons and future broader text handling.

Compatibility

The implementation does not change:

```
latticra_l_ui_ast_report
latticra_l_ui_parse_ast
latticra_l_ui_parse_source
latticra_l_ui_parse_result_report
latticra_l_ui_diagnostic_report
latticra_l_ui_ast_detailed_report existing required fields
```

No-effect boundary

Detailed reporting preserves:

```
no_effect=1
```

```
execution_allowed=0
mutation_allowed=0
server_allowed=0
recovery_allowed=0
hardware_allowed=0
```

Test commands

Run:

```
sh scripts/test-l-ui-ast-detailed-report.sh
sh scripts/test-l-ui-ast-escaped-string-report.sh
sh scripts/test-l-ui-ast-source-backed-text.sh
```

The main C workflow runs these checks after the detailed report implementation-plan guard, escaped string report implementation-plan guard, and source-backed text implementation-plan guard.

Required invariants

The detailed report tests verify:

```
detailed_report_contains_title
detailed_report_contains_card_section
detailed_report_contains_all_rails
detailed_report_contains_all_fields
detailed_report_contains_all_text_nodes
detailed_report_preserves_rail_order
detailed_report_preserves_field_order
detailed_report_preserves_text_order
detailed_report_includes_card_span
detailed_report_includes_rail_spans
detailed_report_includes_field_spans
detailed_report_includes_binding_spans
detailed_report_includes_text_spans
detailed_report_preserves_no_effect_flags
detailed_report_is_deterministic
detailed_report_rejects_bad_arguments
detailed_report_rejects_small_buffers
detailed_report_omits_unused_capacity_slots
detailed_report_handles_failed_parse
```

The escaped string report tests verify additive escaped purpose/text fields and byte-oriented escaping behavior.

The source-backed text tests verify detailed report literal and escaped fields update from validated source values.

Current evidence level

This implementation is an L2 tested detailed metadata, escaped string, and source-backed text report for the fixed-size L-UI AST.

It is not a renderer, UI runtime, command surface, Nucleus task runner, server client, update engine, recovery system, hardware system, boot system, or security boundary.

Next implementation step

The next implementation candidate after source-backed text extraction is:

```
L-UI string-literal escape contract
```

That future work should define whether and how string escapes are decoded before AST extraction decodes escape sequences.

Non-claims

This document and implementation do not claim L-UI rendering, command behavior, Nucleus task handling, live movement, origin mutation, recovery behavior, server interaction, self-update, hardware support, boot readiness, security isolation, sandboxing, or operating-system completeness.

docs/L_UI_AST_DETAILED_REPORT_IMPLEMENTATION_PLAN.md

Source title: Latticra L-UI AST Detailed Report Implementation Plan

Lines: 378 | Words: 826 | SHA-256: 075e0b900bc4974c7099a44f65e5f587fec78deabcedc2c6940b652cd6698960

Latticra L-UI AST Detailed Report Implementation Plan

Status: implementation planning contract Scope: public API addition, report capacity, exact section order, failed-parse behavior, escaping policy, exact tests, and compatibility expectations before detailed AST report code.

Purpose

This document defines the implementation plan for the L-UI AST detailed report.

The detailed report contract is already merged and guarded. This plan decides the exact public API addition, capacity, report section order, failed-parse behavior, escaping policy, exact tests, and compatibility expectations before implementation code is added.

Relationship to previous contracts

This plan depends on:

```
docs/L_UI_AST_DETAILED_REPORT_CONTRACT.md
docs/L_UI_PARSER_AST_IMPLEMENTATION.md
include/latticra/l_ui_parser.h
src/l_ui_parser_ast.c
```

Those files remain the source of truth for AST metadata, compact AST reporting, source spans, and no-effect boundaries.

Implementation language decision

The detailed AST report implementation should be in C.

Reason:

- the AST implementation is in C;
- AST report APIs are C ABI surfaces;
- report generation should remain bounded and deterministic;
- the current C workflow can validate report invariants;
- no dynamic runtime should be required.

Public API addition

Add to:

```
include/latticra/l_ui_parser.h
#define LATTICRA_L_UI_AST_DETAILED_REPORT_MAX 16384u

latticra_status_t latticra_l_ui_ast_detailed_report(
    const latticra_l_ui_ast_result_t *ast,
    char *buffer,
    size_t buffer_len);
```

This must be additive. Existing AST, parser, diagnostics, location, and source-span APIs must remain unchanged.

Module shape

Update:

```
include/latticra/l_ui_parser.h
src/l_ui_parser_ast.c
tests/l_ui_parser_ast_detailed_report_invariants.c
```

```
scripts/test-l-ui-ast-detailed-report.sh
.github/workflows/c.yml
```

Detailed report generation should live in src/l_ui_parser_ast.c with the compact AST report.

Report capacity

Use:

```
LATTICRA_L_UI_AST_DETAILED_REPORT_MAX = 16384
```

The report function must return LATTICRA_STATUS_BUFFER_TOO_SMALL when the provided buffer cannot hold the full deterministic report.

Failed-parse behavior

The first implementation should render a compact failed-parse detailed report instead of rejecting report generation.

Shape:

```
L-UI AST DETAILED REPORT
parse_error=&lt;error-label&gt;
rail_count=0
field_count=0
text_count=0
no_effect=1
execution_allowed=0
mutation_allowed=0
server_allowed=0
recovery_allowed=0
hardware_allowed=0
```

This keeps report generation deterministic for failed parses while not emitting partial AST nodes.

Escaping policy

The first implementation may render current fixture text literally.

Allowed literal values:

```
Latticra / Nucleus Preview / effect-bound
preview-only no-live-movement no-host-effect no-external-effect
operator-visible Nucleus preview report
```

The implementation must not introduce a broader escaping model yet. A future escaping contract should define broader string rendering.

Exact section order

A successful detailed report must render sections in this order:

```
1. top-level summary
2. card section
3. rail sections in AST order
4. field sections in AST order
5. text sections in AST order
```

No unused capacity slots may be printed.

Top-level summary format

```
L-UI AST DETAILED REPORT
card=NucleusPreview
purpose=operator-visible Nucleus preview report
effect=none
boundary=preview_only
rail_count=9
field_count=23
text_count=2
no_effect=1
execution_allowed=0
mutation_allowed=0
server_allowed=0
recovery_allowed=0
hardware_allowed=0
```

Card section format

```
[card]
kind=card
name=NucleusPreview
purpose=operator-visible Nucleus preview report
effect=none
boundary=preview_only
rail_count=9
field_count=23
text_count=2
span_start_offset=&lt;n&gt;
span_end_offset=&lt;n&gt;
span_start_line=&lt;n&gt;
span_start_column=&lt;n&gt;
span_end_line=&lt;n&gt;
span_end_column=&lt;n&gt;
```

Rail section format

For each populated rail:

```
[rail &lt;index&gt;]
kind=rail
name=&lt;rail-name&gt;
first_field_index=&lt;n&gt;
field_count=&lt;n&gt;
first_text_index=&lt;n&gt;
text_count=&lt;n&gt;
span_start_offset=&lt;n&gt;
span_end_offset=&lt;n&gt;
span_start_line=&lt;n&gt;
span_start_column=&lt;n&gt;
span_end_line=&lt;n&gt;
span_end_column=&lt;n&gt;
```

Required order:

```
top
state
trace
safety
gates
effects
policy
execution
bottom
```

Field section format

For each populated field:

```
[field &lt;index&gt;]
kind=field
name=&lt;field-name&gt;
binding=&lt;binding-path&gt;
span_start_offset=&lt;n&gt;
span_end_offset=&lt;n&gt;
span_start_line=&lt;n&gt;
span_start_column=&lt;n&gt;
span_end_line=&lt;n&gt;
span_end_column=&lt;n&gt;
```

```
binding_span_start_offset=&lt;n&gt;
binding_span_end_offset=&lt;n&gt;
binding_span_start_line=&lt;n&gt;
binding_span_start_column=&lt;n&gt;
binding_span_end_line=&lt;n&gt;
binding_span_end_column=&lt;n&gt;
```

Text section format

For each populated text node:

```
[text &lt;index&gt;]
kind=text
value=&lt;literal-text&gt;
span_start_offset=&lt;n&gt;
span_end_offset=&lt;n&gt;
span_start_line=&lt;n&gt;
span_start_column=&lt;n&gt;
span_end_line=&lt;n&gt;
span_end_column=&lt;n&gt;
```

Helper plan

The implementation may add private helpers in src/l_ui_parser_ast.c:

```
append_text
append_span_fields
append_card_section
append_rail_section
append_field_section
append_text_section
append_failed_parse_report
```

Helpers should remain private and bounded.

Compatibility expectations

The detailed report implementation must not change:

```
latticra_l_ui_ast_report
latticra_l_ui_parse_ast
latticra_l_ui_parse_source
latticra_l_ui_parse_result_report
latticra_l_ui_diagnostic_report
```

Existing parser, diagnostic, source-span, location, and compact AST tests must continue to pass.

No-effect preservation

Detailed reporting must preserve:

```
no_effect=1
execution_allowed=0
mutation_allowed=0
server_allowed=0
recovery_allowed=0
hardware_allowed=0
```

Exact implementation test list

The implementation PR should include tests for:

```
detailed_report_contains_title
detailed_report_contains_card_section
detailed_report_contains_all_rails
detailed_report_contains_all_fields
detailed_report_contains_all_text_nodes
detailed_report_preserves_rail_order
detailed_report_preserves_field_order
detailed_report_preserves_text_order
detailed_report_includes_card_span
detailed_report_includes_rail_spans
detailed_report_includes_field_spans
detailed_report_includes_binding_spans
detailed_report_includes_text_spans
detailed_report_preserves_no_effect_flags
```

```
detailed_report_is_deterministic
detailed_report_rejects_bad_arguments
detailed_report_rejects_small_buffers
detailed_report_omits_unused_capacity_slots
detailed_report_handles_failed_parse
```

Test file plan

Add:

```
tests/l_ui_parser_ast_detailed_report_invariants.c
scripts/test-l-ui-ast-detailed-report.sh
```

Wire into:

```
.github/workflows/c.yml
```

Documentation requirement

The implementation PR should update:

```
README.md
docs/FOUNDATION_INDEX.md
docs/L_UI_AST_DETAILED_REPORT_CONTRACT.md
docs/L_UI_PARSER_AST_IMPLEMENTATION.md
```

and add:

```
docs/L_UI_AST_DETAILED_REPORT_IMPLEMENTATION.md
```

Forbidden implementation behavior

The detailed report implementation must not:

- add file I/O to parser or AST code;
- write files;
- open network connections;
- call server code;
- call update code;
- call recovery code;
- call hardware code;
- mutate state lattice;
- perform live movement;
- run L-UI behavior;
- render an interactive UI;
- treat text nodes as commands;
- treat bindings as executable references;
- emit memory addresses.

Current validation command

This plan is guarded by:

```
sh scripts/test-l-ui-ast-detailed-report-implementation-plan.sh
```

The guard is static. It does not implement detailed AST reporting.

Implementation gate

Detailed AST report implementation code may be added only after this plan is merged.

Non-claims

This document does not implement detailed AST reporting, L-UI rendering, command behavior, Nucleus task handling, live movement, origin mutation, recovery behavior, server interaction, self-update, hardware support, boot readiness, security isolation, sandboxing, or operating-system completeness.

docs/L_UI_AST_ESCAPED_STRING_REPORT_CONTRACT.md

Source title: Latticra L-UI AST Escaped String Report Contract

Lines: 309 | Words: 926 | SHA-256: 6c0a5bd771e1a2a1f803be5f57e4963e557ae285d3f43f3f19dcb21f35ff7357

Latticra L-UI AST Escaped String Report Contract

Status: escaped string report contract Scope: stable escaping rules for detailed AST report string values before broader L-UI text values are accepted.

Purpose

This document defines the escaped string report contract for L-UI AST reports.

The detailed AST report now includes additive escaped fields for current fixture text values. Before broader L-UI text values are accepted, these rules define stable escaping behavior for newlines, tabs, quotes, backslashes, control bytes, and non-printable bytes.

The implementation is documented separately in L_UI_AST_ESCAPED_STRING_REPORT_IMPLEMENTATION.md.

Current boundary

The current detailed AST report provides deterministic metadata for:

```
card
rails
fields
text nodes
source spans
binding spans
literal purpose/text fields
escaped purpose/text fields
no-effect flags
```

This contract does not add:

```
new parser grammar
new accepted text values
renderer integration
interactive UI behavior
command behavior
Nucleus task handling
live movement
state mutation
server interaction
update behavior
recovery behavior
hardware behavior
boot behavior
```

Escaping purpose

Escaped string reporting makes text output:

- deterministic;
- single-line when required;
- safe for logs;
- safe for fixture comparisons;

- independent of terminal behavior;
- independent of platform locale;
- unambiguous for quotes and backslashes;
- readable for common whitespace;
- explicit for control and non-printable bytes.

Escaping remains metadata-only.

Escaped fields

Escaping applies to report values that may contain arbitrary source text:

```
card.purpose
text.value
```

It may later apply to labels or bindings if broader syntax permits non-identifier bytes, but current labels and bindings remain controlled identifiers.

Report key naming

The first implementation adds escaped variants:

```
purpose_escaped=&lt;escaped-string&gt;
value_escaped=&lt;escaped-string&gt;
```

Existing literal keys remain:

```
purpose=&lt;literal-purpose&gt;
value=&lt;literal-text&gt;
```

Required escape sequences

Escaped string reporting supports:

```
| Input byte | Report text |
| --- | --- |
| newline LF `0x0A` | `\n` |
| carriage return CR `0x0D` | `\r` |
| horizontal tab `0x09` | `\t` |
| double quote `0x22` | `\&quot;` |
| backslash `0x5C` | `\\` |
| NUL `0x00` | `\x00` |
| other control bytes `0x01`-`0x1F` | `\xNN` |
| DEL `0x7F` | `\x7F` |
| non-ASCII bytes `0x80`-`0xFF` | `\xNN` |
```

Printable ASCII bytes from 0x20 through 0x7E, except double quote and backslash, may be emitted literally.

Hex format

Hex escapes must use uppercase hexadecimal digits:

```
\x00
\x09
\x1F
\x7F
\x80
\xFF
```

Lowercase hex output is not allowed.

Determinism rules

Escaped string output must be deterministic.

Rules:

1. The same byte sequence must always produce the same escaped text.
2. Escaped output must not depend on platform locale.
3. Escaped output must not depend on terminal capabilities.
4. Escaped output must not include memory addresses.
5. Escaped output must not include raw control bytes.
6. Escaped output must not include raw non-ASCII bytes.
7. Escaped output must be NUL-terminated in C buffers.
8. Escaped output must fail with a stable status when the destination buffer is too small.

Byte-oriented rule

Escaping is byte-oriented, not Unicode-codepoint-oriented.

The implementation treats input text as bytes and renders non-ASCII bytes with \xNN escapes. A future Unicode display contract may define higher-level behavior later.

Buffer sizing rule

Worst-case escaped size is four output characters per input byte plus the terminating NUL:

```
input_len * 4 + 1
```

The implementation uses private bounded buffers sized from the AST purpose/text capacities.

Helper function

The implementation uses a private helper:

```
escape_report_string
```

Helper shape:

```
static latticra_status_t escape_report_string(
    const char *input,
    size_t input_len,
    char *output,
    size_t output_len);
```

The helper remains private.

Detailed report integration

The detailed report renders:

```
purpose_escaped=&lt;escaped-purpose&gt;
value_escaped=&lt;escaped-text&gt;
```

Placement:

```
[card]
[text &lt;index&gt;]
```

Failed parse behavior

Escaping does not change failed-parse detailed report behavior.

Failed parse detailed reports continue to render:

```
parse_error=&lt;error-label&gt;
rail_count=0
field_count=0
text_count=0
```

Escaped fields do not appear in failed-parse reports.

Compatibility rule

Escaped string reporting is additive.

It does not change:

```
latticra_l_ui_ast_report
latticra_l_ui_parse_ast
latticra_l_ui_parse_source
latticra_l_ui_parse_result_report
latticra_l_ui_diagnostic_report
latticra_l_ui_ast_detailed_report existing required fields
```

No-effect rule

Escaped string reporting is metadata output only.

It preserves:

```
no_effect=1
execution_allowed=0
mutation_allowed=0
server_allowed=0
recovery_allowed=0
hardware_allowed=0
```

Implementation gate

Escaped string report implementation required a separate implementation plan defining:

1. public API decision;
2. private helper shape;
3. destination buffer sizes;
4. exact escaped report fields;
5. exact report placement;
6. too-small behavior;
7. test file names;
8. exact invariant tests;
9. compatibility expectations.

That plan is recorded in L_UI_AST_ESCAPED_STRING_REPORT_IMPLEMENTATION_PLAN.md.

Test list

Implementation tests verify:

```
escape_preserves_printable_ascii
escape_newline_as_backslash_n
escape_carriage_return_as_backslash_r
escape_tab_as_backslash_t
escape_quote_as_backslash_quote
escape_backslash_as_double_backslash
escape_nul_as_hex_00
escape_control_bytes_as_uppercase_hex
escape_del_as_uppercase_hex
escape_non_ascii_bytes_as_uppercase_hex
escape_rejects_small_buffers
escape_is_deterministic
detailed_report_contains_escaped_purpose
detailed_report_contains_escaped_text_values
detailed_report_escaped_fields_are_additive
detailed_report_escape_preserves_no_effect_flags
detailed_report_escape_does_not_change_failed_parse_report
```

Forbidden behavior

Escaped string implementation must not:

- add file I/O to parser or AST code;
- write files;
- open network connections;
- call server code;
- call update code;
- call recovery code;
- call hardware code;
- mutate state lattice;
- perform live movement;
- run L-UI behavior;
- render an interactive UI;
- treat text nodes as commands;
- treat bindings as executable references;
- emit memory addresses;
- emit raw control bytes in escaped fields;
- emit raw non-ASCII bytes in escaped fields.

Current validation command

This contract is guarded by:

```
sh scripts/test-l-ui-ast-escaped-string-report-contract.sh
```

The guard is static. It validates the contract text.

Non-claims

This document does not broaden accepted L-UI text syntax, implement Unicode display behavior, add L-UI rendering, add command behavior, add Nucleus task handling, add live movement, add origin mutation, add recovery behavior, add server interaction, add self-update, add hardware support, add boot readiness, claim security isolation, claim sandboxing, or claim operating-system completeness.

docs/L_UI_AST_ESCAPED_STRING_REPORT_IMPLEMENTATION.md

Source title: Latticra L-UI AST Escaped String Report Implementation

Lines: 207 | Words: 621 | SHA-256: 45b7595c90c514295231f2be0a72760ce6ba17a2b8dfc167731403584ff73f09

Latticra L-UI AST Escaped String Report Implementation

Status: initial implementation contract Scope: byte-oriented escaped string fields for detailed AST report metadata.

Purpose

The L-UI AST Escaped String Report implementation adds additive escaped string fields to the detailed AST report.

It keeps existing literal fields intact and adds escaped fields for report values that may later contain broader text bytes.

Implementation files

```
src/l_ui_parser_ast.c
tests/l_ui_ast_escaped_string_report_invariants.c
scripts/test-l-ui-ast-escaped-string-report.sh
```

Public API impact

No new public function is added.

Escaping is integrated into the existing detailed report API:

```
latticra_l_ui_ast_detailed_report
```

Private helper

The implementation adds a private helper in src/l_ui_parser_ast.c:

```
escape_report_string
```

The helper is byte-oriented and remains private.

Escaped report fields

The detailed AST report now includes additive escaped fields:

```
purpose_escaped=&lt;escaped-purpose&gt;
value_escaped=&lt;escaped-text&gt;
```

Existing literal fields remain:

```
purpose=&lt;literal-purpose&gt;
value=&lt;literal-text&gt;
```

Field placement

Escaped fields are placed as follows:

```
[card]
purpose=&lt;literal-purpose&gt;
purpose_escaped=&lt;escaped-purpose&gt;

[text &lt;index&gt;]
value=&lt;literal-text&gt;
value_escaped=&lt;escaped-text&gt;
```

Escaped fields are not added to rail sections, field sections, or failed-parse reports.

Escape rules

The helper implements the required byte escape table:

```
| Input byte | Report text |
| --- | --- |
| newline LF `0x0A` | `\n` |
| carriage return CR `0x0D` | `\r` |
| horizontal tab `0x09` | `\t` |
| double quote `0x22` | `\&quot;` |
| backslash `0x5C` | `\\` |
| NUL `0x00` | `\x00` |
| other control bytes `0x01`-`0x1F` | `\xNN` |
| DEL `0x7F` | `\x7F` |
| non-ASCII bytes `0x80`-`0xFF` | `\xNN` |
```

Printable ASCII bytes from 0x20 through 0x7E, except double quote and backslash, are emitted literally.

Hex digits are uppercase:

```
0123456789ABCDEF
```

Buffer behavior

If the output buffer is too small, escaping returns:

```
LATTICRA_STATUS_BUFFER_TOO_SMALL
```

When possible, the destination buffer is cleared to an empty string on failure.

NUL behavior

The private helper supports NUL bytes through explicit input lengths.

Existing AST string fields are still C strings, so detailed report integration uses strlen(...) for current AST values. Dedicated tests validate explicit NUL byte escaping through the private helper test path.

Failed parse behavior

Failed-parse detailed reports are unchanged.

They continue to render:

```
parse_error=&lt;error-label&gt;
rail_count=0
field_count=0
text_count=0
```

No escaped fields appear in failed-parse reports.

Compatibility

This implementation does not change:

```
latticra_l_ui_ast_report
latticra_l_ui_parse_ast
latticra_l_ui_parse_source
latticra_l_ui_parse_result_report
latticra_l_ui_diagnostic_report
latticra_l_ui_ast_detailed_report existing required fields
```

No-effect boundary

Escaped string reporting preserves:

```
no_effect=1
execution_allowed=0
mutation_allowed=0
server_allowed=0
recovery_allowed=0
hardware_allowed=0
```

Test command

Run:

```
sh scripts/test-l-ui-ast-escaped-string-report.sh
```

The main C workflow runs this check after the escaped string report implementation-plan guard.

Required invariants

The escaped string report tests verify:

```
escape_preserves_printable_ascii
escape_newline_as_backslash_n
escape_carriage_return_as_backslash_r
escape_tab_as_backslash_t
escape_quote_as_backslash_quote
escape_backslash_as_double_backslash
escape_nul_as_hex_00
escape_control_bytes_as_uppercase_hex
escape_del_as_uppercase_hex
escape_non_ascii_bytes_as_uppercase_hex
escape_rejects_small_buffers
escape_is_deterministic
detailed_report_contains_escaped_purpose
detailed_report_contains_escaped_text_values
detailed_report_escaped_fields_are_additive
```

```
detailed_report_escape_preserves_no_effect_flags
detailed_report_escape_does_not_change_failed_parse_report
```

The implementation also verifies mutated AST purpose and text values with newline, carriage return, tab, quote, and backslash bytes.

Current evidence level

This implementation is an L2 tested byte-oriented escaping model for detailed AST report string fields.

It is not a broader text grammar, Unicode display model, renderer, UI runtime, command surface, Nucleus task runner, server client, update engine, recovery system, hardware system, boot system, or security boundary.

Next implementation step

The next implementation candidate after escaped string reporting is:

```
L-UI AST source-backed text extraction contract
```

That future work should define how AST text values are extracted from source instead of being fixed fixture metadata.

Non-claims

This document and implementation do not broaden accepted L-UI text syntax, implement Unicode display behavior, add L-UI rendering, add command behavior, add Nucleus task handling, add live movement, add origin mutation, add recovery behavior, add server interaction, add self-update, add hardware support, add boot readiness, claim security isolation, claim sandboxing, or claim operating-system completeness.

docs/L_UI_AST_ESCAPED_STRING_REPORT_IMPLEMENTATION_PLAN.md

Source title: Latticra L-UI AST Escaped String Report Implementation Plan

Lines: 323 | Words: 998 | SHA-256: 1260ac191f37a1eb0953806cfed7d1d6c8f6dcbe343a3ba1ed7c6c5d79c86622

Latticra L-UI AST Escaped String Report Implementation Plan

Status: implementation planning contract Scope: private escape helper shape, escaped report fields, destination sizing, too-small behavior, exact tests, and compatibility expectations before escaped string report implementation.

Purpose

This document defines the implementation plan for escaped string reporting in the L-UI AST detailed report.

The escaped string report contract is already merged and guarded. This plan decides the private helper shape, exact escaped fields, placement in the detailed AST report, destination sizes, too-small behavior, test files, exact tests, and compatibility expectations before code is added.

Relationship to previous contracts

This plan depends on:

```
docs/L_UI_AST_ESCAPED_STRING_REPORT_CONTRACT.md
docs/L_UI_AST_DETAILED_REPORT_IMPLEMENTATION.md
include/latticra/l_ui_parser.h
src/l_ui_parser_ast.c
```

Those files remain the source of truth for detailed AST reporting, text metadata, source spans, and no-effect boundaries.

Implementation language decision

Escaped string reporting should be implemented in C.

Reason:

- the AST detailed report is implemented in C;
- report generation is part of the C public API surface;
- escaping should remain bounded, deterministic, and byte-oriented;
- the current C workflow can validate all escaping invariants;
- no dynamic runtime should be required.

Public API decision

No new public function is needed for the first escaping implementation.

Escaping should be added to the existing detailed report API:

```
latticra_l_ui_ast_detailed_report
```

The implementation should add escaped fields to the detailed report output while preserving existing required literal fields.

Private helper shape

Add a private helper in:

```
src/l_ui_parser_ast.c
```

Proposed helper:

```
static latticra_status_t escape_report_string(
    const char *input,
    size_t input_len,
    char *output,
    size_t output_len);
```

The helper must remain private.

Destination sizes

Add private bounded local buffers for escaped strings in src/l_ui_parser_ast.c.

Required destination sizes:

```
escaped purpose buffer &gt;= LATTICRA_L_UI_AST_PURPOSE_MAX * 4 + 1
escaped text buffer &gt;= LATTICRA_L_UI_AST_PURPOSE_MAX * 4 + 1
```

The first implementation may use private macros:

```
LATTICRA_L_UI_AST_ESCAPED_PURPOSE_MAX
LATTICRA_L_UI_AST_ESCAPED_TEXT_MAX
```

These do not need to be public unless future callers need direct escaping support.

Escaped fields

Add escaped fields to the detailed report only.

Escaped source fields:

```
card.purpose
text.value
```

Report keys:

```
purpose_escaped=&lt;escaped-purpose&gt;
value_escaped=&lt;escaped-text&gt;
```

The existing literal fields should remain:

```
purpose=&lt;literal-purpose&gt;
```

```
value=&lt;literal-text&gt;
```

This makes the first implementation additive.

Field placement

Add escaped fields in these sections:

```
[card]
[text &lt;index&gt;]
```

Placement rules:

1. In [card], print purpose_escaped immediately after purpose.
2. In [text <index>], print value_escaped immediately after value.
3. Do not add escaped fields to rail sections.
4. Do not add escaped fields to field sections.
5. Do not add escaped fields to failed-parse reports.

Escape rules

The helper must implement the contract escape table:

```
| Input byte | Report text |
| --- | --- |
| newline LF `0x0A` | `\n` |
| carriage return CR `0x0D` | `\r` |
| horizontal tab `0x09` | `\t` |
| double quote `0x22` | `\&quot;` |
| backslash `0x5C` | `\\` |
| NUL `0x00` | `\x00` |
| other control bytes `0x01`-`0x1F` | `\xNN` |
| DEL `0x7F` | `\x7F` |
| non-ASCII bytes `0x80`-`0xFF` | `\xNN` |
```

Printable ASCII bytes from 0x20 through 0x7E, except double quote and backslash, should be emitted literally.

Hex rule

Hex escapes must use uppercase hexadecimal digits:

```
0123456789ABCDEF
```

Lowercase hexadecimal output is not allowed.

Byte-oriented rule

Escaping is byte-oriented, not Unicode-codepoint-oriented.

Input should be treated as unsigned char bytes for classification and hex output.

Too-small behavior

If the destination buffer cannot hold the full escaped string and terminating NUL, escape_report_string must return:

```
LATTICRA_STATUS_BUFFER_TOO_SMALL
```

The helper should clear the output buffer to an empty string when possible.

latticra_l_ui_ast_detailed_report must propagate this status if escaping fails.

NUL behavior

The first implementation should support NUL bytes in the private helper test path through explicit input_len.

For existing AST strings, the helper will receive strlen(...) because current AST text fields are C strings. Dedicated helper tests should still validate NUL handling with byte arrays.

Failed parse behavior

Escaping must not change failed-parse detailed report behavior.

Failed parse detailed reports should continue to render:

```
parse_error=&lt;error-label&gt;
rail_count=0
field_count=0
text_count=0
```

No escaped fields should appear in failed-parse reports.

Compatibility expectations

Escaped string reporting must be additive.

It must not change:

```
latticra_l_ui_ast_report
latticra_l_ui_parse_ast
latticra_l_ui_parse_source
latticra_l_ui_parse_result_report
latticra_l_ui_diagnostic_report
latticra_l_ui_ast_detailed_report existing required fields
```

Existing parser, diagnostic, source-span, AST, compact report, and detailed report tests must continue to pass.

No-effect preservation

Escaped string reporting must preserve:

```
no_effect=1
execution_allowed=0
mutation_allowed=0
server_allowed=0
recovery_allowed=0
hardware_allowed=0
```

Exact implementation test list

The implementation PR should include tests for:

```
escape_preserves_printable_ascii
escape_newline_as_backslash_n
escape_carriage_return_as_backslash_r
escape_tab_as_backslash_t
escape_quote_as_backslash_quote
escape_backslash_as_double_backslash
escape_nul_as_hex_00
escape_control_bytes_as_uppercase_hex
escape_del_as_uppercase_hex
escape_non_ascii_bytes_as_uppercase_hex
escape_rejects_small_buffers
escape_is_deterministic
detailed_report_contains_escaped_purpose
detailed_report_contains_escaped_text_values
detailed_report_escaped_fields_are_additive
detailed_report_escape_preserves_no_effect_flags
detailed_report_escape_does_not_change_failed_parse_report
```

Test file plan

Add:

```
tests/l_ui_ast_escaped_string_report_invariants.c
scripts/test-l-ui-ast-escaped-string-report.sh
```

Wire into:

```
.github/workflows/c.yml
```

Documentation requirement

The implementation PR should update:

```
README.md
docs/FOUNDATION_INDEX.md
docs/L_UI_AST_ESCAPED_STRING_REPORT_CONTRACT.md
docs/L_UI_AST_DETAILED_REPORT_IMPLEMENTATION.md
```

and add:

```
docs/L_UI_AST_ESCAPED_STRING_REPORT_IMPLEMENTATION.md
```

Forbidden implementation behavior

The escaped string implementation must not:

- add file I/O to parser or AST code;
- write files;
- open network connections;
- call server code;
- call update code;
- call recovery code;
- call hardware code;
- mutate state lattice;
- perform live movement;
- run L-UI behavior;
- render an interactive UI;
- treat text nodes as commands;
- treat bindings as executable references;
- emit memory addresses;
- emit raw control bytes in escaped fields;
- emit raw non-ASCII bytes in escaped fields.

Current validation command

This plan is guarded by:

```
sh scripts/test-l-ui-ast-escaped-string-report-implementation-plan.sh
```

The guard is static. It does not implement escaped string reporting.

Implementation gate

Escaped string report implementation code may be added only after this plan is merged.

Non-claims

This document does not implement escaped string reporting, broaden accepted L-UI text syntax, implement Unicode display behavior, add L-UI rendering, add command behavior, add Nucleus task handling, add live movement, add origin mutation, add recovery behavior, add server interaction, add self-update, add hardware support, add boot readiness, claim security isolation, claim sandboxing, or claim operating-system completeness.

docs/L_UI_AST_LENGTH_CARRYING_STRING_STORAGE_CONTRACT.md

Source title: Latticra L-UI AST Length-Carrying String Storage Contract

Lines: 397 | Words: 1310 | SHA-256: 6d1ba0e65b3a364051453cb3fbfd9ffc190c32b6ff748194c457fe6ffd6b6020

Latticra L-UI AST Length-Carrying String Storage Contract

Status: AST string storage contract Scope: future explicit decoded byte lengths for L-UI AST purpose and text values before AST string storage is extended.

Purpose

This document defines the contract for length-carrying AST string storage in L-UI.

Current AST string storage uses fixed-size NUL-terminated C strings:

```
latticra_l_ui_ast_card_t.purpose
latticra_l_ui_ast_text_t.value
```

That storage model cannot represent decoded NUL bytes or safely report byte-oriented decoded values that contain embedded NUL. This contract defines the future public storage shape, compatibility rules, report rules, decoding relationship, and no-effect boundary before implementation code is added.

This document does not implement length-carrying AST strings.

The implementation plan is documented separately in L_UI_AST_LENGTH_CARRYING_STRING_STORAGE_IMPLEMENTATION_PLAN.md.

Relationship to previous work

This contract depends on:

```
docs/L_UI_PARSER_AST_IMPLEMENTATION.md
docs/L_UI_AST_SOURCE_BACKED_TEXT_IMPLEMENTATION.md
docs/L_UI_AST_ESCAPED_STRING_REPORT_IMPLEMENTATION.md
docs/L_UI_STRING_LITERAL_ESCAPE_IMPLEMENTATION.md
docs/L_UI_PARSER_STRING_ESCAPE_DIAGNOSTICS_IMPLEMENTATION.md
include/latticra/l_ui_parser.h
src/l_ui_parser_ast.c
src/l_ui_parser.c
src/l_ui_parser_diagnostics.c
```

Those files remain the current source of truth for AST shape, source-backed value materialization, escaped report fields, string-literal escape decoding, parser-level invalid escape diagnostics, and no-effect behavior.

Current boundary

The current system provides:

```
source-backed AST purpose and text values
accepted string-literal escape decoding
parser-level invalid string escape diagnostics
NUL rejection for decoded and literal NUL bytes
fixed-size NUL-terminated AST string buffers
escaped detailed report fields
source-oriented spans
no-effect flags
```

This contract does not add:

```
length-carrying AST string implementation
decoded NUL acceptance
literal NUL acceptance
new accepted escape sequences
Unicode display behavior
renderer behavior
interactive UI behavior
command behavior
Nucleus task handling
live movement
```

```
state mutation
server interaction
update behavior
recovery behavior
hardware behavior
boot behavior
```

Storage purpose

Length-carrying AST string storage should allow AST string values to be treated as byte sequences with explicit decoded lengths while preserving existing C-string compatibility for values that do not contain NUL bytes.

The goal is to make future decoded values unambiguous for:

```
AST consumers
escaped detailed report fields
capacity checks
string-literal escape decoding
future NUL-capable storage work
```

Public API shape

A future implementation should extend public AST structs in:

```
include/latticra/l_ui_parser.h
```

by adding explicit decoded byte length fields:

```
latticra_l_ui_ast_card_t.purpose_len
latticra_l_ui_ast_text_t.value_len
```

Proposed struct relationship:

```
char purpose[LATTICRA_L_UI_AST_PURPOSE_MAX];
size_t purpose_len;

char value[LATTICRA_L_UI_AST_PURPOSE_MAX];
size_t value_len;
```

The length fields store decoded byte counts and do not include any trailing compatibility NUL byte.

Compatibility rule

The existing fixed-size character buffers should remain public fields.

For decoded strings that do not contain NUL bytes:

```
purpose_len == strlen(purpose)
value_len == strlen(value)
```

For future decoded strings that contain NUL bytes, purpose_len and value_len would be the authoritative lengths. Existing C-string fields would remain compatibility buffers but would not be sufficient to inspect the full decoded value through strlen.

NUL byte rule

This contract does not make decoded NUL bytes accepted immediately.

The current parser-level diagnostics still reject:

```
\x00 -&gt; LATTICRA_L_UI_PARSE_DECODED_NUL_IN_STRING
literal 0x00 -&gt; LATTICRA_L_UI_PARSE_LITERAL_NUL_IN_STRING
```

Decoded NUL bytes may be accepted only after:

1. length-carrying AST storage is implemented;
2. report escaping uses explicit lengths;
3. parser string escape diagnostics are updated by a separate contract;
4. string-literal escape decoding behavior is updated by a separate contract.

Source-backed extraction rule

Source-backed extraction should continue to target:

```
purpose &quot;...&quot; -&gt; ast.card.purpose + ast.card.purpose_len
first text &quot;...&quot; -&gt; ast.texts[0].value + ast.texts[0].value_len
second text &quot;...&quot; -&gt; ast.texts[1].value + ast.texts[1].value_len
```

Extraction remains source-backed, deterministic, bounded, and no-effect.

Decoding relationship

Accepted string-literal escapes should continue to decode exactly as they do now:

```
\\
\&quot;
\n
\r
\t
\xNN
```

where \xNN uses exactly two uppercase hexadecimal digits.

For all currently accepted decoded values that do not include NUL, the future length field should match the decoded byte length.

This contract does not broaden the accepted escape set.

Capacity rule

Storage capacity remains bounded by:

```
LATTICRA_L_UI_AST_PURPOSE_MAX
```

for both purpose and text values in the current AST model.

A decoded value fits only when:

```
decoded_len &lt; destination_buffer_len
```

because the compatibility buffer still needs a trailing NUL byte.

If decoded output is greater than or equal to the destination buffer length, parser validation should continue to report:

```
LATTICRA_L_UI_PARSE_STRING_VALUE_TOO_LARGE
```

until a separate capacity expansion contract exists.

Report behavior

Detailed reports should add explicit length fields:

```
purpose_len=&lt;decoded-purpose-byte-length&gt;
value_len=&lt;decoded-text-byte-length&gt;
```

Existing report fields should remain:

```
purpose=&lt;C-string-compatible-purpose&gt;
purpose_escaped=&lt;length-aware-report-safe-purpose&gt;
value=&lt;C-string-compatible-text&gt;
value_escaped=&lt;length-aware-report-safe-text&gt;
```

For values without NUL bytes, these fields should remain compatible with current output.

For any future values with embedded NUL bytes, the stable assertion target should be:

```
purpose_len
purpose_escaped
value_len
value_escaped
```

not raw purpose= or value= C-string fields.

Escaped report rule

The escaped report helper should become length-aware before decoded NUL bytes are accepted.

A future implementation should prefer a helper shape similar to:

```
static latticra_status_t escape_report_bytes(
    const char *input,
    size_t input_len,
    char *output,
    size_t output_len);
```

The helper must emit report-safe byte escapes for control bytes, quotes, backslashes, DEL, non-ASCII bytes, and any future embedded NUL bytes.

Source-span behavior

Source spans remain source-oriented.

Text spans continue to cover the source value range between quotes, not decoded output byte ranges.

For source escapes, spans include the source escape bytes. For example, \n covers two source bytes even though the decoded value length increases by one byte.

This contract does not add a public purpose_span field.

Parser diagnostics compatibility

Current parser diagnostics remain valid:

```
LUI0019 invalid_string_escape
LUI0020 invalid_hex_escape
LUI0021 unterminated_escape
LUI0022 decoded_nul_in_string
LUI0023 literal_nul_in_string
LUI0024 string_value_too_large
```

The first length-carrying storage implementation must not remove NUL rejection diagnostics.

A later decoded-NUL acceptance contract may change LUI0022 behavior, but not as part of this storage contract.

AST compatibility behavior

Failed parse behavior remains unchanged:

```
ast.parse_result.error = parser error
ast.rail_count = 0
ast.field_count = 0
ast.text_count = 0
failed-parse detailed report only
```

Accepted sources should continue to produce the same AST counts and string values, plus explicit lengths.

The first accepted fixture should still report:

```
rail_count=9
field_count=23
text_count=2
effect=none
boundary=preview_only
```

No-effect rule

Length-carrying AST string storage is metadata-only.

It must preserve:

```
no_effect=1
```

```
execution_allowed=0
mutation_allowed=0
server_allowed=0
recovery_allowed=0
hardware_allowed=0
```

Implementation gate

Length-carrying AST string storage implementation must not begin until a separate implementation plan defines:

1. public struct field placement;
2. default initialization rules;
3. source-backed extraction length assignment;
4. string-literal decode length assignment;
5. report field additions;
6. length-aware escaped report helper shape;
7. parser diagnostics compatibility;
8. capacity behavior;
9. exact test file names;
10. exact invariant tests;
11. compatibility expectations.

That plan is recorded in L_UI_AST_LENGTH_CARRYING_STRING_STORAGE_IMPLEMENTATION_PLAN.md.

Future test list

A future implementation plan should include tests for:

```
ast_string_storage_sets_purpose_len
ast_string_storage_sets_text_value_len
ast_string_storage_len_matches_strlen_for_non_nul_values
ast_string_storage_len_tracks_decoded_newline
ast_string_storage_len_tracks_decoded_tab
ast_string_storage_len_tracks_decoded_high_byte_hex
ast_string_storage_preserves_existing_c_string_fields
ast_string_storage_updates_detailed_report_lengths
ast_string_storage_escaped_report_uses_explicit_lengths
ast_string_storage_still_rejects_decoded_nul_until_acceptance_contract
ast_string_storage_still_rejects_literal_nul_until_acceptance_contract
ast_string_storage_still_rejects_oversized_decoded_output
ast_string_storage_preserves_source_spans
ast_string_storage_preserves_no_effect_flags
ast_string_storage_does_not_change_existing_diagnostic_codes
ast_string_storage_does_not_change_failed_parse_report
ast_string_storage_is_deterministic
```

Forbidden behavior

A future length-carrying AST string storage implementation must not:

- add file I/O to parser or AST code;
- write files;
- open network connections;
- call server code;
- call update code;
- call recovery code;
- call hardware code;

- mutate state lattice;
- perform live movement;
- run L-UI behavior;
- render an interactive UI;
- treat text nodes as commands;
- treat bindings as executable references;
- accept decoded NUL bytes without a separate acceptance contract;
- accept literal NUL bytes without a separate acceptance contract;
- broaden accepted string escapes;
- remove existing C-string fields;
- silently truncate decoded values;
- make raw purpose= or value= report fields the assertion target for embedded NUL bytes.

Current validation command

This contract is guarded by:

```
sh scripts/test-l-ui-ast-length-carrying-string-storage-contract.sh
```

The guard is static. It does not implement length-carrying AST string storage.

Non-claims

This document does not implement length-carrying AST strings, accept decoded NUL bytes, accept literal NUL bytes, broaden accepted L-UI syntax, implement Unicode display behavior, add L-UI rendering, add command behavior, add Nucleus task handling, add live movement, add origin mutation, add recovery behavior, add server interaction, add self-update, add hardware support, add boot readiness, claim security isolation, claim sandboxing, or claim operating-system completeness.

Source title: Latticra L-UI AST Length-Carrying String Storage Implementation

Lines: 346 | Words: 931 | SHA-256: dc96a9cd281c7fb0baa359f771036a45335b458dadaef4350d394bbdfcf3067b

Latticra L-UI AST Length-Carrying String Storage Implementation

Status: initial implementation contract Scope: explicit decoded byte lengths for L-UI AST purpose and text values.

Purpose

The L-UI AST Length-Carrying String Storage implementation adds explicit decoded byte lengths for source-backed AST string values while preserving the existing C-string compatibility buffers.

The implementation makes decoded byte lengths available for:

```
latticra_l_ui_ast_card_t.purpose
latticra_l_ui_ast_text_t.value
```

without accepting decoded NUL bytes, broadening accepted escapes, or changing parser execution boundaries.

Implementation files

```
include/latticra/l_ui_parser.h
src/l_ui_parser_ast.c
tests/l_ui_ast_length_carrying_string_storage_invariants.c
scripts/test-l-ui-ast-length-carrying-string-storage.sh
```

Related active files:

```
src/l_ui_parser.c
src/l_ui_parser_diagnostics.c
tests/l_ui_string_literal_escape_invariants.c
scripts/test-l-ui-string-literal-escape.sh
```

Public struct additions

The implementation extends public AST structs with:

```
latticra_l_ui_ast_card_t.purpose_len
latticra_l_ui_ast_text_t.value_len
```

Struct relationship:

```
char purpose[LATTICRA_L_UI_AST_PURPOSE_MAX];
size_t purpose_len;

char value[LATTICRA_L_UI_AST_PURPOSE_MAX];
size_t value_len;
```

The length fields store decoded byte counts and do not include the trailing compatibility NUL byte.

Public API compatibility

No new public function is added.

Existing public C-string fields remain:

```
latticra_l_ui_ast_card_t.purpose
latticra_l_ui_ast_text_t.value
```

For decoded strings that do not contain NUL bytes:

```
purpose_len == strlen(purpose)
value_len == strlen(value)
```

Default initialization

ast_default initializes all string lengths to zero:

```
ast.card.purpose_len = 0
ast.texts[index].value_len = 0
```

Failed parse AST results keep all AST string lengths at zero.

Source-backed extraction length assignment

Source-backed extraction now assigns decoded lengths while materializing AST values:

```
purpose &quot;...&quot; -&gt; ast.card.purpose + ast.card.purpose_len
first text &quot;...&quot; -&gt; ast.texts[0].value + ast.texts[0].value_len
second text &quot;...&quot; -&gt; ast.texts[1].value + ast.texts[1].value_len
```

The decode path reports decoded byte counts from the same output index used to populate the destination buffer.

Decode helper behavior

The private string-literal decode helper now reports decoded length through an output pointer:

```
size_t *decoded_len
```

decoded_len is set to zero before decoding and set to the decoded byte count only on successful decoding.

Accepted escape decoding remains unchanged:

```
\\
\&quot;
\n
\r
\t
\xNN
```

where \xNN uses exactly two uppercase hexadecimal digits.

Capacity behavior

Capacity remains bounded by:

```
LATTICRA_L_UI_AST_PURPOSE_MAX
```

for purpose and text values.

A decoded value fits only when:

```
decoded_len &lt; destination_len
```

because the compatibility C string still needs a trailing NUL byte.

Oversized decoded values continue to be rejected by parser diagnostics as:

```
LATTICRA_L_UI_PARSE_STRING_VALUE_TOO_LARGE
```

NUL behavior

This implementation does not accept decoded or literal NUL bytes.

Parser-level diagnostics continue to reject:

```
\x00 -&gt; LATTICRA_L_UI_PARSE_DECODED_NUL_IN_STRING
literal 0x00 -&gt; LATTICRA_L_UI_PARSE_LITERAL_NUL_IN_STRING
```

The decoded-NUL acceptance contract is recorded in:

```
L_UI_DECODED_NUL_ACCEPTANCE_CONTRACT.md
```

A later decoded-NUL acceptance implementation may change escaped \x00 behavior, but not literal source NUL rejection.

Detailed report behavior

Detailed AST reports now include explicit length fields:

```
purpose_len=&lt;decoded-purpose-byte-length&gt;
value_len=&lt;decoded-text-byte-length&gt;
```

Card section placement:

```
[card]
kind=card
name=&lt;name&gt;
purpose=&lt;purpose&gt;
purpose_len=&lt;purpose_len&gt;
purpose_escaped=&lt;purpose_escaped&gt;
```

Text section placement:

```
[text N]
kind=text
value=&lt;value&gt;
value_len=&lt;value_len&gt;
value_escaped=&lt;value_escaped&gt;
```

Existing field names remain stable.

Length-aware escaped report behavior

The escaped report helper is byte-oriented and length-aware:

```
escape_report_bytes(input, input_len, output, output_len)
```

Detailed report callers pass explicit AST lengths instead of strlen for purpose and text values.

For current non-NUL values, escaped report behavior remains compatible with previous output.

Compact AST report compatibility

The compact AST report remains unchanged:

```
latticra_l_ui_ast_report
```

The detailed AST report gains length fields.

Failed-parse detailed reports remain unchanged and do not include string length fields.

Parser diagnostics compatibility

The implementation does not change existing parser diagnostics.

These diagnostics remain active:

```
LUI0019 invalid_string_escape
LUI0020 invalid_hex_escape
LUI0021 unterminated_escape
LUI0022 decoded_nul_in_string
LUI0023 literal_nul_in_string
LUI0024 string_value_too_large
```

Decoded-NUL and literal-NUL rejection remain active.

Source-span behavior

Source spans remain source-oriented.

Text spans continue to cover the source value range between quotes, not decoded output byte ranges.

For example, source \n covers two source bytes while the decoded AST value length is one byte for that escape.

No public purpose_span field is added.

Compatibility

The implementation does not change:

```
accepted string-literal escape decoding
parser-level invalid string escape diagnostics
existing diagnostic codes LUI0000 through LUI0024
existing parser error labels for current errors
latticra_l_ui_ast_report existing required fields
latticra_l_ui_diagnostic_report existing required fields
existing accepted fixture summary counts
failed-parse detailed report behavior
```

The first accepted fixture still reports:

```
rail_count=9
field_count=23
text_count=2
effect=none
boundary=preview_only
```

No-effect boundary

Length-carrying AST string storage is metadata-only.

It preserves:

```
no_effect=1
execution_allowed=0
mutation_allowed=0
server_allowed=0
```

```
recovery_allowed=0
hardware_allowed=0
```

Test command

Run:

```
sh scripts/test-l-ui-ast-length-carrying-string-storage.sh
```

The main C workflow runs this check after the length-carrying string storage implementation-plan guard.

Required invariants

The length-carrying AST string storage tests verify:

```
ast_string_storage_sets_purpose_len
ast_string_storage_sets_text_value_len
ast_string_storage_len_matches_strlen_for_non_nul_values
ast_string_storage_len_tracks_decoded_newline
ast_string_storage_len_tracks_decoded_tab
ast_string_storage_len_tracks_decoded_high_byte_hex
ast_string_storage_preserves_existing_c_string_fields
ast_string_storage_updates_detailed_report_lengths
ast_string_storage_escaped_report_uses_explicit_lengths
ast_string_storage_still_rejects_decoded_nul_until_acceptance_contract
ast_string_storage_still_rejects_literal_nul_until_acceptance_contract
ast_string_storage_still_rejects_oversized_decoded_output
ast_string_storage_preserves_source_spans
ast_string_storage_preserves_no_effect_flags
ast_string_storage_does_not_change_existing_diagnostic_codes
ast_string_storage_does_not_change_failed_parse_report
ast_string_storage_is_deterministic
```

Current evidence level

This implementation is an L2 tested AST string metadata model for explicit decoded byte lengths.

It is not decoded-NUL acceptance, literal-NUL acceptance, a Unicode display model, renderer, UI runtime, command surface, Nucleus task runner, server client, update engine, recovery system, hardware system, boot system, sandbox, or operating system.

Next implementation step

The decoded-NUL acceptance contract is recorded in:

```
L_UI_DECODED_NUL_ACCEPTANCE_CONTRACT.md
```

The next implementation candidate after that contract is:

```
L-UI decoded-NUL acceptance implementation plan
```

That future work should define parser validation changes, decode helper changes, AST storage expectations, report expectations, diagnostic compatibility behavior, source-span expectations, and exact invariant tests before accepting escaped \x00.

Non-claims

This document and implementation do not accept decoded NUL bytes, accept literal NUL bytes, broaden accepted L-UI syntax, implement Unicode display behavior, add L-UI rendering, add command behavior, add Nucleus task handling, add live movement, add origin mutation, add recovery behavior, add server interaction, add self-update, add hardware support, add boot readiness, claim security isolation, claim sandboxing, or claim operating-system completeness.

docs/L_UI_AST_LENGTH_CARRYING_STRING_STORAGE_IMPLEMENTATION_PLAN.md

Source title: Latticra L-UI AST Length-Carrying String Storage Implementation Plan

Lines: 524 | Words: 1423 | SHA-256: 717e11169439531a28453ed677f966cf4d842b33118b5e94d58c33649756d27d

Latticra L-UI AST Length-Carrying String Storage Implementation Plan

Status: implementation planning contract Scope: public struct field placement, default initialization, source-backed extraction length assignment, string-literal decode length assignment, report field additions, length-aware escaped report helper shape, parser diagnostics compatibility, capacity behavior, exact test files, and exact invariant tests before length-carrying AST string storage code.

Purpose

This document defines the implementation plan for length-carrying AST string storage in L-UI.

The AST length-carrying string storage contract is already merged and guarded. This plan decides the exact public struct changes, default initialization rules, private helper changes, AST value materialization rules, detailed report additions, escaped report helper shape, compatibility behavior, and test coverage before implementation code is added.

This document does not implement length-carrying AST strings.

Relationship to previous contracts

This plan depends on:

```
docs/L_UI_AST_LENGTH_CARRYING_STRING_STORAGE_CONTRACT.md
docs/L_UI_PARSER_AST_IMPLEMENTATION.md
docs/L_UI_AST_SOURCE_BACKED_TEXT_IMPLEMENTATION.md
docs/L_UI_AST_ESCAPED_STRING_REPORT_IMPLEMENTATION.md
docs/L_UI_STRING_LITERAL_ESCAPE_IMPLEMENTATION.md
docs/L_UI_PARSER_STRING_ESCAPE_DIAGNOSTICS_IMPLEMENTATION.md
include/latticra/l_ui_parser.h
src/l_ui_parser_ast.c
src/l_ui_parser.c
src/l_ui_parser_diagnostics.c
```

Those files remain the source of truth for AST shape, source-backed extraction, escaped detailed report fields, string-literal escape decoding, parser-level invalid escape diagnostics, and no-effect behavior.

Implementation language decision

Length-carrying AST string storage should be implemented in C.

Reason:

- the L-UI parser and AST builder are implemented in C;
- AST structs are exposed through a C public API surface;
- report generation is implemented in C;
- storage and report changes must remain bounded, deterministic, and no-effect;
- no dynamic runtime should be required.

Public struct field placement

Extend public AST structs in:

```
include/latticra/l_ui_parser.h
```

Add purpose_len directly after the existing purpose buffer:

```
typedef struct {
    char name[LATTICRA_L_UI_AST_LABEL_MAX];
    char purpose[LATTICRA_L_UI_AST_PURPOSE_MAX];
```

```
    size_t purpose_len;
    char effect[LATTICRA_L_UI_LABEL_MAX];
    char boundary[LATTICRA_L_UI_LABEL_MAX];
    latticra_l_ui_source_span_t span;
    size_t rail_count;
    size_t field_count;
    size_t text_count;
} latticra_l_ui_ast_card_t;
```

Add value_len directly after the existing text value buffer:

```
typedef struct {
    char value[LATTICRA_L_UI_AST_PURPOSE_MAX];
    size_t value_len;
    latticra_l_ui_source_span_t span;
} latticra_l_ui_ast_text_t;
```

The length fields store decoded byte counts and do not include the trailing compatibility NUL byte.

Public API compatibility decision

No new public function is required for the first implementation.

Existing public C-string fields remain:

```
latticra_l_ui_ast_card_t.purpose
latticra_l_ui_ast_text_t.value
```

The new length fields add metadata but do not remove or rename existing fields.

Default initialization rules

Update ast_default in:

```
src/l_ui_parser_ast.c
```

Default values:

```
ast.card.purpose[0] = &#x27;\0&#x27;;
ast.card.purpose_len = 0
ast.texts[index].value[0] = &#x27;\0&#x27;;
ast.texts[index].value_len = 0
```

Failed parse AST results must keep all AST string lengths at zero.

Source-backed extraction length assignment

Source-backed extraction should assign decoded lengths while materializing AST values:

```
purpose &quot;...&quot; -&gt; ast.card.purpose + ast.card.purpose_len
first text &quot;...&quot; -&gt; ast.texts[0].value + ast.texts[0].value_len
second text &quot;...&quot; -&gt; ast.texts[1].value + ast.texts[1].value_len
```

For decoded values without NUL bytes:

```
ast.card.purpose_len == strlen(ast.card.purpose)
ast.texts[index].value_len == strlen(ast.texts[index].value)
```

String-literal decode helper shape

Update private decode helper behavior in:

```
src/l_ui_parser_ast.c
```

Current helper:

```
static latticra_status_t decode_l_ui_string_literal_value(
    const char *source,
    size_t start_offset,
    size_t end_offset,
    char *destination,
    size_t destination_len);
```

Proposed helper:

```
static latticra_status_t decode_l_ui_string_literal_value(
    const char *source,
```

```
    size_t start_offset,
    size_t end_offset,
    char *destination,
    size_t destination_len,
    size_t *decoded_len);
```

decoded_len must be set only on success.

On failure, the destination should remain cleared when possible and the decoded length output should be set to zero when non-null.

Extraction helper shape

Update the source-backed extraction helper in:

```
src/l_ui_parser_ast.c
```

Current helper:

```
static latticra_status_t extract_decoded_quoted_value_after_token(
    const char *source,
    size_t source_len,
    const char *token,
    size_t occurrence,
    char *destination,
    size_t destination_len,
    latticra_l_ui_source_span_t *value_span);
```

Proposed helper:

```
static latticra_status_t extract_decoded_quoted_value_after_token(
    const char *source,
    size_t source_len,
    const char *token,
    size_t occurrence,
    char *destination,
    size_t destination_len,
    size_t *decoded_len,
    latticra_l_ui_source_span_t *value_span);
```

The helper should pass the decoded length back to the AST builder after successful decoding.

Fill helper shape

Update private fill helpers:

```
static void fill_text(
    latticra_l_ui_ast_result_t *ast,
    size_t index,
    const char *value,
    size_t value_len,
    const latticra_l_ui_source_span_t *span);
```

For the card purpose, assign:

```
ast-&gt;card.purpose_len = extracted_purpose_len;
```

For text nodes, assign:

```
ast-&gt;texts[index].value_len = value_len;
```

Capacity behavior

Capacity remains:

```
LATTICRA_L_UI_AST_PURPOSE_MAX
```

for purpose and text values.

A decoded value fits only when:

```
decoded_len &lt; destination_len
```

because the compatibility C string still needs a trailing NUL byte.

If decoded output is greater than or equal to the destination buffer length, parser validation should continue to report:

```
LATTICRA_L_UI_PARSE_STRING_VALUE_TOO_LARGE
```

and AST construction should preserve failed-parse behavior.

NUL behavior

This implementation must not accept decoded or literal NUL bytes.

Parser-level diagnostics must continue to reject:

```
\x00 -&gt; LATTICRA_L_UI_PARSE_DECODED_NUL_IN_STRING
literal 0x00 -&gt; LATTICRA_L_UI_PARSE_LITERAL_NUL_IN_STRING
```

A later decoded-NUL acceptance contract may change this, but not this implementation.

Report field additions

Update detailed AST reports in:

```
latticra_l_ui_ast_detailed_report
```

Add card section field:

```
purpose_len=&lt;decoded-purpose-byte-length&gt;
```

Add each text section field:

```
value_len=&lt;decoded-text-byte-length&gt;
```

Recommended section placement:

```
[card]
kind=card
name=&lt;name&gt;
purpose=&lt;purpose&gt;
purpose_len=&lt;purpose_len&gt;
purpose_escaped=&lt;purpose_escaped&gt;
```

and:

```
[text N]
kind=text
value=&lt;value&gt;
value_len=&lt;value_len&gt;
value_escaped=&lt;value_escaped&gt;
```

Existing field names must remain stable.

Length-aware escaped report helper shape

Replace or refactor the existing escaped report helper into a length-aware byte helper.

Current helper shape:

```
static latticra_status_t escape_report_string(
    const char *input,
    size_t input_len,
    char *output,
    size_t output_len);
```

It already accepts input_len, but callers currently use strlen.

Implementation decision:

```
keep the helper private
keep byte-oriented behavior
ensure callers pass explicit AST lengths instead of strlen for purpose and text values
```

Optional rename:

```
escape_report_bytes
```

If renamed, keep behavior identical for non-NUL values.

AST report compatibility

The compact AST report:

```
latticra_l_ui_ast_report
```

should remain unchanged in the first implementation.

The detailed AST report gains length fields, but existing required fields and ordering should remain stable except for insertion of purpose_len and value_len near their corresponding values.

Failed-parse detailed reports should remain unchanged and should not include string length fields.

Parser diagnostics compatibility

The implementation must not change existing parser diagnostics.

These diagnostics remain active:

```
LUI0019 invalid_string_escape
LUI0020 invalid_hex_escape
LUI0021 unterminated_escape
LUI0022 decoded_nul_in_string
LUI0023 literal_nul_in_string
LUI0024 string_value_too_large
```

This implementation must not remove decoded-NUL or literal-NUL rejection.

Source-span behavior

Source spans remain source-oriented.

Text spans continue to cover the source value range between quotes, not decoded output byte ranges.

For example, source \n covers two source bytes while the decoded AST value length increases by one byte.

No public purpose_span field is added in this implementation.

Compatibility expectations

The implementation must not change:

```
accepted string-literal escape decoding
parser-level invalid string escape diagnostics
existing diagnostic codes LUI0000 through LUI0024
existing parser error labels for current errors
latticra_l_ui_ast_report existing required fields
latticra_l_ui_diagnostic_report existing required fields
existing accepted fixture summary counts
failed-parse detailed report behavior
```

The first accepted fixture should still report:

```
rail_count=9
field_count=23
text_count=2
effect=none
boundary=preview_only
```

No-effect preservation

Length-carrying AST string storage is metadata-only.

It must preserve:

```
no_effect=1
execution_allowed=0
mutation_allowed=0
server_allowed=0
recovery_allowed=0
hardware_allowed=0
```

Exact implementation test list

The implementation PR should include tests for:

```
ast_string_storage_sets_purpose_len
ast_string_storage_sets_text_value_len
ast_string_storage_len_matches_strlen_for_non_nul_values
ast_string_storage_len_tracks_decoded_newline
ast_string_storage_len_tracks_decoded_tab
ast_string_storage_len_tracks_decoded_high_byte_hex
ast_string_storage_preserves_existing_c_string_fields
ast_string_storage_updates_detailed_report_lengths
ast_string_storage_escaped_report_uses_explicit_lengths
ast_string_storage_still_rejects_decoded_nul_until_acceptance_contract
ast_string_storage_still_rejects_literal_nul_until_acceptance_contract
ast_string_storage_still_rejects_oversized_decoded_output
ast_string_storage_preserves_source_spans
ast_string_storage_preserves_no_effect_flags
ast_string_storage_does_not_change_existing_diagnostic_codes
ast_string_storage_does_not_change_failed_parse_report
ast_string_storage_is_deterministic
```

Test file plan

Add:

```
tests/l_ui_ast_length_carrying_string_storage_invariants.c
scripts/test-l-ui-ast-length-carrying-string-storage.sh
```

Wire into:

```
.github/workflows/c.yml
```

Documentation requirement

The implementation PR should update:

```
README.md
docs/FOUNDATION_INDEX.md
docs/L_UI_AST_LENGTH_CARRYING_STRING_STORAGE_CONTRACT.md
docs/L_UI_PARSER_AST_IMPLEMENTATION.md
docs/L_UI_AST_SOURCE_BACKED_TEXT_IMPLEMENTATION.md
docs/L_UI_AST_ESCAPED_STRING_REPORT_IMPLEMENTATION.md
docs/L_UI_STRING_LITERAL_ESCAPE_IMPLEMENTATION.md
docs/L_UI_PARSER_STRING_ESCAPE_DIAGNOSTICS_IMPLEMENTATION.md
```

and add:

```
docs/L_UI_AST_LENGTH_CARRYING_STRING_STORAGE_IMPLEMENTATION.md
```

Forbidden implementation behavior

The length-carrying AST string storage implementation must not:

- add file I/O to parser or AST code;
- write files;
- open network connections;
- call server code;
- call update code;
- call recovery code;
- call hardware code;
- mutate state lattice;
- perform live movement;
- run L-UI behavior;
- render an interactive UI;
- treat text nodes as commands;
- treat bindings as executable references;

- accept decoded NUL bytes without a separate acceptance contract;
- accept literal NUL bytes without a separate acceptance contract;
- broaden accepted string escapes;
- remove existing C-string fields;
- silently truncate decoded values;
- change accepted escape decoding semantics;
- change existing parser diagnostic codes;
- make raw purpose= or value= report fields the assertion target for embedded NUL bytes.

Current validation command

This plan is guarded by:

```
sh scripts/test-l-ui-ast-length-carrying-string-storage-implementation-plan.sh
```

The guard is static. It does not implement length-carrying AST string storage.

Implementation gate

Length-carrying AST string storage implementation code may be added only after this plan is merged.

Non-claims

This document does not implement length-carrying AST strings, accept decoded NUL bytes, accept literal NUL bytes, broaden accepted L-UI syntax, implement Unicode display behavior, add L-UI rendering, add command behavior, add Nucleus task handling, add live movement, add origin mutation, add recovery behavior, add server interaction, add self-update, add hardware support, add boot readiness, claim security isolation, claim sandboxing, or claim operating-system completeness.

docs/L_UI_AST_SOURCE_BACKED_TEXT_CONTRACT.md

Source title: Latticra L-UI AST Source-Backed Text Contract

Lines: 326 | Words: 911 | SHA-256: 11f6b41cc779c7df23543c97fc5bda5891a395444f9e6e65c1c13bcae97543aa

Latticra L-UI AST Source-Backed Text Contract

Status: source-backed text contract Scope: extraction of AST purpose and text values from validated L-UI source instead of fixed fixture metadata.

Purpose

This document defines the source-backed text extraction contract for the L-UI AST.

The AST implementation extracts purpose and text values from validated NucleusPreview source while preserving source spans, escaped reporting, no-effect behavior, and deterministic output.

The source-backed extraction implementation is documented separately in L_UI_AST_SOURCE_BACKED_TEXT_IMPLEMENTATION.md.

The later string-literal escape decoder is documented separately in L_UI_STRING_LITERAL_ESCAPE_IMPLEMENTATION.md.

Current boundary

The current L-UI AST stack provides:

```
validated L-UI parser
source spans
fixed-size AST metadata
source-backed purpose value
source-backed text values
string-literal escape decoding for accepted source escapes
compact AST report
detailed AST report
escaped detailed report fields
no-effect flags
```

This contract does not add:

```
new renderer behavior
interactive UI behavior
command behavior
Nucleus task handling
live movement
state mutation
server interaction
update behavior
recovery behavior
hardware behavior
boot behavior
```

Extraction purpose

Source-backed text extraction makes the AST reflect the actual validated .lui source text for:

```
card.purpose
text.value
```

This allows fixture text changes to be represented in AST metadata without hard-coded AST literals.

Extraction targets

The implementation extracts:

```
purpose &quot;...&quot;
text &quot;...&quot;
```

from the already-validated source.

The first accepted fixture still produces:

```
purpose=operator-visible Nucleus preview report
value=Latticra / Nucleus Preview / effect-bound
value=preview-only no-live-movement no-host-effect no-external-effect
```

No grammar broadening rule

Source-backed extraction does not broaden accepted L-UI syntax by itself.

The parser still rejects unsupported forms according to the existing parser contracts.

Extraction runs only after successful validation by:

```
latticra_l_ui_parse_source
```

Ownership rule

Extracted text is copied into fixed AST storage.

The AST does not retain borrowed pointers into the source buffer.

Destination fields:

```
latticra_l_ui_ast_card_t.purpose
latticra_l_ui_ast_text_t.value
```

The extraction implementation preserves NUL-terminated C strings in AST storage.

Capacity rule

Extraction respects existing capacities:

```
LATTICRA_L_UI_AST_PURPOSE_MAX
LATTICRA_L_UI_AST_TEXT_MAX
```

The implementation classifies oversized extracted or decoded strings with:

```
LATTICRA_L_UI_PARSE_INTERNAL_ERROR
```

and avoids partial AST output.

It does not truncate silently.

Span rule

Extracted values keep source-span metadata where currently supported.

For purpose:

```
card.span covers the card block
```

For text:

```
text.span covers the source text value range
```

Source spans refer to source byte ranges, not decoded output byte ranges.

No public purpose_span field is added in the first source-backed extraction implementation.

Quote handling rule

The implementation extracts quoted string contents.

For source:

```
purpose &quot;abc&quot;
text &quot;xyz&quot;
```

AST values are:

```
abc
xyz
```

The surrounding quotes are not copied into AST values.

Escaped quotes are respected when finding the closing quote.

Escape handling relationship

The initial source-backed extraction phase copied raw bytes between quotes without decoding escapes.

Current source-backed AST values now decode accepted string-literal escapes according to:

```
L_UI_STRING_LITERAL_ESCAPE_CONTRACT.md
L_UI_STRING_LITERAL_ESCAPE_IMPLEMENTATION_PLAN.md
L_UI_STRING_LITERAL_ESCAPE_IMPLEMENTATION.md
```

Accepted escapes such as \n, \r, \t, \", \\, and uppercase \xNN decode before values are stored in AST-owned buffers.

Rejected escapes are classified through:

```
LATTICRA_L_UI_PARSE_INTERNAL_ERROR
```

until parser-level string escape diagnostics are designed.

Detailed report relationship

Detailed reports continue to render:

```
purpose=&lt;literal-purpose&gt;
purpose_escaped=&lt;escaped-purpose&gt;
```

```
value=&lt;literal-text&gt;
value_escaped=&lt;escaped-text&gt;
```

After source-backed extraction and accepted string-literal escape decoding, those report values reflect decoded AST values.

The escaped report fields remain the stable assertion target for control bytes, quotes, backslashes, DEL, and non-ASCII bytes.

Failed parse behavior

Failed parse behavior remains unchanged.

If source validation fails:

```
no partial AST nodes
no extracted text
failed-parse detailed report only
```

No-effect rule

Source-backed text extraction and string-literal escape decoding are metadata-only.

They preserve:

```
no_effect=1
execution_allowed=0
mutation_allowed=0
server_allowed=0
recovery_allowed=0
hardware_allowed=0
```

Compatibility rule

Source-backed text extraction and string-literal escape decoding do not change:

```
latticra_l_ui_parse_source
latticra_l_ui_ast_report
latticra_l_ui_ast_detailed_report existing required fields
latticra_l_ui_diagnostic_report
parser error labels
existing accepted fixture summary
```

The first accepted fixture still reports the same AST summary counts:

```
rail_count=9
field_count=23
text_count=2
```

Implementation gate

Source-backed text extraction implementation required a separate implementation plan defining:

1. extraction helper shapes;
2. exact extraction targets;
3. capacity behavior;
4. span field decision;
5. quote handling behavior;
6. escape handling boundary;
7. failed-parse behavior;
8. test file names;
9. exact invariant tests;
10. compatibility expectations.

That plan is recorded in L_UI_AST_SOURCE_BACKED_TEXT_IMPLEMENTATION_PLAN.md.

String-literal escape decoding required a separate implementation plan before decoder code. That plan is recorded in L_UI_STRING_LITERAL_ESCAPE_IMPLEMENTATION_PLAN.md.

Test list

Source-backed text implementation tests verify:

```
source_backed_purpose_matches_fixture_source
source_backed_top_text_matches_fixture_source
source_backed_bottom_text_matches_fixture_source
source_backed_text_values_are_copied
source_backed_text_does_not_retain_source_pointers
source_backed_text_excludes_quotes
source_backed_text_preserves_ast_counts
source_backed_text_preserves_no_effect_flags
source_backed_text_updates_detailed_report_literals
source_backed_text_updates_detailed_report_escaped_fields
source_backed_text_rejects_or_classifies_oversized_purpose
source_backed_text_rejects_or_classifies_oversized_text
source_backed_text_does_not_change_failed_parse_report
source_backed_text_is_deterministic
source_backed_text_decodes_accepted_string_escapes
```

Forbidden behavior

Source-backed text implementation must not:

- add file I/O to parser or AST code;
- write files;
- open network connections;
- call server code;
- call update code;
- call recovery code;
- call hardware code;
- mutate state lattice;
- perform live movement;
- run L-UI behavior;
- render an interactive UI;
- treat text nodes as commands;
- treat bindings as executable references;
- retain source-buffer pointers in the AST;
- silently truncate extracted values;
- broaden accepted grammar without a grammar contract.

Current validation command

This contract is guarded by:

```
sh scripts/test-l-ui-ast-source-backed-text-contract.sh
```

The guard is static. It validates the contract text.

Non-claims

This document does not broaden non-string L-UI syntax, implement Unicode display behavior, add L-UI rendering, add command behavior, add Nucleus task handling, add live movement, add origin mutation, add recovery behavior, add server interaction, add self-update, add hardware support, add boot readiness, claim security isolation, claim sandboxing, or claim operating-system completeness.

docs/L_UI_AST_SOURCE_BACKED_TEXT_IMPLEMENTATION.md

Source title: Latticra L-UI AST Source-Backed Text Implementation

Lines: 269 | Words: 791 | SHA-256: ad87683a5486c584c18278bb942c18b1be0f21006adb407d5cb1545c043c4933

Latticra L-UI AST Source-Backed Text Implementation

Status: initial implementation contract Scope: source-backed extraction of AST purpose and text values from validated L-UI source.

Purpose

The L-UI AST Source-Backed Text implementation extracts AST purpose and text values from validated L-UI source instead of relying on fixed fixture literals.

It keeps AST storage fixed-size, copies extracted text into AST-owned buffers, preserves no-effect behavior, and leaves parser validation as the gate before extraction.

Accepted string-literal escapes are now decoded during AST value materialization by the later L-UI string-literal escape implementation.

Implementation files

```
src/l_ui_parser_ast.c
tests/l_ui_ast_source_backed_text_invariants.c
scripts/test-l-ui-ast-source-backed-text.sh
```

Extraction targets

The implementation extracts:

```
purpose &quot;...&quot; -&gt; ast.card.purpose
first text &quot;...&quot; -&gt; ast.texts[0].value
second text &quot;...&quot; -&gt; ast.texts[1].value
```

The first accepted fixture still produces:

```
purpose=operator-visible Nucleus preview report
value=Latticra / Nucleus Preview / effect-bound
value=preview-only no-live-movement no-host-effect no-external-effect
```

Private helpers

The original source-backed implementation added private helpers in src/l_ui_parser_ast.c:

```
extract_quoted_value_after_token
copy_extracted_value
```

The string-literal escape implementation later replaced raw value copying with private decoding helpers while preserving the same extraction targets.

These helpers remain private.

Quote behavior

The implementation copies source-backed contents between the opening and closing quote into AST-owned buffers.

For source:

```
purpose &quot;abc&quot;
text &quot;xyz&quot;
```

AST values become:

```
abc
xyz
```

The surrounding quotes are not copied into AST values.

Escaped quotes are respected when finding the closing quote.

Escape handling relationship

The initial source-backed extraction phase copied raw bytes between quotes while respecting escaped quotes for finding the closing quote.

Current AST value materialization decodes accepted string-literal escapes according to:

```
L_UI_STRING_LITERAL_ESCAPE_CONTRACT.md
L_UI_STRING_LITERAL_ESCAPE_IMPLEMENTATION_PLAN.md
L_UI_STRING_LITERAL_ESCAPE_IMPLEMENTATION.md
```

For example, source bytes representing:

```
raw\ntext
```

now become AST bytes representing:

```
raw
text
```

and detailed report escaped fields render that decoded newline safely as:

```
raw\ntext
```

Rejected string escapes classify AST construction with:

```
LATTICRA_L_UI_PARSE_INTERNAL_ERROR
```

until parser-level string escape diagnostics are designed.

Capacity behavior

Extraction and decoding respect destination capacities:

```
LATTICRA_L_UI_AST_PURPOSE_MAX
LATTICRA_L_UI_AST_PURPOSE_MAX for text values
LATTICRA_L_UI_AST_TEXT_MAX for text node count
```

If an extracted or decoded value is too large for its destination, AST construction classifies the result as:

```
LATTICRA_L_UI_PARSE_INTERNAL_ERROR
```

and leaves counts at zero to avoid a partial AST.

The implementation does not silently truncate extracted or decoded values.

Span behavior

The implementation does not add a public purpose span.

text.span is set to the source text value range for text nodes. card.span continues to cover the card block.

Text spans refer to source byte ranges, not decoded output byte ranges.

Successful parse rule

Extraction and decoding run only after:

```
latticra_l_ui_parse_source
```

returns LATTICRA_STATUS_OK and parse_result.error == LATTICRA_L_UI_PARSE_OK.

If parsing fails, extraction and decoding do not run.

Detailed report relationship

Detailed reports continue to render:

```
purpose=&lt;literal-purpose&gt;
purpose_escaped=&lt;escaped-purpose&gt;
value=&lt;literal-text&gt;
value_escaped=&lt;escaped-text&gt;
```

After source-backed extraction and accepted string-literal escape decoding, these values reflect decoded AST values.

The escaped report fields remain the stable assertion target for control bytes, quotes, backslashes, DEL, and non-ASCII bytes.

Failed parse behavior

Failed parse behavior is unchanged:

```
ast.parse_result.error = parser error
ast.rail_count = 0
ast.field_count = 0
ast.text_count = 0
failed-parse detailed report only
```

No source-backed text values are extracted for failed parses.

Compatibility

This implementation does not change:

```
latticra_l_ui_parse_source
latticra_l_ui_ast_report
latticra_l_ui_ast_detailed_report existing required fields
latticra_l_ui_diagnostic_report
parser error labels
existing accepted fixture summary counts
```

The first accepted fixture still reports:

```
rail_count=9
field_count=23
text_count=2
effect=none
boundary=preview_only
```

No-effect boundary

Source-backed text extraction and string-literal escape decoding preserve:

```
no_effect=1
execution_allowed=0
mutation_allowed=0
server_allowed=0
recovery_allowed=0
hardware_allowed=0
```

Test command

Run:

```
sh scripts/test-l-ui-ast-source-backed-text.sh
```

The main C workflow runs this check after the source-backed text implementation-plan guard.

Required invariants

The source-backed text tests verify:

```
source_backed_purpose_matches_fixture_source
source_backed_top_text_matches_fixture_source
source_backed_bottom_text_matches_fixture_source
```

```
source_backed_text_values_are_copied
source_backed_text_does_not_retain_source_pointers
source_backed_text_excludes_quotes
source_backed_text_preserves_ast_counts
source_backed_text_preserves_no_effect_flags
source_backed_text_updates_detailed_report_literals
source_backed_text_updates_detailed_report_escaped_fields
source_backed_text_rejects_or_classifies_oversized_purpose
source_backed_text_rejects_or_classifies_oversized_text
source_backed_text_does_not_change_failed_parse_report
source_backed_text_is_deterministic
source_backed_text_decodes_accepted_string_escapes
```

Current evidence level

This implementation is an L2 tested source-backed text extraction model for validated L-UI AST metadata, now paired with tested string-literal escape decoding.

It is not a broader non-string grammar, Unicode display model, renderer, UI runtime, command surface, Nucleus task runner, server client, update engine, recovery system, hardware system, boot system, or security boundary.

Next implementation step

The next implementation candidate after source-backed text extraction and string-literal escape decoding is:

```
L-UI parser-level string escape diagnostics contract
```

That future work should decide whether invalid string escapes receive first-class parser diagnostic codes instead of AST-level internal-error classification.

Non-claims

This document and implementation do not broaden non-string L-UI syntax, implement Unicode display behavior, add L-UI rendering, add command behavior, add Nucleus task handling, add live movement, add origin mutation, add recovery behavior, add server interaction, add self-update, add hardware support, add boot readiness, claim security isolation, claim sandboxing, or claim operating-system completeness.

docs/L_UI_AST_SOURCE_BACKED_TEXT_IMPLEMENTATION_PLAN.md

Source title: Latticra L-UI AST Source-Backed Text Implementation Plan

Lines: 344 | Words: 978 | SHA-256: 4641b182751d9cb7add7144cd72424d0bbefaa5160ed5656b4679c3d226bbed7

Latticra L-UI AST Source-Backed Text Implementation Plan

Status: implementation planning contract Scope: extraction helpers, exact extraction targets, quote handling, capacity behavior, span decisions, exact tests, and compatibility expectations before source-backed text extraction code.

Purpose

This document defines the implementation plan for source-backed text extraction in the L-UI AST.

The source-backed text contract is already merged and guarded. This plan decides the helper shapes, extraction targets, quote handling, escape handling boundary, capacity behavior, span decision, exact tests, and compatibility expectations before implementation code is added.

Relationship to previous contracts

This plan depends on:

```
docs/L_UI_AST_SOURCE_BACKED_TEXT_CONTRACT.md
```

```
docs/L_UI_PARSER_AST_IMPLEMENTATION.md
docs/L_UI_AST_ESCAPED_STRING_REPORT_IMPLEMENTATION.md
include/latticra/l_ui_parser.h
src/l_ui_parser_ast.c
```

Those files remain the source of truth for AST storage, source spans, detailed reporting, escaped fields, and no-effect boundaries.

Implementation language decision

Source-backed text extraction should be implemented in C.

Reason:

- the AST builder is implemented in C;
- AST storage is a C public API surface;
- extraction must remain bounded, deterministic, and no-effect;
- the current C workflow can validate extraction invariants;
- no dynamic runtime should be required.

Public API decision

No new public function is needed for the first source-backed extraction implementation.

Extraction should be integrated into:

```
latticra_l_ui_parse_ast
```

The public AST fields remain:

```
latticra_l_ui_ast_card_t.purpose
latticra_l_ui_ast_text_t.value
```

Extraction helper plan

Add private helpers in:

```
src/l_ui_parser_ast.c
```

Proposed helpers:

```
static latticra_status_t extract_quoted_value_after_token(
    const char *source,
    size_t source_len,
    const char *token,
    size_t occurrence,
    char *destination,
    size_t destination_len,
    latticra_l_ui_source_span_t *value_span);

static latticra_status_t copy_extracted_value(
    const char *source,
    size_t start_offset,
    size_t end_offset,
    char *destination,
    size_t destination_len);
```

Helpers must remain private.

Extraction targets

The first implementation should extract these source-backed values:

```
purpose &quot;...&quot; -&gt; ast.card.purpose
first text &quot;...&quot; -&gt; ast.texts[0].value
second text &quot;...&quot; -&gt; ast.texts[1].value
```

The first accepted fixture must still produce:

```
purpose=operator-visible Nucleus preview report
value=Latticra / Nucleus Preview / effect-bound
value=preview-only no-live-movement no-host-effect no-external-effect
```

Quote handling behavior

The first implementation should copy bytes between the opening and closing quote.

For source:

```
purpose &quot;abc&quot;
text &quot;xyz&quot;
```

AST values should be:

```
abc
xyz
```

The surrounding quotes must not be copied into AST values.

Escape handling boundary

The first implementation must not decode escape sequences.

Behavior:

```
copy raw bytes between quotes without decoding escapes
```

If later grammar accepts string escapes, a string-literal escape contract should define decoding behavior before AST extraction decodes anything.

Capacity behavior

Extraction must respect destination capacities:

```
LATTICRA_L_UI_AST_PURPOSE_MAX
LATTICRA_L_UI_AST_PURPOSE_MAX for text values
LATTICRA_L_UI_AST_TEXT_MAX for text node count
```

Because latticra_l_ui_ast_text_t.value currently uses LATTICRA_L_UI_AST_PURPOSE_MAX, the text extraction destination capacity is that field size. LATTICRA_L_UI_AST_TEXT_MAX remains the bounded capacity for the number of text nodes.

If extracted text length is greater than or equal to the destination buffer length, extraction should return:

```
LATTICRA_STATUS_BUFFER_TOO_SMALL
```

latticra_l_ui_parse_ast should convert an extraction capacity failure into:

```
ast.parse_result.error = LATTICRA_L_UI_PARSE_INTERNAL_ERROR
```

and should leave counts at zero to avoid a partial AST.

The implementation must not silently truncate extracted values.

Span decision

Do not add a new public purpose_span field in the first implementation.

Reason:

- text.span already exists for text values;
- card.span covers the card block;
- adding a public purpose span would require a broader AST struct change;
- source-backed value correctness can be tested through copied values and detailed reports.

Internal extraction may compute a value span for validation, but it does not need to expose it publicly yet.

Successful parse rule

Extraction must run only after:

```
latticra_l_ui_parse_source
```

returns LATTICRA_STATUS_OK and parse_result.error == LATTICRA_L_UI_PARSE_OK.

If parsing fails, extraction must not run.

Failed parse behavior

Failed parse behavior must remain unchanged:

```
ast.parse_result.error = parser error
ast.rail_count = 0
ast.field_count = 0
ast.text_count = 0
failed-parse detailed report only
```

No source-backed text values should be extracted for failed parses.

Detailed report relationship

Detailed reports should continue to render:

```
purpose=&lt;literal-purpose&gt;
purpose_escaped=&lt;escaped-purpose&gt;
value=&lt;literal-text&gt;
value_escaped=&lt;escaped-text&gt;
```

After source-backed extraction, these values should reflect the extracted source values.

Compatibility expectations

Source-backed text extraction must not change:

```
latticra_l_ui_parse_source
latticra_l_ui_ast_report
latticra_l_ui_ast_detailed_report existing required fields
latticra_l_ui_diagnostic_report
parser error labels
existing accepted fixture summary counts
```

The first accepted fixture should still report:

```
rail_count=9
field_count=23
text_count=2
effect=none
boundary=preview_only
```

No-effect preservation

Source-backed text extraction must preserve:

```
no_effect=1
execution_allowed=0
mutation_allowed=0
server_allowed=0
recovery_allowed=0
hardware_allowed=0
```

Exact implementation test list

The implementation PR should include tests for:

```
source_backed_purpose_matches_fixture_source
source_backed_top_text_matches_fixture_source
source_backed_bottom_text_matches_fixture_source
source_backed_text_values_are_copied
source_backed_text_does_not_retain_source_pointers
source_backed_text_excludes_quotes
source_backed_text_preserves_ast_counts
source_backed_text_preserves_no_effect_flags
source_backed_text_updates_detailed_report_literals
source_backed_text_updates_detailed_report_escaped_fields
source_backed_text_rejects_or_classifies_oversized_purpose
source_backed_text_rejects_or_classifies_oversized_text
source_backed_text_does_not_change_failed_parse_report
source_backed_text_is_deterministic
```

```
source_backed_text_does_not_decode_escapes
```

Test file plan

Add:

```
tests/l_ui_ast_source_backed_text_invariants.c
scripts/test-l-ui-ast-source-backed-text.sh
```

Wire into:

```
.github/workflows/c.yml
```

Documentation requirement

The implementation PR should update:

```
README.md
docs/FOUNDATION_INDEX.md
docs/L_UI_AST_SOURCE_BACKED_TEXT_CONTRACT.md
docs/L_UI_PARSER_AST_IMPLEMENTATION.md
docs/L_UI_AST_DETAILED_REPORT_IMPLEMENTATION.md
```

and add:

```
docs/L_UI_AST_SOURCE_BACKED_TEXT_IMPLEMENTATION.md
```

Forbidden implementation behavior

The source-backed text implementation must not:

- add file I/O to parser or AST code;
- write files;
- open network connections;
- call server code;
- call update code;
- call recovery code;
- call hardware code;
- mutate state lattice;
- perform live movement;
- run L-UI behavior;
- render an interactive UI;
- treat text nodes as commands;
- treat bindings as executable references;
- retain source-buffer pointers in the AST;
- silently truncate extracted values;
- broaden accepted grammar without a grammar contract;
- decode string escapes without a string-literal escape contract.

Current validation command

This plan is guarded by:

```
sh scripts/test-l-ui-ast-source-backed-text-implementation-plan.sh
```

The guard is static. It does not implement source-backed text extraction.

Implementation gate

Source-backed text extraction implementation code may be added only after this plan is merged.

Non-claims

This document does not implement source-backed text extraction, broaden accepted L-UI text syntax, implement string escape decoding, implement Unicode display behavior, add L-UI rendering, add command behavior, add Nucleus task handling, add live movement, add origin mutation, add recovery behavior, add server interaction, add self-update, add hardware support, add boot readiness, claim security isolation, claim sandboxing, or claim operating-system completeness.

docs/L_UI_DECODED_NUL_ACCEPTANCE_CONTRACT.md

Source title: Latticra L-UI Decoded NUL Acceptance Contract

Lines: 370 | Words: 1147 | SHA-256: fad6f30f8b45fc9b65a6d87bf9a5722b2e5ceeddd5084ba8cdcf31c4d9b3cc9c

Latticra L-UI Decoded NUL Acceptance Contract

Status: decoded NUL acceptance contract Scope: future acceptance of escaped decoded NUL bytes in L-UI source-backed AST strings after length-carrying AST string storage.

Purpose

This document defines the contract for accepting escaped decoded NUL bytes in L-UI source-backed AST string values.

The current parser rejects:

```
\x00 -&gt; LATTICRA_L_UI_PARSE_DECODED_NUL_IN_STRING
literal 0x00 -&gt; LATTICRA_L_UI_PARSE_LITERAL_NUL_IN_STRING
```

Now that AST purpose and text values carry explicit decoded byte lengths, a future implementation may accept escaped \x00 in quoted string values while continuing to reject literal NUL bytes in source buffers.

This document does not implement decoded NUL acceptance.

The implementation plan is documented separately in L_UI_DECODED_NUL_ACCEPTANCE_IMPLEMENTATION_PLAN.md.

Relationship to previous work

This contract depends on:

```
docs/L_UI_AST_LENGTH_CARRYING_STRING_STORAGE_CONTRACT.md
docs/L_UI_AST_LENGTH_CARRYING_STRING_STORAGE_IMPLEMENTATION_PLAN.md
docs/L_UI_AST_LENGTH_CARRYING_STRING_STORAGE_IMPLEMENTATION.md
docs/L_UI_PARSER_STRING_ESCAPE_DIAGNOSTICS_IMPLEMENTATION.md
docs/L_UI_STRING_LITERAL_ESCAPE_IMPLEMENTATION.md
include/latticra/l_ui_parser.h
src/l_ui_parser.c
src/l_ui_parser_ast.c
src/l_ui_parser_diagnostics.c
```

Those files remain the source of truth for explicit string lengths, parser diagnostics, string-literal escape decoding, detailed reports, and no-effect behavior.

Current boundary

The current system provides:

```
purpose_len and value_len fields
length-aware escaped detailed report fields
source-backed AST purpose and text values
```

```
accepted string-literal escape decoding
parser-level invalid string escape diagnostics
literal NUL rejection
no-effect flags
```

This contract does not add:

```
decoded NUL acceptance implementation
literal NUL acceptance
new accepted escape sequences beyond \x00 behavior change
Unicode display behavior
renderer behavior
interactive UI behavior
command behavior
Nucleus task handling
live movement
state mutation
server interaction
update behavior
recovery behavior
hardware behavior
boot behavior
```

Acceptance decision

A future implementation may accept escaped decoded NUL bytes only through the existing uppercase hex escape form:

```
\x00
```

Accepted source examples:

```
purpose &quot;A\x00B&quot;
text &quot;left\x00right&quot;
```

The decoded AST byte sequence should contain the NUL byte at that position, and the explicit length field should include that byte.

Literal NUL remains rejected

Literal 0x00 bytes in the source buffer remain rejected.

A source buffer containing a literal NUL inside a quoted value should continue to report:

```
LATTICRA_L_UI_PARSE_LITERAL_NUL_IN_STRING
LUI0023 literal_nul_in_string
```

Reason:

- source buffers are still byte-oriented input;
- literal NUL bytes make source inspection and tool interop ambiguous;
- escaped NUL is deterministic and operator-visible in reports;
- accepting literal NUL requires a separate source-buffer contract.

Parser diagnostic transition

A future implementation should stop reporting this diagnostic for escaped \x00 in source-backed string values:

```
LATTICRA_L_UI_PARSE_DECODED_NUL_IN_STRING
LUI0022 decoded_nul_in_string
```

LUI0022 must remain a stable diagnostic code for compatibility, but escaped \x00 in supported L-UI string values should no longer trigger it after decoded-NUL acceptance is implemented.

LUI0023 literal_nul_in_string remains active.

Accepted escape compatibility

Decoded NUL acceptance must not broaden the accepted escape set beyond the existing contract:

```
\\
\&quot;
\n
\r
\t
\xNN
```

where \xNN uses exactly two uppercase hexadecimal digits.

Lowercase hex remains rejected:

```
\x0a -&gt; LATTICRA_L_UI_PARSE_INVALID_HEX_ESCAPE
```

Unknown escapes remain rejected:

```
\a -&gt; LATTICRA_L_UI_PARSE_INVALID_STRING_ESCAPE
```

AST storage behavior

After implementation, escaped decoded NUL bytes should be represented in the existing AST buffers and lengths:

```
ast.card.purpose
ast.card.purpose_len
ast.texts[index].value
ast.texts[index].value_len
```

For values containing decoded NUL bytes:

```
purpose_len != strlen(purpose)
value_len != strlen(value)
```

The explicit length field is authoritative.

The compatibility C-string buffer remains present, but strlen must not be used to inspect the full value when embedded NUL bytes exist.

Decode helper behavior

The private string-literal decode helper should allow decoded byte value 0x00 only when it came from escaped \x00.

It should still reject literal source NUL bytes before decoding materializes a value.

Decoded length assignment must count decoded NUL bytes:

```
&quot;A\x00B&quot; -&gt; length 3
```

Parser validation order

Decoded NUL acceptance should preserve existing validation order:

1. null argument checks;
2. source size checks;
3. structural parse checks;
4. string escape validation;
5. AST construction.

Structural parse errors must retain priority over decoded-NUL acceptance.

Source-span behavior

Source spans remain source-oriented.

For escaped decoded NUL:

```
\x00 -&gt; source span covers four source bytes when a diagnostic or test inspects that source
range
```

Accepted AST text spans continue to cover the full source value range between quotes.

Decoded output byte positions are not source spans.

Detailed report behavior

Detailed AST reports must use explicit lengths and escaped output as the stable inspection surface.

For decoded NUL bytes, escaped report fields should render:

```
\x00
```

Examples:

```
purpose_len=3
purpose_escaped=A\x00B

value_len=10
value_escaped=left\x00right
```

Raw C-string fields remain compatibility fields:

```
purpose=&lt;C-string-compatible-prefix&gt;
value=&lt;C-string-compatible-prefix&gt;
```

Tests for embedded NUL must assert against:

```
purpose_len
purpose_escaped
value_len
value_escaped
```

not raw purpose= or value= fields.

Compact report compatibility

The compact AST report should remain unchanged in the first decoded-NUL acceptance implementation.

Detailed reports are the stable inspection surface for embedded NUL bytes.

AST compatibility behavior

Failed parse behavior remains unchanged:

```
ast.parse_result.error = parser error
ast.rail_count = 0
ast.field_count = 0
ast.text_count = 0
failed-parse detailed report only
```

Accepted sources should continue to produce the same rail, field, and text counts.

The first accepted fixture should still report:

```
rail_count=9
field_count=23
text_count=2
effect=none
boundary=preview_only
```

No-effect rule

Decoded NUL acceptance is metadata-only.

It must preserve:

```
no_effect=1
execution_allowed=0
mutation_allowed=0
server_allowed=0
recovery_allowed=0
hardware_allowed=0
```

Implementation gate

Decoded NUL acceptance implementation must not begin until a separate implementation plan defines:

1. parser validation changes;
2. decode helper changes;
3. AST storage expectations;
4. report expectations;
5. diagnostic compatibility behavior;
6. source-span expectations;
7. exact test file names;
8. exact invariant tests;
9. compatibility expectations;
10. non-claims.

That plan is recorded in L_UI_DECODED_NUL_ACCEPTANCE_IMPLEMENTATION_PLAN.md.

Future test list

A future implementation plan should include tests for:

```
decoded_nul_accepts_purpose_x00
decoded_nul_accepts_text_x00
decoded_nul_counts_purpose_len
decoded_nul_counts_text_value_len
decoded_nul_preserves_c_string_prefix_compatibility
decoded_nul_reports_purpose_escaped_x00
decoded_nul_reports_text_value_escaped_x00
decoded_nul_does_not_emit_lui0022_for_x00
decoded_nul_still_rejects_literal_nul_lui0023
decoded_nul_still_rejects_lowercase_hex_lui0020
decoded_nul_still_rejects_unknown_escape_lui0019
decoded_nul_preserves_source_spans
decoded_nul_preserves_no_effect_flags
decoded_nul_does_not_change_failed_parse_report
decoded_nul_is_deterministic
```

Forbidden behavior

A future decoded NUL acceptance implementation must not:

- accept literal NUL source bytes;
- accept lowercase hex escapes;
- accept unknown escapes;
- broaden accepted escape forms;
- remove LUI0022 from the diagnostic code table;
- remove LUI0023 literal NUL rejection;
- remove existing C-string fields;
- make raw purpose= or value= report fields the assertion target for embedded NUL bytes;
- add file I/O to parser or AST code;
- write files;
- open network connections;
- call server code;

- call update code;
- call recovery code;
- call hardware code;
- mutate state lattice;
- perform live movement;
- run L-UI behavior;
- render an interactive UI;
- treat text nodes as commands;
- treat bindings as executable references.

Current validation command

This contract is guarded by:

```
sh scripts/test-l-ui-decoded-nul-acceptance-contract.sh
```

The guard is static. It does not implement decoded NUL acceptance.

Non-claims

This document does not implement decoded NUL acceptance, accept literal NUL bytes, broaden accepted L-UI syntax, implement Unicode display behavior, add L-UI rendering, add command behavior, add Nucleus task handling, add live movement, add origin mutation, add recovery behavior, add server interaction, add self-update, add hardware support, add boot readiness, claim security isolation, claim sandboxing, or claim operating-system completeness.

docs/L_UI_DECODED_NUL_ACCEPTANCE_IMPLEMENTATION.md

Source title: Latticra L-UI Decoded NUL Acceptance Implementation

Lines: 335 | Words: 873 | SHA-256: 07e0dd667f8a3db9e434619e3db9d2d28114b6a2c13ea3f8277f31f906b9166a

Latticra L-UI Decoded NUL Acceptance Implementation

Status: initial implementation contract Scope: escaped decoded NUL acceptance for L-UI source-backed AST strings.

Purpose

The L-UI Decoded NUL Acceptance implementation accepts escaped decoded NUL bytes in source-backed AST string values through the existing uppercase hex escape syntax:

```
\x00
```

The implementation relies on the explicit decoded byte lengths added by the L-UI AST length-carrying string storage implementation.

It accepts escaped decoded NUL bytes while continuing to reject literal NUL bytes in source buffers.

Implementation files

```
src/l_ui_parser.c
src/l_ui_parser_ast.c
tests/l_ui_decoded_nul_acceptance_invariants.c
scripts/test-l-ui-decoded-nul-acceptance.sh
```

Related active files:

```
include/latticra/l_ui_parser.h
```

```
src/l_ui_parser_diagnostics.c
tests/l_ui_parser_string_escape_diagnostics_invariants.c
tests/l_ui_ast_length_carrying_string_storage_invariants.c
tests/l_ui_string_literal_escape_invariants.c
```

Accepted form

Only escaped decoded NUL through uppercase hex is accepted:

```
\x00
```

Accepted examples:

```
purpose &quot;A\x00B&quot;
text &quot;left\x00right&quot;
```

The decoded byte sequence contains 0x00 at the escape position.

Literal NUL remains rejected

Literal 0x00 bytes in the source buffer remain rejected.

Literal NUL still reports:

```
LATTICRA_L_UI_PARSE_LITERAL_NUL_IN_STRING
LUI0023 literal_nul_in_string
```

This implementation does not add a source-buffer literal-NUL acceptance model.

The literal-NUL source-buffer policy contract is recorded in:

```
L_UI_SOURCE_BUFFER_LITERAL_NUL_POLICY_CONTRACT.md
```

Parser validation behavior

Parser validation in:

```
src/l_ui_parser.c
```

no longer reports:

```
LATTICRA_L_UI_PARSE_DECODED_NUL_IN_STRING
```

for escaped \x00 in supported source-backed string values.

The parser still rejects:

```
\x0a -&gt; LATTICRA_L_UI_PARSE_INVALID_HEX_ESCAPE
\a -&gt; LATTICRA_L_UI_PARSE_INVALID_STRING_ESCAPE
literal 0x00 -&gt; LATTICRA_L_UI_PARSE_LITERAL_NUL_IN_STRING
```

Diagnostic compatibility

The implementation keeps existing parser errors and diagnostic codes stable:

```
LATTICRA_L_UI_PARSE_DECODED_NUL_IN_STRING
LATTICRA_L_UI_PARSE_LITERAL_NUL_IN_STRING
LUI0022 decoded_nul_in_string
LUI0023 literal_nul_in_string
```

LUI0022 remains available as a stable diagnostic mapping, but escaped \x00 no longer emits it from real supported L-UI string input.

LUI0023 remains active for literal source NUL.

AST storage behavior

Escaped decoded NUL bytes are stored in the existing AST byte buffers and counted by explicit lengths:

```
ast.card.purpose
ast.card.purpose_len
ast.texts[index].value
ast.texts[index].value_len
```

For embedded NUL values:

```
purpose_len != strlen(purpose)
value_len != strlen(value)
```

The explicit length field is authoritative.

C-string prefix compatibility

For decoded value:

```
A\x00B
```

The AST stores:

```
purpose[0] == &#x27;A&#x27;
purpose[1] == &#x27;\0&#x27;
purpose[2] == &#x27;B&#x27;
purpose_len == 3
strlen(purpose) == 1
```

The same rule applies to text values.

Decode helper behavior

The AST string decode helper in:

```
src/l_ui_parser_ast.c
```

now allows decoded byte 0x00 when it is produced by escaped \x00.

The helper still rejects literal source NUL bytes before value materialization.

Decoded length assignment counts decoded NUL bytes:

```
&quot;A\x00B&quot; -&gt; decoded bytes: A, 0x00, B -&gt; length 3
```

Detailed report behavior

Detailed AST reports use explicit lengths and escaped output as the stable inspection surface.

Purpose example:

```
purpose_len=3
purpose_escaped=A\x00B
```

Text example:

```
value_len=10
value_escaped=left\x00right
```

Raw C-string compatibility fields remain prefix-oriented:

```
purpose=&lt;C-string-compatible-prefix&gt;
value=&lt;C-string-compatible-prefix&gt;
```

Embedded-NUL tests assert against:

```
purpose_len
purpose_escaped
value_len
value_escaped
```

not raw purpose= or value= fields.

Compact report compatibility

The compact AST report remains unchanged:

```
latticra_l_ui_ast_report
```

Detailed reports remain the stable inspection surface for embedded NUL values.

Source-span behavior

Source spans remain source-oriented.

A decoded NUL produced by source bytes \x00 counts as one decoded byte but four source bytes.

Accepted AST text spans continue to cover the full source value range between quotes.

No public decoded-byte span field is added.

Validation order

The implementation preserves validation order:

1. null argument checks;
2. source size checks;
3. structural parse checks;
4. string escape validation;
5. AST construction.

Structural parse errors retain priority over decoded-NUL acceptance.

Compatibility

The implementation does not change:

```
accepted escape forms other than \x00 behavior
parser diagnostic code stability
literal source NUL rejection
lowercase hex rejection
unknown escape rejection
existing C-string fields
compact AST report fields
failed-parse detailed report behavior
existing accepted fixture counts
```

The first accepted fixture still reports:

```
rail_count=9
field_count=23
text_count=2
effect=none
boundary=preview_only
```

No-effect boundary

Decoded NUL acceptance is metadata-only.

It preserves:

```
no_effect=1
execution_allowed=0
mutation_allowed=0
server_allowed=0
recovery_allowed=0
hardware_allowed=0
```

Test command

Run:

```
sh scripts/test-l-ui-decoded-nul-acceptance.sh
```

The main C workflow runs this check after the decoded-NUL acceptance implementation-plan guard and before the string-literal escape guards.

Required invariants

The decoded-NUL acceptance tests verify:

```
decoded_nul_accepts_purpose_x00
decoded_nul_accepts_text_x00
decoded_nul_counts_purpose_len
decoded_nul_counts_text_value_len
```

```
decoded_nul_preserves_c_string_prefix_compatibility
decoded_nul_reports_purpose_escaped_x00
decoded_nul_reports_text_value_escaped_x00
decoded_nul_does_not_emit_lui0022_for_x00
decoded_nul_still_rejects_literal_nul_lui0023
decoded_nul_still_rejects_lowercase_hex_lui0020
decoded_nul_still_rejects_unknown_escape_lui0019
decoded_nul_preserves_source_spans
decoded_nul_preserves_no_effect_flags
decoded_nul_does_not_change_failed_parse_report
decoded_nul_is_deterministic
```

Current evidence level

This implementation is an L2 tested decoded-byte storage and reporting model for escaped decoded NUL bytes in L-UI source-backed AST strings.

It is not literal source NUL acceptance, Unicode display behavior, renderer behavior, UI runtime behavior, command behavior, Nucleus task execution, server interaction, update behavior, recovery behavior, hardware behavior, boot behavior, sandboxing, or an operating system.

Next implementation step

The source-buffer literal NUL policy contract is recorded in:

```
L_UI_SOURCE_BUFFER_LITERAL_NUL_POLICY_CONTRACT.md
```

The next implementation candidate after that contract is:

```
L-UI source-buffer literal NUL policy implementation plan
```

That future work should decide whether literal NUL bytes in source buffers remain permanently forbidden or receive their own length-aware source input policy.

Non-claims

This document and implementation do not accept literal NUL bytes, broaden accepted L-UI syntax beyond escaped decoded NUL behavior, implement Unicode display behavior, add L-UI rendering, add command behavior, add Nucleus task handling, add live movement, add origin mutation, add recovery behavior, add server interaction, add self-update, add hardware support, add boot readiness, claim security isolation, claim sandboxing, or claim operating-system completeness.

docs/L_UI_DECODED_NUL_ACCEPTANCE_IMPLEMENTATION_PLAN.md

Source title: Latticra L-UI Decoded NUL Acceptance Implementation Plan

Lines: 435 | Words: 1143 | SHA-256: 5cc0a2c3b87427342bf480f9d8819ded14e288de89aac3d65b726ce254a96e4a

Latticra L-UI Decoded NUL Acceptance Implementation Plan

Status: implementation planning contract Scope: parser validation changes, decode helper changes, AST storage expectations, report expectations, diagnostic compatibility behavior, source-span expectations, exact test files, and exact invariant tests before escaped decoded NUL acceptance code.

Purpose

This document defines the implementation plan for accepting escaped decoded NUL bytes in L-UI source-backed AST string values.

The decoded-NUL acceptance contract is already merged and guarded. This plan decides the exact parser validation changes, private decode helper behavior, AST storage expectations, detailed report expectations, diagnostic compatibility behavior, source-span expectations, and test coverage before implementation code is added.

This document does not implement decoded NUL acceptance.

Relationship to previous contracts

This plan depends on:

```
docs/L_UI_DECODED_NUL_ACCEPTANCE_CONTRACT.md
docs/L_UI_AST_LENGTH_CARRYING_STRING_STORAGE_CONTRACT.md
docs/L_UI_AST_LENGTH_CARRYING_STRING_STORAGE_IMPLEMENTATION_PLAN.md
docs/L_UI_AST_LENGTH_CARRYING_STRING_STORAGE_IMPLEMENTATION.md
docs/L_UI_PARSER_STRING_ESCAPE_DIAGNOSTICS_IMPLEMENTATION.md
docs/L_UI_STRING_LITERAL_ESCAPE_IMPLEMENTATION.md
include/latticra/l_ui_parser.h
src/l_ui_parser.c
src/l_ui_parser_ast.c
src/l_ui_parser_diagnostics.c
```

Those files remain the source of truth for explicit AST string lengths, parser diagnostics, string-literal escape decoding, detailed reports, and no-effect behavior.

Implementation language decision

Decoded NUL acceptance should be implemented in C.

Reason:

- parser validation lives in src/l_ui_parser.c;
- AST decoding lives in src/l_ui_parser_ast.c;
- diagnostics live in src/l_ui_parser_diagnostics.c;
- the public AST API is C;
- the change is byte-oriented, bounded, deterministic, and no-effect.

Acceptance scope

The implementation should accept only escaped decoded NUL through uppercase hex syntax:

```
\x00
```

Accepted sources after implementation:

```
purpose &quot;A\x00B&quot;
text &quot;left\x00right&quot;
```

Literal source NUL bytes remain rejected.

Parser validation changes

Update private string escape validation in:

```
src/l_ui_parser.c
```

The parser currently maps escaped \x00 to:

```
LATTICRA_L_UI_PARSE_DECODED_NUL_IN_STRING
```

The implementation should change parser validation so escaped \x00 in supported source-backed string values is accepted and counted as one decoded byte.

The parser must continue to reject literal source NUL bytes as:

```
LATTICRA_L_UI_PARSE_LITERAL_NUL_IN_STRING
```

Parser diagnostic compatibility

Do not remove existing parser errors or diagnostic codes:

```
LATTICRA_L_UI_PARSE_DECODED_NUL_IN_STRING
LATTICRA_L_UI_PARSE_LITERAL_NUL_IN_STRING
LUI0022 decoded_nul_in_string
LUI0023 literal_nul_in_string
```

After implementation:

```
\x00 -&gt; accepted in source-backed string values
literal 0x00 -&gt; LATTICRA_L_UI_PARSE_LITERAL_NUL_IN_STRING
```

LUI0022 remains reserved and stable, but should not be emitted for accepted escaped \x00 in supported string values.

Decode helper changes

Update private string-literal decoding in:

```
src/l_ui_parser_ast.c
```

The helper currently rejects decoded byte 0x00 through the same capacity/error path used for invalid output.

The implementation should allow decoded byte 0x00 when and only when it is produced by escaped \x00.

It must still reject literal source NUL bytes before value materialization.

Decoded length assignment must count decoded NUL bytes:

```
&quot;A\x00B&quot; -&gt; decoded bytes: A, 0x00, B -&gt; length 3
```

AST storage expectations

Use the existing length-carrying fields:

```
ast.card.purpose
ast.card.purpose_len
ast.texts[index].value
ast.texts[index].value_len
```

For embedded NUL values:

```
purpose_len != strlen(purpose)
value_len != strlen(value)
```

The explicit length field is authoritative.

Existing C-string buffers remain compatibility buffers and should contain the decoded bytes plus a trailing compatibility NUL. Consumers that use strlen will see the prefix before the first embedded NUL.

C-string prefix compatibility

For decoded value:

```
A\x00B
```

Expected compatibility behavior:

```
purpose[0] == &#x27;A&#x27;
purpose[1] == &#x27;\0&#x27;
purpose[2] == &#x27;B&#x27;
purpose_len == 3
strlen(purpose) == 1
```

The same rule applies to text values.

Report expectations

Detailed AST reports should remain the authoritative inspection surface for embedded NUL values.

For purpose:

```
purpose_len=3
purpose_escaped=A\x00B
```

For text:

```
value_len=10
```

```
value_escaped=left\x00right
```

Raw fields remain compatibility fields only:

```
purpose=&lt;C-string-compatible-prefix&gt;
value=&lt;C-string-compatible-prefix&gt;
```

Tests for embedded NUL must assert against:

```
purpose_len
purpose_escaped
value_len
value_escaped
```

not raw purpose= or value= fields.

Escaped report helper expectations

The current length-aware helper:

```
escape_report_bytes(input, input_len, output, output_len)
```

already accepts explicit lengths.

The implementation must ensure callers pass:

```
ast.card.purpose_len
ast.texts[index].value_len
```

for purpose and text values.

The helper should render embedded decoded NUL as:

```
\x00
```

Source-span expectations

Source spans remain source-oriented.

Accepted AST text spans continue to cover the full source value range between quotes.

A decoded NUL produced by source bytes \x00 counts as one decoded byte but four source bytes.

No public decoded-byte span field is added.

Parser validation order

Preserve the current validation order:

1. null argument checks;
2. source size checks;
3. structural parse checks;
4. string escape validation;
5. AST construction.

Structural parse errors must retain priority over decoded-NUL acceptance.

Accepted escape compatibility

Do not broaden the accepted escape set.

Still accepted:

```
\\
\&quot;
\n
\r
\t
\xNN
```

where \xNN uses exactly two uppercase hexadecimal digits.

Still rejected:

```
\x0a -&gt; LATTICRA_L_UI_PARSE_INVALID_HEX_ESCAPE
\a -&gt; LATTICRA_L_UI_PARSE_INVALID_STRING_ESCAPE
literal 0x00 -&gt; LATTICRA_L_UI_PARSE_LITERAL_NUL_IN_STRING
```

Compact report compatibility

The compact AST report:

```
latticra_l_ui_ast_report
```

should remain unchanged.

Detailed AST reports are the stable inspection surface for embedded NUL values.

Failed parse compatibility

Failed parse behavior remains unchanged:

```
ast.parse_result.error = parser error
ast.rail_count = 0
ast.field_count = 0
ast.text_count = 0
failed-parse detailed report only
```

Fixture compatibility

The first accepted fixture should still report:

```
rail_count=9
field_count=23
text_count=2
effect=none
boundary=preview_only
```

No-effect preservation

Decoded NUL acceptance is metadata-only.

It must preserve:

```
no_effect=1
execution_allowed=0
mutation_allowed=0
server_allowed=0
recovery_allowed=0
hardware_allowed=0
```

Exact implementation test list

The implementation PR should include tests for:

```
decoded_nul_accepts_purpose_x00
decoded_nul_accepts_text_x00
decoded_nul_counts_purpose_len
decoded_nul_counts_text_value_len
decoded_nul_preserves_c_string_prefix_compatibility
decoded_nul_reports_purpose_escaped_x00
decoded_nul_reports_text_value_escaped_x00
decoded_nul_does_not_emit_lui0022_for_x00
decoded_nul_still_rejects_literal_nul_lui0023
decoded_nul_still_rejects_lowercase_hex_lui0020
decoded_nul_still_rejects_unknown_escape_lui0019
decoded_nul_preserves_source_spans
decoded_nul_preserves_no_effect_flags
decoded_nul_does_not_change_failed_parse_report
decoded_nul_is_deterministic
```

Test file plan

Add:

```
tests/l_ui_decoded_nul_acceptance_invariants.c
scripts/test-l-ui-decoded-nul-acceptance.sh
```

Wire into:

```
.github/workflows/c.yml
```

Run after:

```
sh scripts/test-l-ui-decoded-nul-acceptance-contract.sh
```

and before:

```
sh scripts/test-l-ui-string-literal-escape-contract.sh
```

Documentation requirement

The implementation PR should update:

```
README.md
docs/FOUNDATION_INDEX.md
docs/L_UI_DECODED_NUL_ACCEPTANCE_CONTRACT.md
docs/L_UI_AST_LENGTH_CARRYING_STRING_STORAGE_IMPLEMENTATION.md
docs/L_UI_PARSER_STRING_ESCAPE_DIAGNOSTICS_IMPLEMENTATION.md
docs/L_UI_STRING_LITERAL_ESCAPE_IMPLEMENTATION.md
```

and add:

```
docs/L_UI_DECODED_NUL_ACCEPTANCE_IMPLEMENTATION.md
```

Forbidden implementation behavior

The decoded NUL acceptance implementation must not:

- accept literal NUL source bytes;
- accept lowercase hex escapes;
- accept unknown escapes;
- broaden accepted escape forms;
- remove LUI0022 from the diagnostic code table;
- remove LUI0023 literal NUL rejection;
- remove existing C-string fields;
- make raw purpose= or value= report fields the assertion target for embedded NUL bytes;
- add file I/O to parser or AST code;
- write files;
- open network connections;
- call server code;
- call update code;
- call recovery code;
- call hardware code;
- mutate state lattice;
- perform live movement;
- run L-UI behavior;
- render an interactive UI;
- treat text nodes as commands;
- treat bindings as executable references.

Current validation command

This plan is guarded by:

```
sh scripts/test-l-ui-decoded-nul-acceptance-implementation-plan.sh
```

The guard is static. It does not implement decoded NUL acceptance.

Implementation gate

Decoded NUL acceptance implementation code may be added only after this plan is merged.

Non-claims

This document does not implement decoded NUL acceptance, accept literal NUL bytes, broaden accepted L-UI syntax, implement Unicode display behavior, add L-UI rendering, add command behavior, add Nucleus task handling, add live movement, add origin mutation, add recovery behavior, add server interaction, add self-update, add hardware support, add boot readiness, claim security isolation, claim sandboxing, or claim operating-system completeness.

docs/L_UI_PARSER.md

Source title: Latticra L-UI Parser

Lines: 234 | Words: 520 | SHA-256: e912de1efede3e08ce866061e96e3d44b057073a3a796d0a9109fa5514413373

Latticra L-UI Parser

Status: implementation contract Scope: no-effect C parser, parse summaries, source locations, and source spans for the first L-UI source fixture.

Purpose

The L-UI Parser validates in-memory .lui source and returns a compact no-effect parse summary.

It does not render UI, run L-UI behavior, perform file I/O, call Nucleus task handling, or mutate state.

Implementation files

```
include/latticra/l_ui_parser.h
src/l_ui_parser.c
tests/l_ui_parser_invariants.c
tests/l_ui_parser_location_invariants.c
tests/l_ui_parser_source_span_invariants.c
scripts/test-l-ui-parser.sh
scripts/test-l-ui-parser-location.sh
scripts/test-l-ui-parser-source-span.sh
```

Source-size limit

The parser defines:

```
LATTICRA_L_UI_SOURCE_MAX = 65536
```

Input larger than this is rejected with:

```
source_too_large
```

Public API

Current API:

```
latticra_l_ui_parse_error_label
latticra_l_ui_parse_source
latticra_l_ui_parse_result_report
```

The parser accepts in-memory source only. It does not read files directly.

Parse result

The parse result contains:

```
status
error
line
column
span
card_name
rail_count
field_count
effect
boundary
no_effect
execution_allowed
mutation_allowed
server_allowed
recovery_allowed
hardware_allowed
```

The source span contains:

```
start_offset
end_offset
start_line
start_column
end_line
end_column
```

For a valid fixture, the expected summary is:

```
status=ok
error=ok
card_name=NucleusPreview
rail_count=9
field_count=23
effect=none
boundary=preview_only
no_effect=1
execution_allowed=0
mutation_allowed=0
server_allowed=0
recovery_allowed=0
hardware_allowed=0
span_start_offset=0
span_end_offset=0
span_start_line=1
span_start_column=1
span_end_line=1
span_end_column=1
```

Accepted fixture

The first accepted source is:

```
examples/l-ui/nucleus-preview-card.lui
```

Error labels

The parser exposes stable labels for:

```
ok
null_argument
empty_source
unsupported_version
missing_card
missing_purpose
missing_effect
unsupported_effect
missing_boundary
unsupported_boundary
missing_rail
unknown_rail
unknown_binding_prefix
missing_required_binding
unterminated_string
unbalanced_brace
forbidden_behavior_marker
source_too_large
internal_error
```

Validation strategy

The parser is intentionally conservative. It performs:

- source length check;
- quote balance check;
- brace balance check;
- required header and card checks;
- required effect and boundary checks;
- forbidden marker checks;
- required rail checks;
- required binding checks;
- point-location metadata;
- source-span metadata;
- no-effect summary output.

It does not produce a full AST yet.

Report shape

The parser result report renders deterministic text and appends span fields:

```
span_start_offset=&lt;n&gt;
span_end_offset=&lt;n&gt;
span_start_line=&lt;n&gt;
span_start_column=&lt;n&gt;
span_end_line=&lt;n&gt;
span_end_column=&lt;n&gt;
```

Test commands

Run:

```
sh scripts/test-l-ui-parser.sh
sh scripts/test-l-ui-parser-location.sh
sh scripts/test-l-ui-parser-source-span.sh
```

The main C workflow runs these checks after existing state, transition, Nucleus, L-UI static report, grammar fixture, parser design, and parser plan guards.

Required invariants

The parser tests verify:

```
valid_fixture_parses_successfully
null_source_is_rejected
null_result_is_rejected
empty_source_is_rejected
oversized_source_is_rejected
unsupported_version_is_rejected
missing_card_is_rejected
missing_purpose_is_rejected
missing_effect_is_rejected
unsupported_effect_is_rejected
missing_boundary_is_rejected
unsupported_boundary_is_rejected
missing_required_rail_is_rejected
missing_required_binding_is_rejected
unknown_binding_prefix_is_rejected
forbidden_behavior_marker_is_rejected
unterminated_string_is_rejected
unbalanced_brace_is_rejected
valid_parse_returns_no_effect_flags
error_results_preserve_no_execution_flags
parse_error_labels_are_stable
```

The source-span tests verify span offsets, exclusive end offsets, one-based line/column ranges, byte-based columns, LF/CRLF/CR handling, report fields, diagnostic span copying, and default success spans.

Current evidence level

This implementation is an L2 tested model for no-effect L-UI source validation, point locations, and source-span metadata.

It is not a renderer, interactive UI, shell, compositor, command language, Nucleus task runner, server client, update engine, recovery system, hardware system, boot system, AST system, or security boundary.

Next implementation step

The next implementation candidate after source spans is:

```
L-UI parser AST contract
```

That future work should define AST shape, node ownership, source-span usage, and no-effect boundaries before any AST implementation.

Non-claims

This document and implementation do not claim AST construction, L-UI rendering, command behavior, Nucleus task handling, live movement, origin mutation, recovery behavior, server interaction, self-update, hardware support, boot readiness, security isolation, sandboxing, or operating-system completeness.

docs/L_UI_PARSER_AST_CONTRACT.md

Source title: Latticra L-UI Parser AST Contract

Lines: 384 | Words: 962 | SHA-256: 69abe05546f83aac90f701823feaf60659367e05877ac8cdf9642b049ed72bde

Latticra L-UI Parser AST Contract

Status: AST contract Scope: future AST shape, node ownership, source-span usage, capacity rules, diagnostics relationship, and no-effect boundaries before AST implementation.

Purpose

This document defines the initial AST contract for the L-UI parser.

The parser currently validates source, produces parse summaries, emits precise point locations, and records source-span metadata. The next architectural step is an AST contract that defines how source may later become a structured tree without adding rendering, command behavior, live movement, or mutation.

This document does not implement an AST.

Current boundary

The current parser provides:

```
parse status
parse error category
point line and column
source span metadata
diagnostic mapping
diagnostic reports
no-effect flags
```

This contract does not add:

```
AST construction
AST allocation
```

```
AST traversal
renderer integration
interactive UI behavior
command behavior
Nucleus task handling
live movement
state mutation
server interaction
update behavior
recovery behavior
hardware behavior
boot behavior
```

AST purpose

A future AST should represent validated .lui source as structured, inspectable metadata.

A future AST may support:

- stable card summaries;
- rail and field enumeration;
- source-span-aware diagnostics;
- fixture validation reports;
- later renderer contracts;
- later tooling that can inspect L-UI source without executing it.

The AST must remain metadata-only until a separate renderer or execution contract exists.

No-effect rule

AST construction must preserve:

```
no_effect=1
execution_allowed=0
mutation_allowed=0
server_allowed=0
recovery_allowed=0
hardware_allowed=0
```

AST code must not run L-UI behavior.

Ownership rule

The first AST implementation should use caller-provided storage or fixed-size result storage.

It must not require unbounded heap allocation.

It must not retain borrowed pointers into a source buffer unless a later lifetime contract explicitly permits it.

The first AST should prefer copied labels and spans:

```
card_name
purpose
boundary
effect
rail names
field names
binding paths
source spans
```

Public API rule

AST implementation will require a public API extension.

A future implementation plan must define:

```
AST struct names
capacity constants
```

```
parse function shape
report function shape
error behavior
compatibility expectations
```

No AST API should be added until an implementation plan is merged.

Proposed capacity constants

Initial proposed constants:

```
LATTICRA_L_UI_AST_RAIL_MAX = 16
LATTICRA_L_UI_AST_FIELD_MAX = 64
LATTICRA_L_UI_AST_TEXT_MAX = 16
LATTICRA_L_UI_AST_LABEL_MAX = 64
LATTICRA_L_UI_AST_BINDING_MAX = 96
LATTICRA_L_UI_AST_PURPOSE_MAX = 128
LATTICRA_L_UI_AST_REPORT_MAX = 2048
```

These values should be reviewed in the implementation plan.

Proposed node kinds

Initial AST node kinds:

```
card
rail
field
text
binding
```

Reserved future node kinds:

```
layout
theme
action
condition
```

Reserved node kinds must not become executable without a future contract.

Card node

The first card node should include:

```
name
purpose
effect
boundary
span
rail_count
field_count
text_count
```

The first accepted card remains:

```
NucleusPreview
```

Rail node

A rail node should include:

```
name
span
first_field_index
field_count
first_text_index
text_count
```

Initial required rails:

```
top
state
trace
safety
gates
effects
policy
execution
bottom
```

Field node

A field node should include:

```
name
binding
span
binding_span
```

Allowed binding prefixes remain:

```
state.
preview.
```

Text node

A text node should include:

```
value
span
```

Text nodes are literal metadata only. They must not be interpreted as commands.

Source-span usage

Every AST node should carry source-span metadata when available.

Rules:

1. Card span covers the full card declaration.
2. Rail span covers the rail block.
3. Field span covers the field declaration.
4. Binding span covers the binding path only.
5. Text span covers the quoted text value or full text declaration, as defined by the implementation plan.
6. Missing constructs should not produce AST nodes.

AST result shape

A future AST parse result may include:

```
parse_result
card
rails[]
fields[]
texts[]
rail_count
field_count
text_count
no_effect
execution_allowed
mutation_allowed
server_allowed
recovery_allowed
hardware_allowed
```

The exact shape must be finalized in an implementation plan.

AST report shape

A future AST report may render deterministic text such as:

```
L-UI AST SUMMARY
card=NucleusPreview
rail_count=&lt;n&gt;
field_count=&lt;n&gt;
text_count=&lt;n&gt;
no_effect=1
execution_allowed=0
mutation_allowed=0
server_allowed=0
```

```
recovery_allowed=0
hardware_allowed=0
```

Detailed rail and field reporting should be planned separately if needed.

Initial accepted fixture

The first AST target should be:

```
examples/l-ui/nucleus-preview-card.lui
```

The expected summary should include:

```
card=NucleusPreview
rail_count=9
field_count=23
text_count=2
effect=none
boundary=preview_only
```

Diagnostics relationship

AST construction should depend on a successful parse.

If parsing fails, AST construction should return the parser error and must not emit partial executable structures.

A later contract may define partial AST behavior for diagnostics, but the first AST should avoid partial AST output.

Forbidden behavior

A future AST implementation must not:

- add file I/O to parser code;
- write files;
- open network connections;
- call server code;
- call update code;
- call recovery code;
- call hardware code;
- mutate state lattice;
- perform live movement;
- run L-UI behavior;
- render an interactive UI;
- accept unsupported effects;
- treat text nodes as commands;
- treat bindings as executable references.

Implementation gate

AST implementation must not begin until a separate implementation plan defines:

1. public API changes;
2. AST struct placement;
3. capacity constants;
4. ownership and lifetime rules;

5. source-span integration;
6. successful parse requirements;
7. report format;
8. test file names;
9. exact invariant tests;
10. compatibility expectations.

Future test list

A future implementation plan should include tests for:

```
valid_fixture_builds_ast_summary
ast_card_name_is_nucleus_preview
ast_counts_match_fixture
ast_preserves_effect_none
ast_preserves_boundary_preview_only
ast_contains_required_rails
ast_contains_required_fields
ast_contains_text_nodes
ast_nodes_have_source_spans
ast_bindings_have_binding_spans
ast_rejects_failed_parse
ast_preserves_no_effect_flags
ast_report_contains_required_fields
ast_report_is_deterministic
ast_capacity_limits_are_enforced
ast_does_not_retain_source_pointers
ast_labels_are_stable
```

Current validation command

This contract is guarded by:

```
sh scripts/test-l-ui-parser-ast-contract.sh
```

The guard is static. It does not implement an AST.

Non-claims

This document does not implement AST construction, AST traversal, L-UI rendering, command behavior, Nucleus task handling, live movement, origin mutation, recovery behavior, server interaction, self-update, hardware support, boot readiness, security isolation, sandboxing, or operating-system completeness.

docs/L_UI_PARSER_AST_IMPLEMENTATION.md

Source title: Latticra L-UI Parser AST Implementation

Lines: 292 | Words: 734 | SHA-256: 5e92b1662cce65c359612288d4869059d1e1efa516e28c512854be224dcf3228

Latticra L-UI Parser AST Implementation

Status: implementation contract Scope: fixed-size AST metadata, source-backed purpose/text extraction, parse-result integration, source-span-aware nodes, compact and detailed AST reports, and no-effect invariants.

Purpose

The L-UI Parser AST implementation builds a fixed-size metadata tree for validated L-UI source.

It depends on successful source validation. It copies labels, bindings, source-backed purpose text, source-backed text values, and source spans into bounded public structures. It does not add rendering, command behavior, Nucleus task handling, live movement, state mutation, server interaction, recovery behavior, self-update behavior, hardware behavior, or boot behavior.

Implementation files

```
include/latticra/l_ui_parser.h
src/l_ui_parser_ast.c
tests/l_ui_parser_ast_invariants.c
tests/l_ui_parser_ast_detailed_report_invariants.c
tests/l_ui_ast_source_backed_text_invariants.c
scripts/test-l-ui-parser-ast.sh
scripts/test-l-ui-ast-detailed-report.sh
scripts/test-l-ui-ast-source-backed-text.sh
```

Public API

```
latticra_l_ui_ast_node_kind_label
latticra_l_ui_parse_ast
latticra_l_ui_ast_report
latticra_l_ui_ast_detailed_report
```

Public types

The implementation adds:

```
latticra_l_ui_ast_node_kind_t
latticra_l_ui_ast_card_t
latticra_l_ui_ast_rail_t
latticra_l_ui_ast_field_t
latticra_l_ui_ast_text_t
latticra_l_ui_ast_result_t
```

Capacity constants

```
LATTICRA_L_UI_AST_RAIL_MAX = 16
LATTICRA_L_UI_AST_FIELD_MAX = 64
LATTICRA_L_UI_AST_TEXT_MAX = 16
LATTICRA_L_UI_AST_LABEL_MAX = 64
LATTICRA_L_UI_AST_BINDING_MAX = 96
LATTICRA_L_UI_AST_PURPOSE_MAX = 128
LATTICRA_L_UI_AST_REPORT_MAX = 2048
LATTICRA_L_UI_AST_DETAILED_REPORT_MAX = 16384
```

Node kinds

Stable node kind labels:

```
card
rail
field
text
binding
unknown
```

AST result

A valid AST result contains:

```
parse_result
card
rails[]
fields[]
texts[]
rail_count
field_count
text_count
no_effect
execution_allowed
mutation_allowed
server_allowed
recovery_allowed
hardware_allowed
```

First accepted fixture

The first accepted source remains:

```
examples/l-ui/nucleus-preview-card.lui
```

The expected AST summary is:

```
card=NucleusPreview
rail_count=9
field_count=23
text_count=2
effect=none
boundary=preview_only
no_effect=1
execution_allowed=0
mutation_allowed=0
server_allowed=0
recovery_allowed=0
hardware_allowed=0
```

Source-backed text extraction

The AST extracts these values from validated source:

```
purpose &quot;...&quot; -&gt; ast.card.purpose
first text &quot;...&quot; -&gt; ast.texts[0].value
second text &quot;...&quot; -&gt; ast.texts[1].value
```

The surrounding quotes are not copied into AST values.

The extraction copies raw bytes between quotes and does not decode string escapes.

If an extracted value is too large for its fixed destination buffer, AST construction classifies the result as:

```
LATTICRA_L_UI_PARSE_INTERNAL_ERROR
```

and avoids partial AST counts.

Source-span usage

The AST copies source spans into populated nodes:

```
card.span
rail.span
field.span
field.binding_span
text.span
```

Text spans cover the extracted text value range. No public purpose span is currently exposed.

Spans are metadata only.

Ownership and lifetime

The AST implementation:

- uses fixed-size public storage;
- copies labels, purpose text, text values, binding paths, and spans;
- does not retain borrowed pointers into source;
- does not require heap allocation;
- treats all nodes as metadata only.

Failed parse behavior

AST construction depends on successful validation by latticra_l_ui_parse_source.

If parsing fails:

```
ast.parse_result.error = parser error
ast.rail_count = 0
ast.field_count = 0
ast.text_count = 0
no_effect=1
```

```
execution_allowed=0
mutation_allowed=0
server_allowed=0
recovery_allowed=0
hardware_allowed=0
```

No partial AST is emitted in the first implementation.

Detailed AST reporting renders a compact failed-parse report in this case.

Compact AST report

The compact AST report renders:

```
L-UI AST SUMMARY
card=&lt;card&gt;
rail_count=&lt;n&gt;
field_count=&lt;n&gt;
text_count=&lt;n&gt;
effect=&lt;effect&gt;
boundary=&lt;boundary&gt;
no_effect=&lt;0|1&gt;
execution_allowed=&lt;0|1&gt;
mutation_allowed=&lt;0|1&gt;
server_allowed=&lt;0|1&gt;
recovery_allowed=&lt;0|1&gt;
hardware_allowed=&lt;0|1&gt;
```

Detailed AST report

The detailed AST report renders deterministic card, rail, field, text, source-span, binding-span, escaped-string, and no-effect metadata.

The detailed report starts with:

```
L-UI AST DETAILED REPORT
card=NucleusPreview
purpose=operator-visible Nucleus preview report
effect=none
boundary=preview_only
rail_count=9
field_count=23
text_count=2
```

Detailed report capacity:

```
LATTICRA_L_UI_AST_DETAILED_REPORT_MAX = 16384
```

Test commands

Run:

```
sh scripts/test-l-ui-parser-ast.sh
sh scripts/test-l-ui-ast-detailed-report.sh
sh scripts/test-l-ui-ast-source-backed-text.sh
```

The main C workflow runs these checks after the AST implementation-plan guard, detailed report implementation-plan guard, and source-backed text implementation-plan guard.

Required invariants

The AST tests verify:

```
valid_fixture_builds_ast_summary
ast_card_name_is_nucleus_preview
ast_counts_match_fixture
ast_preserves_effect_none
ast_preserves_boundary_preview_only
ast_contains_required_rails
ast_contains_required_fields
ast_contains_text_nodes
ast_nodes_have_source_spans
ast_bindings_have_binding_spans
ast_rejects_failed_parse
ast_preserves_no_effect_flags
ast_report_contains_required_fields
ast_report_is_deterministic
```

```
ast_capacity_limits_are_enforced
ast_does_not_retain_source_pointers
ast_labels_are_stable
ast_node_kind_labels_are_stable
```

The detailed report tests verify deterministic card, rail, field, text, source-span, binding-span, failed-parse, and no-effect output.

The source-backed text tests verify extracted purpose/text values, copy ownership, quote exclusion, capacity failure classification, detailed report updates, no-effect preservation, and raw escape preservation.

Current evidence level

This implementation is an L2 tested metadata AST, source-backed text extraction, and detailed-report model for validated L-UI source.

It is not a renderer, UI runtime, command surface, Nucleus task runner, server client, update engine, recovery system, hardware system, boot system, or security boundary.

Next implementation step

The next implementation candidate after source-backed text extraction is:

```
L-UI string-literal escape contract
```

That future work should define whether and how string escapes are decoded before AST extraction decodes escape sequences.

Non-claims

This document and implementation do not claim L-UI rendering, command behavior, Nucleus task handling, live movement, origin mutation, recovery behavior, server interaction, self-update, hardware support, boot readiness, security isolation, sandboxing, or operating-system completeness.

docs/L_UI_PARSER_AST_IMPLEMENTATION_PLAN.md

Source title: Latticra L-UI Parser AST Implementation Plan

Lines: 430 | Words: 1048 | SHA-256: 99f18c7bd47a147f2f22f3025dbdd3839aeaac6f23e5422a6937f67dce092693

Latticra L-UI Parser AST Implementation Plan

Status: implementation planning contract Scope: public API changes, struct placement, capacity constants, ownership/lifetime rules, source-span integration, exact tests, and compatibility expectations before AST implementation.

Purpose

This document defines the implementation plan for the first L-UI parser AST.

The AST contract is already merged and guarded. This plan decides the exact C API, structure layout, capacity model, ownership rules, source-span integration, report format, and test list before AST construction code is added.

Relationship to previous contracts

This plan depends on:

```
docs/L_UI_PARSER_AST_CONTRACT.md
docs/L_UI_PARSER_SOURCE_SPAN_IMPLEMENTATION.md
docs/L_UI_PARSER.md
include/latticra/l_ui_parser.h
src/l_ui_parser.c
```

Those files remain the source of truth for parser behavior, source spans, diagnostics, and no-effect boundaries.

Implementation language decision

The AST implementation should be in C.

Reason:

- the parser is implemented in C;
- parse results and spans are C ABI surfaces;
- the first AST must remain fixed-size and portable;
- the current C workflow can validate AST invariants;
- no dynamic runtime should be required.

Public API change

AST implementation requires public API additions in:

```
include/latticra/l_ui_parser.h
```

The first AST implementation should add structs and functions, but should not change the existing parser function signatures.

Proposed capacity constants

Add:

```
LATTICRA_L_UI_AST_RAIL_MAX = 16
LATTICRA_L_UI_AST_FIELD_MAX = 64
LATTICRA_L_UI_AST_TEXT_MAX = 16
LATTICRA_L_UI_AST_LABEL_MAX = 64
LATTICRA_L_UI_AST_BINDING_MAX = 96
LATTICRA_L_UI_AST_PURPOSE_MAX = 128
LATTICRA_L_UI_AST_REPORT_MAX = 2048
```

These caps are intentionally larger than the first NucleusPreview fixture while remaining bounded.

AST node kind enum

Add:

```
typedef enum {
    LATTICRA_L_UI_AST_NODE_CARD = 0,
    LATTICRA_L_UI_AST_NODE_RAIL = 1,
    LATTICRA_L_UI_AST_NODE_FIELD = 2,
    LATTICRA_L_UI_AST_NODE_TEXT = 3,
    LATTICRA_L_UI_AST_NODE_BINDING = 4,
    LATTICRA_L_UI_AST_NODE_UNKNOWN = 5
} latticra_l_ui_ast_node_kind_t;
```

Reserved future node kinds such as layout, theme, action, and condition must remain unimplemented until future contracts exist.

Card struct

Add a card summary struct:

```
typedef struct {
    char name[LATTICRA_L_UI_AST_LABEL_MAX];
    char purpose[LATTICRA_L_UI_AST_PURPOSE_MAX];
    char effect[LATTICRA_L_UI_LABEL_MAX];
    char boundary[LATTICRA_L_UI_LABEL_MAX];
    latticra_l_ui_source_span_t span;
    size_t rail_count;
    size_t field_count;
    size_t text_count;
} latticra_l_ui_ast_card_t;
```

Rail struct

Add:

```
typedef struct {
    char name[LATTICRA_L_UI_AST_LABEL_MAX];
    latticra_l_ui_source_span_t span;
    size_t first_field_index;
    size_t field_count;
    size_t first_text_index;
    size_t text_count;
} latticra_l_ui_ast_rail_t;
```

Field struct

Add:

```
typedef struct {
    char name[LATTICRA_L_UI_AST_LABEL_MAX];
    char binding[LATTICRA_L_UI_AST_BINDING_MAX];
    latticra_l_ui_source_span_t span;
    latticra_l_ui_source_span_t binding_span;
} latticra_l_ui_ast_field_t;
```

Text struct

Add:

```
typedef struct {
    char value[LATTICRA_L_UI_AST_PURPOSE_MAX];
    latticra_l_ui_source_span_t span;
} latticra_l_ui_ast_text_t;
```

AST result struct

Add:

```
typedef struct {
    latticra_l_ui_parse_result_t parse_result;
    latticra_l_ui_ast_card_t card;
    latticra_l_ui_ast_rail_t rails[LATTICRA_L_UI_AST_RAIL_MAX];
    latticra_l_ui_ast_field_t fields[LATTICRA_L_UI_AST_FIELD_MAX];
    latticra_l_ui_ast_text_t texts[LATTICRA_L_UI_AST_TEXT_MAX];
    size_t rail_count;
    size_t field_count;
    size_t text_count;
    int no_effect;
    int execution_allowed;
    int mutation_allowed;
    int server_allowed;
    int recovery_allowed;
    int hardware_allowed;
} latticra_l_ui_ast_result_t;
```

Public API plan

Add:

```
const char *latticra_l_ui_ast_node_kind_label(
    latticra_l_ui_ast_node_kind_t kind);

latticra_status_t latticra_l_ui_parse_ast(
    const char *source,
    size_t source_len,
    latticra_l_ui_ast_result_t *ast);

latticra_status_t latticra_l_ui_ast_report(
    const latticra_l_ui_ast_result_t *ast,
    char *buffer,
    size_t buffer_len);
```

The AST parser should accept in-memory source only. It must not perform file I/O.

Module shape

Add or update:

```
include/latticra/l_ui_parser.h
src/l_ui_parser_ast.c
tests/l_ui_parser_ast_invariants.c
scripts/test-l-ui-parser-ast.sh
.github/workflows/c.yml
```

A separate src/l_ui_parser_ast.c keeps AST construction distinct from the validator implementation.

Ownership and lifetime rules

The first AST must:

- use fixed-size storage;
- copy labels, purpose text, text values, binding paths, and spans;
- not store borrowed pointers into source;
- not require heap allocation;
- not expose mutable internal references;
- treat all AST nodes as metadata only.

Source-span integration

Every populated node should carry a span when possible.

Rules:

1. Card span covers the full card NucleusPreview { ... } block.
2. Rail span covers the rail block.
3. Field span covers the field declaration.
4. Binding span covers only the binding path.
5. Text span covers the quoted literal text.
6. Missing constructs do not produce AST nodes.

The first implementation may use simple deterministic scanning against the first fixture, but must remain bounded and no-effect.

Successful parse rule

AST construction should depend on successful validation by latticra_l_ui_parse_source.

If parsing fails:

```
ast.parse_result.error = parser error
ast.rail_count = 0
ast.field_count = 0
ast.text_count = 0
no_effect=1
execution_allowed=0
mutation_allowed=0
server_allowed=0
recovery_allowed=0
hardware_allowed=0
```

No partial AST should be emitted in the first implementation.

First accepted fixture summary

For:

```
examples/l-ui/nucleus-preview-card.lui
```

expected AST summary:

```
card=NucleusPreview
```

```
rail_count=9
field_count=23
text_count=2
effect=none
boundary=preview_only
no_effect=1
execution_allowed=0
mutation_allowed=0
server_allowed=0
recovery_allowed=0
hardware_allowed=0
```

AST report shape

The first AST report should render:

```
L-UI AST SUMMARY
card=NucleusPreview
rail_count=&lt;n&gt;
field_count=&lt;n&gt;
text_count=&lt;n&gt;
effect=&lt;effect&gt;
boundary=&lt;boundary&gt;
no_effect=&lt;0|1&gt;
execution_allowed=&lt;0|1&gt;
mutation_allowed=&lt;0|1&gt;
server_allowed=&lt;0|1&gt;
recovery_allowed=&lt;0|1&gt;
hardware_allowed=&lt;0|1&gt;
```

Detailed node reports should be deferred until a later report contract.

Compatibility expectations

Existing parser, diagnostics, location, and source-span tests must continue to pass.

Existing parser API signatures must not be changed.

New AST structs are additive public API.

Existing parser result and diagnostic report shapes must not be modified by the AST implementation.

Exact implementation test list

The AST implementation PR should include tests for:

```
valid_fixture_builds_ast_summary
ast_card_name_is_nucleus_preview
ast_counts_match_fixture
ast_preserves_effect_none
ast_preserves_boundary_preview_only
ast_contains_required_rails
ast_contains_required_fields
ast_contains_text_nodes
ast_nodes_have_source_spans
ast_bindings_have_binding_spans
ast_rejects_failed_parse
ast_preserves_no_effect_flags
ast_report_contains_required_fields
ast_report_is_deterministic
ast_capacity_limits_are_enforced
ast_does_not_retain_source_pointers
ast_labels_are_stable
ast_node_kind_labels_are_stable
```

Required rails

The AST must include rails for:

```
top
state
trace
safety
gates
effects
policy
```

```
execution
bottom
```

Required field names

The first AST implementation should include fields for:

```
origin
route
axis
path
breadcrumb
trace
health
risk
lock
dark_phase
safe_portal
rollback
host
external
requested
request
policy
reason
executed
mutation
server
recovery
hardware
```

Required text values

The first AST implementation should include text values for:

```
Latticra / Nucleus Preview / effect-bound
preview-only no-live-movement no-host-effect no-external-effect
```

Forbidden implementation behavior

The AST implementation must not:

- add file I/O to parser code;
- write files;
- open network connections;
- call server code;
- call update code;
- call recovery code;
- call hardware code;
- mutate state lattice;
- perform live movement;
- run L-UI behavior;
- render an interactive UI;
- accept unsupported effects;
- treat text nodes as commands;
- treat bindings as executable references.

Documentation requirement

The implementation PR should update:

```
README.md
docs/FOUNDATION_INDEX.md
```

```
docs/L_UI_PARSER_AST_CONTRACT.md
```

and add:

```
docs/L_UI_PARSER_AST_IMPLEMENTATION.md
```

Current validation command

This plan is guarded by:

```
sh scripts/test-l-ui-parser-ast-implementation-plan.sh
```

The guard is static. It does not implement an AST.

Implementation gate

AST implementation code may be added only after this plan is merged.

Non-claims

This document does not implement AST construction, AST traversal, L-UI rendering, command behavior, Nucleus task handling, live movement, origin mutation, recovery behavior, server interaction, self-update, hardware support, boot readiness, security isolation, sandboxing, or operating-system completeness.

docs/L_UI_PARSER_DESIGN.md

Source title: Latticra L-UI Parser Design Contract

Lines: 305 | Words: 763 | SHA-256: cbc45e19f3c933758bdd7d8f62b2743ce0b5941d982a80478370b59966655151

Latticra L-UI Parser Design Contract

Status: parser design contract Scope: parser behavior, no-effect constraints, error categories, fixture expectations, and non-claims before parser implementation.

Purpose

This document defines the design contract for a future L-UI parser.

The parser should be introduced only after the L-UI grammar draft and fixtures are stable enough to justify implementation.

This document does not implement a parser.

Current boundary

The current project state includes:

```
L-UI source grammar draft
.lui fixture
static fixture guard script
static C report fixture
```

The current project state does not include:

```
L-UI parser
renderer engine
interactive UI
command execution
Nucleus execution
live movement
server interaction
update behavior
hardware behavior
boot behavior
recovery behavior
```

Parser role

A future L-UI parser should read .lui source and produce a no-effect parse result.

Input:

```
source bytes
source length
optional source name
```

Output:

```
parse status
error category
error location
normalized fixture summary
no-effect proof flags
```

Parser must not

The parser must not:

- execute commands;
- render UI;
- call Nucleus execution;
- mutate state;
- perform live movement;
- perform recovery behavior;
- perform update behavior;
- interact with servers;
- access networking;
- access hardware;
- change boot state;
- perform host effects;
- perform external effects;
- allocate hidden persistent state;
- silently accept unknown effect declarations.

Allowed parser behavior

A future parser may:

- scan source;
- tokenize source;
- validate required clauses;
- validate allowed rails;
- validate allowed bindings;
- validate string literals;
- validate effect none;
- validate boundary preview_only;
- return deterministic errors;
- return a normalized no-effect summary.

Error categories

Initial parser error categories should include:

```
ok
null_argument
empty_source
unsupported_version
missing_card
missing_purpose
missing_effect
unsupported_effect
missing_boundary
unsupported_boundary
missing_rail
unknown_rail
unknown_binding_prefix
missing_required_binding
unterminated_string
unbalanced_brace
forbidden_behavior_marker
source_too_large
internal_error
```

Source size rule

A future parser should define a maximum source size.

Initial proposed limit:

```
64 KiB
```

The parser must reject oversized source rather than reallocating without bounds.

Required fixture behavior

The first parser target should accept:

```
examples/l-ui/nucleus-preview-card.lui
```

The parser must confirm:

- version is lui 0.1;
- card name is NucleusPreview;
- purpose exists;
- effect is none;
- boundary is preview_only;
- required rails exist;
- required bindings exist;
- forbidden behavior markers are absent.

Required rails

The first parser target must recognize:

```
top
state
trace
safety
gates
effects
policy
execution
bottom
```

Required binding prefixes

Initial allowed binding prefixes:

```
state.
preview.
```

No other prefix should be accepted until documented.

Effect validation

Only this effect declaration is valid for the first parser target:

```
effect none
```

Examples that must be rejected:

```
effect read
effect local_mutation
effect host_mutation
effect network
effect hardware
effect boot
effect recovery
effect external
```

Boundary validation

Only this boundary is valid for the first parser target:

```
boundary preview_only
```

Any other boundary should be rejected until documented.

Forbidden markers

Parser and fixture guards should reject markers that imply behavior outside static report layout:

```
execute
host_mutation
network
hardware
boot
recovery
self_update
server call
server_interaction {
```

Future syntax may refine this list, but the first parser must be conservative.

Parse result shape

A future parse result may use a C structure similar to:

```
status
error
line
column
card_name
rail_count
field_count
effect
boundary
no_effect
execution_allowed
mutation_allowed
server_allowed
recovery_allowed
hardware_allowed
```

Required no-effect flags:

```
no_effect=1
execution_allowed=0
mutation_allowed=0
server_allowed=0
recovery_allowed=0
hardware_allowed=0
```

Test plan for future parser implementation

Future parser tests should verify:

- valid fixture parses successfully;
- unsupported version is rejected;
- missing card is rejected;
- missing purpose is rejected;
- missing effect is rejected;
- unsupported effect is rejected;
- missing boundary is rejected;
- unsupported boundary is rejected;
- missing required rail is rejected;
- missing required binding is rejected;
- unknown binding prefix is rejected;
- forbidden behavior marker is rejected;
- oversized source is rejected;
- parser returns no-effect flags for valid fixtures.

Implementation gate

Parser code should not be added until:

1. this design contract is merged;
2. fixture guardrails pass;
3. parser error categories are reviewed;
4. parse result shape is approved;
5. no-effect invariants are explicit in tests.

Current validation command

This design contract is guarded by:

```
sh scripts/test-l-ui-parser-design.sh
```

The guard is static. It does not parse L-UI.

Non-claims

This document does not implement L-UI parsing, rendering, command execution, Nucleus execution, live movement, origin mutation, recovery execution, server interaction, self-update, hardware support, boot readiness, security isolation, sandboxing, or operating-system completeness.

docs/L_UI_PARSER_DIAGNOSTICS.md

Source title: Latticra L-UI Parser Diagnostics Contract

Lines: 234 | Words: 773 | SHA-256: 3dc68bf2c0ad4d31bf44f5f58aa62ac01baae845705071ccce3627b9ecfe425e

Latticra L-UI Parser Diagnostics Contract

Status: diagnostics contract Scope: stable parser diagnostic language, line/column behavior, result reporting, and implementation guardrails before richer diagnostics code.

Purpose

This document defines the diagnostics contract for the L-UI parser.

The current parser already returns an error category, line, column, and deterministic result report. This contract defines how those fields should become stable diagnostic language before richer diagnostic implementation is added.

This document does not implement new diagnostics.

Current boundary

The current parser provides:

```
parse status
parse error category
line
column
card name
rail count
field count
effect
boundary
no-effect flags
parser result report
```

This contract does not add:

```
renderer behavior
interactive UI behavior
command behavior
Nucleus task handling
live movement
state mutation
server interaction
self-update behavior
hardware behavior
boot behavior
recovery behavior
```

Diagnostic shape

A future diagnostic should be representable as:

```
severity=&lt;severity&gt;
code=&lt;stable-code&gt;
message=&lt;stable-message&gt;
line=&lt;line&gt;
column=&lt;column&gt;
hint=&lt;optional-remediation-hint&gt;
```

Severity levels

Initial severity levels:

```
ok
error
internal
```

Meanings:

```
| Severity | Meaning |
| --- | --- |
| `ok` | Valid parse result. |
| `error` | Source was rejected with a stable user-facing reason. |
| `internal` | Unexpected parser-side failure or unknown category. |
```

Stable diagnostic codes

Diagnostic codes should mirror parser error labels.

Initial codes:

```
LUI0000 ok
LUI0001 null_argument
LUI0002 empty_source
LUI0003 unsupported_version
LUI0004 missing_card
LUI0005 missing_purpose
LUI0006 missing_effect
LUI0007 unsupported_effect
LUI0008 missing_boundary
LUI0009 unsupported_boundary
LUI0010 missing_rail
LUI0011 unknown_rail
LUI0012 unknown_binding_prefix
LUI0013 missing_required_binding
LUI0014 unterminated_string
LUI0015 unbalanced_brace
LUI0016 forbidden_behavior_marker
LUI0017 source_too_large
LUI0018 internal_error
```

Stable messages

Initial message language should be concise and deterministic:

```
| Code | Message |
| --- | --- |
| `LUI0000` | Parse completed successfully. |
| `LUI0001` | Parser received a null argument. |
| `LUI0002` | L-UI source is empty. |
| `LUI0003` | L-UI version is not supported. |
| `LUI0004` | Required card declaration is missing. |
| `LUI0005` | Required purpose clause is missing. |
| `LUI0006` | Required effect clause is missing. |
| `LUI0007` | Effect declaration is not supported. |
| `LUI0008` | Required boundary clause is missing. |
| `LUI0009` | Boundary declaration is not supported. |
| `LUI0010` | Required rail is missing. |
| `LUI0011` | Rail name is not supported. |
| `LUI0012` | Binding prefix is not supported. |
| `LUI0013` | Required binding is missing. |
| `LUI0014` | String literal is not terminated. |
| `LUI0015` | Braces are not balanced. |
| `LUI0016` | Source contains a forbidden behavior marker. |
| `LUI0017` | Source exceeds the supported size limit. |
| `LUI0018` | Parser reached an internal error. |
```

Line and column behavior

Line and column should be one-based.

Default values:

```
line=1
column=1
```

A future diagnostics implementation may improve precision, but it must remain deterministic and must not require file I/O inside parser code.

Rules:

1. If a precise location is not available, return line=1 and column=1.
2. If a token location is available, line and column should point to the beginning of the rejected token or clause.

3. Line and column should count bytes in the in-memory source buffer, not terminal display cells.
4. Diagnostics must not depend on platform-specific newline behavior.
5. Diagnostics must preserve no-effect flags.

Hint language

Hints should be stable and optional.

Initial hint examples:

```
Use version header: lui 0.1
Add card NucleusPreview { ... }
Add effect none
Add boundary preview_only
Use only state. or preview. binding prefixes
Remove unsupported effect declarations
```

Hints must not suggest behavior outside the current no-effect grammar.

Report integration

A future parser diagnostic report may extend the current parser result report with:

```
diagnostic_severity=&lt;severity&gt;
diagnostic_code=&lt;code&gt;
diagnostic_message=&lt;message&gt;
diagnostic_hint=&lt;hint-or-empty&gt;
```

This should be added only after tests lock down stable codes and messages.

Required test plan for future diagnostics implementation

Future diagnostics tests should verify:

```
ok_result_has_lui0000
empty_source_reports_lui0002
unsupported_version_reports_lui0003
missing_card_reports_lui0004
missing_purpose_reports_lui0005
missing_effect_reports_lui0006
unsupported_effect_reports_lui0007
missing_boundary_reports_lui0008
unsupported_boundary_reports_lui0009
missing_rail_reports_lui0010
unknown_binding_prefix_reports_lui0012
missing_required_binding_reports_lui0013
unterminated_string_reports_lui0014
unbalanced_brace_reports_lui0015
forbidden_marker_reports_lui0016
source_too_large_reports_lui0017
error_diagnostics_preserve_no_effect_flags
unknown_error_reports_internal
line_and_column_are_one_based
messages_are_stable
```

Implementation gate

Diagnostic implementation code should not be added until:

1. this contract is merged;
2. diagnostic codes are stable;
3. message text is stable;
4. line and column behavior is accepted;
5. tests preserve no-effect flags;
6. result report extension shape is documented.

Current validation command

This contract is guarded by:

```
sh scripts/test-l-ui-parser-diagnostics-contract.sh
```

The guard is static. It does not implement diagnostics.

Non-claims

This document does not implement richer parser diagnostics, L-UI rendering, command behavior, Nucleus task handling, live movement, origin mutation, recovery behavior, server interaction, self-update, hardware support, boot readiness, security isolation, sandboxing, or operating-system completeness.

docs/L_UI_PARSER_DIAGNOSTICS_IMPLEMENTATION.md

Source title: Latticra L-UI Parser Diagnostics Implementation

Lines: 195 | Words: 649 | SHA-256: 7af0c8d7db3ab56783fddbf92bcbecb8cbf2e794e1001d124cc4e6b29f77fae7

Latticra L-UI Parser Diagnostics Implementation

Status: implementation contract Scope: diagnostic severity, stable codes, stable messages, hints, source spans, no-effect flags, and deterministic diagnostic reports.

Purpose

The L-UI Parser Diagnostics implementation maps parser results into stable diagnostics.

It turns latticra_l_ui_parse_result_t into latticra_l_ui_diagnostic_t and renders deterministic diagnostic reports without adding L-UI rendering, interactive UI behavior, command behavior, Nucleus task handling, live movement, state mutation, server interaction, recovery behavior, self-update behavior, hardware behavior, or boot behavior.

Implementation files

```
include/latticra/l_ui_parser.h
src/l_ui_parser_diagnostics.c
tests/l_ui_parser_diagnostics_invariants.c
tests/l_ui_parser_source_span_invariants.c
scripts/test-l-ui-parser-diagnostics.sh
scripts/test-l-ui-parser-source-span.sh
```

Public API

```
latticra_l_ui_diagnostic_severity_label
latticra_l_ui_diagnostic_from_parse_result
latticra_l_ui_diagnostic_report
```

Severity labels

```
ok
error
internal
```

Diagnostic fields

```
severity
code
message
hint
line
column
span
no_effect
execution_allowed
mutation_allowed
server_allowed
recovery_allowed
hardware_allowed
```

The diagnostic span contains:

```
start_offset
end_offset
start_line
start_column
end_line
end_column
```

Diagnostics copy span metadata from parse results.

Report shape

The diagnostic report renders:

```
L-UI PARSE DIAGNOSTIC
severity=&lt;severity&gt;
code=&lt;code&gt;
message=&lt;message&gt;
line=&lt;line&gt;
column=&lt;column&gt;
hint=&lt;hint-or-empty&gt;
no_effect=&lt;0|1&gt;
execution_allowed=&lt;0|1&gt;
mutation_allowed=&lt;0|1&gt;
server_allowed=&lt;0|1&gt;
recovery_allowed=&lt;0|1&gt;
hardware_allowed=&lt;0|1&gt;
span_start_offset=&lt;n&gt;
span_end_offset=&lt;n&gt;
span_start_line=&lt;n&gt;
span_start_column=&lt;n&gt;
span_end_line=&lt;n&gt;
span_end_column=&lt;n&gt;
```

Stable diagnostic mapping

```
| Parser error | Severity | Code | Message |
| --- | --- | --- | --- |
| `ok` | `ok` | `LUI0000` | Parse completed successfully. |
| `null_argument` | `error` | `LUI0001` | Parser received a null argument. |
| `empty_source` | `error` | `LUI0002` | L-UI source is empty. |
| `unsupported_version` | `error` | `LUI0003` | L-UI version is not supported. |
| `missing_card` | `error` | `LUI0004` | Required card declaration is missing. |
| `missing_purpose` | `error` | `LUI0005` | Required purpose clause is missing. |
| `missing_effect` | `error` | `LUI0006` | Required effect clause is missing. |
| `unsupported_effect` | `error` | `LUI0007` | Effect declaration is not supported. |
| `missing_boundary` | `error` | `LUI0008` | Required boundary clause is missing. |
| `unsupported_boundary` | `error` | `LUI0009` | Boundary declaration is not supported. |
| `missing_rail` | `error` | `LUI0010` | Required rail is missing. |
| `unknown_rail` | `error` | `LUI0011` | Rail name is not supported. |
| `unknown_binding_prefix` | `error` | `LUI0012` | Binding prefix is not supported. |
| `missing_required_binding` | `error` | `LUI0013` | Required binding is missing. |
| `unterminated_string` | `error` | `LUI0014` | String literal is not terminated. |
| `unbalanced_brace` | `error` | `LUI0015` | Braces are not balanced. |
| `forbidden_behavior_marker` | `error` | `LUI0016` | Source contains a forbidden behavior marker. |
| `source_too_large` | `error` | `LUI0017` | Source exceeds the supported size limit. |
| `internal_error` | `internal` | `LUI0018` | Parser reached an internal error. |
```

No-effect boundary

Diagnostics copy the safety flags from parse results and preserve:

```
no_effect=1
execution_allowed=0
mutation_allowed=0
server_allowed=0
recovery_allowed=0
hardware_allowed=0
```

Test commands

Run:

```
sh scripts/test-l-ui-parser-diagnostics.sh
sh scripts/test-l-ui-parser-source-span.sh
```

The main C workflow runs these checks after the parser diagnostics implementation plan guard and source-span implementation plan guard.

Required invariants

The diagnostics tests verify:

```
ok_result_has_lui0000
empty_source_reports_lui0002
unsupported_version_reports_lui0003
missing_card_reports_lui0004
missing_purpose_reports_lui0005
missing_effect_reports_lui0006
unsupported_effect_reports_lui0007
missing_boundary_reports_lui0008
unsupported_boundary_reports_lui0009
missing_rail_reports_lui0010
unknown_binding_prefix_reports_lui0012
missing_required_binding_reports_lui0013
unterminated_string_reports_lui0014
unbalanced_brace_reports_lui0015
forbidden_marker_reports_lui0016
source_too_large_reports_lui0017
internal_error_reports_lui0018
error_diagnostics_preserve_no_effect_flags
line_and_column_are_one_based
messages_are_stable
hints_are_stable
diagnostic_report_contains_required_fields
diagnostic_report_rejects_bad_arguments_and_small_buffers
severity_labels_are_stable
```

The source-span tests verify diagnostic span copying and diagnostic report span fields.

Current evidence level

This implementation is an L2 tested diagnostics and source-span metadata model for the L-UI parser.

It is not a renderer, UI runtime, command surface, Nucleus task runner, server client, update engine, recovery system, hardware system, boot system, AST system, or security boundary.

Next implementation step

The next implementation candidate after source spans is:

```
L-UI parser AST contract
```

That future work should define AST shape, node ownership, source-span usage, and no-effect boundaries before any AST implementation.

Non-claims

This document and implementation do not claim AST construction, L-UI rendering, command behavior, Nucleus task handling, live movement, origin mutation, recovery behavior, server interaction, self-update, hardware support, boot readiness, security isolation, sandboxing, or operating-system completeness.

docs/L_UI_PARSER_DIAGNOSTICS_IMPLEMENTATION_PLAN.md

Source title: Latticra L-UI Parser Diagnostics Implementation Plan

Lines: 319 | Words: 1062 | SHA-256: 401b4d340b70afc0c2dab01eafc17bc88eaa61f659adbdac65bb72349c65af4f

Latticra L-UI Parser Diagnostics Implementation Plan

Status: implementation planning contract Scope: diagnostic API shape, exact tests, parser result report extension rules, and no-effect constraints before diagnostic code.

Purpose

This document defines the implementation plan for richer L-UI parser diagnostics.

The diagnostics contract is already merged and guarded. This plan decides the C API, data shape, exact test list, and report extension rules before implementation code is added.

Relationship to previous contracts

This plan depends on:

```
docs/L_UI_PARSER_DIAGNOSTICS.md
docs/L_UI_PARSER.md
docs/L_UI_PARSER_RESULT_REPORT.md
include/latticra/l_ui_parser.h
src/l_ui_parser.c
```

Those files remain the source of truth for parser errors, parse summaries, no-effect flags, and current result reporting.

Implementation language decision

The first diagnostics implementation should be in C.

Reason:

- the parser is already implemented in C;
- diagnostics should be part of the same low-level ABI surface;
- the implementation should remain portable and deterministic;
- diagnostics should require no runtime beyond the current C test environment.

Proposed module shape

The first diagnostics implementation should extend the existing parser module:

```
include/latticra/l_ui_parser.h
src/l_ui_parser.c
tests/l_ui_parser_diagnostics_invariants.c
scripts/test-l-ui-parser-diagnostics.sh
```

A separate diagnostics source file is not required for the first implementation.

Diagnostic enums

Add diagnostic severity enum:

```
LATTICRA_L_UI_DIAGNOSTIC_OK
LATTICRA_L_UI_DIAGNOSTIC_ERROR
LATTICRA_L_UI_DIAGNOSTIC_INTERNAL
```

Diagnostic codes should remain stable strings instead of a second enum in the first implementation.

Reason: parser errors already have a stable enum. Code strings can be mapped directly from the parser error enum.

Diagnostic result shape

Add a compact diagnostic struct:

```
severity
code
message
hint
```

```
line
column
no_effect
execution_allowed
mutation_allowed
server_allowed
recovery_allowed
hardware_allowed
```

Recommended fixed sizes:

```
LATTICRA_L_UI_DIAGNOSTIC_CODE_MAX = 16
LATTICRA_L_UI_DIAGNOSTIC_MESSAGE_MAX = 128
LATTICRA_L_UI_DIAGNOSTIC_HINT_MAX = 128
LATTICRA_L_UI_DIAGNOSTIC_REPORT_MAX = 1024
```

Public API plan

Initial functions:

```
const char *latticra_l_ui_diagnostic_severity_label(
    latticra_l_ui_diagnostic_severity_t severity);

latticra_status_t latticra_l_ui_diagnostic_from_parse_result(
    const latticra_l_ui_parse_result_t *parse_result,
    latticra_l_ui_diagnostic_t *diagnostic);

latticra_status_t latticra_l_ui_diagnostic_report(
    const latticra_l_ui_diagnostic_t *diagnostic,
    char *buffer,
    size_t buffer_len);
```

Parser result report extension

The current parser result report should not be changed in the first diagnostics implementation.

Instead, diagnostics should have a separate deterministic report:

```
L-UI PARSE DIAGNOSTIC
severity=&lt;severity&gt;
code=&lt;code&gt;
message=&lt;message&gt;
line=&lt;line&gt;
column=&lt;column&gt;
hint=&lt;hint-or-empty&gt;
no_effect=&lt;0|1&gt;
execution_allowed=&lt;0|1&gt;
mutation_allowed=&lt;0|1&gt;
server_allowed=&lt;0|1&gt;
recovery_allowed=&lt;0|1&gt;
hardware_allowed=&lt;0|1&gt;
```

This avoids destabilizing the existing parser result report.

Mapping table

The first implementation should map parser errors to diagnostic fields exactly:

```
| Parser error | Severity | Code | Message |
| --- | --- | --- | --- |
| `ok` | `ok` | `LUI0000` | Parse completed successfully. |
| `null_argument` | `error` | `LUI0001` | Parser received a null argument. |
| `empty_source` | `error` | `LUI0002` | L-UI source is empty. |
| `unsupported_version` | `error` | `LUI0003` | L-UI version is not supported. |
| `missing_card` | `error` | `LUI0004` | Required card declaration is missing. |
| `missing_purpose` | `error` | `LUI0005` | Required purpose clause is missing. |
| `missing_effect` | `error` | `LUI0006` | Required effect clause is missing. |
| `unsupported_effect` | `error` | `LUI0007` | Effect declaration is not supported. |
| `missing_boundary` | `error` | `LUI0008` | Required boundary clause is missing. |
| `unsupported_boundary` | `error` | `LUI0009` | Boundary declaration is not supported. |
| `missing_rail` | `error` | `LUI0010` | Required rail is missing. |
| `unknown_rail` | `error` | `LUI0011` | Rail name is not supported. |
| `unknown_binding_prefix` | `error` | `LUI0012` | Binding prefix is not supported. |
| `missing_required_binding` | `error` | `LUI0013` | Required binding is missing. |
```

`unterminated_string`	`error`	`LUI0014`	String literal is not terminated.
`unbalanced_brace`	`error`	`LUI0015`	Braces are not balanced.
`forbidden_behavior_marker`	`error`	`LUI0016`	Source contains a forbidden behavior marker.
`source_too_large`	`error`	`LUI0017`	Source exceeds the supported size limit.
`internal_error`	`internal`	`LUI0018`	Parser reached an internal error.

Hint mapping

Initial hints:

```
LUI0000 -&gt; empty hint
LUI0001 -&gt; Provide non-null source and result pointers.
LUI0002 -&gt; Provide L-UI source beginning with: lui 0.1
LUI0003 -&gt; Use version header: lui 0.1
LUI0004 -&gt; Add card NucleusPreview { ... }
LUI0005 -&gt; Add a purpose string.
LUI0006 -&gt; Add effect none.
LUI0007 -&gt; Use only effect none.
LUI0008 -&gt; Add boundary preview_only.
LUI0009 -&gt; Use only boundary preview_only.
LUI0010 -&gt; Add the required NucleusPreview rails.
LUI0011 -&gt; Use only documented rail names.
LUI0012 -&gt; Use only state. or preview. binding prefixes.
LUI0013 -&gt; Add all required NucleusPreview bindings.
LUI0014 -&gt; Close the string literal.
LUI0015 -&gt; Balance opening and closing braces.
LUI0016 -&gt; Remove behavior markers outside the static report grammar.
LUI0017 -&gt; Keep L-UI source at or below LATTICRA_L_UI_SOURCE_MAX.
LUI0018 -&gt; Report the internal parser error.
```

Hints must not suggest behavior outside the current no-effect grammar.

Line and column behavior

The first implementation should copy line and column from the parse result.

Current parser line and column are conservative:

```
line=1
column=1
```

The diagnostics implementation should not attempt richer location detection yet.

No-effect flags

Diagnostics must copy safety flags from parse results:

```
no_effect
execution_allowed
mutation_allowed
server_allowed
recovery_allowed
hardware_allowed
```

For all current parse paths, expected values remain:

```
no_effect=1
execution_allowed=0
mutation_allowed=0
server_allowed=0
recovery_allowed=0
hardware_allowed=0
```

Exact test list

The first diagnostics implementation PR should include tests for:

```
ok_result_has_lui0000
empty_source_reports_lui0002
unsupported_version_reports_lui0003
missing_card_reports_lui0004
missing_purpose_reports_lui0005
missing_effect_reports_lui0006
unsupported_effect_reports_lui0007
missing_boundary_reports_lui0008
unsupported_boundary_reports_lui0009
```

```
missing_rail_reports_lui0010
unknown_binding_prefix_reports_lui0012
missing_required_binding_reports_lui0013
unterminated_string_reports_lui0014
unbalanced_brace_reports_lui0015
forbidden_marker_reports_lui0016
source_too_large_reports_lui0017
internal_error_reports_lui0018
error_diagnostics_preserve_no_effect_flags
line_and_column_are_one_based
messages_are_stable
hints_are_stable
diagnostic_report_contains_required_fields
diagnostic_report_rejects_bad_arguments_and_small_buffers
severity_labels_are_stable
```

CI requirement

The first diagnostics implementation PR must add:

```
scripts/test-l-ui-parser-diagnostics.sh
```

and wire it into:

```
.github/workflows/c.yml
```

Documentation requirement

The first diagnostics implementation PR must update:

```
README.md
docs/FOUNDATION_INDEX.md
docs/L_UI_PARSER_DIAGNOSTICS.md
```

and add:

```
docs/L_UI_PARSER_DIAGNOSTICS_IMPLEMENTATION.md
```

Forbidden implementation behavior

The diagnostics implementation must not:

- parse files directly;
- write files;
- open network connections;
- call server code;
- call update code;
- call recovery code;
- call hardware code;
- mutate state lattice;
- perform live movement;
- run L-UI behavior;
- render an interactive UI;
- accept unsupported effects.

Current validation command

This plan is guarded by:

```
sh scripts/test-l-ui-parser-diagnostics-implementation-plan.sh
```

The guard is static. It does not implement diagnostics.

Implementation gate

Diagnostics implementation code may be added only after this plan is merged.

Non-claims

This document does not implement richer parser diagnostics, L-UI rendering, command behavior, Nucleus task handling, live movement, origin mutation, recovery behavior, server interaction, self-update, hardware support, boot readiness, security isolation, sandboxing, or operating-system completeness.

docs/L_UI_PARSER_FIXTURE_INTEGRATION.md

Source title: Latticra L-UI Parser Fixture Integration

Lines: 94 | Words: 287 | SHA-256: ba618d5dec97680770d1230bd150419902fd486506d2468f545b358b76776713

Latticra L-UI Parser Fixture Integration

Status: initial implementation contract Scope: repository fixture validation through the in-memory L-UI parser.

Purpose

This document describes the fixture integration test for the L-UI parser.

The parser remains in-memory only. The test harness reads the repository .lui fixture and passes the source bytes into the parser.

Implementation files

```
tests/l_ui_parser_fixture_integration.c
scripts/test-l-ui-parser-fixture-integration.sh
examples/l-ui/nucleus-preview-card.lui
```

Fixture under test

```
examples/l-ui/nucleus-preview-card.lui
```

Boundary

The parser still does not perform file I/O.

Only the test harness reads the fixture file.

The integration test must not add:

- L-UI rendering;
- interactive UI behavior;
- Nucleus task handling;
- live movement;
- state mutation;
- recovery behavior;
- server interaction;
- self-update behavior;
- host effects;
- network effects;
- hardware effects;

- boot effects.

Expected parse summary

The repository fixture must parse as:

```
error=ok
card_name=NucleusPreview
rail_count=9
field_count=23
effect=none
boundary=preview_only
no_effect=1
execution_allowed=0
mutation_allowed=0
server_allowed=0
recovery_allowed=0
hardware_allowed=0
```

Test command

Run:

```
sh scripts/test-l-ui-parser-fixture-integration.sh
```

The main C workflow runs this check after the in-memory parser invariant test.

Current evidence level

This implementation is an L2 tested integration between the repository L-UI fixture and the in-memory parser.

It is not a renderer, UI runtime, command surface, Nucleus task runner, server client, update engine, recovery system, hardware system, boot system, or security boundary.

Next implementation step

The next implementation candidate after fixture integration is:

```
L-UI parser result report
```

That future work should render parse results as deterministic text while preserving no-effect behavior.

Non-claims

This document and implementation do not claim L-UI rendering, command behavior, Nucleus task handling, live movement, origin mutation, recovery behavior, server interaction, self-update, hardware support, boot readiness, security isolation, sandboxing, or operating-system completeness.

docs/L_UI_PARSER_IMPLEMENTATION_PLAN.md

Source title: Latticra L-UI Parser Implementation Plan

Lines: 287 | Words: 674 | SHA-256: c8c0bbab6fc9630056d78ec7a61b72a1fed8dea8834704a275b97202eafd312a

Latticra L-UI Parser Implementation Plan

Status: implementation planning contract Scope: implementation language, module shape, API, source-size limit, exact test list, and no-effect constraints before parser code.

Purpose

This document defines the implementation plan for the first L-UI parser.

The parser should be implemented only after the parser design contract is merged and guarded. This plan decides what parser code is allowed to look like before code is introduced.

Relationship to previous contracts

This plan depends on:

```
docs/L_UI_SOURCE_GRAMMAR.md
docs/L_UI_PARSER_DESIGN.md
examples/l-ui/nucleus-preview-card.lui
scripts/test-l-ui-grammar-fixtures.sh
scripts/test-l-ui-parser-design.sh
```

Those documents and guards remain the source of truth for syntax, error categories, no-effect constraints, and fixture expectations.

Implementation language decision

The first parser should be implemented in C.

Reason:

- Latticra's current implementation foundation is C;
- the parser must stay portable and small;
- the parser output should become part of the low-level Latticra ABI;
- no dynamic runtime should be required;
- the parser can be tested with the existing C workflow.

Rust tooling can be added later for validation helpers, but the first parser should remain a C no-effect parser.

Proposed module shape

```
include/latticra/l_ui_parser.h
src/l_ui_parser.c
tests/l_ui_parser_invariants.c
scripts/test-l-ui-parser.sh
```

Source-size limit

The first parser should define:

```
LATTICRA_L_UI_SOURCE_MAX = 65536
```

Input larger than this must return source_too_large.

Parse result shape

The first parser should return a compact summary rather than a full AST.

Planned struct fields:

```
status
error
line
column
card_name
rail_count
field_count
effect
boundary
no_effect
execution_allowed
mutation_allowed
server_allowed
recovery_allowed
hardware_allowed
```

Error enum

The first C parser should implement these errors exactly:

```
LATTICRA_L_UI_PARSE_OK
LATTICRA_L_UI_PARSE_NULL_ARGUMENT
LATTICRA_L_UI_PARSE_EMPTY_SOURCE
LATTICRA_L_UI_PARSE_UNSUPPORTED_VERSION
LATTICRA_L_UI_PARSE_MISSING_CARD
LATTICRA_L_UI_PARSE_MISSING_PURPOSE
LATTICRA_L_UI_PARSE_MISSING_EFFECT
LATTICRA_L_UI_PARSE_UNSUPPORTED_EFFECT
LATTICRA_L_UI_PARSE_MISSING_BOUNDARY
LATTICRA_L_UI_PARSE_UNSUPPORTED_BOUNDARY
LATTICRA_L_UI_PARSE_MISSING_RAIL
LATTICRA_L_UI_PARSE_UNKNOWN_RAIL
LATTICRA_L_UI_PARSE_UNKNOWN_BINDING_PREFIX
LATTICRA_L_UI_PARSE_MISSING_REQUIRED_BINDING
LATTICRA_L_UI_PARSE_UNTERMINATED_STRING
LATTICRA_L_UI_PARSE_UNBALANCED_BRACE
LATTICRA_L_UI_PARSE_FORBIDDEN_BEHAVIOR_MARKER
LATTICRA_L_UI_PARSE_SOURCE_TOO_LARGE
LATTICRA_L_UI_PARSE_INTERNAL_ERROR
```

Public API plan

Initial functions:

```
const char *latticra_l_ui_parse_error_label(latticra_l_ui_parse_error_t error);

latticra_status_t latticra_l_ui_parse_source(
    const char *source,
    size_t source_len,
    latticra_l_ui_parse_result_t *result);
```

Optional later function, not required in first parser PR:

```
latticra_status_t latticra_l_ui_parse_file(...)
```

The first parser should parse in-memory source only. It should not perform file I/O.

No-effect output flags

For valid fixtures, the parser must return:

```
no_effect=1
execution_allowed=0
mutation_allowed=0
server_allowed=0
recovery_allowed=0
hardware_allowed=0
```

These flags must also remain safe on denied/error results.

First accepted source

The first accepted fixture is:

```
examples/l-ui/nucleus-preview-card.lui
```

The parser should accept this fixture and produce:

```
status=ok
error=ok
card_name=NucleusPreview
rail_count=9
field_count=23
effect=none
boundary=preview_only
no_effect=1
execution_allowed=0
mutation_allowed=0
server_allowed=0
recovery_allowed=0
hardware_allowed=0
```

Exact test list for first parser PR

The first parser implementation PR should include tests for:

```
valid_fixture_parses_successfully
null_source_is_rejected
```

```
null_result_is_rejected
empty_source_is_rejected
oversized_source_is_rejected
unsupported_version_is_rejected
missing_card_is_rejected
missing_purpose_is_rejected
missing_effect_is_rejected
unsupported_effect_is_rejected
missing_boundary_is_rejected
unsupported_boundary_is_rejected
missing_required_rail_is_rejected
missing_required_binding_is_rejected
unknown_binding_prefix_is_rejected
forbidden_behavior_marker_is_rejected
valid_parse_returns_no_effect_flags
error_results_preserve_no_execution_flags
parse_error_labels_are_stable
```

Parser approach

The first parser should be simple and conservative.

Allowed approach:

- bounded source length check;
- string scanning;
- required-pattern validation;
- brace balance check;
- string literal quote balance check;
- required rail and binding validation;
- forbidden marker validation;
- normalized summary output.

Not required in first parser:

- complete AST;
- nested object model;
- renderer integration;
- file I/O;
- allocation-heavy tokenizer;
- recovery parser;
- interactive diagnostics;
- command execution.

Forbidden implementation behavior

The parser implementation must not:

- read files directly;
- write files;
- open sockets;
- call server code;
- call update code;
- call recovery code;

- call hardware code;
- mutate state lattice;
- perform live movement;
- execute L-UI source;
- render UI;
- use unbounded allocation;
- accept unsupported effects.

CI requirement

The first parser PR must add:

```
scripts/test-l-ui-parser.sh
```

and wire it into:

```
.github/workflows/c.yml
```

Documentation requirement

The first parser PR must update:

```
README.md
docs/FOUNDATION_INDEX.md
docs/L_UI_PARSER_DESIGN.md
```

and add:

```
docs/L_UI_PARSER.md
```

Current validation command

This plan is guarded by:

```
sh scripts/test-l-ui-parser-implementation-plan.sh
```

The guard is static. It does not implement the parser.

Implementation gate

Parser code may be added only after this plan is merged.

Non-claims

This document does not implement L-UI parsing, rendering, command execution, Nucleus execution, live movement, origin mutation, recovery execution, server interaction, self-update, hardware support, boot readiness, security isolation, sandboxing, or operating-system completeness.

docs/L_UI_PARSER_LINE_COLUMN_PRECISION_IMPLEMENTATION.md

Source title: Latticra L-UI Parser Line/Column Precision Implementation

Lines: 151 | Words: 361 | SHA-256: f4c84897821cc1d4c87c41a2029ce1b167f72d75ca08d110c14630c76ed3dfa0

Latticra L-UI Parser Line/Column Precision Implementation

Status: initial implementation contract Scope: private parser location helpers, parser touch-point updates, location invariants, and no-effect boundaries.

Purpose

The L-UI Parser Line/Column Precision implementation adds deterministic line and column reporting for selected parser errors.

It updates private parser internals only. It does not change the public parser API.

Implementation files

```
src/l_ui_parser.c
tests/l_ui_parser_location_invariants.c
scripts/test-l-ui-parser-location.sh
```

Public API stability

No public API was added for location precision.

The existing output fields remain the public location surface:

```
latticra_l_ui_parse_result_t.line
latticra_l_ui_parse_result_t.column
```

Diagnostic reports already render those fields through the diagnostic mapping.

Internal helper behavior

The parser now uses private helpers for:

```
location_default
location_for_index
find_slice_index
find_slice_location
card_body_location
find_unbalanced_brace_location
find_unterminated_string_location
set_error_at
```

These helpers remain private to src/l_ui_parser.c.

Location rules

Line and column are one-based.

Columns are byte-based, not display-cell-based.

Recognized newline forms:

```
LF
CRLF
CR
```

Implemented location touch points

The initial precision implementation covers:

```
unsupported_version
unsupported_effect
unsupported_boundary
unknown_binding_prefix
forbidden_behavior_marker
unterminated_string
unbalanced_brace
missing_effect
missing_boundary
missing_rail
```

Other errors may still use conservative default locations until a later source-span contract.

No-effect preservation

Location precision is diagnostic metadata only.

It must not change:

```
no_effect=1
execution_allowed=0
mutation_allowed=0
server_allowed=0
recovery_allowed=0
hardware_allowed=0
```

Test command

Run:

```
sh scripts/test-l-ui-parser-location.sh
```

The main C workflow runs this check after the line-column implementation plan guard.

Required invariants

The location tests verify:

```
unsupported_version_reports_precise_location
unsupported_effect_reports_effect_token_location
unsupported_boundary_reports_boundary_token_location
unknown_binding_prefix_reports_binding_target_location
forbidden_marker_reports_marker_location
unterminated_string_reports_opening_quote_location
unbalanced_open_brace_reports_opening_brace_location
unbalanced_close_brace_reports_closing_brace_location
missing_effect_reports_card_body_location
missing_boundary_reports_card_body_location
missing_rail_reports_card_body_location
location_scanner_handles_lf_newlines
location_scanner_handles_crlf_newlines
location_scanner_handles_cr_newlines
location_columns_are_byte_based
success_result_remains_line_one_column_one
error_locations_preserve_no_effect_flags
location_reports_are_deterministic
```

Current evidence level

This implementation is an L2 tested diagnostic-location model for the L-UI parser.

It is not a renderer, UI runtime, command surface, Nucleus task runner, server client, update engine, recovery system, hardware system, boot system, or security boundary.

Next implementation step

The next implementation candidate after line/column precision is:

```
L-UI parser source-span contract
```

That future work should define richer spans and source ranges before any AST or renderer integration.

Non-claims

This document and implementation do not claim L-UI rendering, command behavior, Nucleus task handling, live movement, origin mutation, recovery behavior, server interaction, self-update, hardware support, boot readiness, security isolation, sandboxing, or operating-system completeness.

docs/L_UI_PARSER_LINE_COLUMN_PRECISION_IMPLEMENTATION_PLAN.md

Source title: Latticra L-UI Parser Line/Column Precision Implementation Plan

Lines: 271 | Words: 799 | SHA-256: a2b5b6974d7fe695334e61ba2d17a05344dcaba91e7c243e1d936a3df96c464d

Latticra L-UI Parser Line/Column Precision Implementation Plan

Status: implementation planning contract Scope: helper shapes, parser touch points, exact tests, and no-effect boundaries before changing parser location behavior.

Purpose

This document defines the implementation plan for precise line and column reporting in the L-UI parser.

The line/column precision plan is already merged and guarded. This plan decides how parser code should be changed before any location-tracking code is added.

Relationship to previous contracts

This plan depends on:

```
docs/L_UI_PARSER_LINE_COLUMN_PRECISION_PLAN.md
docs/L_UI_PARSER_DIAGNOSTICS.md
docs/L_UI_PARSER_DIAGNOSTICS_IMPLEMENTATION.md
include/latticra/l_ui_parser.h
src/l_ui_parser.c
src/l_ui_parser_diagnostics.c
```

Those files remain the source of truth for parser errors, diagnostic reports, and no-effect behavior.

Implementation language decision

The precision implementation should be in C.

Reason:

- the parser is already implemented in C;
- parse results already expose line and column fields;
- diagnostic reports already render those fields;
- precision can be added without changing the public parser API;
- precision must remain portable and deterministic.

Proposed module touch points

The first precision implementation should modify:

```
src/l_ui_parser.c
tests/l_ui_parser_location_invariants.c
scripts/test-l-ui-parser-location.sh
.github/workflows/c.yml
```

It should not add a new public header.

Public API rule

No public API change is required for the first precision implementation.

Existing fields remain the output surface:

```
latticra_l_ui_parse_result_t.line
latticra_l_ui_parse_result_t.column
```

Existing diagnostic reports already include:

```
line=&lt;line&gt;
column=&lt;column&gt;
```

Internal helper shapes

The parser may add internal helpers similar to:

```
static void location_default(size_t *line, size_t *column);

static int find_slice_location(
    const char *source,
    size_t source_len,
    const char *needle,
    size_t *line,
    size_t *column);

static int find_unbalanced_brace_location(
    const char *source,
    size_t source_len,
    size_t *line,
```

```
    size_t *column);

static int find_unterminated_string_location(
    const char *source,
    size_t source_len,
    size_t *line,
    size_t *column);

static void set_error_at(
    latticra_l_ui_parse_result_t *result,
    latticra_l_ui_parse_error_t error,
    size_t line,
    size_t column);
```

These helpers should remain private to src/l_ui_parser.c.

Newline scanner behavior

The scanner must support:

```
LF:   \n
CRLF: \r\n
CR:   \r
```

Rules:

1. Line and column are one-based.
2. \n increments line and resets column to 1.
3. \r\n counts as one newline and resets column to 1.
4. Lone \r counts as one newline and resets column to 1.
5. All other bytes increment column by 1.
6. Columns are byte-based, not display-cell-based.
7. Scanner behavior must not depend on host text mode.

Parser touch-point plan

Initial parser changes should set precise locations for:

```
unsupported_version
unsupported_effect
unsupported_boundary
unknown_binding_prefix
forbidden_behavior_marker
unterminated_string
unbalanced_brace
missing_effect
missing_boundary
missing_rail
```

Other errors may keep conservative defaults until a later source-span contract.

Error location mapping

```
| Parser error | First implementation location |
| --- | --- |
| `ok` | `line=1`, `column=1` |
| `null_argument` | not applicable, direct status return |
| `empty_source` | `line=1`, `column=1` |
| `unsupported_version` | first `lui` token if present, otherwise `line=1`, `column=1` |
| `missing_card` | `line=1`, `column=1` |
| `missing_purpose` | card body start when available |
| `missing_effect` | card body start when available |
| `unsupported_effect` | `effect` token |
| `missing_boundary` | card body start when available |
| `unsupported_boundary` | `boundary` token |
| `missing_rail` | card body start when available |
| `unknown_rail` | unsupported `rail` token when implemented later |
| `unknown_binding_prefix` | unsupported binding target |
```

```
| `missing_required_binding` | relevant rail when available, otherwise card body start |
| `unterminated_string` | opening quote of unterminated string |
| `unbalanced_brace` | unmatched brace when available |
| `forbidden_behavior_marker` | first forbidden marker |
| `source_too_large` | `line=1`, `column=1` |
| `internal_error` | `line=1`, `column=1` |
```

No-effect preservation

Precision metadata must not change safety fields:

```
no_effect=1
execution_allowed=0
mutation_allowed=0
server_allowed=0
recovery_allowed=0
hardware_allowed=0
```

Exact implementation test list

The first precision implementation PR should include tests for:

```
unsupported_version_reports_precise_location
unsupported_effect_reports_effect_token_location
unsupported_boundary_reports_boundary_token_location
unknown_binding_prefix_reports_binding_target_location
forbidden_marker_reports_marker_location
unterminated_string_reports_opening_quote_location
unbalanced_open_brace_reports_opening_brace_location
unbalanced_close_brace_reports_closing_brace_location
missing_effect_reports_card_body_location
missing_boundary_reports_card_body_location
missing_rail_reports_card_body_location
location_scanner_handles_lf_newlines
location_scanner_handles_crlf_newlines
location_scanner_handles_cr_newlines
location_columns_are_byte_based
success_result_remains_line_one_column_one
error_locations_preserve_no_effect_flags
location_reports_are_deterministic
```

Test file plan

Add:

```
tests/l_ui_parser_location_invariants.c
scripts/test-l-ui-parser-location.sh
```

Wire into:

```
.github/workflows/c.yml
```

Documentation requirement

The first precision implementation PR should update:

```
README.md
docs/FOUNDATION_INDEX.md
docs/L_UI_PARSER_LINE_COLUMN_PRECISION_PLAN.md
```

and add:

```
docs/L_UI_PARSER_LINE_COLUMN_PRECISION_IMPLEMENTATION.md
```

Forbidden implementation behavior

The precision implementation must not:

- add file I/O to parser code;
- write files;
- open network connections;
- call server code;

- call update code;
- call recovery code;
- call hardware code;
- mutate state lattice;
- perform live movement;
- run L-UI behavior;
- render an interactive UI;
- change diagnostic report shape;
- accept unsupported effects.

Current validation command

This plan is guarded by:

```
sh scripts/test-l-ui-parser-line-column-precision-implementation-plan.sh
```

The guard is static. It does not implement precision.

Implementation gate

Precision implementation code may be added only after this plan is merged.

Non-claims

This document does not implement precise parser locations, L-UI rendering, command behavior, Nucleus task handling, live movement, origin mutation, recovery behavior, server interaction, self-update, hardware support, boot readiness, security isolation, sandboxing, or operating-system completeness.

docs/L_UI_PARSER_LINE_COLUMN_PRECISION_PLAN.md

Source title: Latticra L-UI Parser Line/Column Precision Plan

Lines: 207 | Words: 805 | SHA-256: 9bc329a60455f329f5237ffeb5448907aa3f4e2357d5c168997194a05b1ed60a

Latticra L-UI Parser Line/Column Precision Plan

Status: precision planning contract Scope: one-based location rules, source scanning policy, future parser changes, exact tests, and no-effect boundaries before precise diagnostics implementation.

Purpose

This document plans richer line and column reporting for the L-UI parser.

The current parser uses conservative location defaults:

```
line=1
column=1
```

That is acceptable for the first no-effect parser. The next step is to define how precise locations should work before changing parser logic.

Current boundary

This plan does not implement precise location tracking.

This plan does not change parser behavior.

This plan does not add an L-UI renderer, interactive UI, command behavior, Nucleus task handling, live movement, state mutation, server interaction, update behavior, recovery behavior, hardware behavior, or boot behavior.

Precision goal

Future parser diagnostics should report the beginning of the rejected token or clause when possible.

Examples:

```
unsupported version      -&gt; location of version header
missing card             -&gt; line=1 column=1 if no card token exists
missing effect           -&gt; location of card body start when available
unsupported effect       -&gt; location of effect token
unsupported boundary     -&gt; location of boundary token
missing rail             -&gt; location of card body start when available
unknown binding prefix   -&gt; location of bind target
unterminated string      -&gt; location of opening quote
unbalanced brace         -&gt; location of unmatched brace when available
forbidden marker         -&gt; location of forbidden marker
```

Location units

Line and column must be one-based.

```
first line = 1
first column = 1
```

Columns count bytes in the in-memory source buffer, not terminal display cells, Unicode grapheme clusters, or rendered visual columns.

This keeps the parser portable, deterministic, and independent of terminal behavior.

Newline policy

Recognized newline forms:

```
\n
\r\n
\r
```

Rules:

1. \n increments line and resets column to 1.
2. \r\n counts as one newline and resets column to 1.
3. Lone \r counts as one newline and resets column to 1.
4. Other bytes increment column by 1.
5. Location scanning must not depend on host platform text mode.

Source scanning helper plan

A future implementation should add internal helpers similar to:

```
find_slice_location(source, source_len, needle, *line, *column)
find_unbalanced_brace_location(source, source_len, *line, *column)
find_unterminated_string_location(source, source_len, *line, *column)
```

These helpers should be internal to the parser implementation unless a later contract approves a public API.

Parse result behavior

Future parser code should set:

```
result.line
result.column
```

for the first relevant error location.

Success results may continue to use:

```
line=1
column=1
```

unless a future AST or source-span contract requires richer success metadata.

Error location plan

```
| Parser error | Planned location |
| --- | --- |
| `ok` | `line=1`, `column=1` |
| `null_argument` | `line=1`, `column=1` |
| `empty_source` | `line=1`, `column=1` |
| `unsupported_version` | first byte of source or found unsupported `lui` token |
| `missing_card` | `line=1`, `column=1` unless card-like token found |
| `missing_purpose` | first byte of `card NucleusPreview` body when available |
| `missing_effect` | first byte of `card NucleusPreview` body when available |
| `unsupported_effect` | first byte of `effect` token |
| `missing_boundary` | first byte of `card NucleusPreview` body when available |
| `unsupported_boundary` | first byte of `boundary` token |
| `missing_rail` | first byte of `card NucleusPreview` body when available |
| `unknown_rail` | first byte of unsupported rail token |
| `unknown_binding_prefix` | first byte of unsupported binding target |
| `missing_required_binding` | first byte of relevant rail when available |
| `unterminated_string` | opening quote of the unterminated string |
| `unbalanced_brace` | unmatched opening or closing brace when available |
| `forbidden_behavior_marker` | first byte of forbidden marker |
| `source_too_large` | `line=1`, `column=1` |
| `internal_error` | `line=1`, `column=1` |
```

No-effect rule

Line and column precision is diagnostic metadata only.

It must not change:

```
no_effect=1
execution_allowed=0
mutation_allowed=0
server_allowed=0
recovery_allowed=0
hardware_allowed=0
```

Exact future test list

The future precision implementation PR should include tests for:

```
unsupported_version_reports_precise_location
unsupported_effect_reports_effect_token_location
unsupported_boundary_reports_boundary_token_location
unknown_binding_prefix_reports_binding_target_location
forbidden_marker_reports_marker_location
unterminated_string_reports_opening_quote_location
unbalanced_open_brace_reports_opening_brace_location
unbalanced_close_brace_reports_closing_brace_location
missing_effect_reports_card_body_location
missing_boundary_reports_card_body_location
missing_rail_reports_card_body_location
location_scanner_handles_lf_newlines
location_scanner_handles_crlf_newlines
location_scanner_handles_cr_newlines
location_columns_are_byte_based
success_result_remains_line_one_column_one
error_locations_preserve_no_effect_flags
location_reports_are_deterministic
```

Diagnostic report impact

The existing diagnostic report already renders:

```
line=&lt;line&gt;
column=&lt;column&gt;
```

Future precision work should update only the values, not the report shape.

Implementation gate

Precise line/column implementation should not be added until:

1. this plan is merged;
2. newline behavior is accepted;
3. byte-based column behavior is accepted;
4. error-location rules are accepted;
5. exact tests are present;
6. no-effect flags remain tested.

Current validation command

This plan is guarded by:

```
sh scripts/test-l-ui-parser-line-column-precision-plan.sh
```

The guard is static. It does not implement precision.

Non-claims

This document does not implement precise parser locations, L-UI rendering, command behavior, Nucleus task handling, live movement, origin mutation, recovery behavior, server interaction, self-update, hardware support, boot readiness, security isolation, sandboxing, or operating-system completeness.

docs/L_UI_PARSER_RESULT_REPORT.md

Source title: Latticra L-UI Parser Result Report

Lines: 128 | Words: 326 | SHA-256: c72ba536de89e4f832264b212d33e011cee1be5c7d9c0542e499e6d2ece5529a

Latticra L-UI Parser Result Report

Status: initial implementation contract Scope: deterministic text reports for L-UI parse summaries.

Purpose

The L-UI Parser Result Report renders latticra_l_ui_parse_result_t as deterministic text.

It exists so parser status, errors, counts, effect labels, boundary labels, and no-effect flags are operator-visible without adding an L-UI renderer, interactive UI, command behavior, or Nucleus task handling.

Implementation files

```
include/latticra/l_ui_parser.h
src/l_ui_parser.c
tests/l_ui_parser_result_report_invariants.c
scripts/test-l-ui-parser-result-report.sh
```

Public API

```
latticra_l_ui_parse_result_report
```

Report shape

The report must render:

```
L-UI PARSE RESULT
status=&lt;status-code&gt;
```

```
error=&lt;error-label&gt;
line=&lt;line&gt;
column=&lt;column&gt;
card_name=&lt;card-name&gt;
rail_count=&lt;rail-count&gt;
field_count=&lt;field-count&gt;
effect=&lt;effect&gt;
boundary=&lt;boundary&gt;
no_effect=&lt;0|1&gt;
execution_allowed=&lt;0|1&gt;
mutation_allowed=&lt;0|1&gt;
server_allowed=&lt;0|1&gt;
recovery_allowed=&lt;0|1&gt;
hardware_allowed=&lt;0|1&gt;
```

Expected valid summary

For the first accepted fixture, the report should include:

```
error=ok
card_name=NucleusPreview
rail_count=9
field_count=23
effect=none
boundary=preview_only
no_effect=1
execution_allowed=0
mutation_allowed=0
server_allowed=0
recovery_allowed=0
hardware_allowed=0
```

Expected error summary

Error results must also preserve no-effect flags:

```
no_effect=1
execution_allowed=0
mutation_allowed=0
server_allowed=0
recovery_allowed=0
hardware_allowed=0
```

Test command

Run:

```
sh scripts/test-l-ui-parser-result-report.sh
```

The main C workflow runs this check after parser fixture integration.

Boundary

This report must not add:

- L-UI rendering;
- interactive UI behavior;
- command behavior;
- Nucleus task handling;
- live movement;
- state mutation;
- recovery behavior;
- server interaction;
- self-update behavior;
- host effects;
- network effects;

- hardware effects;
- boot effects.

Current evidence level

This implementation is an L2 tested report surface for L-UI parse summaries.

It is not a renderer, UI runtime, command surface, Nucleus task runner, server client, update engine, recovery system, hardware system, boot system, or security boundary.

Next implementation step

The next implementation candidate after parser result reporting is:

```
L-UI parser diagnostics contract
```

That future work should define stable diagnostic language and line/column behavior before richer parser diagnostics are implemented.

Non-claims

This document and implementation do not claim L-UI rendering, command behavior, Nucleus task handling, live movement, origin mutation, recovery behavior, server interaction, self-update, hardware support, boot readiness, security isolation, sandboxing, or operating-system completeness.

docs/L_UI_PARSER_SOURCE_SPAN_CONTRACT.md

Source title: Latticra L-UI Parser Source-Span Contract

Lines: 284 | Words: 780 | SHA-256: 8a1f8c02c7e88312f04ad0fddd47bf54d7ba340f1a51da675b2bed21ed755c37

Latticra L-UI Parser Source-Span Contract

Status: source-span contract Scope: source ranges, span rules, byte offsets, line/column ranges, and no-effect boundaries before AST or renderer integration.

Purpose

This document defines the source-span contract for the L-UI parser.

The parser reports precise one-based line and column locations for selected errors. Source spans describe a range in the in-memory source buffer, not only a single point.

This document does not implement source spans. The implementation is documented separately in L_UI_PARSER_SOURCE_SPAN_IMPLEMENTATION.md.

Current boundary

The current parser provides:

```
error category
line
column
source span metadata
no-effect flags
diagnostic mapping
diagnostic reports
```

This contract does not add:

```
AST construction
renderer integration
interactive UI behavior
command behavior
Nucleus task handling
live movement
state mutation
```

```
server interaction
update behavior
recovery behavior
hardware behavior
boot behavior
```

Span purpose

A source span identifies the source range responsible for a parser result or diagnostic.

Source spans can support:

- clearer diagnostics;
- underline-style terminal reports;
- future AST node ranges;
- fixture validation summaries;
- future L-UI tooling.

They must remain no-effect metadata.

Source unit rules

Spans must use byte offsets over the in-memory source buffer.

Rules:

1. start_offset is zero-based.
2. end_offset is zero-based and exclusive.
3. start_offset <= end_offset.
4. Both offsets must be within the provided source length.
5. Line and column are one-based.
6. Columns are byte-based, not display-cell-based.
7. Spans must not depend on host text mode.

Line and column range rules

A span includes:

```
start_line
start_column
end_line
end_column
```

Rules:

1. Start line and column identify the first byte in the span.
2. End line and column identify the location immediately after the final byte in the span.
3. Empty spans are allowed only for missing constructs or successful/default results.
4. Empty spans should set start and end to the same location.
5. Multiline spans are allowed.

Newline policy

The source-span scanner must preserve the current newline policy:

```
LF   -&gt; newline
CRLF -&gt; one newline
CR   -&gt; newline
```

Column reset behavior:

```
line += 1
column = 1
```

for each logical newline.

Span struct

The public span struct is:

```
typedef struct {
    size_t start_offset;
    size_t end_offset;
    size_t start_line;
    size_t start_column;
    size_t end_line;
    size_t end_column;
} latticra_l_ui_source_span_t;
```

Parse result integration

The parser result includes:

```
latticra_l_ui_source_span_t span;
```

Diagnostic integration

Diagnostics include the same span shape:

```
latticra_l_ui_source_span_t span;
```

Diagnostic reports render:

```
span_start_offset=&lt;n&gt;
span_end_offset=&lt;n&gt;
span_start_line=&lt;n&gt;
span_start_column=&lt;n&gt;
span_end_line=&lt;n&gt;
span_end_column=&lt;n&gt;
```

Initial span targets

The first span implementation covers:

```
unsupported_version
unsupported_effect
unsupported_boundary
unknown_binding_prefix
forbidden_behavior_marker
unterminated_string
unbalanced_brace
missing_effect
missing_boundary
missing_rail
```

Span target behavior

```
| Parser result | Span |
| --- | --- |
| `unsupported_version` | unsupported version token or `lui` token |
| `unsupported_effect` | unsupported `effect ...` clause token range |
| `unsupported_boundary` | unsupported `boundary ...` clause token range |
| `unknown_binding_prefix` | unsupported binding target prefix range |
| `forbidden_behavior_marker` | forbidden marker token range |
| `unterminated_string` | opening quote through end of source |
| `unbalanced_brace` | unmatched brace byte |
| `missing_effect` | empty span at card body start |
| `missing_boundary` | empty span at card body start |
| `missing_rail` | empty span at card body start |
```

Empty span rule

Missing constructs use empty spans.

Example:

```
start_offset=end_offset=&lt;card-body-start-offset&gt;
start_line=end_line=&lt;card-body-start-line&gt;
start_column=end_column=&lt;card-body-start-column&gt;
```

This keeps missing data precise without inventing source ranges.

No-effect rule

Source spans are metadata only.

They must not change:

```
no_effect=1
execution_allowed=0
mutation_allowed=0
server_allowed=0
recovery_allowed=0
hardware_allowed=0
```

Implementation gate

Source-span implementation required a separate implementation plan defining:

1. public API changes;
2. struct placement;
3. parse result integration;
4. diagnostic integration;
5. report format changes;
6. test file names;
7. exact invariant tests;
8. compatibility expectations.

That plan is recorded in L_UI_PARSER_SOURCE_SPAN_IMPLEMENTATION_PLAN.md.

Test list

Source-span implementation tests verify:

```
unsupported_effect_reports_effect_span
unsupported_boundary_reports_boundary_span
unknown_binding_prefix_reports_binding_span
forbidden_marker_reports_marker_span
unterminated_string_reports_string_span
unbalanced_open_brace_reports_brace_span
unbalanced_close_brace_reports_brace_span
missing_effect_reports_empty_card_body_span
missing_boundary_reports_empty_card_body_span
missing_rail_reports_empty_card_body_span
span_offsets_are_zero_based
span_end_offset_is_exclusive
span_line_columns_are_one_based
span_columns_are_byte_based
span_scanner_handles_lf_newlines
span_scanner_handles_crlf_newlines
span_scanner_handles_cr_newlines
span_metadata_preserves_no_effect_flags
span_reports_are_deterministic
```

Forbidden behavior

A source-span implementation must not:

- add file I/O to parser code;
- write files;

- open network connections;
- call server code;
- call update code;
- call recovery code;
- call hardware code;
- mutate state lattice;
- perform live movement;
- run L-UI behavior;
- render an interactive UI;
- accept unsupported effects.

Current validation command

This contract is guarded by:

```
sh scripts/test-l-ui-parser-source-span-contract.sh
```

The guard is static. It does not implement source spans.

Non-claims

This document does not implement AST construction, L-UI rendering, command behavior, Nucleus task handling, live movement, origin mutation, recovery behavior, server interaction, self-update, hardware support, boot readiness, security isolation, sandboxing, or operating-system completeness.

docs/L_UI_PARSER_SOURCE_SPAN_IMPLEMENTATION.md

Source title: Latticra L-UI Parser Source-Span Implementation

Lines: 189 | Words: 436 | SHA-256: 8b3e8b05c14086208656596b1de35b111a1caa89589eb1d7da7a1defe84041d6

Latticra L-UI Parser Source-Span Implementation

Status: initial implementation contract Scope: public source-span metadata, parse-result spans, diagnostic spans, report extensions, and invariant tests.

Purpose

The L-UI Parser Source-Span implementation adds source-range metadata to parser results and diagnostics.

Source spans describe ranges in the in-memory source buffer. They are metadata only. They do not add AST construction, L-UI rendering, command behavior, Nucleus task handling, live movement, state mutation, server interaction, recovery behavior, self-update behavior, hardware behavior, or boot behavior.

Implementation files

```
include/latticra/l_ui_parser.h
src/l_ui_parser.c
src/l_ui_parser_diagnostics.c
tests/l_ui_parser_source_span_invariants.c
scripts/test-l-ui-parser-source-span.sh
```

Public source-span struct

```
typedef struct {
    size_t start_offset;
    size_t end_offset;
    size_t start_line;
    size_t start_column;
    size_t end_line;
    size_t end_column;
} latticra_l_ui_source_span_t;
```

Parse-result integration

The parser result includes:

```
latticra_l_ui_source_span_t span;
```

Diagnostic integration

The diagnostic result includes:

```
latticra_l_ui_source_span_t span;
```

Diagnostics copy span metadata from parse results.

Report extensions

Parser result reports and diagnostic reports append:

```
span_start_offset=&lt;n&gt;
span_end_offset=&lt;n&gt;
span_start_line=&lt;n&gt;
span_start_column=&lt;n&gt;
span_end_line=&lt;n&gt;
span_end_column=&lt;n&gt;
```

The extension is append-only. Existing fields remain present and stable.

Span rules

```
start_offset is zero-based
end_offset is zero-based and exclusive
start_offset &lt;= end_offset
line and column are one-based
columns are byte-based
```

Implemented span targets

Initial source spans cover:

```
unsupported_version
unsupported_effect
unsupported_boundary
unknown_binding_prefix
forbidden_behavior_marker
unterminated_string
unbalanced_brace
missing_effect
missing_boundary
missing_rail
```

Empty span behavior

Missing constructs use empty spans at the card-body start when available:

```
start_offset=end_offset
start_line=end_line
start_column=end_column
```

Default success span

Successful parses use the default empty span:

```
start_offset=0
end_offset=0
start_line=1
start_column=1
```

```
end_line=1
end_column=1
```

No-effect boundary

Source-span metadata must preserve:

```
no_effect=1
execution_allowed=0
mutation_allowed=0
server_allowed=0
recovery_allowed=0
hardware_allowed=0
```

Test command

Run:

```
sh scripts/test-l-ui-parser-source-span.sh
```

The main C workflow runs this check after the source-span implementation-plan guard.

Required invariants

The source-span tests verify:

```
unsupported_effect_reports_effect_span
unsupported_boundary_reports_boundary_span
unknown_binding_prefix_reports_binding_span
forbidden_marker_reports_marker_span
unterminated_string_reports_string_span
unbalanced_open_brace_reports_brace_span
unbalanced_close_brace_reports_brace_span
missing_effect_reports_empty_card_body_span
missing_boundary_reports_empty_card_body_span
missing_rail_reports_empty_card_body_span
span_offsets_are_zero_based
span_end_offset_is_exclusive
span_line_columns_are_one_based
span_columns_are_byte_based
span_scanner_handles_lf_newlines
span_scanner_handles_crlf_newlines
span_scanner_handles_cr_newlines
span_metadata_preserves_no_effect_flags
span_reports_are_deterministic
parse_result_report_includes_span_fields
diagnostic_report_includes_span_fields
diagnostic_copies_parse_result_span
success_span_uses_default_empty_span
```

Current evidence level

This implementation is an L2 tested source-span metadata model for the L-UI parser.

It is not an AST system, renderer, UI runtime, command surface, Nucleus task runner, server client, update engine, recovery system, hardware system, boot system, or security boundary.

Next implementation step

The next implementation candidate after source spans is:

```
L-UI parser AST contract
```

That future work should define AST shape, node ownership, source-span usage, and no-effect boundaries before any AST implementation.

Non-claims

This document and implementation do not claim AST construction, L-UI rendering, command behavior, Nucleus task handling, live movement, origin mutation, recovery behavior, server interaction, self-update, hardware support, boot readiness, security isolation, sandboxing, or operating-system completeness.

docs/L_UI_PARSER_SOURCE_SPAN_IMPLEMENTATION_PLAN.md

Source title: Latticra L-UI Parser Source-Span Implementation Plan

Lines: 353 | Words: 886 | SHA-256: bab8ba01866661a22f700259d7270dad67488170a5e1c3497dec31faadb019a9

Latticra L-UI Parser Source-Span Implementation Plan

Status: implementation planning contract Scope: public API changes, struct placement, parse-result integration, diagnostics integration, report format changes, exact tests, and compatibility expectations before source-span implementation.

Purpose

This document defines the implementation plan for L-UI parser source spans.

The source-span contract is already merged and guarded. This plan decides the exact C API, struct placement, parse result integration, diagnostic integration, report format changes, tests, and compatibility expectations before span code is added.

Relationship to previous contracts

This plan depends on:

```
docs/L_UI_PARSER_SOURCE_SPAN_CONTRACT.md
docs/L_UI_PARSER_LINE_COLUMN_PRECISION_IMPLEMENTATION.md
docs/L_UI_PARSER_DIAGNOSTICS_IMPLEMENTATION.md
include/latticra/l_ui_parser.h
src/l_ui_parser.c
src/l_ui_parser_diagnostics.c
```

Those files remain the source of truth for parser errors, precise point locations, diagnostics, and no-effect behavior.

Implementation language decision

The source-span implementation should be in C.

Reason:

- the parser is implemented in C;
- parse results and diagnostics are C ABI surfaces;
- spans should be fixed-size metadata with no allocation requirements;
- span calculations can reuse existing private source-location scanning behavior;
- the current C workflow can validate spans.

Public API change

Unlike line/column precision, source spans require a public API extension.

Add a public span struct in:

```
include/latticra/l_ui_parser.h
```

Proposed public struct:

```
typedef struct {
    size_t start_offset;
    size_t end_offset;
    size_t start_line;
    size_t start_column;
    size_t end_line;
    size_t end_column;
} latticra_l_ui_source_span_t;
```

Parse result integration

Add span to:

```
latticra_l_ui_parse_result_t
```

Proposed field:

```
latticra_l_ui_source_span_t span;
```

Diagnostic integration

Add span to:

```
latticra_l_ui_diagnostic_t
```

Proposed field:

```
latticra_l_ui_source_span_t span;
```

Diagnostics should copy span metadata from parse results.

Report format changes

The parser result report should add:

```
span_start_offset=&lt;n&gt;
span_end_offset=&lt;n&gt;
span_start_line=&lt;n&gt;
span_start_column=&lt;n&gt;
span_end_line=&lt;n&gt;
span_end_column=&lt;n&gt;
```

The diagnostic report should add the same fields:

```
span_start_offset=&lt;n&gt;
span_end_offset=&lt;n&gt;
span_start_line=&lt;n&gt;
span_start_column=&lt;n&gt;
span_end_line=&lt;n&gt;
span_end_column=&lt;n&gt;
```

These additions are append-only to preserve existing report fields.

Compatibility expectations

Existing consumers of parse results must continue to compile after adding the span field, assuming they do not rely on exact struct size.

Existing report tests must be updated to accept the new appended fields.

Existing behavior must remain stable:

```
error labels unchanged
diagnostic codes unchanged
diagnostic messages unchanged
diagnostic hints unchanged
line and column fields unchanged
no-effect flags unchanged
```

Internal helper plan

Extend private parser helpers in src/l_ui_parser.c.

Planned helper shapes:

```
static void span_default(latticra_l_ui_source_span_t *span);

static void span_for_range(
    const char *source,
    size_t source_len,
    size_t start_offset,
    size_t end_offset,
    latticra_l_ui_source_span_t *span);

static int find_slice_span(
    const char *source,
```

```
    size_t source_len,
    const char *needle,
    latticra_l_ui_source_span_t *span);

static int find_unterminated_string_span(
    const char *source,
    size_t source_len,
    latticra_l_ui_source_span_t *span);

static int find_unbalanced_brace_span(
    const char *source,
    size_t source_len,
    latticra_l_ui_source_span_t *span);

static void set_error_with_span(
    latticra_l_ui_parse_result_t *result,
    latticra_l_ui_parse_error_t error,
    const latticra_l_ui_source_span_t *span);
```

These helpers should remain private.

Span defaults

Default span for success and conservative errors:

```
start_offset=0
end_offset=0
start_line=1
start_column=1
end_line=1
end_column=1
```

Span calculation rules

For token spans:

```
start_offset = first byte of token
end_offset = first byte after token
start_line/start_column = location of start_offset
end_line/end_column = location of end_offset
```

For missing constructs:

```
start_offset = card body start offset
end_offset = card body start offset
start_line = card body start line
start_column = card body start column
end_line = start_line
end_column = start_column
```

Initial span targets

The first implementation should add spans for:

```
unsupported_version
unsupported_effect
unsupported_boundary
unknown_binding_prefix
forbidden_behavior_marker
unterminated_string
unbalanced_brace
missing_effect
missing_boundary
missing_rail
```

Span mapping plan

```
| Parser result | Planned span |
| --- | --- |
| `unsupported_version` | unsupported version token or `lui` token |
| `unsupported_effect` | unsupported `effect ...` clause token range |
| `unsupported_boundary` | unsupported `boundary ...` clause token range |
| `unknown_binding_prefix` | unsupported binding target prefix range |
| `forbidden_behavior_marker` | forbidden marker token range |
| `unterminated_string` | opening quote through end of source |
| `unbalanced_brace` | unmatched brace byte |
| `missing_effect` | empty span at card body start |
```

```
| `missing_boundary` | empty span at card body start |
| `missing_rail` | empty span at card body start |
```

No-effect preservation

Source spans are metadata only.

They must not change:

```
no_effect=1
execution_allowed=0
mutation_allowed=0
server_allowed=0
recovery_allowed=0
hardware_allowed=0
```

Exact implementation test list

The source-span implementation PR should include tests for:

```
unsupported_effect_reports_effect_span
unsupported_boundary_reports_boundary_span
unknown_binding_prefix_reports_binding_span
forbidden_marker_reports_marker_span
unterminated_string_reports_string_span
unbalanced_open_brace_reports_brace_span
unbalanced_close_brace_reports_brace_span
missing_effect_reports_empty_card_body_span
missing_boundary_reports_empty_card_body_span
missing_rail_reports_empty_card_body_span
span_offsets_are_zero_based
span_end_offset_is_exclusive
span_line_columns_are_one_based
span_columns_are_byte_based
span_scanner_handles_lf_newlines
span_scanner_handles_crlf_newlines
span_scanner_handles_cr_newlines
span_metadata_preserves_no_effect_flags
span_reports_are_deterministic
parse_result_report_includes_span_fields
diagnostic_report_includes_span_fields
diagnostic_copies_parse_result_span
success_span_uses_default_empty_span
```

Test file plan

Add:

```
tests/l_ui_parser_source_span_invariants.c
scripts/test-l-ui-parser-source-span.sh
```

Wire into:

```
.github/workflows/c.yml
```

Documentation requirement

The implementation PR should update:

```
README.md
docs/FOUNDATION_INDEX.md
docs/L_UI_PARSER.md
docs/L_UI_PARSER_DIAGNOSTICS_IMPLEMENTATION.md
docs/L_UI_PARSER_SOURCE_SPAN_CONTRACT.md
```

and add:

```
docs/L_UI_PARSER_SOURCE_SPAN_IMPLEMENTATION.md
```

Forbidden implementation behavior

The source-span implementation must not:

- add file I/O to parser code;
- write files;

- open network connections;
- call server code;
- call update code;
- call recovery code;
- call hardware code;
- mutate state lattice;
- perform live movement;
- run L-UI behavior;
- render an interactive UI;
- accept unsupported effects.

Current validation command

This plan is guarded by:

```
sh scripts/test-l-ui-parser-source-span-implementation-plan.sh
```

The guard is static. It does not implement source spans.

Implementation gate

Source-span implementation code may be added only after this plan is merged.

Non-claims

This document does not implement source spans, AST construction, L-UI rendering, command behavior, Nucleus task handling, live movement, origin mutation, recovery behavior, server interaction, self-update, hardware support, boot readiness, security isolation, sandboxing, or operating-system completeness.

docs/L_UI_PARSER_STRING_ESCAPE_DIAGNOSTICS_CONTRACT.md

Source title: Latticra L-UI Parser String Escape Diagnostics Contract

Lines: 357 | Words: 1213 | SHA-256: 49921552235fdc99f60f5f2f24735ee44497a29b94e9961bd1893322a9e8c0b6

Latticra L-UI Parser String Escape Diagnostics Contract

Status: parser string escape diagnostics contract Scope: parser-level diagnostics for invalid L-UI string-literal escape sequences before and after parser diagnostics extension.

Purpose

This document defines the parser-level diagnostics contract for invalid L-UI string-literal escape sequences.

The string-literal escape decoder originally ran during AST construction. Invalid escapes were classified as:

```
LATTICRA_L_UI_PARSE_INTERNAL_ERROR
```

at the AST layer so the structural parser remained compatible. This contract defined the parser-level diagnostic surface before parser validation was extended to report invalid escapes directly.

This document does not implement parser-level string escape diagnostics.

The implementation plan is documented separately in L_UI_PARSER_STRING_ESCAPE_DIAGNOSTICS_IMPLEMENTATION_PLAN.md.

The implementation is documented separately in L_UI_PARSER_STRING_ESCAPE_DIAGNOSTICS_IMPLEMENTATION.md.

Relationship to existing diagnostics

This contract extends the existing parser diagnostics track:

```
docs/L_UI_PARSER_DIAGNOSTICS.md
docs/L_UI_PARSER_DIAGNOSTICS_IMPLEMENTATION_PLAN.md
docs/L_UI_PARSER_DIAGNOSTICS_IMPLEMENTATION.md
docs/L_UI_PARSER_STRING_ESCAPE_DIAGNOSTICS_IMPLEMENTATION_PLAN.md
docs/L_UI_PARSER_STRING_ESCAPE_DIAGNOSTICS_IMPLEMENTATION.md
docs/L_UI_STRING_LITERAL_ESCAPE_CONTRACT.md
docs/L_UI_STRING_LITERAL_ESCAPE_IMPLEMENTATION_PLAN.md
docs/L_UI_STRING_LITERAL_ESCAPE_IMPLEMENTATION.md
include/latticra/l_ui_parser.h
src/l_ui_parser.c
src/l_ui_parser_ast.c
```

The existing diagnostics contract owns stable parser diagnostic language. This contract defines the extension set for rejected string-literal escapes only.

Current boundary

The current system provides:

```
structural L-UI parser diagnostics
source spans
line and column metadata
string-literal escape decoding during AST construction
parser-level invalid escape diagnostics
escaped detailed AST report fields
no-effect flags
```

This contract does not add:

```
new accepted escape sequences
length-carrying AST strings
Unicode display behavior
renderer behavior
interactive UI behavior
command behavior
Nucleus task handling
live movement
state mutation
server interaction
update behavior
recovery behavior
hardware behavior
boot behavior
```

Diagnostic purpose

Parser-level string escape diagnostics make rejected string-literal escapes visible before AST construction.

The behavior allows:

```
latticra_l_ui_parse_source
latticra_l_ui_diagnostic_from_parse_result
latticra_l_ui_diagnostic_report
```

to report stable invalid-escape categories, messages, hints, source spans, and no-effect flags.

Parser error additions

The implementation extends latticra_l_ui_parse_error_t after LATTICRA_L_UI_PARSE_INTERNAL_ERROR with:

```
LATTICRA_L_UI_PARSE_INVALID_STRING_ESCAPE
LATTICRA_L_UI_PARSE_INVALID_HEX_ESCAPE
```

```
LATTICRA_L_UI_PARSE_UNTERMINATED_ESCAPE
LATTICRA_L_UI_PARSE_DECODED_NUL_IN_STRING
LATTICRA_L_UI_PARSE_LITERAL_NUL_IN_STRING
LATTICRA_L_UI_PARSE_STRING_VALUE_TOO_LARGE
```

These names are reserved by this contract for parser-level string escape diagnostics.

Diagnostic codes

The diagnostic codes extend the existing LUI0000 through LUI0018 code range:

```
LUI0019 invalid_string_escape
LUI0020 invalid_hex_escape
LUI0021 unterminated_escape
LUI0022 decoded_nul_in_string
LUI0023 literal_nul_in_string
LUI0024 string_value_too_large
```

The code numbers are stable.

Stable messages

Message language is concise and deterministic:

```
| Code | Message |
| --- | --- |
| `LUI0019` | String literal escape is not supported. |
| `LUI0020` | Hex string escape must use exactly two uppercase hexadecimal digits. |
| `LUI0021` | String literal escape is not terminated. |
| `LUI0022` | Decoded NUL bytes are not supported in AST strings. |
| `LUI0023` | Literal NUL bytes are not supported in AST strings. |
| `LUI0024` | Decoded string value exceeds the supported AST storage limit. |
```

Messages do not include dynamic source fragments.

Hint language

Hint language is stable:

```
| Code | Hint |
| --- | --- |
| `LUI0019` | Use only \\, \&quot;, \n, \r, \t, or uppercase \xNN escapes. |
| `LUI0020` | Use exactly two uppercase hex digits, such as \x0A or \x7F. |
| `LUI0021` | Complete the escape sequence or remove the trailing backslash. |
| `LUI0022` | Avoid \x00 until length-carrying AST strings exist. |
| `LUI0023` | Remove literal NUL bytes from the source string. |
| `LUI0024` | Shorten the decoded purpose or text value. |
```

Hints must not suggest unsupported escape forms such as Unicode escapes.

Source-span behavior

Diagnostics must remain source-oriented.

For invalid escapes, spans should cover the rejected source bytes:

```
\a      -&gt; span covers \a
\x0a    -&gt; span covers \x0a
\xGG    -&gt; span covers \xGG
\       -&gt; span covers the trailing backslash
\x      -&gt; span covers \x
\x0     -&gt; span covers \x0
\x00    -&gt; span covers \x00
literal NUL -&gt; span covers the literal NUL source byte
oversized decoded output -&gt; span covers the full source value range between quotes
```

Line and column should point to the first byte of the rejected span.

Line and column remain one-based byte positions in the in-memory source buffer.

Validation order

Parser-level string escape validation runs only after basic structural fixture checks.

It runs before AST construction and before AST values are materialized.

It must not hide earlier structural parser errors when those errors occur before a string-literal escape can be inspected deterministically.

When source structure is valid but a string escape is invalid, the string escape diagnostic is reported instead of allowing AST construction to classify an internal error.

Accepted escape compatibility

Parser-level diagnostics preserve the accepted escape set:

```
\\
\&quot;
\n
\r
\t
\xNN
```

where \xNN uses exactly two uppercase hexadecimal digits.

The diagnostics implementation must not broaden accepted escapes without a separate grammar or string-literal escape contract update.

AST compatibility

Invalid escapes are rejected by:

```
latticra_l_ui_parse_source
```

before AST construction runs.

For invalid escape source, AST behavior is:

```
ast.parse_result.error = parser-level string escape error
ast.rail_count = 0
ast.field_count = 0
ast.text_count = 0
failed-parse detailed report only
```

Accepted escapes continue to decode in AST values exactly as the string-literal escape implementation defines.

Report relationship

Diagnostic reports render:

```
diagnostic_severity=error
diagnostic_code=&lt;LUI0019-through-LUI0024&gt;
diagnostic_message=&lt;stable-message&gt;
diagnostic_hint=&lt;stable-hint&gt;
```

Parser result reports continue to include stable parse error labels.

Detailed AST reports continue using the failed-parse report path for rejected sources.

No-effect rule

Parser-level string escape diagnostics are metadata-only.

They preserve:

```
no_effect=1
execution_allowed=0
mutation_allowed=0
server_allowed=0
recovery_allowed=0
hardware_allowed=0
```

Compatibility rule

The implementation must not change:

```
accepted string-literal escape decoding
```

```
latticra_l_ui_ast_report existing required fields
latticra_l_ui_ast_detailed_report existing required fields for accepted sources
latticra_l_ui_diagnostic_report existing required fields
existing diagnostic codes LUI0000 through LUI0018
existing parser error labels for current errors
existing accepted fixture summary counts
```

The first accepted fixture still reports:

```
rail_count=9
field_count=23
text_count=2
effect=none
boundary=preview_only
```

Implementation evidence

Parser-level string escape diagnostics implementation required a separate implementation plan defining:

1. parser enum additions;
2. diagnostic code additions;
3. parse error labels;
4. stable messages;
5. stable hints;
6. source-span rules;
7. validation order;
8. AST compatibility behavior;
9. report compatibility behavior;
10. exact test file names;
11. exact invariant tests.

That plan is recorded in L_UI_PARSER_STRING_ESCAPE_DIAGNOSTICS_IMPLEMENTATION_PLAN.md.

The implementation is recorded in L_UI_PARSER_STRING_ESCAPE_DIAGNOSTICS_IMPLEMENTATION.md.

Test list

The implementation tests verify:

```
string_escape_diagnostic_rejects_unknown_escape_lui0019
string_escape_diagnostic_rejects_lowercase_hex_lui0020
string_escape_diagnostic_rejects_short_hex_lui0020
string_escape_diagnostic_rejects_invalid_hex_lui0020
string_escape_diagnostic_rejects_unterminated_escape_lui0021
string_escape_diagnostic_rejects_decoded_nul_lui0022
string_escape_diagnostic_rejects_literal_nul_lui0023
string_escape_diagnostic_rejects_oversized_decoded_output_lui0024
string_escape_diagnostic_reports_source_span
string_escape_diagnostic_reports_line_column
string_escape_diagnostic_preserves_no_effect_flags
string_escape_diagnostic_does_not_change_accepted_escape_decoding
string_escape_diagnostic_does_not_change_existing_error_codes
string_escape_diagnostic_uses_failed_parse_ast_report
string_escape_diagnostic_is_deterministic
```

Forbidden behavior

The parser-level string escape diagnostics implementation must not:

- add file I/O to parser or AST code;
- write files;
- open network connections;

- call server code;
- call update code;
- call recovery code;
- call hardware code;
- mutate state lattice;
- perform live movement;
- run L-UI behavior;
- render an interactive UI;
- treat text nodes as commands;
- treat bindings as executable references;
- accept lowercase hex escapes;
- accept Unicode escapes;
- accept unknown escapes literally;
- allow decoded NUL bytes before length-carrying AST strings exist;
- broaden accepted grammar beyond the string-literal escape contract.

Current validation commands

This contract is guarded by:

```
sh scripts/test-l-ui-parser-string-escape-diagnostics-contract.sh
```

The implementation is tested by:

```
sh scripts/test-l-ui-parser-string-escape-diagnostics.sh
```

Non-claims

This document and implementation do not change AST storage, implement length-carrying AST strings, allow decoded NUL bytes, broaden accepted L-UI syntax, implement Unicode display behavior, add L-UI rendering, add command behavior, add Nucleus task handling, add live movement, add origin mutation, add recovery behavior, add server interaction, add self-update, add hardware support, add boot readiness, claim security isolation, claim sandboxing, or claim operating-system completeness.

docs/L_UI_PARSER_STRING_ESCAPE_DIAGNOSTICS_IMPLEMENTATION.md

Source title: Latticra L-UI Parser String Escape Diagnostics Implementation

Lines: 344 | Words: 1034 | SHA-256: 5f531f3281225a78b7e3f774832c9253a43d79edf2277c10fc394550595733fb

Latticra L-UI Parser String Escape Diagnostics Implementation

Status: initial implementation contract Scope: parser-level diagnostics for invalid L-UI string-literal escape sequences.

Purpose

The L-UI Parser String Escape Diagnostics implementation promotes invalid string-literal escape failures from AST-level internal-error classification to parser-level diagnostics.

The implementation reports stable parser errors, diagnostic codes, messages, hints, source spans, and no-effect flags before AST construction materializes source-backed string values.

Implementation files

```
include/latticra/l_ui_parser.h
src/l_ui_parser.c
src/l_ui_parser_diagnostics.c
tests/l_ui_parser_string_escape_diagnostics_invariants.c
scripts/test-l-ui-parser-string-escape-diagnostics.sh
```

Related existing files remain active:

```
src/l_ui_parser_ast.c
tests/l_ui_string_literal_escape_invariants.c
scripts/test-l-ui-string-literal-escape.sh
```

Public API additions

The implementation extends latticra_l_ui_parse_error_t with:

```
LATTICRA_L_UI_PARSE_INVALID_STRING_ESCAPE = 19
LATTICRA_L_UI_PARSE_INVALID_HEX_ESCAPE = 20
LATTICRA_L_UI_PARSE_UNTERMINATED_ESCAPE = 21
LATTICRA_L_UI_PARSE_DECODED_NUL_IN_STRING = 22
LATTICRA_L_UI_PARSE_LITERAL_NUL_IN_STRING = 23
LATTICRA_L_UI_PARSE_STRING_VALUE_TOO_LARGE = 24
```

No new public function is added.

Parse error labels

The implementation adds stable parse error labels:

```
invalid_string_escape
invalid_hex_escape
unterminated_escape
decoded_nul_in_string
literal_nul_in_string
string_value_too_large
```

Existing parse error labels remain unchanged.

Diagnostic codes

The implementation adds diagnostic codes:

```
LUI0019 invalid_string_escape
LUI0020 invalid_hex_escape
LUI0021 unterminated_escape
LUI0022 decoded_nul_in_string
LUI0023 literal_nul_in_string
LUI0024 string_value_too_large
```

Existing diagnostic codes LUI0000 through LUI0018 remain unchanged.

Stable messages

The implementation uses these deterministic messages:

```
LUI0019: String literal escape is not supported.
LUI0020: Hex string escape must use exactly two uppercase hexadecimal digits.
LUI0021: String literal escape is not terminated.
LUI0022: Decoded NUL bytes are not supported in AST strings.
LUI0023: Literal NUL bytes are not supported in AST strings.
LUI0024: Decoded string value exceeds the supported AST storage limit.
```

Messages do not include dynamic source fragments.

Stable hints

The implementation uses these deterministic hints:

```
LUI0019: Use only \\, \&quot;, \n, \r, \t, or uppercase \xNN escapes.
LUI0020: Use exactly two uppercase hex digits, such as \x0A or \x7F.
LUI0021: Complete the escape sequence or remove the trailing backslash.
LUI0022: Avoid \x00 until length-carrying AST strings exist.
LUI0023: Remove literal NUL bytes from the source string.
LUI0024: Shorten the decoded purpose or text value.
```

Hints do not suggest unsupported Unicode escapes.

Parser helper implementation

The implementation adds private helpers in src/l_ui_parser.c:

```
is_upper_hex_digit
upper_hex_value
validate_string_literal_escape_span
validate_l_ui_string_literal_escapes
```

These helpers remain private.

Validation targets

The implementation validates quoted values used as source-backed AST strings:

```
purpose &quot;...&quot;
first text &quot;...&quot;
second text &quot;...&quot;
```

It does not validate or decode:

```
card names
rail names
field names
binding values
effect values
boundary values
```

Validation order

String escape validation runs inside:

```
latticra_l_ui_parse_source
```

after structural fixture checks and before returning LATTICRA_L_UI_PARSE_OK.

Existing structural errors retain priority over string escape diagnostics.

When source structure is valid but a string escape is invalid, the parser reports the string escape diagnostic instead of allowing AST construction to classify an internal error.

Source-span behavior

Diagnostics remain source-oriented.

For invalid escapes, spans cover the rejected source bytes:

```
\a      -&gt; span covers \a
\x0a    -&gt; span covers \x0a
\xGG    -&gt; span covers \xGG
\x      -&gt; span covers \x
\x0     -&gt; span covers \x0
\x00    -&gt; span covers \x00
literal NUL -&gt; span covers the literal NUL source byte
oversized decoded output -&gt; span covers the full source value range between quotes
```

Line and column point to the first byte of the rejected span.

Line and column remain one-based byte positions in the in-memory source buffer.

Capacity behavior

Parser validation uses the current AST string storage capacity:

```
LATTICRA_L_UI_AST_PURPOSE_MAX
```

for both purpose and text values.

If decoded output would be greater than or equal to the destination capacity, parser validation returns:

```
LATTICRA_L_UI_PARSE_STRING_VALUE_TOO_LARGE
```

NUL behavior

Decoded \x00 returns:

```
LATTICRA_L_UI_PARSE_DECODED_NUL_IN_STRING
```

Literal 0x00 source bytes inside the validated string value range return:

```
LATTICRA_L_UI_PARSE_LITERAL_NUL_IN_STRING
```

NUL bytes remain rejected until a length-carrying AST string storage contract exists.

That storage contract is now recorded in:

```
L_UI_AST_LENGTH_CARRYING_STRING_STORAGE_CONTRACT.md
```

AST compatibility behavior

Invalid escapes are rejected by:

```
latticra_l_ui_parse_source
```

before AST construction materializes values.

For invalid escape source, latticra_l_ui_parse_ast preserves failed-parse behavior:

```
ast.parse_result.error = parser-level string escape error
ast.rail_count = 0
ast.field_count = 0
ast.text_count = 0
failed-parse detailed report only
```

Accepted escapes continue to decode in AST values exactly as the string-literal escape implementation defines.

Report compatibility behavior

Parser result reports render the new parse error labels through existing report fields.

Diagnostic reports render:

```
diagnostic_severity=error
diagnostic_code=&lt;LUI0019-through-LUI0024&gt;
diagnostic_message=&lt;stable-message&gt;
diagnostic_hint=&lt;stable-hint&gt;
```

Detailed AST reports continue using the failed-parse report path for rejected sources.

Existing report fields remain stable.

Compatibility

The implementation does not change:

```
accepted string-literal escape decoding
existing diagnostic codes LUI0000 through LUI0018
existing parser error labels for current errors
latticra_l_ui_ast_report existing required fields
latticra_l_ui_ast_detailed_report existing required fields for accepted sources
latticra_l_ui_diagnostic_report existing required fields
existing accepted fixture summary counts
```

The first accepted fixture still reports:

```
rail_count=9
field_count=23
text_count=2
effect=none
boundary=preview_only
```

No-effect boundary

Parser-level string escape diagnostics preserve:

```
no_effect=1
execution_allowed=0
mutation_allowed=0
```

```
server_allowed=0
recovery_allowed=0
hardware_allowed=0
```

Test command

Run:

```
sh scripts/test-l-ui-parser-string-escape-diagnostics.sh
```

The main C workflow runs this check after the parser string escape diagnostics implementation-plan guard.

Required invariants

The parser string escape diagnostics tests verify:

```
string_escape_diagnostic_rejects_unknown_escape_lui0019
string_escape_diagnostic_rejects_lowercase_hex_lui0020
string_escape_diagnostic_rejects_short_hex_lui0020
string_escape_diagnostic_rejects_invalid_hex_lui0020
string_escape_diagnostic_rejects_unterminated_escape_lui0021
string_escape_diagnostic_rejects_decoded_nul_lui0022
string_escape_diagnostic_rejects_literal_nul_lui0023
string_escape_diagnostic_rejects_oversized_decoded_output_lui0024
string_escape_diagnostic_reports_source_span
string_escape_diagnostic_reports_line_column
string_escape_diagnostic_preserves_no_effect_flags
string_escape_diagnostic_does_not_change_accepted_escape_decoding
string_escape_diagnostic_does_not_change_existing_error_codes
string_escape_diagnostic_uses_failed_parse_ast_report
string_escape_diagnostic_is_deterministic
```

Current evidence level

This implementation is an L2 tested parser-level diagnostic model for invalid L-UI string-literal escapes.

It is not a length-carrying AST string model, Unicode display model, renderer, UI runtime, command surface, Nucleus task runner, server client, update engine, recovery system, hardware system, boot system, sandbox, or operating system.

Next implementation step

The length-carrying AST string storage contract is recorded in:

```
L_UI_AST_LENGTH_CARRYING_STRING_STORAGE_CONTRACT.md
```

The next implementation candidate after that contract is:

```
L-UI AST length-carrying string storage implementation plan
```

That future work should define public struct field placement, initialization rules, source-backed extraction length assignment, string decode length assignment, report field additions, length-aware escaped report helper shape, and exact invariant tests before storage code changes.

Non-claims

This document and implementation do not implement length-carrying AST strings, allow decoded NUL bytes, broaden accepted L-UI syntax, implement Unicode display behavior, add L-UI rendering, add command behavior, add Nucleus task handling, add live movement, add origin mutation, add recovery behavior, add server interaction, add self-update, add hardware support, add boot readiness, claim security isolation, claim sandboxing, or claim operating-system completeness.

docs/L_UI_PARSER_STRING_ESCAPE_DIAGNOSTICS_IMPLEMENTATION_PLAN.md

Source title: Latticra L-UI Parser String Escape Diagnostics Implementation Plan

Lines: 461 | Words: 1402 | SHA-256: ea934787218331c7fdfb1edf9f67d9f4434157e6128e520b5a8d82d0f12d7e47

Latticra L-UI Parser String Escape Diagnostics Implementation Plan

Status: implementation planning contract Scope: parser enum additions, diagnostic code additions, parse error labels, stable messages, stable hints, source-span rules, validation order, AST/report compatibility, exact test file names, and exact invariant tests before parser-level string escape diagnostics code.

Purpose

This document defines the implementation plan for parser-level diagnostics for invalid L-UI string-literal escape sequences.

The parser string escape diagnostics contract is already merged and guarded. This plan decides the exact public enum changes, diagnostic mapping updates, parser validation helper shape, source-span behavior, AST compatibility behavior, report behavior, test files, and compatibility expectations before implementation code is added.

Relationship to previous contracts

This plan depends on:

```
docs/L_UI_PARSER_STRING_ESCAPE_DIAGNOSTICS_CONTRACT.md
docs/L_UI_PARSER_DIAGNOSTICS.md
docs/L_UI_PARSER_DIAGNOSTICS_IMPLEMENTATION.md
docs/L_UI_STRING_LITERAL_ESCAPE_IMPLEMENTATION.md
include/latticra/l_ui_parser.h
src/l_ui_parser.c
src/l_ui_parser_ast.c
```

Those files remain the source of truth for current parser diagnostics, source spans, string-literal escape decoding, AST failure behavior, and no-effect boundaries.

Implementation language decision

Parser-level string escape diagnostics should be implemented in C.

Reason:

- the L-UI parser is implemented in C;
- diagnostics are exposed through a C public API surface;
- validation must remain bounded, deterministic, and no-effect;
- the current C workflow can validate diagnostic invariants;
- no dynamic runtime should be required.

Public API decision

Extend the existing public parser error enum in:

```
include/latticra/l_ui_parser.h
```

Add the new values after:

```
LATTICRA_L_UI_PARSE_INTERNAL_ERROR = 18
```

Proposed exact values:

```
LATTICRA_L_UI_PARSE_INVALID_STRING_ESCAPE = 19
```

```
LATTICRA_L_UI_PARSE_INVALID_HEX_ESCAPE = 20
LATTICRA_L_UI_PARSE_UNTERMINATED_ESCAPE = 21
LATTICRA_L_UI_PARSE_DECODED_NUL_IN_STRING = 22
LATTICRA_L_UI_PARSE_LITERAL_NUL_IN_STRING = 23
LATTICRA_L_UI_PARSE_STRING_VALUE_TOO_LARGE = 24
```

No new public function is required for the first implementation.

Parse error label decision

Update:

```
latticra_l_ui_parse_error_label
```

with stable labels:

```
invalid_string_escape
invalid_hex_escape
unterminated_escape
decoded_nul_in_string
literal_nul_in_string
string_value_too_large
```

Existing labels must remain unchanged.

Diagnostic mapping decision

Update:

```
latticra_l_ui_diagnostic_from_parse_result
```

so the new parser errors map to:

```
LUI0019 invalid_string_escape
LUI0020 invalid_hex_escape
LUI0021 unterminated_escape
LUI0022 decoded_nul_in_string
LUI0023 literal_nul_in_string
LUI0024 string_value_too_large
```

Severity for all new diagnostics should be:

```
LATTICRA_L_UI_DIAGNOSTIC_ERROR
```

Stable messages

Use these exact messages:

```
LUI0019: String literal escape is not supported.
LUI0020: Hex string escape must use exactly two uppercase hexadecimal digits.
LUI0021: String literal escape is not terminated.
LUI0022: Decoded NUL bytes are not supported in AST strings.
LUI0023: Literal NUL bytes are not supported in AST strings.
LUI0024: Decoded string value exceeds the supported AST storage limit.
```

Messages must remain deterministic and must not include dynamic source fragments.

Stable hints

Use these exact hints:

```
LUI0019: Use only \\, \&quot;, \n, \r, \t, or uppercase \xNN escapes.
LUI0020: Use exactly two uppercase hex digits, such as \x0A or \x7F.
LUI0021: Complete the escape sequence or remove the trailing backslash.
LUI0022: Avoid \x00 until length-carrying AST strings exist.
LUI0023: Remove literal NUL bytes from the source string.
LUI0024: Shorten the decoded purpose or text value.
```

Hints must not suggest unsupported escape forms such as Unicode escapes.

Parser helper plan

Add private helpers in:

```
src/l_ui_parser.c
```

Proposed helpers:

```
static int is_upper_hex_digit(unsigned char byte);

static unsigned char upper_hex_value(unsigned char byte);

static latticra_l_ui_parse_error_t validate_string_literal_escape_span(
    const char *source,
    size_t source_len,
    size_t value_start,
    size_t value_end,
    size_t destination_len,
    latticra_l_ui_source_span_t *span);

static latticra_l_ui_parse_error_t validate_l_ui_string_literal_escapes(
    const char *source,
    size_t source_len,
    latticra_l_ui_source_span_t *span);
```

Helpers must remain private.

The validation helper may share logic with AST decoding later, but this first implementation can duplicate small byte-oriented logic to avoid changing public API or adding shared modules.

Validation targets

The first parser-level string escape diagnostics implementation should validate only quoted source values used as AST strings:

```
purpose &quot;...&quot;
first text &quot;...&quot;
second text &quot;...&quot;
```

It should not validate or decode:

```
card names
rail names
field names
binding values
effect values
boundary values
```

Validation order

Parser-level string escape validation should run inside:

```
latticra_l_ui_parse_source
```

after these checks:

```
null argument check
empty source check
source size check
unterminated string check
unbalanced brace check
version check
card check
purpose presence check
effect presence and supported effect checks
boundary presence and supported boundary checks
forbidden behavior marker check
required rail checks
unknown binding prefix check
required binding checks
```

and before the parser returns LATTICRA_L_UI_PARSE_OK.

Reason:

- existing structural errors should keep their current priority;
- validation should only inspect string escapes after the accepted fixture structure is present;
- accepted sources should remain compatible;

- invalid escapes should no longer reach AST construction as internal errors when structure is otherwise valid.

Source-span behavior

Use source-oriented spans.

Exact span expectations:

```
\a      -&gt; span covers \a
\x0a    -&gt; span covers \x0a
\xGG    -&gt; span covers \xGG
\       -&gt; span covers the trailing backslash
\x      -&gt; span covers \x
\x0     -&gt; span covers \x0
\x00    -&gt; span covers \x00
literal NUL -&gt; span covers the literal NUL source byte
oversized decoded output -&gt; span covers the full source value range between quotes
```

Line and column should point to the first byte of the rejected span.

Line and column remain one-based byte positions in the in-memory source buffer.

Capacity behavior

Parser validation should use the current AST string storage capacity:

```
LATTICRA_L_UI_AST_PURPOSE_MAX
```

for both purpose and text values.

If decoded output would be greater than or equal to the destination capacity, parser validation should return:

```
LATTICRA_L_UI_PARSE_STRING_VALUE_TOO_LARGE
```

This prevents oversized decoded values from reaching AST construction.

NUL behavior

Decoded \x00 should return:

```
LATTICRA_L_UI_PARSE_DECODED_NUL_IN_STRING
```

Literal 0x00 source bytes inside the validated string value range should return:

```
LATTICRA_L_UI_PARSE_LITERAL_NUL_IN_STRING
```

NUL bytes remain rejected until a length-carrying AST string storage contract exists.

AST compatibility behavior

After parser-level diagnostics are implemented, invalid escapes should be rejected by:

```
latticra_l_ui_parse_source
```

before AST construction materializes values.

For invalid escape source, latticra_l_ui_parse_ast should preserve failed-parse behavior:

```
ast.parse_result.error = parser-level string escape error
ast.rail_count = 0
ast.field_count = 0
ast.text_count = 0
failed-parse detailed report only
```

Accepted escapes must continue to decode in AST values exactly as the current string-literal escape implementation defines.

Report compatibility behavior

Parser result reports should render the new parse error labels through existing report fields.

Diagnostic reports should render:

```
diagnostic_severity=error
diagnostic_code=&lt;LUI0019-through-LUI0024&gt;
diagnostic_message=&lt;stable-message&gt;
diagnostic_hint=&lt;stable-hint&gt;
```

Detailed AST reports should continue using the failed-parse report path for rejected sources.

Existing report fields must remain stable.

Compatibility expectations

The implementation must not change:

```
accepted string-literal escape decoding
existing diagnostic codes LUI0000 through LUI0018
existing parser error labels for current errors
latticra_l_ui_ast_report existing required fields
latticra_l_ui_ast_detailed_report existing required fields for accepted sources
latticra_l_ui_diagnostic_report existing required fields
existing accepted fixture summary counts
```

The first accepted fixture should still report:

```
rail_count=9
field_count=23
text_count=2
effect=none
boundary=preview_only
```

No-effect preservation

Parser-level string escape diagnostics must preserve:

```
no_effect=1
execution_allowed=0
mutation_allowed=0
server_allowed=0
recovery_allowed=0
hardware_allowed=0
```

Exact implementation test list

The implementation PR should include tests for:

```
string_escape_diagnostic_rejects_unknown_escape_lui0019
string_escape_diagnostic_rejects_lowercase_hex_lui0020
string_escape_diagnostic_rejects_short_hex_lui0020
string_escape_diagnostic_rejects_invalid_hex_lui0020
string_escape_diagnostic_rejects_unterminated_escape_lui0021
string_escape_diagnostic_rejects_decoded_nul_lui0022
string_escape_diagnostic_rejects_literal_nul_lui0023
string_escape_diagnostic_rejects_oversized_decoded_output_lui0024
string_escape_diagnostic_reports_source_span
string_escape_diagnostic_reports_line_column
string_escape_diagnostic_preserves_no_effect_flags
string_escape_diagnostic_does_not_change_accepted_escape_decoding
string_escape_diagnostic_does_not_change_existing_error_codes
string_escape_diagnostic_uses_failed_parse_ast_report
string_escape_diagnostic_is_deterministic
```

Test file plan

Add:

```
tests/l_ui_parser_string_escape_diagnostics_invariants.c
scripts/test-l-ui-parser-string-escape-diagnostics.sh
```

Wire into:

```
.github/workflows/c.yml
```

Documentation requirement

The implementation PR should update:

```
README.md
docs/FOUNDATION_INDEX.md
docs/L_UI_PARSER_STRING_ESCAPE_DIAGNOSTICS_CONTRACT.md
docs/L_UI_PARSER_DIAGNOSTICS.md
docs/L_UI_PARSER_DIAGNOSTICS_IMPLEMENTATION.md
docs/L_UI_STRING_LITERAL_ESCAPE_IMPLEMENTATION.md
```

and add:

```
docs/L_UI_PARSER_STRING_ESCAPE_DIAGNOSTICS_IMPLEMENTATION.md
```

Forbidden implementation behavior

The parser-level string escape diagnostics implementation must not:

- add file I/O to parser or AST code;
- write files;
- open network connections;
- call server code;
- call update code;
- call recovery code;
- call hardware code;
- mutate state lattice;
- perform live movement;
- run L-UI behavior;
- render an interactive UI;
- treat text nodes as commands;
- treat bindings as executable references;
- accept lowercase hex escapes;
- accept Unicode escapes;
- accept unknown escapes literally;
- allow decoded NUL bytes before length-carrying AST strings exist;
- broaden accepted grammar beyond the string-literal escape contract;
- change accepted escape decoding semantics.

Current validation command

This plan is guarded by:

```
sh scripts/test-l-ui-parser-string-escape-diagnostics-implementation-plan.sh
```

The guard is static. It does not implement parser-level string escape diagnostics.

Implementation gate

Parser-level string escape diagnostics implementation code may be added only after this plan is merged.

Non-claims

This document does not implement parser-level string escape diagnostics, change parser error enums, change diagnostic codes, change AST storage, implement length-carrying AST strings, broaden accepted L-UI syntax, implement Unicode display behavior, add L-UI rendering, add command behavior, add Nucleus task handling, add live movement, add origin mutation, add recovery behavior, add server interaction, add self-update, add hardware support, add boot readiness, claim security isolation, claim sandboxing, or claim operating-system completeness.

docs/L_UI_RENDERING_CONTRACT.md

Source title: Latticra L-UI Rendering Contract

Lines: 509 | Words: 1365 | SHA-256: beb92b09054894159cf2598febafc2ad408baef0ca37e591730d80e4651cc873

Latticra L-UI Rendering Contract

Status: L-UI rendering contract Scope: first operator-visible L-UI rendering boundary before renderer implementation, terminal UI behavior, interactive UI behavior, command behavior, execution, mutation, networking, recovery, hardware behavior, or production UI claims.

Purpose

This document defines the first contract for L-UI rendering in Latticra.

L-UI rendering means turning already validated L-UI/LIR metadata into deterministic operator-visible text output.

This document does not implement L-UI rendering.

The implementation plan is recorded in:

```
L_UI_RENDERING_IMPLEMENTATION_PLAN.md
```

Relationship to previous work

This contract depends on:

```
docs/L_UI_PARSER_AST_IMPLEMENTATION.md
docs/L_UI_AST_DETAILED_REPORT_IMPLEMENTATION.md
docs/L_UI_AST_ESCAPED_STRING_REPORT_IMPLEMENTATION.md
docs/L_UI_AST_SOURCE_BACKED_TEXT_IMPLEMENTATION.md
docs/L_UI_AST_LENGTH_CARRYING_STRING_STORAGE_IMPLEMENTATION.md
docs/L_UI_DECODED_NUL_ACCEPTANCE_IMPLEMENTATION.md
docs/L_UI_SOURCE_BUFFER_LITERAL_NUL_POLICY_IMPLEMENTATION.md
docs/L_UI_SEMANTIC_VALIDATION_IMPLEMENTATION.md
docs/LIR_SHAPE_IMPLEMENTATION.md
docs/CONSTRAINED_CPP_AUTHORITY_LAYER_IMPLEMENTATION.md
include/latticra/l_ui_parser.h
include/latticra/lir.h
include/latticra/cpp/authority.hpp
src/l_ui_parser_ast.c
src/l_ui_parser_semantic.c
src/lir.c
src/cpp/authority.cpp
```

Those files remain the source of truth for L-UI AST shape, source-backed text, length-carrying strings, escaped decoded NUL handling, literal source-buffer NUL rejection, semantic validation, LIR shape, constrained C++ authority validation, and no-effect boundaries.

Rendering role

L-UI rendering should be a deterministic presentation layer over validated metadata.

Recommended future pipeline:

```
source bytes
  -&gt; structural parser
  -&gt; AST construction
  -&gt; semantic validation
  -&gt; LIR lowering
  -&gt; constrained authority validation
  -&gt; L-UI rendering
  -&gt; operator-visible text output
```

Rendering must not bypass parser, semantic validation, LIR shape, or authority-layer checks.

First rendering unit

The first renderer should render one validated L-UI card or one validated LIR module.

Suggested future root object:

```
latticra_l_ui_render_result_t
```

Suggested future input object:

```
latticra_l_ui_render_request_t
```

Initial rendered unit labels:

```
card
rail
field
text
binding
effect
boundary
source_span
authority
```

Input prerequisites

Rendering may only operate after the input metadata is valid:

```
parser_error=ok
semantic_error=ok
lir_error=ok
authority_status=ok
no_effect=1
execution_allowed=0
mutation_allowed=0
server_allowed=0
recovery_allowed=0
hardware_allowed=0
```

If parsing, semantic validation, LIR lowering, or authority validation failed, rendering should return a bounded failure report instead of rendering a partial operator surface.

Render modes

Initial render modes should be explicit and bounded.

Suggested render modes:

```
summary
detailed
diagnostics_only
authority_only
```

The first implementation plan must choose exact enum names.

Render modes must not imply interactive UI, live terminal control, command execution, or event handling.

Output target

The first renderer should write into caller-provided buffers only.

Suggested output behavior:

```
caller-provided char buffer
explicit buffer length
NUL-terminated on success
cleared on too-small failure
no heap allocation
no file output
no terminal escape control by default
```

The first renderer should not write directly to stdout, stderr, files, terminals, sockets, servers, logs, or devices.

Rendered report model

A future rendered report should be deterministic and bounded.

Suggested report header:

```
LATTICRA L-UI RENDER REPORT
status=&lt;status-label&gt;
mode=&lt;render-mode-label&gt;
card=&lt;card-name&gt;
effect=&lt;effect-label&gt;
boundary=&lt;boundary-label&gt;
rail_count=&lt;count&gt;
field_count=&lt;count&gt;
text_count=&lt;count&gt;
binding_count=&lt;count&gt;
node_count=&lt;count&gt;
edge_count=&lt;count&gt;
no_effect=&lt;0|1&gt;
execution_allowed=&lt;0|1&gt;
mutation_allowed=&lt;0|1&gt;
server_allowed=&lt;0|1&gt;
recovery_allowed=&lt;0|1&gt;
hardware_allowed=&lt;0|1&gt;
```

Detailed output may include rail, field, text, binding, LIR node, and authority sections, but only as text metadata.

Suggested section order

Detailed rendering should use stable section order:

```
HEADER
CARD
AUTHORITY
RAILS
FIELDS
TEXT
BINDINGS
LIR
SOURCE_SPANS
NO_EFFECT_FLAGS
```

The order must be deterministic across repeated runs.

Rail rendering

Rail rendering should preserve validated rail order from AST/LIR metadata.

Rail output should include:

```
rail index
rail name
field count
text count
source span
```

The renderer must not invent rails or reorder them unless a future contract explicitly defines a display sort mode.

Field and binding rendering

Field rendering should preserve validated field metadata.

Field output should include:

```
field index
field name
binding target
binding prefix
source span
binding source span
```

Bindings remain symbolic. Rendering must not evaluate state, preview values, host state, or runtime state.

Text rendering

Text rendering must respect length-carrying storage.

Rules:

```
value_len is authoritative
escaped output is used for operator-visible text
escaped decoded NUL through \x00 remains representable
literal source-buffer NUL remains rejected before rendering
raw C-string fields are not authoritative for embedded NUL values
```

Rendering must not drop embedded NUL metadata or silently truncate text.

Source-span rendering

Source spans should be operator-visible where useful.

Suggested source-span fields:

```
start_offset
end_offset
start_line
start_column
end_line
end_column
```

Rendering must not invent byte positions, line numbers, or column numbers.

LIR rendering

LIR rendering should display LIR metadata only.

LIR output may include:

```
source_kind
module_name
card_name
node_count
edge_count
binding_count
text_count
node kinds
edge kinds
binding refs
text refs
```

Rendering must not execute LIR, lower LIR into behavior, evaluate bindings, render an interactive UI, or call Nucleus task execution.

Authority rendering

Authority rendering should display constrained C++ authority-layer report metadata only.

Authority output may include:

```
authority status
authority validator
authority requested effect
authority denial reason
authority no-effect flags
```

Rendering authority metadata must not broaden authority, perform effects, or alter authority-layer state.

Error model

Rendering should have a separate error space.

Recommended future labels:

```
ok
null_argument
invalid_input
parser_failed
semantic_failed
lir_failed
authority_failed
capacity_exceeded
unsupported_render_mode
unsupported_effect
unsupported_boundary
internal_error
```

Exact enum names must be defined by a future implementation plan.

Capacity policy

The first implementation should use fixed capacities and caller-owned buffers.

Suggested constants:

```
LATTICRA_L_UI_RENDER_REPORT_MAX
LATTICRA_L_UI_RENDER_LINE_MAX
LATTICRA_L_UI_RENDER_SECTION_MAX
```

The implementation plan must name exact capacities before code is added.

Small output buffers should return a stable capacity error and clear the output buffer.

No-effect rule

L-UI rendering is presentation-only.

It must preserve:

```
no_effect=1
execution_allowed=0
mutation_allowed=0
server_allowed=0
recovery_allowed=0
hardware_allowed=0
```

Rendering must not execute commands, mutate state, evaluate host state, call Nucleus task execution, write files, read files, open network connections, call server code, call update code, call recovery code, or touch hardware.

Compatibility expectations

L-UI rendering work must not change:

```
existing parser behavior
existing parser diagnostic codes
existing AST construction behavior
existing detailed AST report behavior
existing escaped string report behavior
existing source-backed text behavior
existing length-carrying string behavior
existing decoded NUL acceptance
existing literal source-buffer NUL rejection
existing semantic validation behavior
existing LIR shape behavior
existing constrained C++ authority behavior
source-span byte offset behavior
no-effect flags
current accepted fixture counts
```

The first accepted fixture should still preserve:

```
rail_count=9
field_count=23
text_count=2
effect=none
boundary=preview_only
```

Future implementation gate

L-UI rendering implementation must not begin until a separate implementation plan defines:

1. implementation language;
2. public API shape;
3. public header path;
4. source file path;
5. render request struct;
6. render result struct;
7. render mode enum;
8. render error enum;
9. capacity constants;
10. output buffer rules;
11. section order;
12. source-span rendering rules;
13. embedded NUL rendering rules;
14. authority metadata rendering rules;
15. exact tests;
16. compatibility expectations;
17. non-claims.

That plan is recorded in:

```
L_UI_RENDERING_IMPLEMENTATION_PLAN.md
```

Future file policy

Recommended future files:

```
include/latticra/l_ui_renderer.h
src/l_ui_renderer.c
tests/l_ui_rendering_invariants.c
scripts/test-l-ui-rendering.sh
docs/L_UI_RENDERING_IMPLEMENTATION_PLAN.md
docs/L_UI_RENDERING_IMPLEMENTATION.md
```

The implementation plan confirms exact paths before renderer code is added.

Future test list

A future implementation plan should include tests for:

```
l_ui_rendering_accepts_semantically_valid_l_ui_fixture
l_ui_rendering_requires_semantic_success
l_ui_rendering_requires_lir_success
l_ui_rendering_requires_authority_success
l_ui_rendering_preserves_card_metadata
l_ui_rendering_preserves_rail_order
l_ui_rendering_preserves_field_bindings
l_ui_rendering_preserves_text_lengths
l_ui_rendering_preserves_escaped_x00_visibility
```

```
l_ui_rendering_preserves_source_spans
l_ui_rendering_preserves_no_effect_flags
l_ui_rendering_report_is_deterministic
l_ui_rendering_report_rejects_small_buffer
l_ui_rendering_does_not_change_ast_report
l_ui_rendering_does_not_change_lir_report
l_ui_rendering_does_not_execute_bindings
l_ui_rendering_does_not_call_nucleus_execution
l_ui_rendering_is_deterministic
```

The implementation-plan test list is now recorded in:

```
L_UI_RENDERING_IMPLEMENTATION_PLAN.md
```

Forbidden behavior

L-UI rendering work must not:

- render parser-failed input as a valid surface;
- render semantic-failed input as a valid surface;
- render LIR-failed input as a valid surface;
- bypass constrained authority validation;
- execute bindings;
- evaluate host state;
- evaluate runtime state;
- call Nucleus task execution;
- execute Lat;
- execute LIR;
- mutate state;
- write files;
- read files;
- open network connections;
- call server code;
- call update code;
- call recovery code;
- call hardware code;
- emit terminal escape control by default;
- create an interactive UI loop;
- broaden accepted syntax;
- weaken parser diagnostics;
- weaken semantic validation;
- weaken LIR validation;
- weaken constrained C++ authority validation;
- accept literal source-buffer NUL;
- remove escaped decoded NUL support;
- make raw C-string fields authoritative for embedded NUL values;

- imply a production UI, runtime, sandbox, malware prevention, ransomware prevention, or operating-system surface.

Current validation command

This contract is guarded by:

```
sh scripts/test-l-ui-rendering-contract.sh
```

The guard is static. It does not implement L-UI rendering.

Non-claims

This document does not implement L-UI rendering, interactive UI behavior, terminal control, command behavior, Lat execution, LIR execution, Nucleus task execution, live movement, state mutation, recovery behavior, server interaction, self-update, hardware support, boot readiness, security isolation, sandboxing, malware prevention, ransomware prevention, or operating-system completeness.

docs/L_UI_RENDERING_DETAILED_REPORT_REFINEMENT.md

Source title: Latticra L-UI Rendering Detailed Report Refinement

Lines: 120 | Words: 271 | SHA-256: 072730fca8ae88a23c027a6cd2bf8a2fb5c7a95a235096799a87acdc1196ea0d

Latticra L-UI Rendering Detailed Report Refinement

Status: implementation refinement Scope: deterministic detailed-report metadata for the no-effect L-UI renderer.

Purpose

This refinement makes the existing L-UI detailed rendering surface easier to audit by adding explicit metadata fields for report classification, detail level, detailed-report availability, detailed section count, deterministic section sequence, no-effect-chain status, and evidence level.

The renderer remains presentation-only.

Implementation files

This slice updates:

```
include/latticra/l_ui_renderer.h
src/l_ui_renderer.c
tests/l_ui_rendering_detailed_report_refinement.c
scripts/test-l-ui-rendering-detailed-report-refinement.sh
.github/workflows/l-ui-rendering-detailed-report-refinement.yml
.github/workflows/c.yml
```

Added metadata

The render result now exposes:

```
report_classification
detail_level
section_sequence
no_effect_chain
evidence_level
detailed_report_available
detailed_section_count
```

Detailed mode reports:

```
report_classification=detailed_report
detail_level=detailed
detailed_report_available=1
detailed_section_count=10
section_sequence=HEADER,CARD,AUTHORITY,RAILS,FIELDS,TEXT,BINDINGS,LIR,SOURCE_SPANS,NO_EFFECT_FLA
GS
```

```
no_effect_chain=preserved
evidence_level=metadata
```

Summary mode remains a header-only report:

```
report_classification=summary_report
detail_level=summary
detailed_report_available=0
detailed_section_count=0
section_sequence=HEADER
```

Boundary

This refinement does not add:

```
interactive UI behavior
terminal control
command behavior
Lat execution
LIR execution
Nucleus task execution
file I/O
network I/O
state mutation
server interaction
self-update
recovery behavior
hardware behavior
sandboxing
malware prevention
ransomware prevention
operating-system completeness
```

Validation

Run:

```
sh scripts/test-l-ui-rendering-detailed-report-refinement.sh
sh scripts/test-l-ui-rendering.sh
```

The focused test verifies:

```
detailed mode sets explicit report metadata
detailed report emits explicit metadata
summary mode remains single-header reporting
no-effect flags remain preserved
```

Compatibility expectations

This refinement preserves:

```
existing parser behavior
existing semantic validation behavior
existing LIR shape behavior
existing authority behavior
existing render modes
existing no-effect flags
existing detailed report section order
existing summary report behavior
```

Non-claims

This document and implementation do not claim a finished operating system, hardened sandbox, production runtime, production security boundary, malware prevention, ransomware prevention, recovery system, update system, bootable image, public UI product, terminal UI product, or public release readiness.

docs/L_UI_RENDERING_IMPLEMENTATION.md

Source title: Latticra L-UI Rendering Implementation

Lines: 335 | Words: 715 | SHA-256: b73e0ebc8e01f40eca3870dcdf5ac3b277c02b216217ba3bb055823e880e2233

Latticra L-UI Rendering Implementation

Status: initial implementation contract Scope: first no-effect C L-UI renderer API, bounded render result metadata, deterministic report output, semantic/LIR/authority prerequisites, source-span rendering, length-aware text rendering, compatibility expectations, validation, and non-claims.

Purpose

This document records the first L-UI rendering implementation.

The implementation follows:

```
docs/L_UI_RENDERING_CONTRACT.md
docs/L_UI_RENDERING_IMPLEMENTATION_PLAN.md
```

The renderer turns already validated L-UI/LIR metadata into deterministic operator-visible text output.

It is presentation-only.

Implementation files

This slice adds:

```
include/latticra/l_ui_renderer.h
src/l_ui_renderer.c
tests/l_ui_rendering_invariants.c
scripts/test-l-ui-rendering.sh
```

It also wires the renderer test into:

```
.github/workflows/c.yml
```

Public API

The public API is:

```
latticra_l_ui_render_error_t
latticra_l_ui_render_mode_t
latticra_l_ui_render_authority_summary_t
latticra_l_ui_render_request_t
latticra_l_ui_render_result_t
latticra_l_ui_render_error_label
latticra_l_ui_render_mode_label
latticra_l_ui_render
latticra_l_ui_render_report
```

The API is C and uses caller-owned input/output structures.

Capacity constants

The renderer defines:

```
LATTICRA_L_UI_RENDER_LABEL_MAX 64u
LATTICRA_L_UI_RENDER_REASON_MAX 128u
LATTICRA_L_UI_RENDER_REPORT_MAX 16384u
LATTICRA_L_UI_RENDER_LINE_MAX 512u
LATTICRA_L_UI_RENDER_SECTION_MAX 16u
LATTICRA_L_UI_RENDER_AUTHORITY_REPORT_MAX 4096u
```

The renderer uses fixed-capacity fields and caller-provided report buffers.

Render errors

Stable render error labels:

```
ok
null_argument
invalid_input
parser_failed
semantic_failed
lir_failed
authority_failed
```

```
capacity_exceeded
unsupported_render_mode
unsupported_effect
unsupported_boundary
internal_error
```

Render modes

Supported render modes:

```
summary
detailed
diagnostics_only
authority_only
```

Render modes are presentation choices only. They do not imply interactive UI behavior, command execution, live terminal control, or event handling.

Input prerequisites

Rendering succeeds only when:

```
parser_error=ok
semantic_error=ok
lir_error=ok
authority_status=ok
no_effect=1
execution_allowed=0
mutation_allowed=0
server_allowed=0
recovery_allowed=0
hardware_allowed=0
```

The renderer rejects parser-failed, semantic-failed, LIR-failed, authority-failed, non-no-effect, unsupported-effect, unsupported-boundary, and unsupported-mode inputs.

Render result metadata

The render result records:

```
card name
effect
boundary
rail count
field count
text count
binding count
node count
edge count
section count
card source span
authority summary
no-effect flags
bounded rail snapshots
bounded field snapshots
bounded binding-prefix snapshots
bounded text length and escaped-value snapshots
bounded source-span snapshots
```

The renderer does not retain request pointers after latticra_l_ui_render returns.

Report output

latticra_l_ui_render_report writes a deterministic report into a caller-provided buffer.

Header fields include:

```
LATTICRA L-UI RENDER REPORT
status=&lt;integer-status&gt;
error=&lt;render-error-label&gt;
mode=&lt;render-mode-label&gt;
card=&lt;card-name&gt;
effect=&lt;effect-label&gt;
boundary=&lt;boundary-label&gt;
rail_count=&lt;count&gt;
field_count=&lt;count&gt;
text_count=&lt;count&gt;
```

```
binding_count=&lt;count&gt;
node_count=&lt;count&gt;
edge_count=&lt;count&gt;
section_count=&lt;count&gt;
no_effect=&lt;0|1&gt;
execution_allowed=&lt;0|1&gt;
mutation_allowed=&lt;0|1&gt;
server_allowed=&lt;0|1&gt;
recovery_allowed=&lt;0|1&gt;
hardware_allowed=&lt;0|1&gt;
authority_status=&lt;authority-status-label&gt;
authority_validator=&lt;authority-validator-label&gt;
authority_requested_effect=&lt;authority-effect-label&gt;
authority_denial_reason=&lt;authority-denial-reason&gt;
span_start_offset=&lt;offset&gt;
span_end_offset=&lt;offset&gt;
span_start_line=&lt;line&gt;
span_start_column=&lt;column&gt;
span_end_line=&lt;line&gt;
span_end_column=&lt;column&gt;
```

Small output buffers return LATTICRA_STATUS_BUFFER_TOO_SMALL and clear the buffer.

Detailed report sections

Detailed mode emits sections in this order:

```
HEADER
CARD
AUTHORITY
RAILS
FIELDS
TEXT
BINDINGS
LIR
SOURCE_SPANS
NO_EFFECT_FLAGS
```

The order is deterministic across repeated runs.

Text and embedded NUL behavior

The renderer respects length-carrying text metadata.

Rules:

```
value_len is authoritative
escaped output is used for operator-visible text
escaped decoded NUL through \x00 remains visible
literal source-buffer NUL remains rejected before rendering
raw C-string fields are not authoritative for embedded NUL values
```

Authority metadata behavior

The renderer consumes a C-compatible authority summary.

It displays authority metadata but does not broaden authority, perform effects, call C++ authority APIs directly, or expose C++ object lifetimes through the renderer API.

No-effect behavior

Rendering preserves:

```
no_effect=1
execution_allowed=0
mutation_allowed=0
server_allowed=0
recovery_allowed=0
hardware_allowed=0
```

Rendering does not execute commands, mutate state, evaluate host state, call Nucleus task execution, write files, read files, open network connections, call server code, call update code, call recovery code, or touch hardware.

Validation

Run:

```
sh scripts/test-l-ui-rendering.sh
```

The test suite covers:

```
l_ui_rendering_accepts_semantically_valid_l_ui_fixture
l_ui_rendering_requires_semantic_success
l_ui_rendering_requires_lir_success
l_ui_rendering_requires_authority_success
l_ui_rendering_rejects_non_no_effect_flags
l_ui_rendering_preserves_card_metadata
l_ui_rendering_preserves_rail_order
l_ui_rendering_preserves_field_bindings
l_ui_rendering_preserves_text_lengths
l_ui_rendering_preserves_escaped_x00_visibility
l_ui_rendering_preserves_source_spans
l_ui_rendering_preserves_no_effect_flags
l_ui_rendering_report_is_deterministic
l_ui_rendering_report_rejects_small_buffer
l_ui_rendering_rejects_unsupported_mode
l_ui_rendering_does_not_change_ast_report
l_ui_rendering_does_not_change_lir_report
l_ui_rendering_does_not_execute_bindings
l_ui_rendering_does_not_call_nucleus_execution
l_ui_rendering_is_deterministic
```

Compatibility expectations

This implementation must not change:

```
existing parser behavior
existing parser diagnostic codes
existing AST construction behavior
existing detailed AST report behavior
existing escaped string report behavior
existing source-backed text behavior
existing length-carrying string behavior
existing decoded NUL acceptance
existing literal source-buffer NUL rejection
existing semantic validation behavior
existing LIR shape behavior
existing constrained C++ authority behavior
source-span byte offset behavior
no-effect flags
current accepted fixture counts
```

The first accepted fixture still preserves:

```
rail_count=9
field_count=23
text_count=2
effect=none
boundary=preview_only
```

Current boundary

This implementation does not provide:

```
interactive UI behavior
terminal control
command behavior
Lat execution
LIR execution
Nucleus task execution
file I/O
network I/O
state mutation
server interaction
self-update
recovery behavior
hardware behavior
sandboxing
malware prevention
ransomware prevention
operating-system completeness
```

Non-claims

This document and implementation do not claim a finished operating system, hardened sandbox, production runtime, production security boundary, malware prevention, ransomware prevention, recovery system, update system, bootable image, public UI product, terminal UI product, or public release readiness.

docs/L_UI_RENDERING_IMPLEMENTATION_PLAN.md

Source title: Latticra L-UI Rendering Implementation Plan

Lines: 640 | Words: 1634 | SHA-256: 3a6c57934332789aa4e8aa1b02658622c1ba0de62a48ff1974b2b3da22816d59

Latticra L-UI Rendering Implementation Plan

Status: implementation planning contract Scope: exact public API, renderer files, render request/result structs, render mode enum, render error enum, capacity constants, output-buffer behavior, section order, source-span rendering, embedded-NUL rendering, authority metadata rendering, tests, compatibility expectations, and non-claims before L-UI renderer code.

Purpose

This document defines the implementation plan for the first L-UI renderer.

The L-UI rendering contract is already merged and guarded. This plan turns that contract into exact public API, file paths, data structures, capacity constants, render modes, error labels, report format, output-buffer rules, authority metadata handling, tests, compatibility expectations, and non-claims required before renderer code is added.

This document does not implement L-UI rendering.

Relationship to previous work

This plan depends on:

```
docs/L_UI_RENDERING_CONTRACT.md
docs/L_UI_PARSER_AST_IMPLEMENTATION.md
docs/L_UI_AST_DETAILED_REPORT_IMPLEMENTATION.md
docs/L_UI_AST_ESCAPED_STRING_REPORT_IMPLEMENTATION.md
docs/L_UI_AST_SOURCE_BACKED_TEXT_IMPLEMENTATION.md
docs/L_UI_AST_LENGTH_CARRYING_STRING_STORAGE_IMPLEMENTATION.md
docs/L_UI_DECODED_NUL_ACCEPTANCE_IMPLEMENTATION.md
docs/L_UI_SOURCE_BUFFER_LITERAL_NUL_POLICY_IMPLEMENTATION.md
docs/L_UI_SEMANTIC_VALIDATION_IMPLEMENTATION.md
docs/LIR_SHAPE_IMPLEMENTATION.md
docs/CONSTRAINED_CPP_AUTHORITY_LAYER_IMPLEMENTATION.md
include/latticra/l_ui_parser.h
include/latticra/lir.h
include/latticra/cpp/authority.hpp
src/l_ui_parser_ast.c
src/l_ui_parser_semantic.c
src/lir.c
src/cpp/authority.cpp
```

Those files remain the source of truth for parser behavior, AST shape, source-backed text, length-carrying strings, escaped decoded NUL handling, literal source-buffer NUL rejection, semantic validation, LIR shape, constrained C++ authority validation, and no-effect boundaries.

Implementation language decision

The first L-UI renderer should be implemented in C.

Reason:

- L-UI parser, AST, semantic validation, detailed reports, and LIR shape are C;

- C remains the secure substrate;
- renderer output should be deterministic and bounded;
- renderer code should use caller-provided buffers and avoid heap allocation;
- the C++ authority layer remains a validation/report dependency, not the rendering substrate.

The renderer may consume authority metadata through a small C-compatible authority summary struct or a pre-rendered authority report snapshot. It should not include or require C++ object lifetime in the public C renderer API.

Implementation files

The implementation PR should add or modify:

```
include/latticra/l_ui_renderer.h
src/l_ui_renderer.c
tests/l_ui_rendering_invariants.c
scripts/test-l-ui-rendering.sh
.github/workflows/c.yml
docs/L_UI_RENDERING_IMPLEMENTATION.md
```

The implementation PR should not add interactive UI behavior, terminal control, command behavior, Lat execution, LIR execution, Nucleus task execution, file I/O, network I/O, state mutation, recovery behavior, update behavior, server interaction, hardware behavior, or security guarantees.

Public API shape

Add public API names:

```
latticra_l_ui_render_error_t
latticra_l_ui_render_mode_t
latticra_l_ui_render_authority_summary_t
latticra_l_ui_render_request_t
latticra_l_ui_render_result_t
latticra_l_ui_render_error_label
latticra_l_ui_render_mode_label
latticra_l_ui_render
latticra_l_ui_render_report
```

Recommended function signatures:

```
const char *latticra_l_ui_render_error_label(latticra_l_ui_render_error_t error);
const char *latticra_l_ui_render_mode_label(latticra_l_ui_render_mode_t mode);

latticra_status_t latticra_l_ui_render(
    const latticra_l_ui_render_request_t *request,
    latticra_l_ui_render_result_t *result);

latticra_status_t latticra_l_ui_render_report(
    const latticra_l_ui_render_result_t *result,
    char *buffer,
    size_t buffer_len);
```

The first renderer should generate metadata reports only.

Capacity constants

Add exact bounded constants:

```
LATTICRA_L_UI_RENDER_LABEL_MAX 64u
LATTICRA_L_UI_RENDER_REASON_MAX 128u
LATTICRA_L_UI_RENDER_REPORT_MAX 16384u
LATTICRA_L_UI_RENDER_LINE_MAX 512u
LATTICRA_L_UI_RENDER_SECTION_MAX 16u
LATTICRA_L_UI_RENDER_AUTHORITY_REPORT_MAX 4096u
```

The first implementation must reject or report capacity failures deterministically. It must not silently truncate semantically meaningful fields.

Render error enum

Add render error enum values:

```
LATTICRA_L_UI_RENDER_OK
LATTICRA_L_UI_RENDER_NULL_ARGUMENT
LATTICRA_L_UI_RENDER_INVALID_INPUT
LATTICRA_L_UI_RENDER_PARSER_FAILED
LATTICRA_L_UI_RENDER_SEMANTIC_FAILED
LATTICRA_L_UI_RENDER_LIR_FAILED
LATTICRA_L_UI_RENDER_AUTHORITY_FAILED
LATTICRA_L_UI_RENDER_CAPACITY_EXCEEDED
LATTICRA_L_UI_RENDER_UNSUPPORTED_RENDER_MODE
LATTICRA_L_UI_RENDER_UNSUPPORTED_EFFECT
LATTICRA_L_UI_RENDER_UNSUPPORTED_BOUNDARY
LATTICRA_L_UI_RENDER_INTERNAL_ERROR
```

Stable labels:

```
ok
null_argument
invalid_input
parser_failed
semantic_failed
lir_failed
authority_failed
capacity_exceeded
unsupported_render_mode
unsupported_effect
unsupported_boundary
internal_error
```

Render mode enum

Add render mode enum values:

```
LATTICRA_L_UI_RENDER_MODE_SUMMARY
LATTICRA_L_UI_RENDER_MODE_DETAILED
LATTICRA_L_UI_RENDER_MODE_DIAGNOSTICS_ONLY
LATTICRA_L_UI_RENDER_MODE_AUTHORITY_ONLY
```

Stable labels:

```
summary
detailed
diagnostics_only
authority_only
```

Render modes are presentation choices only. They must not imply interaction, command execution, live terminal control, or event handling.

Authority summary struct

Add a C-compatible authority summary struct:

```
latticra_status_t status;
char status_label[LATTICRA_L_UI_RENDER_LABEL_MAX];
char validator_label[LATTICRA_L_UI_RENDER_LABEL_MAX];
char requested_effect_label[LATTICRA_L_UI_RENDER_LABEL_MAX];
char denial_reason[LATTICRA_L_UI_RENDER_REASON_MAX];
int no_effect;
int execution_allowed;
int mutation_allowed;
int server_allowed;
int recovery_allowed;
int hardware_allowed;
```

This struct lets the C renderer display authority metadata without owning C++ objects or exposing C++ object lifetimes through a C ABI.

The first implementation may use a helper in tests to populate this struct from known good authority metadata, but renderer code must remain C.

Render request struct

Add request fields:

```
latticra_l_ui_render_mode_t mode;
const latticra_l_ui_ast_result_t *ast;
const latticra_l_ui_semantic_result_t *semantic;
const latticra_lir_module_t *lir;
const latticra_l_ui_render_authority_summary_t *authority;
```

The renderer must not retain pointers from the request after the call returns.

Render result struct

Add result fields:

```
latticra_status_t status;
latticra_l_ui_render_error_t error;
latticra_l_ui_render_mode_t mode;
char card_name[LATTICRA_L_UI_RENDER_LABEL_MAX];
char effect[LATTICRA_L_UI_RENDER_LABEL_MAX];
char boundary[LATTICRA_L_UI_RENDER_LABEL_MAX];
size_t rail_count;
size_t field_count;
size_t text_count;
size_t binding_count;
size_t node_count;
size_t edge_count;
size_t section_count;
latticra_l_ui_source_span_t span;
latticra_l_ui_render_authority_summary_t authority;
int no_effect;
int execution_allowed;
int mutation_allowed;
int server_allowed;
int recovery_allowed;
int hardware_allowed;
```

The result must be fully initialized on success and failure.

Input prerequisite behavior

Rendering may succeed only when:

```
parser_error=ok
semantic_error=ok
lir_error=ok
authority_status=ok
no_effect=1
execution_allowed=0
mutation_allowed=0
server_allowed=0
recovery_allowed=0
hardware_allowed=0
```

Failure behavior:

```
parser failure -&gt; LATTICRA_L_UI_RENDER_PARSER_FAILED
semantic failure -&gt; LATTICRA_L_UI_RENDER_SEMANTIC_FAILED
LIR failure -&gt; LATTICRA_L_UI_RENDER_LIR_FAILED
authority failure -&gt; LATTICRA_L_UI_RENDER_AUTHORITY_FAILED
non-no-effect flags -&gt; LATTICRA_L_UI_RENDER_AUTHORITY_FAILED
unsupported mode -&gt; LATTICRA_L_UI_RENDER_UNSUPPORTED_RENDER_MODE
unsupported effect -&gt; LATTICRA_L_UI_RENDER_UNSUPPORTED_EFFECT
unsupported boundary -&gt; LATTICRA_L_UI_RENDER_UNSUPPORTED_BOUNDARY
```

The renderer must not produce a valid surface from invalid inputs.

Output buffer rules

latticra_l_ui_render_report should:

```
write only to caller-provided buffers
require explicit buffer length
NUL-terminate on success
clear the buffer on too-small failure
return LATTICRA_STATUS_BUFFER_TOO_SMALL for small buffers
avoid heap allocation
avoid file output
avoid stdout
avoid stderr
avoid terminal escape control
```

The renderer must not write directly to files, terminals, sockets, servers, logs, or devices.

Report format

latticra_l_ui_render_report should emit:

```
LATTICRA L-UI RENDER REPORT
status=&lt;integer-status&gt;
error=&lt;render-error-label&gt;
mode=&lt;render-mode-label&gt;
card=&lt;card-name&gt;
effect=&lt;effect-label&gt;
boundary=&lt;boundary-label&gt;
rail_count=&lt;count&gt;
field_count=&lt;count&gt;
text_count=&lt;count&gt;
binding_count=&lt;count&gt;
node_count=&lt;count&gt;
edge_count=&lt;count&gt;
section_count=&lt;count&gt;
no_effect=&lt;0|1&gt;
execution_allowed=&lt;0|1&gt;
mutation_allowed=&lt;0|1&gt;
server_allowed=&lt;0|1&gt;
recovery_allowed=&lt;0|1&gt;
hardware_allowed=&lt;0|1&gt;
authority_status=&lt;authority-status-label&gt;
authority_validator=&lt;authority-validator-label&gt;
authority_requested_effect=&lt;authority-effect-label&gt;
authority_denial_reason=&lt;authority-denial-reason&gt;
span_start_offset=&lt;offset&gt;
span_end_offset=&lt;offset&gt;
span_start_line=&lt;line&gt;
span_start_column=&lt;column&gt;
span_end_line=&lt;line&gt;
span_end_column=&lt;column&gt;
```

Summary mode may stop at the metadata header.

Detailed mode should add deterministic sections in the section order below.

Section order

Detailed rendering must use this section order:

```
HEADER
CARD
AUTHORITY
RAILS
FIELDS
TEXT
BINDINGS
LIR
SOURCE_SPANS
NO_EFFECT_FLAGS
```

The renderer must produce deterministic section order across repeated runs.

Rail rendering rules

Rail rendering should preserve validated rail order.

Detailed output should include:

```
rail[&lt;index&gt;].name=&lt;rail-name&gt;
rail[&lt;index&gt;].field_count=&lt;count&gt;
rail[&lt;index&gt;].text_count=&lt;count&gt;
rail[&lt;index&gt;].span_start_offset=&lt;offset&gt;
rail[&lt;index&gt;].span_end_offset=&lt;offset&gt;
```

The renderer must not invent rails or reorder rails.

Field and binding rendering rules

Field output should preserve validated field metadata:

```
field[&lt;index&gt;].name=&lt;field-name&gt;
field[&lt;index&gt;].binding=&lt;binding-target&gt;
field[&lt;index&gt;].binding_prefix=&lt;binding-prefix&gt;
field[&lt;index&gt;].span_start_offset=&lt;offset&gt;
field[&lt;index&gt;].binding_span_start_offset=&lt;offset&gt;
```

Bindings remain symbolic. Rendering must not evaluate state, preview values, host state, runtime state, or environment state.

Text rendering rules

Text rendering must respect length-carrying storage.

Rules:

```
value_len is authoritative
escaped output is used for operator-visible text
escaped decoded NUL through \x00 remains visible
literal source-buffer NUL remains rejected before rendering
raw C-string fields are not authoritative for embedded NUL values
```

Detailed output should include:

```
text[&lt;index&gt;].value_len=&lt;length&gt;
text[&lt;index&gt;].escaped_value=&lt;escaped-text&gt;
text[&lt;index&gt;].span_start_offset=&lt;offset&gt;
text[&lt;index&gt;].span_end_offset=&lt;offset&gt;
```

Rendering must not silently drop or truncate embedded NUL metadata.

Source-span rendering rules

Source-span output should use existing parser/AST/LIR spans.

Required fields:

```
start_offset
end_offset
start_line
start_column
end_line
end_column
```

Rendering must not invent byte offsets, line numbers, or column numbers.

LIR rendering rules

LIR rendering should display LIR metadata only.

Detailed LIR output may include:

```
source_kind
module_name
card_name
node_count
edge_count
binding_count
text_count
node kind labels
edge kind labels
binding refs
text refs
```

Rendering must not execute LIR, lower LIR into behavior, evaluate bindings, render an interactive UI, or call Nucleus task execution.

Authority metadata rendering rules

Authority rendering should display the C-compatible authority summary only.

Authority output may include:

```
authority_status
authority_validator
authority_requested_effect
authority_denial_reason
```

```
authority no-effect flags
```

Rendering authority metadata must not broaden authority, perform effects, or alter authority-layer state.

No-effect preservation

The renderer is presentation-only.

It must preserve:

```
no_effect=1
execution_allowed=0
mutation_allowed=0
server_allowed=0
recovery_allowed=0
hardware_allowed=0
```

Rendering must not execute commands, mutate state, evaluate host state, call Nucleus task execution, write files, read files, open network connections, call server code, call update code, call recovery code, or touch hardware.

Exact implementation test list

The implementation PR should include tests for:

```
l_ui_rendering_accepts_semantically_valid_l_ui_fixture
l_ui_rendering_requires_semantic_success
l_ui_rendering_requires_lir_success
l_ui_rendering_requires_authority_success
l_ui_rendering_rejects_non_no_effect_flags
l_ui_rendering_preserves_card_metadata
l_ui_rendering_preserves_rail_order
l_ui_rendering_preserves_field_bindings
l_ui_rendering_preserves_text_lengths
l_ui_rendering_preserves_escaped_x00_visibility
l_ui_rendering_preserves_source_spans
l_ui_rendering_preserves_no_effect_flags
l_ui_rendering_report_is_deterministic
l_ui_rendering_report_rejects_small_buffer
l_ui_rendering_rejects_unsupported_mode
l_ui_rendering_does_not_change_ast_report
l_ui_rendering_does_not_change_lir_report
l_ui_rendering_does_not_execute_bindings
l_ui_rendering_does_not_call_nucleus_execution
l_ui_rendering_is_deterministic
```

Test file plan

Add:

```
tests/l_ui_rendering_invariants.c
scripts/test-l-ui-rendering.sh
```

Wire into:

```
.github/workflows/c.yml
```

Run after:

```
sh scripts/test-l-ui-rendering-implementation-plan.sh
```

and before:

```
sh scripts/test-l-ui-string-literal-escape-contract.sh
```

Documentation update plan

The implementation PR should update:

```
README.md
STATUS.md
docs/FOUNDATION_INDEX.md
docs/status/CURRENT_STATUS.md
docs/status/ANNOUNCEMENTS.md
docs/project_notes/CURRENT_DIRECTION.md
docs/project_notes/UPCOMING_WORK.md
```

```
docs/strategy/2026-05-15-2249-cdt-national-security-open-system-strategy.md
docs/L_UI_RENDERING_CONTRACT.md
scripts/test-project-strategy-status-framework.sh
```

and add:

```
docs/L_UI_RENDERING_IMPLEMENTATION.md
```

Compatibility expectations

The implementation must not change:

```
existing parser behavior
existing parser diagnostic codes
existing AST construction behavior
existing detailed AST report behavior
existing escaped string report behavior
existing source-backed text behavior
existing length-carrying string behavior
existing decoded NUL acceptance
existing literal source-buffer NUL rejection
existing semantic validation behavior
existing LIR shape behavior
existing constrained C++ authority behavior
source-span byte offset behavior
no-effect flags
current accepted fixture counts
```

The first accepted fixture should still preserve:

```
rail_count=9
field_count=23
text_count=2
effect=none
boundary=preview_only
```

Forbidden implementation behavior

The first L-UI renderer implementation must not:

- render parser-failed input as a valid surface;
- render semantic-failed input as a valid surface;
- render LIR-failed input as a valid surface;
- bypass constrained authority validation;
- execute bindings;
- evaluate host state;
- evaluate runtime state;
- call Nucleus task execution;
- execute Lat;
- execute LIR;
- mutate state;
- write files;
- read files;
- open network connections;
- call server code;
- call update code;
- call recovery code;
- call hardware code;

- emit terminal escape control by default;
- create an interactive UI loop;
- broaden accepted syntax;
- weaken parser diagnostics;
- weaken semantic validation;
- weaken LIR validation;
- weaken constrained C++ authority validation;
- accept literal source-buffer NUL;
- remove escaped decoded NUL support;
- make raw C-string fields authoritative for embedded NUL values;
- imply a production UI, runtime, sandbox, malware prevention, ransomware prevention, or operating-system surface.

Current validation command

This implementation plan is guarded by:

```
sh scripts/test-l-ui-rendering-implementation-plan.sh
```

The guard is static. It does not implement L-UI rendering.

Implementation gate

L-UI renderer implementation code may be added only after this plan is merged.

Non-claims

This document does not implement L-UI rendering, interactive UI behavior, terminal control, command behavior, Lat execution, LIR execution, Nucleus task execution, live movement, state mutation, recovery behavior, server interaction, self-update, hardware support, boot readiness, security isolation, sandboxing, malware prevention, ransomware prevention, or operating-system completeness.

docs/L_UI_SEMANTIC_VALIDATION_CONTRACT.md

Source title: Latticra L-UI Semantic Validation Contract

Lines: 407 | Words: 1208 | SHA-256: 17c684cce51e9183745a09d1553dea32cbcc35aed8a9bf1c8eb3cf58061de651

Latticra L-UI Semantic Validation Contract

Status: semantic validation contract Scope: future semantic validation layer for L-UI after structural parsing, source policies, AST construction, and string handling.

Purpose

This document defines the contract for a future L-UI semantic validation layer.

The current L-UI parser verifies a controlled structural fixture shape, source spans, diagnostics, AST metadata, string-literal escapes, escaped decoded NUL behavior, and literal source-buffer NUL rejection.

Semantic validation is the next layer. It should validate meaning after structural parsing succeeds but before any future rendering, LIR lowering, Lat integration, or Nucleus task handling.

This document does not implement semantic validation.

The implementation plan is recorded in:

```
L_UI_SEMANTIC_VALIDATION_IMPLEMENTATION_PLAN.md
```

Relationship to previous work

This contract depends on:

```
docs/L_UI_PARSER.md
docs/L_UI_PARSER_AST_IMPLEMENTATION.md
docs/L_UI_AST_DETAILED_REPORT_IMPLEMENTATION.md
docs/L_UI_AST_SOURCE_BACKED_TEXT_IMPLEMENTATION.md
docs/L_UI_AST_LENGTH_CARRYING_STRING_STORAGE_IMPLEMENTATION.md
docs/L_UI_DECODED_NUL_ACCEPTANCE_IMPLEMENTATION.md
docs/L_UI_SOURCE_BUFFER_LITERAL_NUL_POLICY_IMPLEMENTATION.md
include/latticra/l_ui_parser.h
src/l_ui_parser.c
src/l_ui_parser_ast.c
src/l_ui_parser_diagnostics.c
```

Those files remain the source of truth for parse results, AST shape, diagnostics, source spans, string storage, and source-buffer policy.

Semantic validation layer

Semantic validation is a distinct layer after structural parsing.

Recommended pipeline:

```
source bytes
  -&gt; structural parser
  -&gt; parser diagnostics
  -&gt; AST construction
  -&gt; semantic validation
  -&gt; semantic report
  -&gt; future rendering or lowering only if allowed
```

Semantic validation should not replace structural parsing.

Initial semantic scope

The first semantic validation layer should check:

```
required rail set
rail uniqueness
field uniqueness within a rail
required field ownership
binding prefix policy
binding target consistency
text node placement
card effect boundary
card boundary policy
no-effect preservation
```

Required rail semantics

The accepted L-UI fixture currently uses these rails:

```
top
state
trace
safety
gates
effects
policy
execution
bottom
```

Semantic validation should verify:

- each required rail is present exactly once;
- rails appear in deterministic report order;
- rail names are known;
- each rail owns only its expected fields or text nodes;

- text-only rails do not own fields;
- field-only rails do not own text nodes unless a future contract expands the grammar.

Field ownership semantics

Initial expected ownership:

```
state: origin, route, axis, path
trace: breadcrumb, trace
safety: health, risk, lock, dark_phase
gates: safe_portal, rollback
effects: host, external, requested
policy: request, policy, reason
execution: executed, mutation, server, recovery, hardware
```

Semantic validation should reject fields that appear under the wrong rail, duplicate fields, or missing required fields when a semantic validation API is introduced.

Binding semantics

Initial allowed binding prefixes:

```
state.
preview.
```

Expected binding relationships:

```
origin -&gt; state.origin
route -&gt; state.route
axis -&gt; state.axis
path -&gt; state.path
breadcrumb -&gt; state.breadcrumb
trace -&gt; state.trace
health -&gt; state.health
risk -&gt; state.risk
lock -&gt; state.lock
dark_phase -&gt; state.dark_phase
safe_portal -&gt; state.safe_portal
rollback -&gt; state.rollback
host -&gt; state.host_effect
external -&gt; state.external_effect
requested -&gt; preview.requested_effect
request -&gt; preview.request
policy -&gt; preview.policy
reason -&gt; preview.reason
executed -&gt; preview.executed
mutation -&gt; preview.mutation_allowed
server -&gt; preview.server_interaction_allowed
recovery -&gt; preview.recovery_allowed
hardware -&gt; preview.hardware_allowed
```

Semantic validation should treat mismatched field/binding pairs as semantic errors.

Text semantics

Initial text node placement:

```
top rail -&gt; first text node
bottom rail -&gt; second text node
```

Semantic validation should verify:

- exactly two text nodes exist;
- the top rail owns the first text node;
- the bottom rail owns the second text node;
- text values use explicit value_len when inspected;
- raw value= compatibility fields are not authoritative for embedded NUL values.

Card semantics

The initial card remains:

```
NucleusPreview
```

Required card metadata:

```
effect=none
boundary=preview_only
rail_count=9
field_count=23
text_count=2
```

Semantic validation should reject unsupported cards, effects, boundaries, or mismatched counts.

Semantic diagnostic model

A future implementation should introduce semantic validation diagnostics without destabilizing existing parser diagnostic codes.

Recommended semantic diagnostic code range:

```
LUI1000-LUI1099
```

Initial candidate diagnostics:

```
LUI1000 semantic_validation_failed
LUI1001 duplicate_rail
LUI1002 missing_required_rail
LUI1003 duplicate_field
LUI1004 field_rail_mismatch
LUI1005 binding_field_mismatch
LUI1006 unsupported_binding_target
LUI1007 text_rail_mismatch
LUI1008 card_count_mismatch
LUI1009 semantic_internal_error
```

The exact names and codes must be finalized in the implementation plan before code is added.

Semantic report model

A future semantic report should be deterministic and bounded.

Suggested fields:

```
L-UI SEMANTIC VALIDATION RESULT
status=&lt;ok|error&gt;
semantic_error=&lt;label&gt;
card=&lt;card-name&gt;
rail_count=&lt;count&gt;
field_count=&lt;count&gt;
text_count=&lt;count&gt;
no_effect=&lt;0|1&gt;
execution_allowed=&lt;0|1&gt;
mutation_allowed=&lt;0|1&gt;
server_allowed=&lt;0|1&gt;
recovery_allowed=&lt;0|1&gt;
hardware_allowed=&lt;0|1&gt;
```

For semantic failures, the report should include a source span when available.

Source-span behavior

Semantic diagnostics should use the most specific existing source span available:

- rail errors should use the rail span;
- field errors should use the field span;
- binding errors should use the binding span;
- text errors should use the text span;
- card-level errors should use the card span;
- internal semantic errors should use a default span only when no better span exists.

Semantic validation should not invent byte positions that are not represented by parser or AST metadata.

AST relationship

Semantic validation should operate on latticra_l_ui_ast_result_t after latticra_l_ui_parse_ast returns parser success.

If ast.parse_result.error != LATTICRA_L_UI_PARSE_OK, semantic validation should not attempt semantic inspection and should report parser failure or semantic not-run state.

Public API expectation

A future implementation plan should define public API additions such as:

```
latticra_l_ui_semantic_result_t
latticra_l_ui_validate_semantics
latticra_l_ui_semantic_error_label
latticra_l_ui_semantic_report
```

No public API is added by this contract.

No-effect rule

Semantic validation is metadata-only.

It must preserve:

```
no_effect=1
execution_allowed=0
mutation_allowed=0
server_allowed=0
recovery_allowed=0
hardware_allowed=0
```

Semantic validation must not render UI, lower to LIR, execute bindings, mutate state, call Nucleus task code, interact with a server, write files, read files, or touch hardware.

Compatibility expectations

Semantic validation must not change:

```
existing parser behavior
existing parser diagnostic codes
existing AST construction behavior
existing detailed AST report behavior
escaped decoded NUL acceptance
literal source-buffer NUL rejection
source-span byte offset behavior
no-effect flags
current accepted fixture counts
```

The first accepted fixture should still report:

```
rail_count=9
field_count=23
text_count=2
effect=none
boundary=preview_only
```

Future implementation gate

Semantic validation implementation must not begin until a separate implementation plan defines:

1. public API shape;
2. semantic result struct fields;
3. semantic error enum labels;
4. diagnostic code mapping;

5. report format;
6. rail semantic checks;
7. field semantic checks;
8. binding semantic checks;
9. text semantic checks;
10. exact tests;
11. compatibility expectations;
12. non-claims.

That plan is recorded in:

```
L_UI_SEMANTIC_VALIDATION_IMPLEMENTATION_PLAN.md
```

Future test list

A future implementation plan should include tests for:

```
semantic_validation_accepts_current_fixture
semantic_validation_rejects_duplicate_rail
semantic_validation_rejects_missing_required_rail
semantic_validation_rejects_duplicate_field
semantic_validation_rejects_field_rail_mismatch
semantic_validation_rejects_binding_field_mismatch
semantic_validation_rejects_unsupported_binding_target
semantic_validation_rejects_text_rail_mismatch
semantic_validation_rejects_card_count_mismatch
semantic_validation_skips_when_parser_failed
semantic_validation_reports_source_spans
semantic_validation_preserves_no_effect_flags
semantic_validation_does_not_change_ast_report
semantic_validation_does_not_change_escaped_x00_acceptance
semantic_validation_does_not_change_literal_nul_rejection
semantic_validation_is_deterministic
```

The implementation-plan test list is now recorded in:

```
L_UI_SEMANTIC_VALIDATION_IMPLEMENTATION_PLAN.md
```

Forbidden behavior

Semantic validation must not:

- execute bindings;
- evaluate host state;
- call Nucleus task execution;
- render L-UI;
- lower to LIR;
- mutate state;
- write files;
- read files;
- open network connections;
- call server code;
- call update code;
- call recovery code;
- call hardware code;

- broaden accepted syntax;
- weaken parser diagnostics;
- accept literal source-buffer NUL;
- remove escaped decoded NUL support;
- make raw value= or purpose= fields authoritative for embedded NUL values.

Current validation command

This contract is guarded by:

```
sh scripts/test-l-ui-semantic-validation-contract.sh
```

The guard is static. It does not implement semantic validation.

Non-claims

This document does not implement semantic validation, LIR lowering, L-UI rendering, Lat execution, command behavior, Nucleus task handling, live movement, origin mutation, recovery behavior, server interaction, self-update, hardware support, boot readiness, security isolation, sandboxing, malware prevention, ransomware prevention, or operating-system completeness.

docs/L_UI_SEMANTIC_VALIDATION_IMPLEMENTATION.md

Source title: Latticra L-UI Semantic Validation Implementation

Lines: 270 | Words: 583 | SHA-256: 7a98415c171aa537ca4f86c97598f6e30892b434ea1db877233fb5b53b1f0d23

Latticra L-UI Semantic Validation Implementation

Status: initial implementation contract Scope: no-effect semantic validation API, result model, reports, and invariants for L-UI ASTs.

Purpose

The L-UI Semantic Validation implementation adds a bounded, deterministic validation layer after structural parsing and AST construction.

It validates meaning over the existing L-UI AST without rendering UI, lowering to LIR, executing bindings, reading files, writing files, opening network connections, mutating state, or calling Nucleus task behavior.

Implementation files

```
include/latticra/l_ui_parser.h
src/l_ui_parser_semantic.c
tests/l_ui_semantic_validation_invariants.c
scripts/test-l-ui-semantic-validation.sh
.github/workflows/c.yml
```

Related active files:

```
src/l_ui_parser.c
src/l_ui_parser_ast.c
src/l_ui_parser_diagnostics.c
docs/L_UI_SEMANTIC_VALIDATION_CONTRACT.md
docs/L_UI_SEMANTIC_VALIDATION_IMPLEMENTATION_PLAN.md
```

Public API

The public API adds:

```
latticra_l_ui_semantic_error_t
latticra_l_ui_semantic_result_t
latticra_l_ui_semantic_error_label
latticra_l_ui_validate_semantics
```

```
latticra_l_ui_semantic_report
```

The validator consumes:

```
const latticra_l_ui_ast_result_t *ast
```

and writes:

```
latticra_l_ui_semantic_result_t *result
```

Semantic error labels

Stable labels:

```
ok
parser_failed
duplicate_rail
missing_required_rail
duplicate_field
field_rail_mismatch
binding_field_mismatch
unsupported_binding_target
text_rail_mismatch
card_count_mismatch
internal_error
```

Semantic report

The semantic report is deterministic and bounded.

It starts with:

```
L-UI SEMANTIC VALIDATION RESULT
```

and includes:

```
status
error
parser_error
card
rail
field
binding
rail_index
field_index
text_index
rail_count
field_count
text_count
no_effect
execution_allowed
mutation_allowed
server_allowed
recovery_allowed
hardware_allowed
span_start_offset
span_end_offset
span_start_line
span_start_column
span_end_line
span_end_column
```

Small output buffers return:

```
LATTICRA_STATUS_BUFFER_TOO_SMALL
```

and clear the output buffer.

Checks implemented

The first semantic validation implementation verifies:

```
card=NucleusPreview
effect=none
boundary=preview_only
rail_count=9
field_count=23
text_count=2
required rail names
```

```
rail uniqueness
rail field/text ownership metadata
field uniqueness
field names in deterministic order
binding prefixes
field/binding pair consistency
text placement
no-effect flags
```

Parser-failed behavior

If parsing failed, semantic validation does not inspect AST nodes.

It reports:

```
error=parser_failed
parser_error=&lt;existing-parser-error-label&gt;
rail_count=0
field_count=0
text_count=0
```

This does not replace parser diagnostics or failed-parse AST reports.

Source-span behavior

Semantic failures use existing AST spans:

```
rail errors -&gt; rail span
field errors -&gt; field span
binding errors -&gt; binding span
text errors -&gt; text span
card/count errors -&gt; card span
parser_failed -&gt; parse-result span
```

Semantic validation does not invent byte offsets.

No-effect boundary

Semantic validation is metadata-only.

It preserves:

```
no_effect=1
execution_allowed=0
mutation_allowed=0
server_allowed=0
recovery_allowed=0
hardware_allowed=0
```

Compatibility

This implementation does not change:

```
existing parser behavior
existing parser diagnostic codes
existing AST construction behavior
existing detailed AST report behavior
escaped decoded NUL acceptance
literal source-buffer NUL rejection
source-span byte offset behavior
current accepted fixture counts
compact AST report behavior
failed-parse detailed report behavior
```

The first accepted fixture still reports:

```
rail_count=9
field_count=23
text_count=2
effect=none
boundary=preview_only
```

Test command

Run:

```
sh scripts/test-l-ui-semantic-validation.sh
```

The main C workflow runs this check after the semantic validation implementation-plan guard and before the string-literal escape guards.

Required invariants

The semantic validation tests verify:

```
semantic_validation_accepts_current_fixture
semantic_validation_rejects_duplicate_rail
semantic_validation_rejects_missing_required_rail
semantic_validation_rejects_duplicate_field
semantic_validation_rejects_field_rail_mismatch
semantic_validation_rejects_binding_field_mismatch
semantic_validation_rejects_unsupported_binding_target
semantic_validation_rejects_text_rail_mismatch
semantic_validation_rejects_card_count_mismatch
semantic_validation_skips_when_parser_failed
semantic_validation_reports_source_spans
semantic_validation_preserves_no_effect_flags
semantic_validation_does_not_change_ast_report
semantic_validation_does_not_change_escaped_x00_acceptance
semantic_validation_does_not_change_literal_nul_rejection
semantic_validation_is_deterministic
semantic_validation_report_rejects_small_buffer
semantic_validation_error_labels_are_stable
```

Current evidence level

This implementation is an L2 tested semantic validation layer for the current L-UI AST fixture model.

It is not LIR lowering, L-UI rendering, Lat execution, command behavior, Nucleus task execution, live movement, origin mutation, recovery behavior, server interaction, self-update, hardware support, boot readiness, security isolation, sandboxing, malware prevention, ransomware prevention, or operating-system completeness.

Next implementation step

The next implementation candidate is:

```
LIR shape contract
```

That future work should define the first Latticra Intermediate Representation shape before any lowering implementation.

Non-claims

This document and implementation do not implement LIR lowering, L-UI rendering, Lat execution, command behavior, Nucleus task handling, live movement, origin mutation, recovery behavior, server interaction, self-update, hardware support, boot readiness, security isolation, sandboxing, malware prevention, ransomware prevention, or operating-system completeness.

docs/L_UI_SEMANTIC_VALIDATION_IMPLEMENTATION_PLAN.md

Source title: Latticra L-UI Semantic Validation Implementation Plan

Lines: 556 | Words: 1327 | SHA-256: 05b7a2e5a16d1bd86a7d9b0ea72405f8fde4c7926304937fb76b9820622dba6f

Latticra L-UI Semantic Validation Implementation Plan

Status: implementation planning contract Scope: public API shape, semantic result structs, semantic errors, diagnostic mapping, report format, semantic checks, exact tests, and compatibility expectations before semantic validation code.

Purpose

This document defines the implementation plan for the L-UI semantic validation layer.

The semantic-validation contract is already merged and guarded. This plan names the exact API, result shape, error labels, diagnostic mapping, report format, semantic checks, source-span behavior, tests, and non-claims required before implementation code is added.

This document does not implement semantic validation.

Relationship to previous work

This plan depends on:

```
docs/L_UI_SEMANTIC_VALIDATION_CONTRACT.md
docs/L_UI_PARSER.md
docs/L_UI_PARSER_AST_IMPLEMENTATION.md
docs/L_UI_AST_DETAILED_REPORT_IMPLEMENTATION.md
docs/L_UI_AST_SOURCE_BACKED_TEXT_IMPLEMENTATION.md
docs/L_UI_AST_LENGTH_CARRYING_STRING_STORAGE_IMPLEMENTATION.md
docs/L_UI_DECODED_NUL_ACCEPTANCE_IMPLEMENTATION.md
docs/L_UI_SOURCE_BUFFER_LITERAL_NUL_POLICY_IMPLEMENTATION.md
include/latticra/l_ui_parser.h
src/l_ui_parser.c
src/l_ui_parser_ast.c
src/l_ui_parser_diagnostics.c
```

Those files remain the source of truth for parse results, AST shape, diagnostics, source spans, string storage, decoded NUL behavior, and source-buffer policy.

Implementation language decision

Semantic validation should be implemented in C.

Reason:

- the parser and AST implementation are C;
- the public L-UI API is C;
- semantic validation consumes latticra_l_ui_ast_result_t;
- existing tests and runners are C and POSIX shell;
- the first semantic layer should stay deterministic, bounded, and no-effect.

Implementation files

The implementation PR should modify:

```
include/latticra/l_ui_parser.h
src/l_ui_parser_semantic.c
src/l_ui_parser_diagnostics.c
.github/workflows/c.yml
```

The implementation PR should add:

```
docs/L_UI_SEMANTIC_VALIDATION_IMPLEMENTATION.md
tests/l_ui_semantic_validation_invariants.c
scripts/test-l-ui-semantic-validation.sh
```

The implementation should not add file I/O, network I/O, rendering code, LIR lowering, or task execution.

Public API shape

Add public semantic validation API declarations to:

```
include/latticra/l_ui_parser.h
```

Required API names:

```
latticra_l_ui_semantic_error_t
latticra_l_ui_semantic_result_t
latticra_l_ui_semantic_error_label
latticra_l_ui_validate_semantics
latticra_l_ui_semantic_report
```

Recommended function signatures:

```
const char *latticra_l_ui_semantic_error_label(latticra_l_ui_semantic_error_t error);

latticra_status_t latticra_l_ui_validate_semantics(
    const latticra_l_ui_ast_result_t *ast,
    latticra_l_ui_semantic_result_t *result);

latticra_status_t latticra_l_ui_semantic_report(
    const latticra_l_ui_semantic_result_t *result,
    char *buffer,
    size_t buffer_len);
```

Semantic error enum

Add a semantic error enum with stable labels:

```
LATTICRA_L_UI_SEMANTIC_OK
LATTICRA_L_UI_SEMANTIC_PARSER_FAILED
LATTICRA_L_UI_SEMANTIC_DUPLICATE_RAIL
LATTICRA_L_UI_SEMANTIC_MISSING_REQUIRED_RAIL
LATTICRA_L_UI_SEMANTIC_DUPLICATE_FIELD
LATTICRA_L_UI_SEMANTIC_FIELD_RAIL_MISMATCH
LATTICRA_L_UI_SEMANTIC_BINDING_FIELD_MISMATCH
LATTICRA_L_UI_SEMANTIC_UNSUPPORTED_BINDING_TARGET
LATTICRA_L_UI_SEMANTIC_TEXT_RAIL_MISMATCH
LATTICRA_L_UI_SEMANTIC_CARD_COUNT_MISMATCH
LATTICRA_L_UI_SEMANTIC_INTERNAL_ERROR
```

Required labels:

```
ok
parser_failed
duplicate_rail
missing_required_rail
duplicate_field
field_rail_mismatch
binding_field_mismatch
unsupported_binding_target
text_rail_mismatch
card_count_mismatch
internal_error
```

Semantic result struct

Add a semantic result struct that includes:

```
latticra_status_t status;
latticra_l_ui_semantic_error_t error;
latticra_l_ui_parse_error_t parser_error;
latticra_l_ui_source_span_t span;
size_t rail_index;
size_t field_index;
size_t text_index;
char card_name[LATTICRA_L_UI_AST_NAME_MAX];
char rail_name[LATTICRA_L_UI_AST_NAME_MAX];
char field_name[LATTICRA_L_UI_AST_NAME_MAX];
char binding[LATTICRA_L_UI_AST_BINDING_MAX];
size_t rail_count;
size_t field_count;
size_t text_count;
int no_effect;
int execution_allowed;
int mutation_allowed;
int server_allowed;
int recovery_allowed;
int hardware_allowed;
```

The result should be deterministic and fully initialized for both success and failure.

Semantic diagnostic mapping

Semantic validation should use a separate diagnostic code range from parser diagnostics:

```
LUI1000-LUI1099
```

Initial mapping:

```
LUI1000 semantic_validation_failed
```

```
LUI1001 duplicate_rail
LUI1002 missing_required_rail
LUI1003 duplicate_field
LUI1004 field_rail_mismatch
LUI1005 binding_field_mismatch
LUI1006 unsupported_binding_target
LUI1007 text_rail_mismatch
LUI1008 card_count_mismatch
LUI1009 semantic_internal_error
```

parser_failed may report a semantic not-run state in semantic reports, but it must not replace existing parser diagnostic codes.

Semantic report format

latticra_l_ui_semantic_report should produce a deterministic report:

```
L-UI SEMANTIC VALIDATION RESULT
status=&lt;integer-status&gt;
error=&lt;semantic-error-label&gt;
parser_error=&lt;parser-error-label&gt;
card=&lt;card-name&gt;
rail=&lt;rail-name&gt;
field=&lt;field-name&gt;
binding=&lt;binding&gt;
rail_index=&lt;index&gt;
field_index=&lt;index&gt;
text_index=&lt;index&gt;
rail_count=&lt;count&gt;
field_count=&lt;count&gt;
text_count=&lt;count&gt;
no_effect=&lt;0|1&gt;
execution_allowed=&lt;0|1&gt;
mutation_allowed=&lt;0|1&gt;
server_allowed=&lt;0|1&gt;
recovery_allowed=&lt;0|1&gt;
hardware_allowed=&lt;0|1&gt;
span_start_offset=&lt;offset&gt;
span_end_offset=&lt;offset&gt;
span_start_line=&lt;line&gt;
span_start_column=&lt;column&gt;
span_end_line=&lt;line&gt;
span_end_column=&lt;column&gt;
```

The report must return LATTICRA_STATUS_BUFFER_TOO_SMALL and clear the buffer when the output does not fit.

Rail semantic checks

Semantic validation should verify exactly these rail names in deterministic order:

```
top
state
trace
safety
gates
effects
policy
execution
bottom
```

Checks:

- all required rails are present;
- no duplicate rail names exist;
- no unknown rail names exist;
- rail order is deterministic;
- rail field/text ownership metadata is consistent.

Expected rail ownership:

```
top: text_count=1, field_count=0
state: field_count=4, text_count=0
```

```
trace: field_count=2, text_count=0
safety: field_count=4, text_count=0
gates: field_count=2, text_count=0
effects: field_count=3, text_count=0
policy: field_count=3, text_count=0
execution: field_count=5, text_count=0
bottom: text_count=1, field_count=0
```

Field semantic checks

Expected field ownership:

```
state: origin, route, axis, path
trace: breadcrumb, trace
safety: health, risk, lock, dark_phase
gates: safe_portal, rollback
effects: host, external, requested
policy: request, policy, reason
execution: executed, mutation, server, recovery, hardware
```

Checks:

- all required fields exist;
- no duplicate field appears within the same rail;
- field order remains deterministic;
- each field appears in its expected rail;
- field source spans remain available.

Binding semantic checks

Allowed binding prefixes:

```
state.
preview.
```

Expected field/binding pairs:

```
origin -&gt; state.origin
route -&gt; state.route
axis -&gt; state.axis
path -&gt; state.path
breadcrumb -&gt; state.breadcrumb
trace -&gt; state.trace
health -&gt; state.health
risk -&gt; state.risk
lock -&gt; state.lock
dark_phase -&gt; state.dark_phase
safe_portal -&gt; state.safe_portal
rollback -&gt; state.rollback
host -&gt; state.host_effect
external -&gt; state.external_effect
requested -&gt; preview.requested_effect
request -&gt; preview.request
policy -&gt; preview.policy
reason -&gt; preview.reason
executed -&gt; preview.executed
mutation -&gt; preview.mutation_allowed
server -&gt; preview.server_interaction_allowed
recovery -&gt; preview.recovery_allowed
hardware -&gt; preview.hardware_allowed
```

Checks:

- unsupported binding prefixes are rejected;
- mismatched field/binding pairs are rejected;
- binding source spans are used for binding diagnostics.

Text semantic checks

Expected text ownership:

```
top rail -&gt; first text node
bottom rail -&gt; second text node
```

Checks:

- exactly two text nodes exist;
- top rail owns one text node;
- bottom rail owns one text node;
- no other rail owns text nodes;
- text spans remain available;
- value_len is used for length-aware checks.

Card semantic checks

Required card semantics:

```
card=NucleusPreview
effect=none
boundary=preview_only
rail_count=9
field_count=23
text_count=2
```

Checks:

- unsupported card names are rejected;
- unsupported effect values are rejected;
- unsupported boundary values are rejected;
- card counts must match aggregate AST counts;
- no-effect flags remain denied for execution, mutation, server, recovery, and hardware.

Parser-failed behavior

If ast->parse_result.error != LATTICRA_L_UI_PARSE_OK, semantic validation should not inspect semantic nodes.

Expected result:

```
status=LATTICRA_STATUS_OK
error=LATTICRA_L_UI_SEMANTIC_PARSER_FAILED
parser_error=&lt;existing parser error&gt;
rail_count=0
field_count=0
text_count=0
```

This does not replace parser diagnostics or failed-parse AST reports.

Source-span behavior

Semantic failures should report the most specific span available:

```
rail errors -&gt; rail span
field errors -&gt; field span
binding errors -&gt; binding span
text errors -&gt; text span
card/count errors -&gt; card span
parser_failed -&gt; parser result span
internal_error -&gt; default span only if no better span exists
```

Semantic validation must not invent byte offsets.

Exact implementation test list

The implementation PR should include tests for:

```
semantic_validation_accepts_current_fixture
```

```
semantic_validation_rejects_duplicate_rail
semantic_validation_rejects_missing_required_rail
semantic_validation_rejects_duplicate_field
semantic_validation_rejects_field_rail_mismatch
semantic_validation_rejects_binding_field_mismatch
semantic_validation_rejects_unsupported_binding_target
semantic_validation_rejects_text_rail_mismatch
semantic_validation_rejects_card_count_mismatch
semantic_validation_skips_when_parser_failed
semantic_validation_reports_source_spans
semantic_validation_preserves_no_effect_flags
semantic_validation_does_not_change_ast_report
semantic_validation_does_not_change_escaped_x00_acceptance
semantic_validation_does_not_change_literal_nul_rejection
semantic_validation_is_deterministic
semantic_validation_report_rejects_small_buffer
semantic_validation_error_labels_are_stable
```

Test file plan

Add:

```
tests/l_ui_semantic_validation_invariants.c
scripts/test-l-ui-semantic-validation.sh
```

Wire into:

```
.github/workflows/c.yml
```

Run after:

```
sh scripts/test-l-ui-semantic-validation-contract.sh
```

and before:

```
sh scripts/test-l-ui-string-literal-escape-contract.sh
```

Documentation update plan

The implementation PR should update:

```
README.md
STATUS.md
docs/FOUNDATION_INDEX.md
docs/status/CURRENT_STATUS.md
docs/status/ANNOUNCEMENTS.md
docs/project_notes/CURRENT_DIRECTION.md
docs/project_notes/UPCOMING_WORK.md
docs/strategy/2026-05-15-2249-cdt-national-security-open-system-strategy.md
docs/L_UI_SEMANTIC_VALIDATION_CONTRACT.md
scripts/test-project-strategy-status-framework.sh
```

and add:

```
docs/L_UI_SEMANTIC_VALIDATION_IMPLEMENTATION.md
```

No-effect preservation

Semantic validation is metadata-only.

It must preserve:

```
no_effect=1
execution_allowed=0
mutation_allowed=0
server_allowed=0
recovery_allowed=0
hardware_allowed=0
```

Compatibility expectations

The implementation must not change:

```
existing parser behavior
existing parser diagnostic codes
existing AST construction behavior
existing detailed AST report behavior
escaped decoded NUL acceptance
literal source-buffer NUL rejection
```

```
source-span byte offset behavior
no-effect flags
current accepted fixture counts
```

The first accepted fixture should still report:

```
rail_count=9
field_count=23
text_count=2
effect=none
boundary=preview_only
```

Forbidden implementation behavior

Semantic validation implementation must not:

- execute bindings;
- evaluate host state;
- call Nucleus task execution;
- render L-UI;
- lower to LIR;
- mutate state;
- write files;
- read files;
- open network connections;
- call server code;
- call update code;
- call recovery code;
- call hardware code;
- broaden accepted syntax;
- weaken parser diagnostics;
- accept literal source-buffer NUL;
- remove escaped decoded NUL support;
- make raw value= or purpose= fields authoritative for embedded NUL values;
- change compact AST report behavior;
- change failed-parse detailed report behavior.

Current validation command

This implementation plan is guarded by:

```
sh scripts/test-l-ui-semantic-validation-implementation-plan.sh
```

The guard is static. It does not implement semantic validation.

Implementation gate

Semantic validation implementation code may be added only after this plan is merged.

Non-claims

This document does not implement semantic validation, LIR lowering, L-UI rendering, Lat execution, command behavior, Nucleus task handling, live movement, origin mutation, recovery behavior, server interaction, self-update, hardware support, boot readiness, security isolation, sandboxing, malware prevention, ransomware prevention, or operating-system completeness.

docs/L_UI_SOURCE_BUFFER_LITERAL_NUL_POLICY_CONTRACT.md

Source title: Latticra L-UI Source Buffer Literal NUL Policy Contract

Lines: 325 | Words: 1037 | SHA-256: a62c0adcf5ff0a5941cb3ad7ecc09d709871346ae0cc5a599dcec5a6d10d0b5b

Latticra L-UI Source Buffer Literal NUL Policy Contract

Status: source-buffer literal NUL policy contract Scope: policy for literal 0x00 bytes in L-UI source buffers after escaped decoded NUL acceptance.

Purpose

This document defines the L-UI policy for literal NUL bytes in source buffers.

L-UI now accepts escaped decoded NUL bytes through:

```
\x00
```

inside supported source-backed AST string values. That does not mean literal 0x00 bytes in the source buffer are accepted.

This contract keeps literal source NUL bytes rejected by default and defines what a future source-buffer model would need to prove before that boundary could change.

This document does not implement literal NUL acceptance.

The implementation plan is recorded in:

```
L_UI_SOURCE_BUFFER_LITERAL_NUL_POLICY_IMPLEMENTATION_PLAN.md
```

Relationship to previous work

This contract depends on:

```
docs/L_UI_DECODED_NUL_ACCEPTANCE_CONTRACT.md
docs/L_UI_DECODED_NUL_ACCEPTANCE_IMPLEMENTATION_PLAN.md
docs/L_UI_DECODED_NUL_ACCEPTANCE_IMPLEMENTATION.md
docs/L_UI_AST_LENGTH_CARRYING_STRING_STORAGE_IMPLEMENTATION.md
docs/L_UI_STRING_LITERAL_ESCAPE_IMPLEMENTATION.md
include/latticra/l_ui_parser.h
src/l_ui_parser.c
src/l_ui_parser_ast.c
src/l_ui_parser_diagnostics.c
```

Those files remain the source of truth for escaped decoded NUL acceptance, explicit AST string lengths, parser diagnostics, AST decoding, detailed reports, and no-effect behavior.

Current boundary

The current system provides:

```
escaped decoded NUL acceptance through \x00
purpose_len and value_len fields
length-aware escaped detailed report fields
literal source NUL rejection
parser-level literal NUL diagnostics
no-effect flags
```

This contract does not add:

```
literal source NUL acceptance
```

```
new source-buffer ownership model
new accepted escape sequences
Unicode display behavior
renderer behavior
interactive UI behavior
command behavior
Nucleus task handling
live movement
state mutation
server interaction
update behavior
recovery behavior
hardware behavior
boot behavior
```

Policy decision

Literal 0x00 bytes in L-UI source buffers remain forbidden.

The accepted way to express a decoded NUL byte inside a source-backed string value is the escaped form:

```
\x00
```

Literal NUL bytes in the source buffer should continue to report:

```
LATTICRA_L_UI_PARSE_LITERAL_NUL_IN_STRING
LUI0023 literal_nul_in_string
```

Rationale

Literal source NUL bytes remain forbidden because:

- source buffers still cross C APIs and C-compatible tooling;
- many tools treat NUL as a string terminator;
- embedded source NUL can hide or truncate source text in logs and diagnostics;
- escaped \x00 is deterministic and visible;
- detailed reports already render escaped decoded NUL as \x00;
- accepting literal source NUL requires a separate source-buffer ownership model.

Escaped decoded NUL remains accepted

This policy must not roll back escaped decoded NUL support.

The following remains accepted in supported source-backed string values:

```
purpose &quot;A\x00B&quot;
text &quot;left\x00right&quot;
```

The decoded AST byte sequence contains a NUL byte, and the explicit length fields remain authoritative:

```
ast.card.purpose_len
ast.texts[index].value_len
```

Literal NUL diagnostic behavior

Literal source NUL inside a validated quoted string value should report:

```
LATTICRA_L_UI_PARSE_LITERAL_NUL_IN_STRING
LUI0023 literal_nul_in_string
```

The diagnostic span should cover the literal source NUL byte.

The diagnostic should preserve:

```
no_effect=1
execution_allowed=0
mutation_allowed=0
server_allowed=0
recovery_allowed=0
```

```
hardware_allowed=0
```

Parser behavior

Parser validation should keep detecting literal source NUL bytes before AST materialization.

Literal source NUL should not be treated as:

```
empty source
unterminated string
invalid hex escape
decoded NUL
internal error
```

Literal source NUL remains a distinct source-buffer error.

AST behavior

Literal source NUL input should not produce a partial AST.

Failed parse behavior remains:

```
ast.parse_result.error = LATTICRA_L_UI_PARSE_LITERAL_NUL_IN_STRING
ast.rail_count = 0
ast.field_count = 0
ast.text_count = 0
failed-parse detailed report only
```

Report behavior

Literal source NUL failures should continue to use failed-parse detailed report behavior.

No decoded AST value should be materialized for literal source NUL input.

Detailed report embedded-NUL surfaces remain reserved for escaped decoded NUL values:

```
purpose_len
purpose_escaped
value_len
value_escaped
```

Source-span behavior

For literal source NUL failures, spans should cover exactly the literal 0x00 byte in the source buffer.

Line and column remain one-based byte positions in the in-memory source buffer.

Escaped decoded NUL spans remain source-oriented and cover the source bytes \x00 when relevant.

Future source-buffer model requirements

A future implementation may revisit literal source NUL only after a separate implementation plan defines:

1. source buffer ownership rules;
2. source length authority rules;
3. source display and logging behavior;
4. diagnostic rendering for literal NUL;
5. file fixture policy;
6. C API compatibility rules;
7. command-line tooling behavior;
8. report escaping behavior;

9. exact tests;
10. non-claims.

Until that exists, literal source NUL remains forbidden.

The current implementation plan keeps literal source NUL rejected and adds exact enforcement tests:

```
L_UI_SOURCE_BUFFER_LITERAL_NUL_POLICY_IMPLEMENTATION_PLAN.md
```

Compatibility expectations

This policy must not change:

```
escaped decoded NUL acceptance
literal source NUL rejection
LUI0023 diagnostic mapping
accepted string-literal escape decoding
parser diagnostic code stability
existing C-string fields
purpose_len and value_len semantics
failed-parse detailed report behavior
existing accepted fixture counts
```

The first accepted fixture should still report:

```
rail_count=9
field_count=23
text_count=2
effect=none
boundary=preview_only
```

No-effect rule

Literal NUL rejection is metadata-only.

It must preserve:

```
no_effect=1
execution_allowed=0
mutation_allowed=0
server_allowed=0
recovery_allowed=0
hardware_allowed=0
```

Future test list

A future implementation plan for source-buffer literal NUL policy enforcement should include tests for:

```
literal_nul_policy_rejects_purpose_literal_nul
literal_nul_policy_rejects_text_literal_nul
literal_nul_policy_reports_lui0023
literal_nul_policy_span_covers_literal_nul_byte
literal_nul_policy_preserves_no_effect_flags
literal_nul_policy_does_not_emit_decoded_nul_lui0022
literal_nul_policy_does_not_materialize_partial_ast
literal_nul_policy_does_not_change_escaped_x00_acceptance
literal_nul_policy_does_not_change_failed_parse_report
literal_nul_policy_is_deterministic
```

That implementation-plan test list is now recorded in:

```
L_UI_SOURCE_BUFFER_LITERAL_NUL_POLICY_IMPLEMENTATION_PLAN.md
```

Forbidden behavior

Future source-buffer work must not:

- accept literal NUL source bytes without a separate implementation plan;
- treat literal source NUL as escaped decoded NUL;
- remove LUI0023 literal NUL rejection;

- remove LUI0022 diagnostic compatibility;
- hide literal source NUL in diagnostics;
- produce a partial AST for literal source NUL input;
- make raw purpose= or value= report fields the assertion target for embedded NUL bytes;
- broaden accepted escape forms;
- add file I/O to parser or AST code;
- write files;
- open network connections;
- call server code;
- call update code;
- call recovery code;
- call hardware code;
- mutate state lattice;
- perform live movement;
- run L-UI behavior;
- render an interactive UI;
- treat text nodes as commands;
- treat bindings as executable references.

Current validation command

This contract is guarded by:

```
sh scripts/test-l-ui-source-buffer-literal-nul-policy-contract.sh
```

The guard is static. It does not implement literal source NUL acceptance.

Non-claims

This document does not implement literal source NUL acceptance, source-buffer ownership changes, Unicode display behavior, L-UI rendering, command behavior, Nucleus task handling, live movement, origin mutation, recovery behavior, server interaction, self-update, hardware support, boot readiness, security isolation, sandboxing, or operating-system completeness.

docs/L_UI_SOURCE_BUFFER_LITERAL_NUL_POLICY_IMPLEMENTATION.md

Source title: Latticra L-UI Source Buffer Literal NUL Policy Implementation

Lines: 235 | Words: 604 | SHA-256: e22141b44c7e6887f46990a95de68ac2b4455bf1e51fc21ae83f2d3ddaf30fb5

Latticra L-UI Source Buffer Literal NUL Policy Implementation

Status: initial implementation contract Scope: enforcement tests and documentation for rejecting literal 0x00 bytes in L-UI source buffers while preserving escaped decoded NUL acceptance.

Purpose

This implementation locks down the L-UI source-buffer literal NUL policy.

Literal 0x00 bytes in L-UI source buffers remain rejected.

Escaped decoded NUL remains accepted through:

```
\x00
```

inside supported source-backed string values.

This implementation does not accept literal source NUL bytes.

Implementation files

```
tests/l_ui_source_buffer_literal_nul_policy_invariants.c
scripts/test-l-ui-source-buffer-literal-nul-policy.sh
.github/workflows/c.yml
```

Related active files:

```
include/latticra/l_ui_parser.h
src/l_ui_parser.c
src/l_ui_parser_ast.c
src/l_ui_parser_diagnostics.c
docs/L_UI_SOURCE_BUFFER_LITERAL_NUL_POLICY_CONTRACT.md
docs/L_UI_SOURCE_BUFFER_LITERAL_NUL_POLICY_IMPLEMENTATION_PLAN.md
docs/L_UI_DECODED_NUL_ACCEPTANCE_IMPLEMENTATION.md
```

Behavior

Literal source-buffer NUL remains rejected as:

```
LATTICRA_L_UI_PARSE_LITERAL_NUL_IN_STRING
LUI0023 literal_nul_in_string
```

Literal source NUL is not treated as:

```
empty_source
unterminated_string
invalid_string_escape
invalid_hex_escape
decoded_nul_in_string
internal_error
```

Escaped decoded NUL compatibility

Escaped decoded NUL remains accepted:

```
purpose &quot;A\x00B&quot;
text &quot;left\x00right&quot;
```

The decoded AST byte sequence contains a NUL byte, and explicit length fields remain authoritative:

```
ast.card.purpose_len
ast.texts[index].value_len
```

Diagnostic behavior

Literal source NUL maps to:

```
LUI0023 literal_nul_in_string
```

Stable message:

```
Literal NUL bytes are not supported in AST strings.
```

Stable hint:

```
Remove literal NUL bytes from the source string.
```

LUI0022 decoded_nul_in_string remains available as a compatibility diagnostic, but literal source NUL must not emit it.

Source-span behavior

Literal source NUL spans cover exactly one source byte:

```
span_end_offset - span_start_offset == 1
source[span_start_offset] == 0x00
```

Line and column remain one-based byte positions in the in-memory source buffer.

AST behavior

Literal source NUL input does not produce a partial AST.

Expected failed AST state:

```
ast.parse_result.error = LATTICRA_L_UI_PARSE_LITERAL_NUL_IN_STRING
ast.rail_count = 0
ast.field_count = 0
ast.text_count = 0
ast.card.rail_count = 0
ast.card.field_count = 0
ast.card.text_count = 0
ast.card.purpose_len = 0
ast.texts[index].value_len = 0
```

Report behavior

Literal source NUL failures use failed-parse detailed report behavior.

Expected report fields:

```
parse_error=literal_nul_in_string
rail_count=0
field_count=0
text_count=0
```

Failed reports do not materialize string sections for literal source NUL input:

```
purpose_escaped=
value_escaped=
```

Test command

Run:

```
sh scripts/test-l-ui-source-buffer-literal-nul-policy.sh
```

The main C workflow runs this check after the source-buffer literal NUL policy implementation-plan guard and before the string-literal escape guards.

Required invariants

The implementation tests verify:

```
literal_nul_policy_rejects_purpose_literal_nul
literal_nul_policy_rejects_text_literal_nul
literal_nul_policy_reports_lui0023
literal_nul_policy_span_covers_literal_nul_byte
literal_nul_policy_preserves_no_effect_flags
literal_nul_policy_does_not_emit_decoded_nul_lui0022
literal_nul_policy_does_not_materialize_partial_ast
literal_nul_policy_does_not_change_escaped_x00_acceptance
literal_nul_policy_does_not_change_failed_parse_report
literal_nul_policy_is_deterministic
```

No-effect boundary

Literal source NUL rejection is metadata-only.

It preserves:

```
no_effect=1
execution_allowed=0
mutation_allowed=0
server_allowed=0
recovery_allowed=0
hardware_allowed=0
```

Compatibility

This implementation does not change:

```
escaped decoded NUL acceptance
literal source NUL rejection
LUI0023 diagnostic mapping
accepted string-literal escape decoding
```

```
parser diagnostic code stability
existing C-string fields
purpose_len and value_len semantics
failed-parse detailed report behavior
existing accepted fixture counts
```

The first accepted fixture still reports:

```
rail_count=9
field_count=23
text_count=2
effect=none
boundary=preview_only
```

Current evidence level

This implementation is an L2 tested source-buffer policy enforcement model for literal source NUL rejection.

It is not literal source NUL acceptance, source-buffer ownership changes, Unicode display behavior, L-UI rendering, command behavior, Nucleus task execution, runtime security, malware prevention, ransomware prevention, sandboxing, or an operating system.

Next implementation step

The next implementation candidate is:

```
L-UI semantic validation contract
```

That future work should define semantic checks beyond structural parsing, including field/binding consistency, duplicate handling, rail semantics, and reportable validation errors.

Non-claims

This document and implementation do not accept literal source NUL bytes, change source-buffer ownership, implement Unicode display behavior, add L-UI rendering, add command behavior, add Nucleus task handling, add live movement, add origin mutation, add recovery behavior, add server interaction, add self-update, add hardware support, add boot readiness, claim security isolation, claim sandboxing, claim malware prevention, claim ransomware prevention, or claim operating-system completeness.

docs/L_UI_SOURCE_BUFFER_LITERAL_NUL_POLICY_IMPLEMENTATION_PLAN.md

Source title: Latticra L-UI Source Buffer Literal NUL Policy Implementation Plan

Lines: 354 | Words: 996 | SHA-256: 19b7d9e58cd6147c399dde516fa920a9ba2207a1d068c9d63931ff4d9da4724c

Latticra L-UI Source Buffer Literal NUL Policy Implementation Plan

Status: implementation planning contract Scope: exact implementation and test plan for enforcing the policy that literal 0x00 bytes in L-UI source buffers remain rejected.

Purpose

This document defines the implementation plan for L-UI source-buffer literal NUL policy enforcement.

The policy contract is already merged and guarded. This plan defines exact parser behavior, diagnostic behavior, AST behavior, report behavior, source-span expectations, tests, documentation updates, and non-claims before any implementation slice changes or extends literal source-buffer handling.

This document does not implement literal NUL acceptance.

Relationship to previous work

This plan depends on:

```
docs/L_UI_SOURCE_BUFFER_LITERAL_NUL_POLICY_CONTRACT.md
docs/L_UI_DECODED_NUL_ACCEPTANCE_CONTRACT.md
docs/L_UI_DECODED_NUL_ACCEPTANCE_IMPLEMENTATION_PLAN.md
docs/L_UI_DECODED_NUL_ACCEPTANCE_IMPLEMENTATION.md
docs/L_UI_AST_LENGTH_CARRYING_STRING_STORAGE_IMPLEMENTATION.md
docs/L_UI_STRING_LITERAL_ESCAPE_IMPLEMENTATION.md
include/latticra/l_ui_parser.h
src/l_ui_parser.c
src/l_ui_parser_ast.c
src/l_ui_parser_diagnostics.c
```

Those files remain the source of truth for escaped decoded NUL acceptance, explicit AST string lengths, parser diagnostics, AST decoding, detailed reports, and no-effect behavior.

Implementation language decision

Literal source-buffer NUL policy enforcement should remain in C.

Reason:

- source validation lives in src/l_ui_parser.c;
- AST construction lives in src/l_ui_parser_ast.c;
- diagnostics live in src/l_ui_parser_diagnostics.c;
- tests are C fixtures and shell runners;
- the behavior is byte-oriented and bounded.

Policy decision

Literal 0x00 bytes in L-UI source buffers remain rejected.

The accepted way to express a decoded NUL byte inside a source-backed string value remains:

```
\x00
```

This plan is for policy enforcement and regression coverage, not literal-NUL acceptance.

Parser behavior plan

Parser validation in:

```
src/l_ui_parser.c
```

should continue detecting literal source-buffer NUL bytes before AST materialization.

Literal source NUL inside a quoted value should report:

```
LATTICRA_L_UI_PARSE_LITERAL_NUL_IN_STRING
```

Literal source NUL should not be classified as:

```
empty_source
unterminated_string
invalid_string_escape
invalid_hex_escape
decoded_nul_in_string
internal_error
```

Diagnostic behavior plan

Literal source NUL should map to:

```
LUI0023 literal_nul_in_string
```

The diagnostic message and hint remain stable:

```
Literal NUL bytes are not supported in AST strings.
Remove literal NUL bytes from the source string.
```

LUI0022 decoded_nul_in_string remains available as a stable compatibility diagnostic, but literal source NUL must not emit it.

Source-span plan

For literal source NUL failures, the parse-result and diagnostic span should cover exactly the literal 0x00 byte in the source buffer.

Expected span rule:

```
span_end_offset - span_start_offset == 1
source[span_start_offset] == 0x00
```

Line and column remain one-based byte positions in the in-memory source buffer.

AST behavior plan

Literal source NUL input should not produce a partial AST.

Expected failed-parse AST state:

```
ast.parse_result.error = LATTICRA_L_UI_PARSE_LITERAL_NUL_IN_STRING
ast.rail_count = 0
ast.field_count = 0
ast.text_count = 0
ast.card.rail_count = 0
ast.card.field_count = 0
ast.card.text_count = 0
ast.card.purpose_len = 0
ast.texts[index].value_len = 0
```

Report behavior plan

Literal source NUL failures should use failed-parse detailed report behavior.

Expected report behavior:

```
parse_error=literal_nul_in_string
rail_count=0
field_count=0
text_count=0
```

The report should not include materialized AST string sections for literal source NUL input:

```
purpose=
value=
purpose_escaped=
value_escaped=
```

Escaped decoded NUL compatibility

This implementation plan must not roll back escaped decoded NUL acceptance.

The following should remain accepted:

```
purpose &quot;A\x00B&quot;
text &quot;left\x00right&quot;
```

The existing decoded-NUL acceptance tests should remain valid.

Accepted escape compatibility

Do not broaden or reduce the accepted escape set.

Still accepted:

```
\\
\&quot;
\n
```

```
\r
\t
\xNN
```

where \xNN uses exactly two uppercase hexadecimal digits.

Still rejected:

```
\x0a -&gt; LATTICRA_L_UI_PARSE_INVALID_HEX_ESCAPE
\a -&gt; LATTICRA_L_UI_PARSE_INVALID_STRING_ESCAPE
literal 0x00 -&gt; LATTICRA_L_UI_PARSE_LITERAL_NUL_IN_STRING
```

Source-buffer construction test plan

Literal source NUL tests should construct source buffers with explicit byte lengths.

Tests should not rely on C string termination to place the literal NUL.

Recommended helper shape:

```
make_source_binary(buffer, buffer_len, purpose, purpose_len, top_text, top_text_len,
bottom_text, bottom_text_len, source_len)
```

This helper should preserve embedded literal NUL bytes in the source buffer and pass the explicit source_len to parser APIs.

Exact implementation test list

The implementation PR should include tests for:

```
literal_nul_policy_rejects_purpose_literal_nul
literal_nul_policy_rejects_text_literal_nul
literal_nul_policy_reports_lui0023
literal_nul_policy_span_covers_literal_nul_byte
literal_nul_policy_preserves_no_effect_flags
literal_nul_policy_does_not_emit_decoded_nul_lui0022
literal_nul_policy_does_not_materialize_partial_ast
literal_nul_policy_does_not_change_escaped_x00_acceptance
literal_nul_policy_does_not_change_failed_parse_report
literal_nul_policy_is_deterministic
```

Test file plan

Add or update:

```
tests/l_ui_source_buffer_literal_nul_policy_invariants.c
scripts/test-l-ui-source-buffer-literal-nul-policy.sh
```

Wire into:

```
.github/workflows/c.yml
```

Run after:

```
sh scripts/test-l-ui-source-buffer-literal-nul-policy-contract.sh
```

and before:

```
sh scripts/test-l-ui-string-literal-escape-contract.sh
```

Documentation update plan

The implementation PR should update:

```
README.md
STATUS.md
docs/FOUNDATION_INDEX.md
docs/status/CURRENT_STATUS.md
docs/status/ANNOUNCEMENTS.md
docs/project_notes/UPCOMING_WORK.md
docs/L_UI_SOURCE_BUFFER_LITERAL_NUL_POLICY_CONTRACT.md
docs/L_UI_DECODED_NUL_ACCEPTANCE_IMPLEMENTATION.md
```

and add:

```
docs/L_UI_SOURCE_BUFFER_LITERAL_NUL_POLICY_IMPLEMENTATION.md
```

No-effect preservation

Literal source NUL rejection is metadata-only.

It must preserve:

```
no_effect=1
execution_allowed=0
mutation_allowed=0
server_allowed=0
recovery_allowed=0
hardware_allowed=0
```

Compatibility expectations

This implementation plan must not change:

```
escaped decoded NUL acceptance
literal source NUL rejection
LUI0023 diagnostic mapping
accepted string-literal escape decoding
parser diagnostic code stability
existing C-string fields
purpose_len and value_len semantics
failed-parse detailed report behavior
existing accepted fixture counts
```

The first accepted fixture should still report:

```
rail_count=9
field_count=23
text_count=2
effect=none
boundary=preview_only
```

Forbidden implementation behavior

Future source-buffer work must not:

- accept literal NUL source bytes without a separate acceptance contract;
- treat literal source NUL as escaped decoded NUL;
- remove LUI0023 literal NUL rejection;
- remove LUI0022 diagnostic compatibility;
- hide literal source NUL in diagnostics;
- produce a partial AST for literal source NUL input;
- make raw purpose= or value= report fields the assertion target for embedded NUL bytes;
- broaden accepted escape forms;
- add file I/O to parser or AST code;
- write files;
- open network connections;
- call server code;
- call update code;
- call recovery code;
- call hardware code;
- mutate state lattice;
- perform live movement;
- run L-UI behavior;

- render an interactive UI;
- treat text nodes as commands;
- treat bindings as executable references.

Current validation command

This implementation plan is guarded by:

```
sh scripts/test-l-ui-source-buffer-literal-nul-policy-implementation-plan.sh
```

The guard is static. It does not implement literal source NUL acceptance.

Implementation gate

Literal source-buffer NUL policy implementation code may be added only after this plan is merged.

Non-claims

This document does not implement literal source NUL acceptance, source-buffer ownership changes, Unicode display behavior, L-UI rendering, command behavior, Nucleus task handling, live movement, origin mutation, recovery behavior, server interaction, self-update, hardware support, boot readiness, security isolation, sandboxing, or operating-system completeness.

docs/L_UI_SOURCE_GRAMMAR.md

Source title: Latticra L-UI Source Grammar Draft

Lines: 212 | Words: 540 | SHA-256: 4082904c6c9512cb869312d04d0d728f177d5aa06f59e10e3b8c0b9e88a66c67

Latticra L-UI Source Grammar Draft

Status: grammar draft and fixture contract Scope: L-UI source shape, static fixtures, reserved words, validation guards, and non-claims.

Purpose

This document defines the first draft of L-UI source syntax.

L-UI is the planned terminal/operator UI dialect for Latticra. This draft exists before a parser so the project can refine syntax, fixtures, names, and boundaries before implementation work begins.

Current boundary

This is not a parser.

This is not a renderer engine.

This is not an interactive UI.

This is not a command language.

This is not live Nucleus execution.

This document defines a source grammar direction and fixture rules only.

File extension

Planned extension:

```
.lui
```

Version header

Every L-UI fixture should begin with:

```
lui 0.1
```

Initial top-level forms

Initial forms:

```
card &lt;Name&gt; {
  ...
}
```

Reserved future forms:

```
rail &lt;Name&gt; { ... }
layout &lt;Name&gt; { ... }
theme &lt;Name&gt; { ... }
```

Only card fixtures are used in the first draft.

Card grammar direction

Draft shape:

```
lui 0.1

card NucleusPreview {
  purpose &quot;operator-visible Nucleus preview report&quot;
  effect none
  boundary preview_only

  rail top {
    text &quot;Latticra / Nucleus Preview / effect-bound&quot;
  }

  rail state {
    field origin bind state.origin
    field route bind state.route
    field axis bind state.axis
    field path bind state.path
  }
}
```

Required card clauses

Every initial card fixture must include:

```
purpose &quot;...&quot;
effect none
boundary preview_only
```

Required Nucleus preview rails

The initial NucleusPreview fixture must include these rails:

```
top
state
trace
safety
gates
effects
policy
execution
bottom
```

Bind syntax

Field binding direction:

```
field &lt;label&gt; bind &lt;source.path&gt;
```

Allowed source prefixes in the first draft:

```
state.
preview.
```

Examples:

```
field origin bind state.origin
field requested_effect bind preview.requested_effect
field policy bind preview.policy
```

Literal syntax

String literals use double quotes:

```
text &quot;preview-only no-live-movement no-host-effect no-external-effect&quot;
```

Effect rule

The only allowed effect declaration in the first draft is:

```
effect none
```

No other effect value is allowed in initial fixtures.

Boundary rule

The initial allowed boundary is:

```
boundary preview_only
```

This means the fixture is intended for static, no-effect report layout only.

Forbidden fixture behavior

An L-UI fixture must not include behavior that implies:

- command execution;
- state mutation;
- live movement;
- host effects;
- network effects;
- hardware effects;
- boot effects;
- recovery behavior;
- update behavior;
- server interaction;
- hidden side effects.

First fixture

The first fixture is:

```
examples/l-ui/nucleus-preview-card.lui
```

It should mirror the existing C static report rails while remaining source-only.

Guard script

Fixture validation is performed by:

```
sh scripts/test-l-ui-grammar-fixtures.sh
```

The guard script performs static checks only. It does not parse or execute L-UI.

Future parser rule

A future parser may only be added after:

1. this grammar draft is stable;
2. fixtures are reviewed;
3. forbidden behavior tests exist;
4. syntax and error reporting rules are documented;
5. parsing remains no-effect.

Non-claims

This document and its fixtures do not implement L-UI parsing, rendering, command execution, Nucleus execution, live movement, origin mutation, recovery execution, server interaction, self-update, hardware support, boot readiness, security isolation, sandboxing, or operating-system completeness.

docs/L_UI_STATIC_REPORT.md

Source title: Latticra L-UI Static Report Fixture

Lines: 121 | Words: 402 | SHA-256: e763f842adf9cdc7e007220e55367beaa1e691713e2a8338a479c611b006c829

Latticra L-UI Static Report Fixture

Status: initial implementation contract Scope: terminal-facing static report fixture for Nucleus preview and state lattice data.

Purpose

The L-UI Static Report Fixture is the fourth Latticra implementation unit.

It defines a deterministic terminal-facing layout that composes the state lattice and Nucleus preview classification into operator-visible rails.

This is not a parser, renderer engine, interactive UI, shell, compositor, or live control surface.

Implementation files

```
include/latticra/l_ui_static_report.h
src/l_ui_static_report.c
tests/l_ui_static_report_invariants.c
scripts/test-l-ui-static-report.sh
```

Report kind

Initial report kind:

```
nucleus-preview
```

Required rails

The static report must render:

```
L-UI STATIC REPORT
kind=nucleus-preview
rail.top=Latticra / Nucleus Preview / effect-bound
rail.state=origin:&lt;origin&gt; route:&lt;route&gt; axis:&lt;axis&gt; path:&lt;path&gt;
rail.trace=breadcrumb:&lt;breadcrumb&gt; trace:&lt;trace&gt;
rail.safety=health:&lt;health&gt; risk:&lt;risk&gt; lock:&lt;lock&gt; dark_phase:&lt;
dark_phase&gt;
rail.gates=safe_portal:&lt;safe_portal&gt; rollback:&lt;rollback&gt;
rail.effects=host:&lt;host_effect&gt; external:&lt;external_effect&gt; requested:&lt;
requested_effect&gt;
rail.policy=request:&lt;request&gt; policy:&lt;policy&gt; reason:&lt;reason&gt;
rail.execution=executed:&lt;0|1&gt; mutation:&lt;0|1&gt; server:&lt;0|1&gt; recovery:&lt;0|1&gt;
 hardware:&lt;0|1&gt;
rail.bottom=preview-only no-live-movement no-host-effect no-external-effect
```

Preview-only boundary

The fixture must not:

- parse L-UI source;
- execute commands;
- mutate state;
- perform live movement;
- interact with servers;
- perform update behavior;
- perform recovery behavior;
- touch hardware;
- touch boot state;
- perform host effects;
- perform external effects.

Public API

Initial API:

```
latticra_l_ui_report_kind_label
latticra_l_ui_nucleus_preview_card
```

Test command

Run:

```
sh scripts/test-l-ui-static-report.sh
```

The main C workflow runs state-lattice, tri-plane transition, Nucleus preview, and L-UI static report tests.

Required invariants

The tests must verify:

- report title is stable;
- report kind is stable;
- top rail is present;
- state rail is present;
- trace rail is present;
- safety rail is present;
- gate rail is present;
- effect rail is present;
- policy rail is present;
- execution rail is present;
- bottom boundary rail is present;
- denied requests can be rendered;
- bad arguments are rejected;
- small buffers are rejected.

Current evidence level

This implementation is an L2 tested model for a terminal-facing static report fixture.

It is not a live L-UI language implementation, renderer, shell, compositor, parser, supervisor executor, server client, update engine, recovery system, hardware system, boot system, or security boundary.

Next implementation step

The next implementation candidate after this model is:

```
L-UI source grammar draft
```

That future work should define syntax and fixtures before adding a parser.

Non-claims

This document and implementation do not claim live UI execution, L-UI parsing, live Nucleus execution, live movement, origin mutation, recovery execution, server interaction, self-update, hardware support, boot readiness, security isolation, sandboxing, or operating-system completeness.

docs/L_UI_STRING_LITERAL_ESCAPE_CONTRACT.md

Source title: Latticra L-UI String-Literal Escape Contract

Lines: 310 | Words: 973 | SHA-256: 062edcb425263f2138b070961bf8f09730a6aefb0bf00ae1b2c3e607963ed678

Latticra L-UI String-Literal Escape Contract

Status: string-literal escape contract Scope: decoding rules for quoted L-UI source strings used by source-backed AST purpose and text values.

Purpose

This document defines the string-literal escape contract for L-UI source strings.

Latticra now decodes the accepted string-literal escape set while materializing source-backed AST string values. The contract defines which escape sequences are accepted, how they decode, what is rejected, how spans are preserved, how failures are classified, and how reporting remains deterministic.

The implementation plan is documented separately in L_UI_STRING_LITERAL_ESCAPE_IMPLEMENTATION_PLAN.md.

The implementation is documented separately in L_UI_STRING_LITERAL_ESCAPE_IMPLEMENTATION.md.

Current boundary

The current L-UI AST stack provides:

```
validated L-UI parser
source-backed purpose extraction
source-backed text extraction
accepted string-literal escape decoding
escaped report fields
source spans
no-effect flags
```

This contract does not add:

```
parser-level invalid escape diagnostics
new accepted non-string grammar
renderer behavior
interactive UI behavior
command behavior
```

```
Nucleus task handling
live movement
state mutation
server interaction
update behavior
recovery behavior
hardware behavior
boot behavior
```

Escape decoding purpose

String-literal escape decoding allows quoted L-UI strings to represent bytes that are awkward or unsafe to write literally while keeping source parsing deterministic.

Decoding applies to source-backed AST values:

```
card.purpose
text.value
```

It remains metadata-only unless a later execution or rendering contract explicitly says otherwise.

Accepted escape set

The implementation supports only this initial escape set:

```
| Source escape | Decoded byte |
| --- | --- |
| `\\` | backslash `0x5C` |
| `\&quot;` | double quote `0x22` |
| `\n` | LF `0x0A` |
| `\r` | CR `0x0D` |
| `\t` | horizontal tab `0x09` |
| `\xNN` | byte value from two uppercase hexadecimal digits |
```

No other escape sequences are accepted in the first implementation.

Hex escape rule

Hex escapes must use exactly two uppercase hexadecimal digits:

```
\x09
\x1F
\x7F
\x80
\xFF
```

Lowercase hexadecimal digits are rejected in the first implementation.

Examples that are rejected:

```
\x0a
\x0
\x001
\xGG
```

Unknown escape rule

Unknown escape sequences are rejected, not copied literally.

Examples that are rejected:

```
\a
\b
\f
\v
\u1234
\U00000000
```

Unterminated escape rule

Unterminated escape sequences are rejected.

Examples:

```
\
\x
\x0
```

Output byte rule

Decoded output is byte-oriented, not Unicode-codepoint-oriented.

The implementation decodes into bounded byte buffers used by AST string fields.

A future Unicode display contract may define higher-level text behavior later.

NUL byte rule

The contract may allow \x00 as a decoded byte only after the AST storage model supports explicit lengths.

Current AST text fields are NUL-terminated C strings, so this implementation rejects decoded NUL bytes for AST values.

Literal 0x00 source bytes inside AST string values are also rejected.

Storage rule

The current AST storage uses NUL-terminated fixed-size buffers:

```
latticra_l_ui_ast_card_t.purpose
latticra_l_ui_ast_text_t.value
```

The implementation does not silently truncate decoded output.

If decoded output does not fit the destination buffer, decoding returns a stable failure and AST construction avoids partial AST output.

Source-span rule

Decoded values preserve source-span metadata.

Spans continue to refer to source byte ranges, not decoded output byte ranges.

For text nodes:

```
text.span covers the source value range between quotes
```

For purpose values, no public purpose span exists yet; card.span remains the available public metadata unless a future purpose-span contract adds a new field.

Report relationship

Detailed AST reports continue to render:

```
purpose=&lt;decoded-purpose-as-current-C-string&gt;
purpose_escaped=&lt;report-safe-purpose&gt;
value=&lt;decoded-text-as-current-C-string&gt;
value_escaped=&lt;report-safe-text&gt;
```

The escaped report fields remain the stable assertion target for decoded control bytes, quotes, backslashes, DEL, and non-ASCII bytes.

Failure behavior

If string-literal escape decoding fails, AST construction avoids partial AST output.

Until parser-level string escape validation exists, invalid escapes classify the AST result as:

```
LATTICRA_L_UI_PARSE_INTERNAL_ERROR
```

The structural parser remains compatible and does not yet expose first-class invalid escape errors.

No-effect rule

String-literal escape decoding is metadata-only.

It preserves:

```
no_effect=1
execution_allowed=0
mutation_allowed=0
server_allowed=0
recovery_allowed=0
hardware_allowed=0
```

Compatibility rule

The implementation does not change:

```
latticra_l_ui_parse_source existing accepted fixture behavior
latticra_l_ui_ast_report existing required fields
latticra_l_ui_ast_detailed_report existing required fields
latticra_l_ui_diagnostic_report existing required fields
existing escaped report field semantics
existing accepted fixture summary counts
```

The current first fixture contains no source escapes and remains unchanged.

Implementation evidence

String-literal escape decoding required a separate implementation plan defining:

1. parser-level validation decision;
2. AST-level decoding helper shape;
3. accepted escape sequences;
4. rejected escape sequences;
5. NUL byte behavior;
6. capacity failure behavior;
7. span behavior;
8. detailed report behavior;
9. test file names;
10. exact invariant tests;
11. compatibility expectations.

That plan is recorded in L_UI_STRING_LITERAL_ESCAPE_IMPLEMENTATION_PLAN.md.

The implementation is recorded in L_UI_STRING_LITERAL_ESCAPE_IMPLEMENTATION.md.

Test list

The implementation tests verify:

```
string_escape_decodes_backslash
string_escape_decodes_quote
string_escape_decodes_newline
string_escape_decodes_carriage_return
string_escape_decodes_tab
string_escape_decodes_uppercase_hex
string_escape_decodes_high_byte_hex
string_escape_rejects_lowercase_hex
string_escape_rejects_short_hex
string_escape_rejects_invalid_hex
string_escape_rejects_unknown_escape
string_escape_rejects_unterminated_escape
string_escape_rejects_decoded_nul_until_length_storage_exists
string_escape_rejects_literal_nul_until_length_storage_exists
string_escape_rejects_oversized_decoded_output
```

```
string_escape_preserves_source_spans
string_escape_updates_detailed_report_escaped_fields
string_escape_preserves_no_effect_flags
string_escape_does_not_change_parse_source_summary
string_escape_does_not_change_failed_parse_report
string_escape_is_deterministic
```

Current validation commands

This contract is guarded by:

```
sh scripts/test-l-ui-string-literal-escape-contract.sh
```

The implementation is tested by:

```
sh scripts/test-l-ui-string-literal-escape.sh
```

Forbidden behavior

The string-literal escape implementation must not:

- add file I/O to parser or AST code;
- write files;
- open network connections;
- call server code;
- call update code;
- call recovery code;
- call hardware code;
- mutate state lattice;
- perform live movement;
- run L-UI behavior;
- render an interactive UI;
- treat text nodes as commands;
- treat bindings as executable references;
- silently truncate decoded values;
- emit raw control bytes in escaped report fields;
- decode bindings, field names, rail names, card names, effect values, or boundary values;
- broaden accepted grammar beyond this contract without a grammar update.

Non-claims

This document and implementation do not implement parser-level string escape diagnostics, length-carrying AST strings, Unicode display behavior, L-UI rendering, command behavior, Nucleus task handling, live movement, origin mutation, recovery behavior, server interaction, self-update, hardware support, boot readiness, security isolation, sandboxing, or operating-system completeness.

docs/L_UI_STRING_LITERAL_ESCAPE_IMPLEMENTATION.md

Source title: Latticra L-UI String-Literal Escape Implementation

Lines: 328 | Words: 891 | SHA-256: 0d4830a455183ab9ce9e9ff5c54b466125900638b9de787eb9ad5df90cc34943

Latticra L-UI String-Literal Escape Implementation

Status: initial implementation contract Scope: byte-oriented string-literal escape decoding for source-backed L-UI AST purpose and text values.

Purpose

The L-UI String-Literal Escape implementation decodes accepted escape sequences in quoted L-UI source strings while materializing AST-owned metadata values.

This implementation keeps decoding bounded, deterministic, source-span aware, and no-effect. It does not add rendering behavior, command behavior, parser-level string escape diagnostics, Unicode display semantics, or length-carrying AST strings.

Implementation files

```
src/l_ui_parser_ast.c
tests/l_ui_string_literal_escape_invariants.c
scripts/test-l-ui-string-literal-escape.sh
```

Related source-backed extraction files remain active:

```
tests/l_ui_ast_source_backed_text_invariants.c
scripts/test-l-ui-ast-source-backed-text.sh
```

Public API decision

No new public function is added.

Decoding is integrated into:

```
latticra_l_ui_parse_ast
```

The public AST storage remains:

```
latticra_l_ui_ast_card_t.purpose
latticra_l_ui_ast_text_t.value
```

No new public parser error enum value is added in this slice.

Private helper implementation

The implementation adds private helpers in src/l_ui_parser_ast.c:

```
is_upper_hex_digit
upper_hex_value
append_decoded_byte
decode_l_ui_string_literal_value
extract_decoded_quoted_value_after_token
```

These helpers remain private and are used only while constructing AST string values.

Decoding targets

The implementation decodes only source-backed AST string values:

```
purpose &quot;...&quot; -&gt; ast.card.purpose
first text &quot;...&quot; -&gt; ast.texts[0].value
second text &quot;...&quot; -&gt; ast.texts[1].value
```

It does not decode:

```
card names
rail names
field names
binding values
effect values
boundary values
```

Accepted escape behavior

The implementation accepts only this escape set:

```
\\
\&quot;
```

```
\n
\r
\t
\xNN
```

Decoded byte mapping:

```
\\ -&gt; 0x5C
\&quot; -&gt; 0x22
\n -&gt; 0x0A
\r -&gt; 0x0D
\t -&gt; 0x09
\x41 -&gt; 0x41
\x7F -&gt; 0x7F
\x80 -&gt; 0x80
\xFF -&gt; 0xFF
```

The \xNN form requires exactly two uppercase hexadecimal digits.

Rejected escape behavior

The implementation rejects unknown, malformed, incomplete, and lowercase-hex escapes, including:

```
\a
\b
\f
\v
\u1234
\U00000000
\x0a
\x0
\x001
\xGG
\
\x
\x0
```

Rejected escape sequences are not copied literally.

NUL byte behavior

Decoded NUL bytes are rejected in this implementation.

This includes:

```
\x00
```

Literal 0x00 source bytes inside AST string values are also rejected.

Reason:

```
latticra_l_ui_ast_card_t.purpose
latticra_l_ui_ast_text_t.value
```

are NUL-terminated fixed-size C strings and do not carry explicit decoded lengths.

Capacity behavior

Decoded output must fit the destination buffer.

If decoded output length is greater than or equal to the destination capacity, decoding fails and clears the destination buffer when possible.

The implementation does not silently truncate decoded values.

AST failure behavior

When string-literal escape decoding fails, AST construction returns:

```
LATTICRA_STATUS_OK
```

and classifies the AST parse result as:

```
LATTICRA_L_UI_PARSE_INTERNAL_ERROR
```

The AST avoids partial output:

```
ast.rail_count = 0
ast.field_count = 0
ast.text_count = 0
ast.card.rail_count = 0
ast.card.field_count = 0
ast.card.text_count = 0
```

This preserves the current parser API until parser-level string escape diagnostics are designed.

Source-span behavior

Source spans remain source-oriented.

For text nodes:

```
text.span covers the source value range between quotes
```

If the source contains \n, the span covers the two source bytes \ and n, even though the AST value contains one LF byte.

No public purpose_span field is added.

Detailed report relationship

Detailed reports continue to render:

```
purpose=&lt;decoded-purpose-as-current-C-string&gt;
purpose_escaped=&lt;report-safe-purpose&gt;
value=&lt;decoded-text-as-current-C-string&gt;
value_escaped=&lt;report-safe-text&gt;
```

For decoded control bytes, quote bytes, backslashes, DEL, and non-ASCII bytes, the stable assertion target is the escaped report field.

The existing report escaping layer remains responsible for deterministic report-safe string output.

Parser compatibility

The structural parser remains unchanged for this slice.

latticra_l_ui_parse_source does not perform string-literal escape validation yet.

Invalid escape sequences found during AST construction classify the AST as:

```
LATTICRA_L_UI_PARSE_INTERNAL_ERROR
```

until a future parser diagnostics contract promotes them to first-class parser errors.

That parser-level extension is now specified by:

```
L_UI_PARSER_STRING_ESCAPE_DIAGNOSTICS_CONTRACT.md
```

Failed parse compatibility

Existing failed parse behavior remains unchanged:

```
ast.parse_result.error = parser error
ast.rail_count = 0
ast.field_count = 0
ast.text_count = 0
failed-parse detailed report only
```

String decoding does not run for structurally failed parses.

No-effect boundary

String-literal escape decoding is metadata-only.

It preserves:

```
no_effect=1
execution_allowed=0
mutation_allowed=0
server_allowed=0
recovery_allowed=0
hardware_allowed=0
```

Test command

Run:

```
sh scripts/test-l-ui-string-literal-escape.sh
```

The main C workflow runs this check after the string-literal escape implementation-plan guard.

Required invariants

The string-literal escape tests verify:

```
string_escape_decodes_backslash
string_escape_decodes_quote
string_escape_decodes_newline
string_escape_decodes_carriage_return
string_escape_decodes_tab
string_escape_decodes_uppercase_hex
string_escape_decodes_high_byte_hex
string_escape_rejects_lowercase_hex
string_escape_rejects_short_hex
string_escape_rejects_invalid_hex
string_escape_rejects_unknown_escape
string_escape_rejects_unterminated_escape
string_escape_rejects_decoded_nul_until_length_storage_exists
string_escape_rejects_literal_nul_until_length_storage_exists
string_escape_rejects_oversized_decoded_output
string_escape_preserves_source_spans
string_escape_updates_detailed_report_escaped_fields
string_escape_preserves_no_effect_flags
string_escape_does_not_change_parse_source_summary
string_escape_does_not_change_failed_parse_report
string_escape_is_deterministic
```

Current evidence level

This implementation is an L2 tested string-literal escape decoding model for validated L-UI AST metadata.

It is not a parser-level string escape diagnostic system, Unicode display model, renderer, UI runtime, command surface, Nucleus task runner, server client, update engine, recovery system, hardware system, boot system, sandbox, or operating system.

Next implementation step

The parser-level string escape diagnostics contract is recorded in:

```
L_UI_PARSER_STRING_ESCAPE_DIAGNOSTICS_CONTRACT.md
```

The next implementation candidate after that contract is:

```
L-UI parser-level string escape diagnostics implementation plan
```

That future work should define parser enum additions, diagnostic code additions, parse error labels, source-span handling, validation order, messages, hints, AST compatibility, report compatibility, and exact tests before parser diagnostics are extended.

Non-claims

This document and implementation do not implement parser-level escape diagnostics, implement length-carrying AST strings, broaden accepted non-string L-UI grammar, implement Unicode display behavior, add L-UI rendering, add command behavior, add Nucleus task handling, add live movement, add origin mutation, add recovery behavior, add server interaction, add self-update, add hardware support, add boot readiness, claim security isolation, claim sandboxing, or claim operating-system completeness.

docs/L_UI_STRING_LITERAL_ESCAPE_IMPLEMENTATION_PLAN.md

Source title: Latticra L-UI String-Literal Escape Implementation Plan

Lines: 465 | Words: 1424 | SHA-256: ecb377e87fe1b7ba9c8e9fcfa82e3062970fabf31c6a312a45b4fdedb7aab7c4

Latticra L-UI String-Literal Escape Implementation Plan

Status: implementation planning contract Scope: parser-level validation decision, AST-level decoding helper shape, accepted and rejected escapes, NUL behavior, capacity behavior, span behavior, detailed report behavior, exact tests, and compatibility expectations before string-literal escape decoding code.

Purpose

This document defines the implementation plan for L-UI string-literal escape decoding.

The string-literal escape contract is already merged and guarded. This plan decides where the first decoding implementation belongs, which private helpers should be added, how accepted escapes decode, how rejected escapes fail, how NUL bytes are handled under the current NUL-terminated AST storage model, how source spans remain source-oriented, how detailed reports stay deterministic, and which tests must exist before decoding is considered implemented.

Relationship to previous contracts

This plan depends on:

```
docs/L_UI_STRING_LITERAL_ESCAPE_CONTRACT.md
docs/L_UI_AST_SOURCE_BACKED_TEXT_IMPLEMENTATION.md
docs/L_UI_AST_ESCAPED_STRING_REPORT_IMPLEMENTATION.md
docs/L_UI_PARSER_AST_IMPLEMENTATION.md
include/latticra/l_ui_parser.h
src/l_ui_parser.c
src/l_ui_parser_ast.c
```

Those files remain the source of truth for accepted parser summaries, AST storage, source-backed purpose/text extraction, report escaping, source spans, parse error labels, and no-effect boundaries.

Implementation language decision

String-literal escape decoding should be implemented in C.

Reason:

- the L-UI parser and AST builder are implemented in C;
- AST string storage is a C public API surface;
- decoding must remain bounded, deterministic, and no-effect;
- the current C workflow can validate decoding invariants;
- no dynamic runtime should be required.

Public API decision

No new public function is needed for the first string-literal escape implementation.

Decoding should be integrated into:

```
latticra_l_ui_parse_ast
```

The public AST fields remain:

```
latticra_l_ui_ast_card_t.purpose
latticra_l_ui_ast_text_t.value
```

The first implementation should not add a new public latticra_l_ui_parse_error_t value for invalid string escapes.

Parser-level validation decision

The first implementation should keep latticra_l_ui_parse_source behavior compatible and should not add parser-level string-escape validation yet.

Decision:

```
latticra_l_ui_parse_source remains a structural parser for the current L-UI fixture shape.
latticra_l_ui_parse_ast performs string-literal escape decoding while constructing AST values.
invalid escapes found during AST decoding classify the AST result as
LATTICRA_L_UI_PARSE_INTERNAL_ERROR.
```

Reason:

- the current parse error enum has no string-escape-specific error;
- adding parser-level escape errors is a broader diagnostic/API change;
- AST extraction already owns source-backed purpose/text value materialization;
- this keeps latticra_l_ui_parse_source accepted fixture summaries stable;
- failed AST construction already has a no-partial-output path.

A later parser diagnostics contract may promote invalid string escape reporting to parser-level errors.

Decoding helper plan

Add private helpers in:

```
src/l_ui_parser_ast.c
```

Proposed helpers:

```
static int is_upper_hex_digit(unsigned char byte);

static unsigned char upper_hex_value(unsigned char byte);

static latticra_status_t decode_l_ui_string_literal_value(
    const char *source,
    size_t start_offset,
    size_t end_offset,
    char *destination,
    size_t destination_len);

static latticra_status_t extract_decoded_quoted_value_after_token(
    const char *source,
    size_t source_len,
    const char *token,
    size_t occurrence,
    char *destination,
    size_t destination_len,
    latticra_l_ui_source_span_t *value_span);
```

Helpers must remain private.

The existing raw extraction helper may be replaced or refactored, but the new behavior must decode the value before writing into the AST destination buffer.

Extraction targets

The first implementation should decode only source-backed AST string values:

```
purpose &quot;...&quot; -&gt; ast.card.purpose
first text &quot;...&quot; -&gt; ast.texts[0].value
second text &quot;...&quot; -&gt; ast.texts[1].value
```

No binding values, rail names, field names, card names, effect values, or boundary values should be decoded in this slice.

Accepted escape behavior

The first implementation should accept only:

```
\\
\&quot;
\n
\r
\t
\xNN
```

where \xNN uses exactly two uppercase hexadecimal digits.

Decoded byte mapping:

```
\\ -&gt; 0x5C
\&quot; -&gt; 0x22
\n -&gt; 0x0A
\r -&gt; 0x0D
\t -&gt; 0x09
\x41 -&gt; 0x41
\x7F -&gt; 0x7F
\x80 -&gt; 0x80
\xFF -&gt; 0xFF
```

Printable non-escaped source bytes should be copied unchanged unless they are NUL bytes.

Rejected escape behavior

The first implementation should reject:

```
\a
\b
\f
\v
\u1234
\U00000000
\x0a
\x0
\x001
\xGG
\
\x
\x0
```

Any backslash followed by an unsupported escape marker must fail instead of being copied literally.

Lowercase hex digits must fail in the first implementation.

NUL byte behavior

Decoded NUL bytes must be rejected in the first implementation.

This includes:

```
\x00
```

and any literal 0x00 source byte that would enter an AST string value.

Reason:

```
latticra_l_ui_ast_card_t.purpose
latticra_l_ui_ast_text_t.value
```

are currently NUL-terminated fixed-size C strings without explicit decoded lengths.

A later length-carrying AST string storage contract may allow NUL bytes.

Capacity behavior

Decoding must respect destination capacities:

```
LATTICRA_L_UI_AST_PURPOSE_MAX
latticra_l_ui_ast_card_t.purpose
latticra_l_ui_ast_text_t.value
```

If decoded output length is greater than or equal to the destination buffer length, decoding should return:

```
LATTICRA_STATUS_BUFFER_TOO_SMALL
```

and clear the destination to an empty C string when possible.

The implementation must not silently truncate decoded values.

AST failure behavior

If string-literal escape decoding fails, latticra_l_ui_parse_ast should return:

```
LATTICRA_STATUS_OK
```

and classify the AST parse result as:

```
ast.parse_result.error = LATTICRA_L_UI_PARSE_INTERNAL_ERROR
```

The AST must avoid partial output:

```
ast.rail_count = 0
ast.field_count = 0
ast.text_count = 0
ast.card.rail_count = 0
ast.card.field_count = 0
ast.card.text_count = 0
```

The failed-parse detailed report path should remain the compact failed-parse report.

Source-span behavior

Decoded values must preserve source-span metadata.

Spans continue to refer to source byte ranges, not decoded output byte ranges.

For text nodes:

```
text.span covers the source value range between quotes
```

The span range includes the source escape bytes. For example, a source value containing \n has a text span over two source bytes, even though the decoded AST value contains one LF byte.

Do not add a new public purpose_span field in the first implementation.

Detailed report relationship

Detailed reports should continue to render:

```
purpose=&lt;decoded-purpose-as-current-C-string&gt;
purpose_escaped=&lt;report-safe-purpose&gt;
value=&lt;decoded-text-as-current-C-string&gt;
value_escaped=&lt;report-safe-text&gt;
```

For decoded control bytes, quote bytes, backslashes, DEL, and non-ASCII bytes, the stable assertion target should be:

```
purpose_escaped=&lt;report-safe-purpose&gt;
value_escaped=&lt;report-safe-text&gt;
```

The existing escape_report_string helper must remain the report-safe representation layer.

Successful parse rule

Decoding must run only after:

```
latticra_l_ui_parse_source
```

returns LATTICRA_STATUS_OK and parse_result.error == LATTICRA_L_UI_PARSE_OK.

If parsing fails structurally, decoding must not run.

Failed parse compatibility

Existing failed parse behavior must remain unchanged:

```
ast.parse_result.error = parser error
ast.rail_count = 0
ast.field_count = 0
ast.text_count = 0
failed-parse detailed report only
```

String decoding must not hide or replace existing structural parser errors.

Compatibility expectations

String-literal escape decoding must not change:

```
latticra_l_ui_parse_source existing accepted fixture behavior
latticra_l_ui_ast_report existing required fields
latticra_l_ui_ast_detailed_report existing required fields
latticra_l_ui_diagnostic_report existing required fields
parser error labels
existing escaped report field semantics
existing accepted fixture summary counts
```

The first accepted fixture should still report:

```
rail_count=9
field_count=23
text_count=2
effect=none
boundary=preview_only
```

Fixtures without source escapes must produce the same AST values they produced before this implementation.

No-effect preservation

String-literal escape decoding is metadata-only and must preserve:

```
no_effect=1
execution_allowed=0
mutation_allowed=0
server_allowed=0
recovery_allowed=0
hardware_allowed=0
```

Exact implementation test list

The implementation PR should include tests for:

```
string_escape_decodes_backslash
string_escape_decodes_quote
string_escape_decodes_newline
string_escape_decodes_carriage_return
string_escape_decodes_tab
string_escape_decodes_uppercase_hex
string_escape_decodes_high_byte_hex
string_escape_rejects_lowercase_hex
string_escape_rejects_short_hex
string_escape_rejects_invalid_hex
string_escape_rejects_unknown_escape
string_escape_rejects_unterminated_escape
string_escape_rejects_decoded_nul_until_length_storage_exists
string_escape_rejects_literal_nul_until_length_storage_exists
string_escape_rejects_oversized_decoded_output
string_escape_preserves_source_spans
string_escape_updates_detailed_report_escaped_fields
```

```
string_escape_preserves_no_effect_flags
string_escape_does_not_change_parse_source_summary
string_escape_does_not_change_failed_parse_report
string_escape_is_deterministic
```

Invalid escape tests should assert AST classification through:

```
LATTICRA_L_UI_PARSE_INTERNAL_ERROR
```

until parser-level string escape diagnostics are designed.

Test file plan

Add:

```
tests/l_ui_string_literal_escape_invariants.c
scripts/test-l-ui-string-literal-escape.sh
```

Wire into:

```
.github/workflows/c.yml
```

Documentation requirement

The implementation PR should update:

```
README.md
docs/FOUNDATION_INDEX.md
docs/L_UI_STRING_LITERAL_ESCAPE_CONTRACT.md
docs/L_UI_AST_SOURCE_BACKED_TEXT_IMPLEMENTATION.md
docs/L_UI_AST_ESCAPED_STRING_REPORT_IMPLEMENTATION.md
docs/L_UI_PARSER_AST_IMPLEMENTATION.md
```

and add:

```
docs/L_UI_STRING_LITERAL_ESCAPE_IMPLEMENTATION.md
```

Forbidden implementation behavior

The string-literal escape implementation must not:

- add file I/O to parser or AST code;
- write files;
- open network connections;
- call server code;
- call update code;
- call recovery code;
- call hardware code;
- mutate state lattice;
- perform live movement;
- run L-UI behavior;
- render an interactive UI;
- treat text nodes as commands;
- treat bindings as executable references;
- silently truncate decoded values;
- emit raw control bytes in escaped report fields;
- decode bindings, field names, rail names, card names, effect values, or boundary values in this slice;
- broaden accepted grammar beyond the string-literal escape contract;

- add parser-level escape diagnostics without a parser diagnostics contract;
- add length-carrying AST string storage without a storage contract.

Current validation command

This plan is guarded by:

```
sh scripts/test-l-ui-string-literal-escape-implementation-plan.sh
```

The guard is static. It does not implement string-literal escape decoding.

Implementation gate

String-literal escape decoding implementation code may be added only after this plan is merged.

Non-claims

This document does not implement string-literal escape decoding, implement parser-level escape diagnostics, implement length-carrying AST strings, broaden accepted non-string L-UI grammar, implement Unicode display behavior, add L-UI rendering, add command behavior, add Nucleus task handling, add live movement, add origin mutation, add recovery behavior, add server interaction, add self-update, add hardware support, add boot readiness, claim security isolation, claim sandboxing, or claim operating-system completeness.

docs/LANGUAGE_NAMING_POLICY.md

Source title: Latticra Language Naming Policy

Lines: 185 | Words: 680 | SHA-256: 48d2decf5506ecf865fc62713714ffe02f1f43cb006681e573f642b39a51ddb3

Latticra Language Naming Policy

Status: language naming policy Scope: public naming and file-extension policy for the Latticra native language family.

Purpose

This document corrects the early shorthand that called the native Latticra programming language L.

Plain L is too collision-prone for a public language name or file extension. Latticra should use project-specific language names and extensions before language implementation begins.

This policy does not implement a programming language, parser, compiler, runtime, package format, or execution model.

Collision rule

Latticra must not claim plain:

```
L
.l
```

as the public native language name or canonical file extension.

Reason:

- single-letter language names are ambiguous;
- existing language literature already uses L-like names and variants;
- .l is too short and too likely to collide with existing tools;

- Latticra should avoid avoidable naming confusion before syntax stabilizes.

Public native language name

The public native language name should be:

```
Latticra Language
```

The approved short name should be:

```
Lat
```

Lat is a project-specific shorthand for Latticra Language.

File extension policy

The canonical source file extension for the native Latticra Language should be:

```
.lat
```

Reserved related extensions:

```
.lat
.lui
.lir
```

Meaning:

```
| Extension | Meaning |
| --- | --- |
| `.lat` | Latticra Language source, including future Lat-Core and Lat-Orch forms. |
| `.lui` | Latticra UI declaration source. |
| `.lir` | Latticra Intermediate Representation, internal or generated unless later promoted. |
```

The project should not use .l for Latticra source.

Dialect naming policy

Rename the intended language-family labels as follows:

```
| Old shorthand | New public label | Role |
| --- | --- | --- |
| `L` | `Lat` / `Latticra Language` | Native Latticra language family. |
| `L-Core` | `Lat-Core` | State, policy, assertion, and transition declarations. |
| `L-Orch` | `Lat-Orch` | Nucleus orchestration planning and effect-gated task descriptions. |
| `L-UI` | `L-UI` | Operator interface declaration language; existing `.lui` files remain valid. |
| `LIR` | `LIR` | Latticra Intermediate Representation. |
```

L-UI may keep its existing name because it is already a compound project-specific label and has an existing .lui fixture path.

LIR may remain as an internal representation name because it expands to Latticra Intermediate Representation, but .lir should be treated as internal or generated until a later contract promotes it.

Documentation rule

Future docs should write:

```
Lat / Latticra Language
```

instead of:

```
L
```

when referring to the native Latticra language.

Historical references may say:

```
formerly documented as L
```

only when explaining the migration.

Syntax example rule

Syntax examples should be marked as:

```
Lat example syntax only
```

not:

```
L syntax
```

until a grammar contract exists.

Implementation boundary

This policy does not change:

```
L-UI parser behavior
.lui fixtures
LIR shape
AST behavior
string-literal escape behavior
parser diagnostics
state lattice behavior
Nucleus preview behavior
```

Future implementation gate

Before implementing native Latticra Language parsing, a future contract must define:

1. canonical language name;
2. canonical file extension;
3. dialect boundaries;
4. grammar scope;
5. parser input ownership;
6. effect boundary;
7. non-claims;
8. exact fixture paths;
9. exact tests.

That future work should use the names and extensions from this policy.

Forbidden behavior

Future language work must not:

- claim plain L as the public language name;
- claim .l as the canonical source extension;
- imply compatibility with unrelated L-like languages;
- imply a completed compiler or runtime before implementation exists;
- treat .lat files as executable before an execution contract exists;
- treat .lui files as commands;
- broaden L-UI behavior through the language naming policy.

Current validation command

This policy is guarded by:

```
sh scripts/test-language-naming-policy.sh
```

The guard is static. It does not implement a language.

Non-claims

This document does not implement Lat, Lat-Core, Lat-Orch, L-UI rendering, LIR lowering, a parser, compiler, runtime, package manager, command behavior, Nucleus task execution, live movement, state mutation, server interaction, recovery behavior, hardware behavior, boot readiness, sandboxing, or operating-system completeness.

docs/LANGUAGE_STRATEGY.md

Source title: Latticra Language Strategy

Lines: 249 | Words: 953 | SHA-256: c5530db3246e74c433900c154f3200b332aa658e1bee22fc6ec58097e82ad4a6

Latticra Language Strategy

Status: active language strategy Scope: C, constrained C++, Lat, L-UI, LIR, and implementation ordering.

Purpose

Latticra needs a language strategy from the beginning.

The real system should not grow as an accidental collection of shell scripts, raw C files, ad-hoc config formats, and UI strings. Latticra should define which languages own which parts of the architecture before implementation expands.

This document avoids using plain L as the public native language name. The language naming policy is defined in LANGUAGE_NAMING_POLICY.md.

The active C/C++ foundation direction is defined in C_CPP_FOUNDATION_DIRECTION.md.

Direction summary

```
C is the metal.
C++ is the disciplined structure.
Latticra is the contract.
```

Latticra should use a constrained C/C++ foundation for a security-conscious system.

This does not mean unrestricted C++.

Language roles

```
| Language | Role |
| --- | --- |
| C | Secure substrate, boot paths, ABI boundaries, platform shims, fixed-size data structures,
and freestanding-adjacent boundaries. |
| C++ | Governed authority layer for policy, validators, effect gates, audit logic, bounded
orchestration structures, and safe wrappers over C substrate APIs. |
| Lat / Latticra Language | Native contract/declaration language family for state, policy,
orchestration, assertions, and controlled system expression. |
| L-UI | Terminal/operator UI declaration language or dialect. |
| LIR | Latticra Intermediate Representation for validating and lowering Latticra
language-family documents. |
```

C secure substrate

C owns the lowest software boundary.

Primary C responsibilities:

- boot paths;
- ABI boundaries;
- platform shims;
- fixed-size data structures;

- freestanding-adjacent boundaries;
- minimal substrate behavior;
- portable test fixtures.

C must remain disciplined:

- no unsafe string APIs;
- no unchecked pointer mutation;
- no undefined behavior tolerated;
- no implicit effects without explicit gates;
- no global mutable state unless named in a contract;
- all transitions return status codes;
- all source/input behavior remains bounded and testable.

C++ governed authority layer

C++ is allowed above the C substrate as a governed authority layer.

Primary C++ responsibilities:

- policy logic;
- validators;
- effect gates;
- audit logic;
- bounded orchestration structures;
- operator-visible reports;
- higher-level state coordination;
- safe wrappers around C substrate APIs.

C++ must be constrained.

It is not:

```
unrestricted C++
exception-heavy C++
reflection-heavy C++
template metaprogramming as architecture
hidden allocation by default
implicit authority
unchecked host execution
```

Lat / Latticra Language

The native language is planned as:

```
Lat
```

Full descriptive name:

```
Latticra Language
```

Canonical source extension:

```
.lat
```

Plain L and .l are not the public language name or canonical file extension.

Lat should begin as a controlled system language, not a general-purpose programming language.

Early Lat responsibilities:

- declare lattice state;
- declare policies;
- declare effect requirements;
- declare transition rules;
- declare assertions;
- describe supervisor orchestration plans;
- describe operator-visible state reports.

Lat should not initially provide a general-purpose runtime, unrestricted system access, production runtime claims, or broad platform claims.

Lat-Core

Lat-Core is the first native-language target.

Purpose:

```
state + policy + assertion + transition declaration
```

Lat example syntax only:

```
state RootCell {
  origin = &quot;0/0&quot;
  route = &quot;ROOT&quot;
  axis = &quot;ROOT&quot;
  host_effect = none
  external_effect = none
}

transition move_right from RootCell {
  require lock == open
  require risk != high
  effect host = none
  effect external = none
}
```

This is example syntax only. It is not implemented yet.

Lat-Orch

Lat-Orch is the future orchestration dialect for Nucleus.

Purpose:

```
supervisor task planning + effect gates + recovery visibility + update staging
```

Lat-Orch must be explicit about:

- requested effect;
- required gate;
- rollback behavior;
- failure behavior;
- operator confirmation;
- server interaction;
- audit trail.

L-UI

L-UI is the terminal/operator interface language or dialect.

Purpose:

```
operator rails + state cards + reports + safe command surfaces
```

L-UI should be declarative, not a hidden imperative UI runtime.

The .lui extension remains valid for L-UI fixtures and source documents.

LIR

LIR is the Latticra Intermediate Representation.

Purpose:

- normalize Lat and L-UI documents;
- validate names and effects;
- preserve source spans;
- reject forbidden behavior;
- support deterministic testing;
- provide stable input for C and constrained C++ implementations.

LIR should be boring, explicit, serializable, and test-friendly.

The .lir extension is reserved for Latticra Intermediate Representation and should remain internal or generated until a future contract promotes it.

Rust relationship

Rust is not the current public foundation direction for Latticra.

Rust may appear only as optional external tooling or historical comparison if separately justified, but it is not the default public implementation lane and should not be presented as a primary foundation layer.

Extension policy

The reserved Latticra language-family extensions are:

```
.lat
.lui
.lir
```

Meaning:

```
| Extension | Meaning |
| --- | --- |
| `.lat` | Latticra Language source, including future Lat-Core and Lat-Orch forms. |
| `.lui` | Latticra UI declaration source. |
| `.lir` | Latticra Intermediate Representation, internal or generated unless later promoted. |
```

The project should not use .l as the canonical source extension.

Implementation order

1. Define contracts and docs.
2. Add C substrate fixtures and invariant tests.
3. Add C parser, AST, semantic validation, and LIR metadata foundations.
4. Define constrained C++ policy/validator/effect-gate layers after C substrate contracts stabilize.
5. Define Lat-Core grammar and implementation plans before parser code.
6. Define Lat-to-LIR lowering only after parser and semantic contracts exist.

7. Add execution only after explicit runtime/effect/security contracts.

Non-claims

This document does not claim that Lat, Lat-Core, Lat-Orch, L-UI, LIR, C++ authority layers, or any runtime are fully implemented.

It defines the intended language architecture before broader native-language implementation begins.

docs/LAT_LANGUAGE_FOUNDATION_ANALYSIS.md

Source title: Latticra Lat Language Foundation Analysis

Lines: 264 | Words: 1028 | SHA-256: 805d045a07e767659da6acc1200821afd9439607485fe0da0d924cfed9b7551e

Latticra Lat Language Foundation Analysis

Status: foundation analysis proposal Scope: deeper Lat / Latticra Language foundation after the initial bounded grammar parser.

Purpose

Lat should mature as a contract and declaration language, not as an accidental executable scripting surface. The existing grammar parser is a necessary first slice, but a stronger foundation requires a semantic layer that decides what a parsed Lat document means, what names are valid, what relationships are permitted, and what remains explicitly non-operational.

This analysis defines the next foundation layer:

```
Lat source -&gt; bounded parser -&gt; Lat AST metadata -&gt; semantic validation -&gt;
normalized Lat model
-&gt; LIR metadata lowering
```

The parser, semantic validation, normalized model, and Lat-to-LIR metadata lowering phases now exist in bounded no-effect form. This analysis remains the foundation record for the semantic and normalization direction.

Current foundation summary

The current Lat parser already establishes important constraints:

- source size is bounded;
- names, values, declarations, clauses, and reports use fixed-size storage;
- the parser preserves source spans;
- declarations are metadata only;
- no execution, mutation, server, recovery, or hardware behavior is allowed;
- Lat uses the public name Lat / Latticra Language and .lat, not plain L or .l.

That is the right parser posture. The missing foundation is semantic meaning.

Main gap

A grammar parser can say:

```
this document has a transition declaration
```

It cannot yet say:

```
the transition source state exists
the effect target is allowed
the declaration name is unique
the field name belongs to the Lat-Core state vocabulary
```

```
the document still preserves the no-effect boundary
```

Without these semantic checks, Lat remains syntactically bounded but architecturally loose.

Foundation principle

The next layer should be semantic validation, not execution.

Lat semantic validation should answer:

1. Is the parsed module internally coherent?
2. Are declaration names unique and resolvable?
3. Are transition references valid?
4. Are state fields from the known state-lattice vocabulary?
5. Are effect targets known and denied by default unless they are none?
6. Are policy and assertion clauses restricted to requirement/assurance forms?
7. Are reports deterministic, bounded, source-aware, and operator-readable?

It should not answer:

- how to execute a transition;
- how to mutate state;
- how to lower to LIR;
- how to render L-UI;
- how to call Nucleus;
- how to authorize real host, network, recovery, or hardware effects.

Proposed Lat foundation phases

Phase 0: Naming and role policy

Lat is the approved short name. .lat is the canonical extension. Plain L and .l remain forbidden.

Phase 1: Lexical and grammar parser

Current parser role:

```
source bytes -&gt; bounded AST metadata + parse report
```

It owns source spans, syntax errors, declaration records, clause records, and no-effect parse reports.

Phase 2: Semantic validation

Proposed role:

```
parse result -&gt; semantic diagnostics + semantic report
```

It owns:

- duplicate declaration detection;
- transition source resolution;
- declaration-specific clause rules;
- state-field vocabulary checking;
- effect-target checking;

- first default-deny effect validation;
- stable diagnostic labels;
- deterministic semantic reports.

Phase 3: Lat model normalization

Current role:

```
parse result + semantic result -&gt; normalized Lat module model
```

The normalized model carries explicit declaration and clause index tables for states, policies, transitions, assertions, and effect declarations. It remains no-effect and does not read source bytes.

Phase 4: Lat-to-LIR lowering

Current role:

```
semantic Lat module metadata -&gt; bounded LIR shape
```

The current implementation remains metadata-only and no-effect. It does not execute Lat or LIR.

Phase 5: Effect-gated runtime interpretation

Future role:

```
validated Lat / LIR -&gt; runtime request classification -&gt; effect gate -&gt; denied or
authorized
behavior
```

This must wait for explicit runtime, threat-model, effect-gate, audit, and authority-layer contracts.

Semantic validation rules proposed for this slice

Module rule

The parser must have succeeded before semantic validation runs.

```
parse.error == ok
```

If parsing did not succeed, semantic validation returns a semantic parse_not_ok diagnostic and does not reinterpret the source.

Declaration identity rule

Declaration names are globally unique within a module for this slice.

Reason: global uniqueness prevents ambiguity before namespacing, imports, traits, modules, or overloads exist.

State declaration rule

A state declaration may contain only field assignments.

Allowed fields:

```
origin
route
axis
path
breadcrumb
trace
safe_portal
rollback
health
risk
lock
dark_phase
```

```
host_effect
external_effect
```

host_effect and external_effect must use known effect labels, and this first semantic slice accepts only none as an allowed declared effect value.

Policy declaration rule

A policy declaration may contain only:

```
require left operator right
ensure left operator right
```

Field assignments and effect assignments are rejected in policies for this slice.

Transition declaration rule

A transition declaration must name an existing source state:

```
transition MoveRight from RootCell { ... }
```

RootCell must resolve to a declared state.

A transition may contain requirement clauses and explicit no-effect metadata clauses:

```
require lock == &quot;open&quot;
effect host = none
effect external = none
```

This first semantic slice rejects non-none declared effects.

Assertion declaration rule

An assertion declaration may contain only require or ensure clauses.

Assertions are semantic checks, not runtime actions.

Effect declaration rule

An effect declaration may contain only known effect targets:

```
host
external
network
hardware
boot
recovery
local
```

The value must be a known Lat effect label. This first slice accepts only none as an allowed declared value.

Diagnostic model

Semantic diagnostics should be stable, bounded, source-span-aware, and deterministic.

Each diagnostic records:

```
error label
source span
declaration index
clause index
name
detail
```

The semantic result records the first error as the summary error while retaining a bounded diagnostic list.

Evidence level

This proposal targets an L2 implementation slice:

```
contract + implementation plan + C implementation + invariant tests + deterministic report
```

It does not claim runtime capability.

Non-claims

This analysis does not implement Lat execution, Lat compilation, Lat interpretation, LIR lowering, L-UI rendering, command behavior, Nucleus task handling, live movement, state mutation, recovery behavior, server interaction, self-update, hardware support, boot readiness, security isolation, sandboxing, malware prevention, ransomware prevention, or operating-system completeness.

docs/LAT_LANGUAGE_GRAMMAR_CONTRACT.md

Source title: Latticra Lat Language Grammar Contract

Lines: 548 | Words: 1346 | SHA-256: 2a9632b7bb77464c720d0c9e51ec646f66f2a9f51fae54ce7b686118a511ade6

Latticra Lat Language Grammar Contract

Status: Lat language grammar contract Scope: first grammar contract for Lat / Latticra Language before parser implementation, LIR lowering, execution, runtime behavior, or operating-system behavior.

Purpose

This document defines the first grammar contract for:

```
Lat / Latticra Language
```

Lat is the approved short name for the Latticra Language. The canonical source extension is:

```
.lat
```

This contract defines the first syntax shape for Lat-Core declarations only. It does not implement a parser, compiler, interpreter, runtime, package format, command behavior, Nucleus task execution, LIR lowering, L-UI rendering, or operating-system behavior.

The implementation plan is recorded in:

```
LAT_LANGUAGE_GRAMMAR_IMPLEMENTATION_PLAN.md
```

Naming boundary

Lat must follow the language naming policy:

```
docs/LANGUAGE_NAMING_POLICY.md
```

The public language name is:

```
Lat / Latticra Language
```

The canonical source extension is:

```
.lat
```

Forbidden public claims:

```
L
.l
```

Plain L is not the public language name, and .l is not the canonical source extension.

Relationship to previous work

This contract depends on:

```
docs/LANGUAGE_NAMING_POLICY.md
docs/LANGUAGE_STRATEGY.md
docs/LIR_SHAPE_CONTRACT.md
docs/LIR_SHAPE_IMPLEMENTATION_PLAN.md
docs/LIR_SHAPE_IMPLEMENTATION.md
docs/EFFECT_GATES.md
```

```
docs/STATE_LATTICE.md
docs/TRI_PLANE_TRANSITION.md
docs/NUCLEUS_PREVIEW.md
include/latticra/lir.h
include/latticra/state_lattice.h
```

Those files remain the source of truth for public naming, language-family roles, LIR shape, effect vocabulary, state-lattice fixtures, no-effect preview behavior, and Nucleus preview boundaries.

First grammar target

The first grammar target is:

```
Lat-Core
```

Lat-Core is the state, policy, assertion, and transition declaration subset of Lat.

Lat-Orch remains future work and must not be implemented or implied by this contract.

Source unit

A Lat source unit should represent one module-like document:

```
lat module &lt;ModuleName&gt; {
  ... declarations ...
}
```

The first grammar should require an explicit module wrapper.

Initial declaration kinds

The first Lat-Core grammar should define these declaration kinds:

```
state
policy
transition
assertion
effect
```

These declarations are metadata only until separate parser, semantic, lowering, and execution contracts exist.

Lexical grammar

The first lexical grammar should include:

```
identifier
keyword
string_literal
integer_literal
boolean_literal
effect_literal
operator
punctuation
comment
whitespace
```

Identifier policy:

```
[A-Za-z_][A-Za-z0-9_]*
```

Reserved keywords:

```
lat
module
state
policy
transition
assertion
effect
from
require
ensure
where
let
true
```

```
false
none
read
local_mutation
host_mutation
network
hardware
boot
recovery
external
```

Future implementation may add keywords only through a separate contract or implementation plan.

Comment policy

The first grammar should allow line comments only:

```
// comment text
```

Block comments are out of scope until a later contract.

String literal policy

Lat string literals should use quoted strings:

```
&quot;text&quot;
```

String escapes should align with the L-UI string-literal escape policy unless a future Lat-specific contract changes it:

```
\\
\&quot;
\n
\r
\t
\xHH
```

Escaped decoded NUL through \x00 may be represented only with explicit length-carrying storage in a future implementation.

Literal source-buffer NUL bytes remain forbidden.

Effect literals

Initial effect literals:

```
none
read
local_mutation
host_mutation
network
hardware
boot
recovery
external
```

The first parser may accept effect declarations as metadata, but it must not perform the effect.

State declaration grammar

Lat example syntax only:

```
state RootCell {
  origin = &quot;0/0&quot;
  route = &quot;ROOT&quot;
  axis = &quot;ROOT&quot;
  path = &quot;/&quot;
  host_effect = none
  external_effect = none
}
```

State declarations should allow fields compatible with the current state lattice vocabulary:

```
origin
route
axis
path
breadcrumb
trace
safe_portal
rollback
health
risk
lock
dark_phase
host_effect
external_effect
```

This grammar does not mutate runtime state.

Policy declaration grammar

Lat example syntax only:

```
policy SafePreview {
  require risk != &quot;high&quot;
  require lock == &quot;open&quot;
  ensure host_effect == none
  ensure external_effect == none
}
```

Policy declarations should describe requirements and assertions as metadata only.

Transition declaration grammar

Lat example syntax only:

```
transition MoveRight from RootCell {
  require lock == &quot;open&quot;
  require risk != &quot;high&quot;
  effect host = none
  effect external = none
}
```

Transition declarations should require:

```
transition name
source state name
require clauses
effect clauses
```

Transition declarations must not execute movement, mutate state, or call Nucleus task execution.

Assertion declaration grammar

Lat example syntax only:

```
assertion RootCellIsSafe {
  require health == &quot;ok&quot;
  require host_effect == none
  require external_effect == none
}
```

Assertions are metadata until a future validator implements them.

Effect declaration grammar

Lat example syntax only:

```
effect PreviewOnly {
  host = none
  external = none
  network = none
  hardware = none
}
```

Effect declarations describe intended effect boundaries only. They do not grant capability.

Expression grammar

The first expression grammar should be deliberately small:

```
identifier
string_literal
integer_literal
boolean_literal
effect_literal
comparison_expression
logical_and_expression
logical_or_expression
parenthesized_expression
```

Initial comparison operators:

```
==
!=
&lt;
&lt;=
&gt;
&gt;=
```

Initial logical operators:

```
&amp;&amp;
||
```

No function calls, loops, arbitrary arithmetic, imports, macros, generic types, allocation, host calls, network calls, or hardware calls are in scope.

Module report model

A future Lat grammar parser should produce deterministic bounded reports.

Suggested report fields:

```
LAT GRAMMAR REPORT
status=&lt;status&gt;
module=&lt;module-name&gt;
state_count=&lt;count&gt;
policy_count=&lt;count&gt;
transition_count=&lt;count&gt;
assertion_count=&lt;count&gt;
effect_count=&lt;count&gt;
no_effect=&lt;0|1&gt;
execution_allowed=&lt;0|1&gt;
mutation_allowed=&lt;0|1&gt;
server_allowed=&lt;0|1&gt;
recovery_allowed=&lt;0|1&gt;
hardware_allowed=&lt;0|1&gt;
```

The exact implementation report is defined in:

```
LAT_LANGUAGE_GRAMMAR_IMPLEMENTATION_PLAN.md
```

Source-span behavior

Future Lat parser and AST work should preserve source spans for:

```
module declarations
state declarations
policy declarations
transition declarations
assertion declarations
effect declarations
field assignments
require clauses
ensure clauses
effect clauses
string literals
identifier references
```

Lat source-span behavior must not invent byte offsets.

LIR relationship

Lat grammar work must not lower to LIR until a separate Lat-to-LIR lowering contract exists.

The first relationship is planning-only:

```
Lat source -&gt; future Lat parser -&gt; future Lat AST -&gt; future Lat semantic validation -
&gt; future
LIR lowering
```

The current LIR shape implementation lowers semantically valid L-UI ASTs only.

No-effect rule

Lat grammar work is metadata-only.

It must preserve:

```
no_effect=1
execution_allowed=0
mutation_allowed=0
server_allowed=0
recovery_allowed=0
hardware_allowed=0
```

Lat grammar work must not execute declarations, mutate state, render UI, lower to LIR, call Nucleus task code, write files, read files, open network connections, call server code, call update code, call recovery code, or touch hardware.

Compatibility expectations

Lat grammar work must not change:

```
language naming policy
.lat canonical extension
L-UI parser behavior
L-UI semantic validation behavior
LIR shape behavior
state lattice behavior
Nucleus preview behavior
escaped decoded NUL acceptance
literal source-buffer NUL rejection
no-effect flags
```

Future implementation gate

Lat parser implementation must not begin until a separate implementation plan defines:

1. public API shape;
2. parser result structs;
3. AST structs;
4. capacity constants;
5. error enum labels;
6. diagnostic/report format;
7. accepted fixture paths;
8. parser ownership rules;
9. string literal handling;
10. source-span mapping;
11. exact tests;
12. compatibility expectations;
13. non-claims.

That next planning slice is:

```
Lat language grammar implementation plan
LAT_LANGUAGE_GRAMMAR_IMPLEMENTATION_PLAN.md
```

Future test list

A future implementation plan should include tests for:

```
lat_grammar_accepts_minimal_module
lat_grammar_accepts_state_declaration
lat_grammar_accepts_policy_declaration
lat_grammar_accepts_transition_declaration
lat_grammar_accepts_assertion_declaration
lat_grammar_accepts_effect_declaration
lat_grammar_rejects_plain_l_extension_claim
lat_grammar_rejects_unknown_keyword
lat_grammar_rejects_unterminated_string
lat_grammar_rejects_invalid_escape
lat_grammar_rejects_literal_source_nul
lat_grammar_reports_source_spans
lat_grammar_preserves_no_effect_flags
lat_grammar_report_is_deterministic
lat_grammar_does_not_lower_to_lir
lat_grammar_does_not_execute_declarations
lat_grammar_is_deterministic
```

The implementation-plan test list is now recorded in:

```
LAT_LANGUAGE_GRAMMAR_IMPLEMENTATION_PLAN.md
```

Forbidden behavior

Lat grammar work must not:

- claim plain L as the public language name;
- claim .l as the canonical source extension;
- implement a parser before an implementation plan;
- execute declarations;
- mutate state;
- lower to LIR;
- render L-UI;
- call Nucleus task execution;
- evaluate host state;
- write files;
- read files;
- open network connections;
- call server code;
- call update code;
- call recovery code;
- call hardware code;
- broaden L-UI behavior;
- weaken semantic validation;
- accept literal source-buffer NUL;
- remove escaped decoded NUL support;

- imply a compiler, interpreter, runtime, package manager, sandbox, or operating-system surface.

Current validation command

This contract is guarded by:

```
sh scripts/test-lat-language-grammar-contract.sh
```

The guard is static. It does not implement Lat.

Non-claims

This document does not implement Lat, Lat-Core, Lat-Orch, a parser, compiler, interpreter, runtime, package manager, LIR lowering, L-UI rendering, command behavior, Nucleus task handling, live movement, state mutation, recovery behavior, server interaction, self-update, hardware support, boot readiness, security isolation, sandboxing, malware prevention, ransomware prevention, or operating-system completeness.

docs/LAT_LANGUAGE_GRAMMAR_IMPLEMENTATION.md

Source title: Latticra Lat Language Grammar Implementation

Lines: 315 | Words: 765 | SHA-256: bb704eb7a593f116e924e77cf4a9215c4eb0b00830a45f6619ec33a4b4dd1395

Latticra Lat Language Grammar Implementation

Status: implementation with line-comment metadata and unsupported block-comment rejection
Scope: bounded no-effect Lat / Latticra Language grammar parser, parse result model, AST metadata, line-comment metadata, unsupported block-comment rejection, report surface, fixture, and invariants.

Purpose

This implementation adds the first bounded parser for the Lat / Latticra Language grammar.

The parser accepts the first Lat-Core declaration grammar shape and records module, declaration, clause, effect, source-span, and no-effect metadata.

The parser also records deterministic line-comment metadata for audit visibility. Line comments are skipped by the grammar, may contain otherwise forbidden behavior marker words, and do not change no-effect flags or clause/operator behavior.

Block comments are rejected with a deterministic unsupported_block_comment parse error outside strings and line comments. / and / text inside string literals remains ordinary string content.

This implementation does not execute Lat, compile Lat, interpret Lat, lower Lat to LIR, render L-UI, call Nucleus task behavior, read files, write files, open network connections, mutate state, or touch hardware.

Implementation files

```
include/latticra/lat_parser.h
src/lat_parser.c
tests/lat_language_grammar_invariants.c
scripts/test-lat-language-grammar.sh
fixtures/lat/minimal_module.lat
.github/workflows/c.yml
```

Related active files:

```
docs/LAT_LANGUAGE_GRAMMAR_CONTRACT.md
docs/LAT_LANGUAGE_GRAMMAR_IMPLEMENTATION_PLAN.md
docs/LANGUAGE_NAMING_POLICY.md
docs/LANGUAGE_STRATEGY.md
docs/C_CPP_FOUNDATION_DIRECTION.md
```

```
docs/LIR_SHAPE_IMPLEMENTATION.md
```

Public API

The public API adds:

```
latticra_lat_parse_error_t
latticra_lat_declaration_kind_t
latticra_lat_effect_t
latticra_lat_source_span_t
latticra_lat_parse_result_t
latticra_lat_ast_module_t
latticra_lat_ast_declaration_t
latticra_lat_ast_clause_t
latticra_lat_parse_error_label
latticra_lat_declaration_kind_label
latticra_lat_effect_label
latticra_lat_parse_source
latticra_lat_parse_report
```

Capacity constants

The first Lat parser implementation uses exact bounded constants:

```
LATTICRA_LAT_SOURCE_MAX 65536u
LATTICRA_LAT_NAME_MAX 64u
LATTICRA_LAT_VALUE_MAX 128u
LATTICRA_LAT_DECLARATION_MAX 64u
LATTICRA_LAT_CLAUSE_MAX 128u
LATTICRA_LAT_REPORT_MAX 4096u
```

Grammar accepted in this slice

The implementation accepts a bounded module wrapper:

```
lat module &lt;ModuleName&gt; {
  ... declarations ...
}
```

Accepted declaration kinds:

```
state
policy
transition
assertion
effect
```

Accepted clause forms:

```
field = value
require left operator right
ensure left operator right
effect target = effect_value
```

Transition declarations preserve the from <StateName> source state in source_name.

Fixture

The first repository Lat fixture is:

```
fixtures/lat/minimal_module.lat
```

It contains a minimal RootModule with a RootCell state declaration.

Error labels

Stable parse error labels include:

```
ok
null_argument
empty_source
source_too_large
unsupported_extension_claim
missing_module
invalid_module_name
unbalanced_brace
unknown_declaration
invalid_declaration_name
```

```
unterminated_string
invalid_string_escape
invalid_hex_escape
literal_nul_in_string
capacity_exceeded
forbidden_behavior_marker
unsupported_block_comment
internal_error
```

No-effect boundary

Lat grammar parsing is metadata-only.

It preserves:

```
no_effect=1
execution_allowed=0
mutation_allowed=0
server_allowed=0
recovery_allowed=0
hardware_allowed=0
```

Forbidden behavior markers

The parser rejects behavior markers before execution contracts exist:

```
exec
spawn
syscall
socket
open_file
write_file
hardware_write
```

Markers inside line comments are ignored by the marker scan.

Source-span behavior

The parser records source-span metadata for module, declaration, and clause records.

Source spans are byte-offset and line/column based.

The parser does not invent byte offsets.

Report format

latticra_lat_parse_report emits a deterministic bounded report beginning with:

```
LAT GRAMMAR REPORT
```

and including:

```
status
error
module
declaration_count
state_count
policy_count
transition_count
assertion_count
effect_count
clause_count
comment_count
first_comment_start_offset
first_comment_end_offset
first_comment_start_line
first_comment_start_column
first_comment_end_line
first_comment_end_column
first_declaration_index
first_declaration_kind
first_declaration_name
first_declaration_source
first_declaration_first_clause_index
first_declaration_clause_count
first_clause_index
first_clause_keyword
first_clause_left
```

```
first_clause_operator
first_clause_right
first_clause_effect
no_effect
execution_allowed
mutation_allowed
server_allowed
recovery_allowed
hardware_allowed
span_start_offset
span_end_offset
span_start_line
span_start_column
span_end_line
span_end_column
```

The first declaration and first clause fields are copied from the parsed AST only when parsing succeeds. They are report metadata only; clause operators are not evaluated.

Small output buffers return:

```
LATTICRA_STATUS_BUFFER_TOO_SMALL
```

and clear the output buffer.

Test command

Run:

```
sh scripts/test-lat-language-grammar.sh
```

The main C workflow runs this check after the Lat grammar implementation-plan guard and before the state lattice tests.

Required invariants

The Lat grammar tests verify:

```
lat_grammar_accepts_minimal_module
lat_grammar_accepts_state_declaration
lat_grammar_accepts_policy_declaration
lat_grammar_accepts_transition_declaration
lat_grammar_accepts_assertion_declaration
lat_grammar_accepts_effect_declaration
lat_grammar_rejects_plain_l_extension_claim
lat_grammar_rejects_unknown_keyword
lat_grammar_rejects_unterminated_string
lat_grammar_rejects_invalid_escape
lat_grammar_rejects_literal_source_nul
lat_grammar_reports_source_spans
lat_grammar_preserves_no_effect_flags
lat_grammar_report_is_deterministic
lat_grammar_report_rejects_small_buffer
lat_grammar_error_labels_are_stable
lat_grammar_kind_labels_are_stable
lat_grammar_does_not_lower_to_lir
lat_grammar_does_not_execute_declarations
lat_grammar_is_deterministic
```

Compatibility

This implementation does not change:

```
language naming policy
.lat canonical extension
C/C++ foundation direction
L-UI parser behavior
L-UI semantic validation behavior
LIR shape behavior
state lattice behavior
Nucleus preview behavior
escaped decoded NUL acceptance
literal source-buffer NUL rejection
no-effect flags
```

Current evidence level

This implementation is an L2 tested grammar parser foundation for bounded Lat-Core metadata.

It is not Lat execution, Lat compilation, Lat interpretation, LIR lowering, L-UI rendering, command behavior, Nucleus task execution, live movement, state mutation, recovery behavior, server interaction, self-update, hardware support, boot readiness, security isolation, sandboxing, malware prevention, ransomware prevention, or operating-system completeness.

Next implementation step

The next implementation candidate is:

```
Constrained C++ authority layer contract
```

That future work should define the governed C++ layer before any C++ policy, validator, effect-gate, or audit implementation.

Non-claims

This document and implementation do not implement Lat execution, Lat compilation, Lat interpretation, LIR lowering, L-UI rendering, command behavior, Nucleus task handling, live movement, state mutation, recovery behavior, server interaction, self-update, hardware support, boot readiness, security isolation, sandboxing, malware prevention, ransomware prevention, or operating-system completeness.

docs/LAT_LANGUAGE_GRAMMAR_IMPLEMENTATION_PLAN.md

Source title: Latticra Lat Language Grammar Implementation Plan

Lines: 579 | Words: 1338 | SHA-256: c38e373621fdeb1130b455252dbd81be379263fefc2155c3743ab14fec7f586f

Latticra Lat Language Grammar Implementation Plan

Status: implementation planning contract Scope: exact public API, parser result structs, AST structs, capacities, error labels, reports, fixture paths, parser ownership rules, string handling, source-span mapping, tests, compatibility expectations, and non-claims before Lat parser code.

Purpose

This document defines the implementation plan for the first Lat / Latticra Language grammar parser.

The Lat grammar contract is already merged and guarded. This plan names the exact public API, result shape, AST metadata, capacity constants, error labels, report format, fixture paths, ownership rules, string literal handling, source-span mapping, tests, and compatibility expectations required before parser code is added.

This document does not implement Lat parsing.

Relationship to previous work

This plan depends on:

```
docs/LAT_LANGUAGE_GRAMMAR_CONTRACT.md
docs/LANGUAGE_NAMING_POLICY.md
docs/LANGUAGE_STRATEGY.md
docs/C_CPP_FOUNDATION_DIRECTION.md
docs/LIR_SHAPE_IMPLEMENTATION.md
docs/EFFECT_GATES.md
docs/STATE_LATTICE.md
include/latticra/lir.h
include/latticra/state_lattice.h
```

Those files remain the source of truth for naming, .lat extension policy, C/C++ foundation direction, LIR shape, effect vocabulary, and state-lattice vocabulary.

Implementation language decision

The first Lat grammar parser should be implemented in C.

Reason:

- current parser, AST, semantic validation, and LIR foundations are C;
- C is the secure substrate;
- the first Lat parser should be bounded, deterministic, and no-effect;
- tests and runners use C and POSIX shell;
- constrained C++ policy layers are planned separately and should not precede a stable C parser substrate.

Implementation files

The implementation PR should modify or add:

```
include/latticra/lat_parser.h
src/lat_parser.c
tests/lat_language_grammar_invariants.c
scripts/test-lat-language-grammar.sh
.github/workflows/c.yml
docs/LAT_LANGUAGE_GRAMMAR_IMPLEMENTATION.md
```

The implementation should not add C++ infrastructure, LIR lowering, L-UI rendering, Lat execution, runtime behavior, file I/O, network I/O, state mutation, recovery behavior, update behavior, or hardware behavior.

Public API shape

Add public API names:

```
latticra_lat_parse_error_t
latticra_lat_declaration_kind_t
latticra_lat_effect_t
latticra_lat_source_span_t
latticra_lat_parse_result_t
latticra_lat_ast_module_t
latticra_lat_ast_declaration_t
latticra_lat_ast_clause_t
latticra_lat_parse_error_label
latticra_lat_declaration_kind_label
latticra_lat_effect_label
latticra_lat_parse_source
latticra_lat_parse_report
```

Recommended function signatures:

```
const char *latticra_lat_parse_error_label(latticra_lat_parse_error_t error);
const char *latticra_lat_declaration_kind_label(latticra_lat_declaration_kind_t kind);
const char *latticra_lat_effect_label(latticra_lat_effect_t effect);

latticra_status_t latticra_lat_parse_source(
    const char *source,
    size_t source_len,
    latticra_lat_parse_result_t *result);

latticra_status_t latticra_lat_parse_report(
    const latticra_lat_parse_result_t *result,
    char *buffer,
    size_t buffer_len);
```

Capacity constants

Add exact bounded constants:

```
LATTICRA_LAT_SOURCE_MAX 65536u
LATTICRA_LAT_NAME_MAX 64u
```

```
LATTICRA_LAT_VALUE_MAX 128u
LATTICRA_LAT_DECLARATION_MAX 64u
LATTICRA_LAT_CLAUSE_MAX 128u
LATTICRA_LAT_REPORT_MAX 4096u
```

The first implementation should reject sources larger than LATTICRA_LAT_SOURCE_MAX.

Parse error enum

Add parse error enum values:

```
LATTICRA_LAT_PARSE_OK
LATTICRA_LAT_PARSE_NULL_ARGUMENT
LATTICRA_LAT_PARSE_EMPTY_SOURCE
LATTICRA_LAT_PARSE_SOURCE_TOO_LARGE
LATTICRA_LAT_PARSE_UNSUPPORTED_EXTENSION_CLAIM
LATTICRA_LAT_PARSE_MISSING_MODULE
LATTICRA_LAT_PARSE_INVALID_MODULE_NAME
LATTICRA_LAT_PARSE_UNBALANCED_BRACE
LATTICRA_LAT_PARSE_UNKNOWN_DECLARATION
LATTICRA_LAT_PARSE_INVALID_DECLARATION_NAME
LATTICRA_LAT_PARSE_UNTERMINATED_STRING
LATTICRA_LAT_PARSE_INVALID_STRING_ESCAPE
LATTICRA_LAT_PARSE_INVALID_HEX_ESCAPE
LATTICRA_LAT_PARSE_LITERAL_NUL_IN_STRING
LATTICRA_LAT_PARSE_CAPACITY_EXCEEDED
LATTICRA_LAT_PARSE_FORBIDDEN_BEHAVIOR_MARKER
LATTICRA_LAT_PARSE_INTERNAL_ERROR
```

Stable labels:

```
ok
null_argument
empty_source
source_too_large
unsupported_extension_claim
missing_module
invalid_module_name
unbalanced_brace
unknown_declaration
invalid_declaration_name
unterminated_string
invalid_string_escape
invalid_hex_escape
literal_nul_in_string
capacity_exceeded
forbidden_behavior_marker
internal_error
```

Declaration kind enum

Add declaration kind enum values:

```
LATTICRA_LAT_DECLARATION_STATE
LATTICRA_LAT_DECLARATION_POLICY
LATTICRA_LAT_DECLARATION_TRANSITION
LATTICRA_LAT_DECLARATION_ASSERTION
LATTICRA_LAT_DECLARATION_EFFECT
LATTICRA_LAT_DECLARATION_UNKNOWN
```

Stable labels:

```
state
policy
transition
assertion
effect
unknown
```

Effect enum

Add effect enum values:

```
LATTICRA_LAT_EFFECT_NONE
LATTICRA_LAT_EFFECT_READ
LATTICRA_LAT_EFFECT_LOCAL_MUTATION
LATTICRA_LAT_EFFECT_HOST_MUTATION
LATTICRA_LAT_EFFECT_NETWORK
LATTICRA_LAT_EFFECT_HARDWARE
```

```
LATTICRA_LAT_EFFECT_BOOT
LATTICRA_LAT_EFFECT_RECOVERY
LATTICRA_LAT_EFFECT_EXTERNAL
LATTICRA_LAT_EFFECT_UNKNOWN
```

Stable labels:

```
none
read
local_mutation
host_mutation
network
hardware
boot
recovery
external
unknown
```

Effects remain metadata only.

Source span struct

Use a Lat source-span struct compatible with existing source-span conventions:

```
size_t start_offset;
size_t end_offset;
size_t start_line;
size_t start_column;
size_t end_line;
size_t end_column;
```

A future implementation may reuse latticra_l_ui_source_span_t only if that does not create unwanted coupling.

AST module struct

Add module metadata fields:

```
char module_name[LATTICRA_LAT_NAME_MAX];
latticra_lat_source_span_t span;
size_t declaration_count;
size_t state_count;
size_t policy_count;
size_t transition_count;
size_t assertion_count;
size_t effect_count;
```

AST declaration struct

Add declaration metadata fields:

```
latticra_lat_declaration_kind_t kind;
char name[LATTICRA_LAT_NAME_MAX];
char source_name[LATTICRA_LAT_NAME_MAX];
latticra_lat_source_span_t span;
size_t first_clause_index;
size_t clause_count;
```

source_name is used by transition declarations for the from <StateName> source state.

AST clause struct

Add clause metadata fields:

```
char keyword[LATTICRA_LAT_NAME_MAX];
char left[LATTICRA_LAT_NAME_MAX];
char operator_text[LATTICRA_LAT_NAME_MAX];
char right[LATTICRA_LAT_VALUE_MAX];
latticra_lat_effect_t effect;
latticra_lat_source_span_t span;
```

Clause values are metadata only.

Parse result struct

Add parse result fields:

```
latticra_status_t status;
latticra_lat_parse_error_t error;
latticra_lat_source_span_t span;
latticra_lat_ast_module_t module;
latticra_lat_ast_declaration_t declarations[LATTICRA_LAT_DECLARATION_MAX];
latticra_lat_ast_clause_t clauses[LATTICRA_LAT_CLAUSE_MAX];
size_t declaration_count;
size_t clause_count;
int no_effect;
int execution_allowed;
int mutation_allowed;
int server_allowed;
int recovery_allowed;
int hardware_allowed;
```

The result must be fully initialized on success and failure.

Accepted fixture paths

The implementation PR should add at least one fixture file:

```
fixtures/lat/minimal_module.lat
```

Recommended fixture content:

```
lat module RootModule {
  state RootCell {
    origin = &quot;0/0&quot;
    route = &quot;ROOT&quot;
    axis = &quot;ROOT&quot;
    path = &quot;/&quot;
    host_effect = none
    external_effect = none
  }
}
```

Additional in-test string fixtures may be used for policy, transition, assertion, and effect declarations.

Parser ownership rules

The first parser should:

- never retain pointers into caller-owned source buffers;
- copy names and values into bounded fixed-size fields;
- reject capacity overflow deterministically;
- preserve source spans;
- return status codes;
- avoid heap allocation;
- avoid file I/O;
- avoid global mutable state;
- avoid execution or evaluation.

String literal handling

String handling should align with L-UI string policy:

```
\\
\&quot;
\n
\r
\t
\xHH
```

The first Lat parser should reject:

```
unterminated strings
unsupported escapes
invalid hex escapes
```

```
literal source-buffer NUL bytes
string values that exceed bounded storage
```

Escaped decoded NUL through \x00 may be accepted only if explicit length-carrying storage is implemented in the same parser slice. If not, it should be rejected in the first parser implementation plan follow-up.

Forbidden behavior markers

The parser should reject obvious behavior markers that imply execution before contracts exist:

```
exec
spawn
syscall
socket
open_file
write_file
hardware_write
```

These markers may appear only in comments if comments are stripped before validation.

Report format

latticra_lat_parse_report should emit a deterministic bounded report:

```
LAT GRAMMAR REPORT
status=&lt;integer-status&gt;
error=&lt;lat-error-label&gt;
module=&lt;module-name&gt;
declaration_count=&lt;count&gt;
state_count=&lt;count&gt;
policy_count=&lt;count&gt;
transition_count=&lt;count&gt;
assertion_count=&lt;count&gt;
effect_count=&lt;count&gt;
clause_count=&lt;count&gt;
no_effect=&lt;0|1&gt;
execution_allowed=&lt;0|1&gt;
mutation_allowed=&lt;0|1&gt;
server_allowed=&lt;0|1&gt;
recovery_allowed=&lt;0|1&gt;
hardware_allowed=&lt;0|1&gt;
span_start_offset=&lt;offset&gt;
span_end_offset=&lt;offset&gt;
span_start_line=&lt;line&gt;
span_start_column=&lt;column&gt;
span_end_line=&lt;line&gt;
span_end_column=&lt;column&gt;
```

Small output buffers should return LATTICRA_STATUS_BUFFER_TOO_SMALL and clear the buffer.

Source-span mapping

Use these source-span mappings:

```
module -&gt; full module declaration span
declaration -&gt; full declaration span
field assignment -&gt; assignment clause span
require clause -&gt; requirement clause span
ensure clause -&gt; ensure clause span
effect clause -&gt; effect clause span
string literal -&gt; string token span if exposed later
identifier reference -&gt; identifier token span if exposed later
```

The parser must not invent byte offsets.

No-effect preservation

Lat grammar parsing is metadata-only.

It must preserve:

```
no_effect=1
execution_allowed=0
mutation_allowed=0
```

```
server_allowed=0
recovery_allowed=0
hardware_allowed=0
```

Exact implementation test list

The implementation PR should include tests for:

```
lat_grammar_accepts_minimal_module
lat_grammar_accepts_state_declaration
lat_grammar_accepts_policy_declaration
lat_grammar_accepts_transition_declaration
lat_grammar_accepts_assertion_declaration
lat_grammar_accepts_effect_declaration
lat_grammar_rejects_plain_l_extension_claim
lat_grammar_rejects_unknown_keyword
lat_grammar_rejects_unterminated_string
lat_grammar_rejects_invalid_escape
lat_grammar_rejects_literal_source_nul
lat_grammar_reports_source_spans
lat_grammar_preserves_no_effect_flags
lat_grammar_report_is_deterministic
lat_grammar_report_rejects_small_buffer
lat_grammar_error_labels_are_stable
lat_grammar_kind_labels_are_stable
lat_grammar_does_not_lower_to_lir
lat_grammar_does_not_execute_declarations
lat_grammar_is_deterministic
```

Test file plan

Add:

```
tests/lat_language_grammar_invariants.c
scripts/test-lat-language-grammar.sh
fixtures/lat/minimal_module.lat
```

Wire into:

```
.github/workflows/c.yml
```

Run after:

```
sh scripts/test-lat-language-grammar-contract.sh
```

and before:

```
sh scripts/test-state-lattice.sh
```

Documentation update plan

The implementation PR should update:

```
README.md
STATUS.md
docs/FOUNDATION_INDEX.md
docs/status/CURRENT_STATUS.md
docs/status/ANNOUNCEMENTS.md
docs/project_notes/CURRENT_DIRECTION.md
docs/project_notes/UPCOMING_WORK.md
docs/strategy/2026-05-15-2249-cdt-national-security-open-system-strategy.md
docs/LAT_LANGUAGE_GRAMMAR_CONTRACT.md
scripts/test-project-strategy-status-framework.sh
```

and add:

```
docs/LAT_LANGUAGE_GRAMMAR_IMPLEMENTATION.md
```

Compatibility expectations

The implementation must not change:

```
language naming policy
.lat canonical extension
C/C++ foundation direction
L-UI parser behavior
L-UI semantic validation behavior
LIR shape behavior
state lattice behavior
```

```
Nucleus preview behavior
escaped decoded NUL acceptance
literal source-buffer NUL rejection
no-effect flags
```

Forbidden implementation behavior

Lat grammar implementation must not:

- claim plain L as the public language name;
- claim .l as the canonical source extension;
- execute declarations;
- mutate state;
- lower to LIR;
- render L-UI;
- call Nucleus task execution;
- evaluate host state;
- write files;
- read files;
- open network connections;
- call server code;
- call update code;
- call recovery code;
- call hardware code;
- broaden L-UI behavior;
- weaken semantic validation;
- accept literal source-buffer NUL;
- imply a compiler, interpreter, runtime, package manager, sandbox, or operating-system surface.

Current validation command

This implementation plan is guarded by:

```
sh scripts/test-lat-language-grammar-implementation-plan.sh
```

The guard is static. It does not implement Lat parsing.

Implementation gate

Lat grammar parser implementation code may be added only after this plan is merged.

Non-claims

This document does not implement Lat, Lat-Core, Lat-Orch, a parser, compiler, interpreter, runtime, package manager, LIR lowering, L-UI rendering, command behavior, Nucleus task handling, live movement, state mutation, recovery behavior, server interaction, self-update, hardware support, boot readiness, security isolation, sandboxing, malware prevention, ransomware prevention, or operating-system completeness.

docs/LAT_MODEL_NORMALIZATION_IMPLEMENTATION.md

Source title: Lat Model Normalization Implementation

Lines: 151 | Words: 430 | SHA-256: 2f4a44b217a2915941eed90be561646dee5dc149a9b0598ca88987e49e71898a

Lat Model Normalization Implementation

Status: no-effect implementation with first-declaration and first-clause report metadata

Scope: bounded Lat / Latticra Language model normalization after grammar parsing and semantic validation, before LIR lowering, execution, runtime behavior, or operating-system behavior.

Purpose

This slice adds a normalized Lat module model between semantic validation and Lat-to-LIR lowering.

The model consumes only bounded parser and semantic metadata. It builds deterministic declaration and clause tables for states, policies, transitions, assertions, and effect declarations while preserving source spans and no-effect flags.

It does not read source bytes, execute Lat, interpret transitions, lower to LIR, execute LIR, mutate state, perform file I/O, perform network I/O, call recovery behavior, touch hardware, or grant runtime authority.

Implementation Files

```
include/latticra/lat_model.h
src/lat_model.c
tests/lat_model_normalization_invariants.c
scripts/test-lat-model-normalization.sh
.github/workflows/lat-model-normalization.yml
```

Public API

The public API adds:

```
latticra_lat_model_error_t
latticra_lat_model_clause_role_t
latticra_lat_model_declaration_t
latticra_lat_model_clause_t
latticra_lat_model_t
latticra_lat_model_error_label
latticra_lat_model_clause_role_label
latticra_lat_model_normalize_module
latticra_lat_model_report
```

Normalized Tables

The model preserves the parser declaration order and adds typed index tables:

```
state_indices
policy_indices
transition_indices
assertion_indices
effect_indices
```

Transition declarations also carry a resolved source-state declaration index.

Clauses are normalized into stable roles:

```
field
require
ensure
effect
```

Each clause records its owner declaration index, owner declaration kind, name, operator text, value, effect metadata, and source span.

Report Format

latticra_lat_model_report emits a deterministic bounded report beginning with:

```
LAT MODEL NORMALIZATION REPORT
```

and including:

```
status
error
module
declaration_count
state_count
policy_count
transition_count
assertion_count
effect_count
clause_count
first_declaration_index
first_declaration_kind
first_declaration_name
first_declaration_source
first_declaration_parse_index
first_declaration_first_clause_index
first_declaration_clause_count
first_declaration_source_index
first_state_index
first_policy_index
first_transition_index
first_transition_source_index
first_clause_index
first_clause_role
first_clause_effect
first_clause_name
first_clause_operator
first_clause_value
first_assertion_index
first_effect_index
no_effect
execution_allowed
mutation_allowed
server_allowed
recovery_allowed
hardware_allowed
source span fields
```

The first-declaration fields are copied from the normalized declaration table for audit visibility only and are materialized only after successful normalization.

The first-clause fields are copied from the normalized clause table for audit visibility only. Operators are not evaluated.

Small output buffers return LATTICRA_STATUS_BUFFER_TOO_SMALL and clear the output buffer when possible.

Validation

Run:

```
sh scripts/test-lat-model-normalization.sh
sh scripts/test-lat-pipeline.sh
```

The invariants verify:

```
lat_model_labels_are_stable
lat_model_normalizes_foundation_counts
lat_model_builds_typed_declaration_indices
lat_model_builds_clause_roles_and_owners
lat_model_rejects_parse_failure
lat_model_rejects_semantic_failure
lat_model_preserves_no_effect_flags
lat_model_report_is_deterministic
lat_model_report_rejects_small_buffer
```

The Lat pipeline now also calls latticra_lat_model_normalize_module internally. Callers that need the normalized model can use latticra_lat_pipeline_run_source_with_model; existing callers can continue using latticra_lat_pipeline_run_source.

Lat-to-LIR lowering now has a model-aware entry point, latticra_lir_lower_lat_model, that consumes this normalized model directly. The older latticra_lir_lower_lat_module entry point remains available and normalizes a local model before lowering.

Non-Claims

This implementation does not provide Lat execution, Lat compilation, Lat interpretation, LIR execution, runtime behavior, command execution, mutation, file I/O, network I/O, recovery behavior, hardware behavior, sandboxing, malware prevention, ransomware prevention, certification, accreditation, or operating-system completeness.

docs/LAT_PIPELINE_CONTRACT.md

Source title: Latticra Lat Pipeline Contract

Lines: 176 | Words: 521 | SHA-256: cfa96866bc3e88ff65611da64945f3d33107cfd929356e34f1cb160cec97763b

Latticra Lat Pipeline Contract

Status: Lat pipeline contract Scope: bounded no-effect composition of Lat grammar parsing, Lat semantic validation, and Lat-to-LIR lowering.

Purpose

This contract defines the first Lat / Latticra Language pipeline boundary.

The pipeline consumes Lat source bytes and coordinates the already bounded stages:

```
Lat source -&gt; grammar parser -&gt; semantic validator -&gt; Lat-to-LIR lowering -&gt;
pipeline report
```

The pipeline is not a compiler, interpreter, runtime, executor, package manager, or operating-system surface. It is a deterministic composition/report boundary over parser, semantic, and LIR metadata.

Relationship to existing work

This contract depends on:

```
include/latticra/lat_parser.h
include/latticra/lat_semantic.h
include/latticra/lat_to_lir.h
include/latticra/lir.h
src/lat_parser.c
src/lat_semantic.c
src/lat_to_lir.c
docs/LAT_LANGUAGE_GRAMMAR_IMPLEMENTATION.md
docs/LAT_SEMANTIC_VALIDATION_IMPLEMENTATION.md
docs/LAT_TO_LIR_LOWERING_IMPLEMENTATION.md
```

Those files remain the source of truth for syntax parsing, semantic validation, LIR shape, lowering behavior, reports, capacities, and non-claims.

Pipeline posture

The pipeline must preserve:

```
no_effect=1
execution_allowed=0
mutation_allowed=0
server_allowed=0
recovery_allowed=0
hardware_allowed=0
```

The pipeline must not execute Lat or LIR. It must not evaluate host state, mutate state, write files, read files, open network connections, invoke server behavior, invoke recovery behavior, touch hardware, boot anything, or perform command behavior.

Input contract

The pipeline accepts:

```
const char *source
size_t source_len
```

The caller provides storage for all intermediate and final records:

```
latticra_lat_parse_result_t
latticra_lat_semantic_result_t
latticra_lir_module_t
latticra_lat_to_lir_result_t
latticra_lat_pipeline_result_t
```

The pipeline does not allocate memory and does not take ownership of caller buffers.

Output contract

The pipeline produces:

```
latticra_lat_pipeline_result_t
```

The result summarizes:

```
status
pipeline error
parse error
semantic error
lowering error
LIR error
module name
source length
declaration count
clause count
node count
edge count
semantic_valid
no-effect flags
source span
```

Stable pipeline error labels

The first stable pipeline labels are:

```
ok
null_argument
parse_not_ok
semantic_not_ok
semantic_not_valid
lowering_not_ok
no_effect_violation
internal_error
```

Classification rules

Pipeline classification is ordered:

1. Null arguments return LATTICRA_STATUS_NULL_ARGUMENT.
2. Parser status failures are internal status failures.
3. Parser metadata errors are summarized as parse_not_ok.
4. Semantic metadata errors are summarized as semantic_not_ok.
5. A semantic result that is not valid is summarized as semantic_not_valid.
6. Lat-to-LIR or LIR metadata errors are summarized as lowering_not_ok.
7. Any no-effect flag violation is summarized as no_effect_violation.
8. Only a fully successful bounded path reports ok.

Report format

latticra_lat_pipeline_report emits a deterministic bounded report beginning with:

```
LAT PIPELINE REPORT
```

The report includes status, error labels, module metadata, counts, no-effect flags, and source-span metadata.

Small output buffers must return LATTICRA_STATUS_BUFFER_TOO_SMALL and clear the buffer when possible.

Required implementation files

The implementation slice must add:

```
include/latticra/lat_pipeline.h
src/lat_pipeline.c
tests/lat_pipeline_invariants.c
scripts/test-lat-pipeline.sh
.github/workflows/lat-pipeline.yml
docs/LAT_PIPELINE_IMPLEMENTATION_PLAN.md
docs/LAT_PIPELINE_IMPLEMENTATION.md
```

Required tests

The implementation must include invariant coverage for:

```
lat_pipeline_accepts_foundation_model
lat_pipeline_preserves_counts
lat_pipeline_rejects_parse_failure
lat_pipeline_rejects_semantic_failure
lat_pipeline_preserves_no_effect_flags
lat_pipeline_report_is_deterministic
lat_pipeline_report_rejects_small_buffer
lat_pipeline_error_labels_are_stable
```

Compatibility expectations

This contract must not change parser behavior, semantic validation behavior, LIR shape behavior, Lat-to-LIR lowering behavior, L-UI behavior, C++ authority behavior, Nucleus behavior, runtime behavior, or existing report labels.

Non-claims

This contract does not implement Lat execution, Lat compilation, Lat interpretation, LIR execution, L-UI rendering, command behavior, runtime behavior, Nucleus task execution, mutation, file I/O, network I/O, recovery behavior, hardware behavior, malware prevention, ransomware prevention, sandboxing, certification, accreditation, or operating-system completeness.

docs/LAT_PIPELINE_DIAGNOSTIC_INTEGRATION_REFINEMENT.md

Source title: Lat Pipeline Diagnostic Integration Refinement

Lines: 104 | Words: 324 | SHA-256: ae6340877df5028763ddf7410396ba49df9d428f353f599a1f23050f8fc5a6e6

Lat Pipeline Diagnostic Integration Refinement

Status: lowering-aware implementation with parse-error, pipeline-span, comment, first-declaration, and first-clause metadata

This slice adds a companion Lat pipeline diagnostics API that combines pipeline stage/error state with parser error metadata, pipeline span metadata, parser line-comment metadata, Lat semantic diagnostic class, count, first-diagnostic indices, model-stage classification, and optional Lat-to-LIR lowering diagnostic metadata.

Files:

```
include/latticra/lat_pipeline_diagnostics.h
src/lat_pipeline_diagnostics.c
src/lat_pipeline_diagnostics_eval.c
src/lat_pipeline_diagnostics_report.c
include/latticra/lat_to_lir_diagnostics.h
src/lat_to_lir_diagnostics.c
tests/lat_pipeline_diagnostic_integration_refinement.c
```

The compatibility evaluator remains available:

```
latticra_lat_pipeline_diagnostics_evaluate
```

The lowering-aware evaluator adds optional lowering and LIR inputs:

```
latticra_lat_pipeline_diagnostics_evaluate_with_lowering
```

The diagnostic class labels include:

```
valid
parse
semantic
model
lowering
lir
effect-check
internal
```

When lowering metadata is provided, the pipeline diagnostic result also records:

```
lowering_class
lowering_error
model_error
lir_error
parse_error
pipeline_span_start_offset
pipeline_span_end_offset
pipeline_span_start_line
pipeline_span_start_column
pipeline_span_end_line
pipeline_span_end_column
comment_count
first_comment_start_offset
first_comment_end_offset
first_comment_start_line
first_comment_start_column
first_comment_end_line
first_comment_end_column
lowering_model_declaration_count
lowering_model_clause_count
lowering_first_declaration_node_index
lowering_first_declaration_kind
lowering_first_declaration_name
lowering_first_declaration_source
lowering_first_declaration_parse_index
lowering_first_declaration_first_clause_index
lowering_first_declaration_clause_count
lowering_first_declaration_source_index
lowering_first_transition_source_index
lowering_first_clause_node_index
lowering_first_clause_role
lowering_first_clause_effect
lowering_first_clause_name
lowering_first_clause_operator
lowering_first_clause_value
lowering_failed
model_failed
lir_failed
```

Parse-error metadata is copied from the Lat pipeline result. It records the parser error label, including specific parse-failure reasons such as unsupported_block_comment, for report/audit use only.

Pipeline span metadata is copied from the Lat pipeline result. It records the successful module span or the parse-failure diagnostic span for report/audit use only.

Comment metadata is copied from the Lat pipeline result. It records the parser line-comment count and first-comment span for diagnostic/report audit use only, including parse-failure diagnostics where a line comment appears before an unsupported block-comment opener.

First-declaration metadata is copied from the Lat-to-LIR diagnostic result. It records the first lowered declaration node index, declaration kind, name, source name, parse declaration index, first-clause index, clause count, and source declaration index for report/audit use only.

First-clause metadata is copied from the Lat-to-LIR diagnostic result. It records the first lowered clause node index, normalized clause role, effect label, name, operator text, and value text for report/audit use only.

Validation:

```
sh scripts/test-lat-pipeline-diagnostic-integration-refinement.sh
sh scripts/test-lat-pipeline.sh
```

Boundary: diagnostic metadata only. No Lat execution is added.

docs/LAT_PIPELINE_DIAGNOSTIC_MAIN_TEST_INTEGRATION_AUDIT.md

Source title: Lat Pipeline Diagnostic Main Test Integration Audit

Lines: 25 | Words: 73 | SHA-256: 6f130f6e8ea29512838ee45b28e4aac7cf05c7f72fb18b8bfa5c9601bb95c242

Lat Pipeline Diagnostic Main Test Integration Audit

Status: initial audit guard

This record verifies that the Lat pipeline diagnostic integration is covered by the main Lat pipeline test runner, not only by its focused guard.

Audit expectations:

```
scripts/test-lat-pipeline.sh links src/lat_pipeline_diagnostics.c
scripts/test-lat-pipeline.sh links src/lat_pipeline_diagnostics_eval.c
scripts/test-lat-pipeline.sh links src/lat_pipeline_diagnostics_report.c
scripts/test-lat-pipeline.sh links src/lat_to_lir_diagnostics.c
scripts/test-lat-pipeline.sh compiles tests/lat_pipeline_diagnostic_integration_refinement.c
.github/workflows/lat-pipeline.yml runs scripts/test-lat-pipeline.sh
```

Validation:

```
sh scripts/test-lat-pipeline-diagnostic-main-test-integration-audit.sh
sh scripts/test-lat-pipeline.sh
```

Boundary: audit/guard only. No Lat execution is added.

docs/LAT_PIPELINE_IMPLEMENTATION.md

Source title: Latticra Lat Pipeline Implementation

Lines: 98 | Words: 387 | SHA-256: 577b63b96ed2349a82ad6eca0ba8064014884b28af17772ac1f778d8888e9aea

Latticra Lat Pipeline Implementation

Status: initial implementation contract Scope: first bounded no-effect Lat pipeline API, source composition, summary report, invariants, and workflow.

Purpose

This slice adds a no-effect Lat pipeline that composes the existing Lat parser, Lat semantic validator, Lat model normalization layer, and Lat-to-LIR lowering layer into one deterministic report boundary.

The pipeline is intended to make the currently separate stages easier to validate together without changing the behavior of any stage.

Added files

```
include/latticra/lat_pipeline.h
src/lat_pipeline.c
tests/lat_pipeline_invariants.c
scripts/test-lat-pipeline.sh
.github/workflows/lat-pipeline.yml
```

Public API

The public API adds:

```
latticra_lat_pipeline_error_t
latticra_lat_pipeline_result_t
latticra_lat_pipeline_error_label
latticra_lat_pipeline_run_source
latticra_lat_pipeline_run_source_with_model
latticra_lat_pipeline_report
```

Behavior

latticra_lat_pipeline_run_source performs the bounded metadata path:

```
source bytes
  -&gt; latticra_lat_parse_source
  -&gt; latticra_lat_validate_module
  -&gt; latticra_lat_model_normalize_module
  -&gt; latticra_lir_lower_lat_model
  -&gt; latticra_lat_pipeline_result_t
```

The wrapper entry point latticra_lat_pipeline_run_source preserves the original caller shape and runs normalization internally. The model-aware entry point latticra_lat_pipeline_run_source_with_model also returns the normalized model to callers. Lowering now consumes that normalized model directly.

The function records parser, semantic, model, lowering, and LIR errors separately, then classifies the aggregate pipeline state.

The companion pipeline diagnostic surface can now evaluate with optional Lat-to-LIR lowering diagnostics so pipeline reports can expose lowering class, model error, LIR error, model counts, transition source index, first-clause metadata, and failure flags without changing pipeline execution behavior.

Report surface

latticra_lat_pipeline_report emits:

```
LAT PIPELINE REPORT
```

with deterministic fields for status, aggregate error, stage errors, module name, source length, validity, parser counts, model counts, transition source index metadata, first-clause metadata copied from lowering, no-effect flags, and source spans.

Small buffers return LATTICRA_STATUS_BUFFER_TOO_SMALL and are cleared when possible.

Validation

Run:

```
sh scripts/test-lat-pipeline.sh
```

The invariant suite covers:

```
lat_pipeline_accepts_foundation_model
lat_pipeline_exposes_normalized_model
lat_pipeline_preserves_counts
lat_pipeline_rejects_parse_failure
lat_pipeline_rejects_semantic_failure
lat_pipeline_preserves_no_effect_flags
lat_pipeline_report_is_deterministic
lat_pipeline_report_rejects_small_buffer
lat_pipeline_error_labels_are_stable
```

Boundary

This slice does not execute Lat, execute LIR, perform runtime behavior, mutate state, perform file I/O, perform network I/O, call server code, call recovery code, touch hardware, control a terminal, call Nucleus task execution, or grant C++ authority.

Compatibility

The implementation is a composition layer. It does not modify parser, semantic validator, Lat model normalization, LIR, Lat-to-LIR lowering, L-UI, C++ authority, Nucleus, or runtime-boundary APIs.

Non-claims

This implementation does not provide a Lat compiler, Lat interpreter, Lat runtime, LIR executor, command system, task executor, production runtime, security boundary, malware prevention guarantee, ransomware prevention guarantee, certification, accreditation, or operating-system replacement.

docs/LAT_PIPELINE_IMPLEMENTATION_PLAN.md

Source title: Latticra Lat Pipeline Implementation Plan

Lines: 194 | Words: 435 | SHA-256: cf8e4f401ddc11cc5ca0d6402fb3b03ed15daa97690e93b1ba1a27572c557e82

Latticra Lat Pipeline Implementation Plan

Status: implementation planning contract Scope: exact public API, result struct, classification rules, report surface, tests, workflow, compatibility expectations, and non-claims before Lat pipeline implementation code.

Purpose

This plan defines the first no-effect Lat pipeline implementation.

The implementation should compose the existing bounded stages:

```
latticra_lat_parse_source
latticra_lat_validate_module
latticra_lir_lower_lat_module
```

and summarize their outputs through one deterministic pipeline result and report.

Implementation files

Add:

```
include/latticra/lat_pipeline.h
src/lat_pipeline.c
tests/lat_pipeline_invariants.c
scripts/test-lat-pipeline.sh
.github/workflows/lat-pipeline.yml
docs/LAT_PIPELINE_IMPLEMENTATION.md
```

Update status and index records to include the pipeline as the next bounded no-effect Lat integration slice.

Public API shape

Add:

```
latticra_lat_pipeline_error_t
latticra_lat_pipeline_result_t
latticra_lat_pipeline_error_label
latticra_lat_pipeline_run_source
latticra_lat_pipeline_report
```

Recommended signatures:

```
const char *latticra_lat_pipeline_error_label(latticra_lat_pipeline_error_t error);

latticra_status_t latticra_lat_pipeline_run_source(
    const char *source,
    size_t source_len,
    latticra_lat_parse_result_t *parse_result,
    latticra_lat_semantic_result_t *semantic_result,
    latticra_lir_module_t *module,
    latticra_lat_to_lir_result_t *lowering_result,
    latticra_lat_pipeline_result_t *pipeline_result);

latticra_status_t latticra_lat_pipeline_report(
    const latticra_lat_pipeline_result_t *result,
    char *buffer,
    size_t buffer_len);
```

Capacity constant

Add:

```
LATTICRA_LAT_PIPELINE_REPORT_MAX 8192u
```

Result fields

The result should include:

```
latticra_status_t status;
latticra_lat_pipeline_error_t error;
latticra_lat_parse_error_t parse_error;
latticra_lat_semantic_error_t semantic_error;
latticra_lat_to_lir_error_t lowering_error;
latticra_lir_error_t lir_error;
latticra_lat_source_span_t span;
char module_name[LATTICRA_LAT_NAME_MAX];
size_t source_len;
size_t declaration_count;
size_t clause_count;
size_t node_count;
size_t edge_count;
int semantic_valid;
int no_effect;
int execution_allowed;
int mutation_allowed;
int server_allowed;
int recovery_allowed;
int hardware_allowed;
```

Error enum

Add:

```
LATTICRA_LAT_PIPELINE_OK
LATTICRA_LAT_PIPELINE_NULL_ARGUMENT
LATTICRA_LAT_PIPELINE_PARSE_NOT_OK
LATTICRA_LAT_PIPELINE_SEMANTIC_NOT_OK
LATTICRA_LAT_PIPELINE_SEMANTIC_NOT_VALID
LATTICRA_LAT_PIPELINE_LOWERING_NOT_OK
LATTICRA_LAT_PIPELINE_NO_EFFECT_VIOLATION
LATTICRA_LAT_PIPELINE_INTERNAL_ERROR
```

Stable labels:

```
ok
null_argument
parse_not_ok
semantic_not_ok
semantic_not_valid
lowering_not_ok
no_effect_violation
internal_error
```

Algorithm

1. Reject null pointers with LATTICRA_STATUS_NULL_ARGUMENT.
2. Initialize the pipeline result deterministically.
3. Parse the source using the existing Lat parser.

4. Validate semantic metadata using the existing Lat semantic validator.
5. Lower to LIR using the existing Lat-to-LIR lowering layer.
6. Summarize parse, semantic, lowering, LIR, count, source-span, and no-effect metadata.
7. Classify the pipeline result using ordered metadata errors.
8. Emit deterministic reports with small-buffer rejection and clearing.

Test command

Add:

```
sh scripts/test-lat-pipeline.sh
```

Compile with:

```
-std=c99 -Wall -Wextra -Werror -pedantic
```

and include:

```
src/lat_parser.c
src/lat_semantic.c
src/lir.c
src/lat_to_lir.c
src/lat_pipeline.c
tests/lat_pipeline_invariants.c
```

Workflow

Add a dedicated workflow:

```
.github/workflows/lat-pipeline.yml
```

The workflow should run the pipeline test script on pull requests and pushes to main.

Compatibility expectations

This implementation must not change:

```
Lat parser API or labels
Lat semantic validation API or labels
LIR API or labels
Lat-to-LIR lowering API or labels
L-UI parser, semantic, LIR, or rendering behavior
C++ authority behavior
Nucleus task behavior
runtime boundary behavior
no-effect flags
```

Non-claims

This implementation plan does not implement Lat execution, Lat compilation, Lat interpretation, LIR execution, command behavior, runtime behavior, Nucleus task execution, mutation, file I/O, network I/O, recovery behavior, hardware behavior, sandboxing, malware prevention, ransomware prevention, or operating-system completeness.

docs/LAT_PIPELINE_REPORT_REFINEMENT.md

Source title: Latticra Lat Pipeline Report Refinement

Lines: 221 | Words: 662 | SHA-256: 57248b254624b081e625c8dc456bbb88d837bdb57030a48bd5e53107f8122508

Latticra Lat Pipeline Report Refinement

Status: Lat pipeline report refinement implementation with comment, first-declaration, and first-clause metadata Scope: deterministic Lat pipeline stage-summary metadata, parser span report fields, line-comment report fields, first-declaration report fields, first-clause report fields, invariant tests, guard coverage, and workflow wiring.

Purpose

This document records the Lat pipeline report refinement after the first Lat pipeline implementation and the runtime boundary report refinement.

The goal is to make the Lat pipeline report clearer about which stage completed, which stage failed, and whether the full no-effect chain remained intact.

This refinement does not execute Lat, execute LIR, compile Lat, interpret Lat, mutate state, perform I/O, or provide runtime behavior.

Added report metadata

The Lat pipeline result now records:

```
last_completed_stage
failed_stage
parse_ok
semantic_ok
model_ok
lowering_ok
lir_ok
no_effect_chain_ok
evidence_level
comment_count
first_comment_start_offset
first_comment_end_offset
first_comment_start_line
first_comment_start_column
first_comment_end_line
first_comment_end_column
first_declaration_node_index
first_declaration_kind
first_declaration_name
first_declaration_source
first_declaration_parse_index
first_declaration_first_clause_index
first_declaration_clause_count
first_declaration_source_index
first_clause_node_index
first_clause_role
first_clause_effect
first_clause_name
first_clause_operator
first_clause_value
```

The deterministic LAT PIPELINE REPORT now emits these fields as labels and integers. Line-comment metadata is copied from the parser result, and first-declaration plus first-clause metadata is copied from the Lat-to-LIR lowering result for audit visibility only.

The pipeline span is copied from the parser result span. Successful parses therefore report the module span, while parse failures report the parser diagnostic span, such as the unsupported block-comment opener location.

Stage labels

Initial stage labels:

```
none
parse
semantic
model
lowering
lir
effect-check
report
unknown
```

Evidence level

The Lat pipeline report uses a small deterministic evidence label:

```
0 -&gt; unavailable or internal/null pipeline evidence
```

```
1 -&gt; partial pipeline evidence with a known failed stage
2 -&gt; complete no-effect pipeline report evidence
```

This is a project-internal evidence label, not a certification, production-readiness claim, or security guarantee.

Successful report path

A successful Lat pipeline report records:

```
last_completed_stage=report
failed_stage=none
parse_ok=1
semantic_ok=1
model_ok=1
lowering_ok=1
lir_ok=1
no_effect_chain_ok=1
evidence_level=2
comment_count=&lt;line comment count from parse result&gt;
first_comment_start_offset=&lt;first line comment start offset&gt;
first_comment_end_offset=&lt;first line comment end offset&gt;
first_comment_start_line=&lt;first line comment start line&gt;
first_comment_start_column=&lt;first line comment start column&gt;
first_comment_end_line=&lt;first line comment end line&gt;
first_comment_end_column=&lt;first line comment end column&gt;
first_declaration_node_index=&lt;first lowered declaration node index&gt;
first_declaration_kind=&lt;first lowered declaration kind&gt;
first_declaration_name=&lt;first lowered declaration name&gt;
first_declaration_source=&lt;first lowered declaration source name&gt;
first_declaration_parse_index=&lt;first lowered declaration parse index&gt;
first_declaration_first_clause_index=&lt;first lowered declaration first clause index&gt;
first_declaration_clause_count=&lt;first lowered declaration clause count&gt;
first_declaration_source_index=&lt;first lowered declaration source index&gt;
first_clause_node_index=&lt;first lowered clause node index&gt;
first_clause_role=&lt;first lowered clause role&gt;
first_clause_effect=&lt;first lowered clause effect&gt;
first_clause_name=&lt;first lowered clause name&gt;
first_clause_operator=&lt;first lowered clause operator text&gt;
first_clause_value=&lt;first lowered clause value text&gt;
```

Failure report path

Known failure paths record the failed stage deterministically:

```
parse_not_ok -&gt; failed_stage=parse
semantic_not_ok -&gt; failed_stage=semantic
semantic_not_valid -&gt; failed_stage=semantic
model_not_ok -&gt; failed_stage=model
lowering_not_ok -&gt; failed_stage=lowering
no_effect_violation -&gt; failed_stage=effect-check
null_argument / internal_error -&gt; failed_stage=unknown
```

Implementation files

This slice updates or adds:

```
include/latticra/lat_pipeline.h
src/lat_pipeline.c
tests/lat_pipeline_invariants.c
tests/lat_pipeline_report_refinement.c
docs/LAT_PIPELINE_REPORT_REFINEMENT.md
scripts/test-lat-pipeline-report-refinement.sh
.github/workflows/lat-pipeline-report-refinement.yml
```

The existing Lat pipeline runner also compiles and runs the focused report refinement tests:

```
scripts/test-lat-pipeline.sh
```

Validation

Run:

```
sh scripts/test-lat-pipeline-report-refinement.sh
sh scripts/test-lat-pipeline.sh
```

The focused invariant tests verify:

```
lat_pipeline_report_refinement_labels_are_stable
lat_pipeline_report_refinement_reports_success_stage_summary
lat_pipeline_report_refinement_reports_parse_failure_stage
lat_pipeline_report_refinement_reports_semantic_failure_stage
lat_pipeline_report_refinement_null_result_sets_unknown_stage
```

The aggregate Lat pipeline invariants also verify that parser comment metadata is copied into the pipeline result and emitted in LAT PIPELINE REPORT on both successful parses and parse failures such as unsupported block-comment rejection. They also verify that parse-failure reports preserve the parser diagnostic span instead of falling back to an empty module span.

Compatibility

This refinement preserves the existing Lat pipeline behavior for:

```
source parsing
semantic validation
Lat model normalization
Lat-to-LIR lowering
LIR metadata output
aggregate pipeline error labels
module/source/count/span reporting
parser line-comment count and first-comment span reporting
parse-failure comment metadata reporting
parse-failure diagnostic span reporting
no-effect flags
small-buffer behavior
null-argument behavior
```

Non-claims

This report refinement does not provide:

```
Lat execution
Lat compilation
Lat interpretation
LIR execution
runtime behavior
command execution
task effect execution
state mutation
file I/O
network I/O
server interaction
hardware behavior
terminal control
security isolation
sandboxing
malware prevention
ransomware prevention
certification
accreditation
operating-system completeness
```

docs/LAT_SEMANTIC_DIAGNOSTICS_REFINEMENT.md

Source title: Latticra Lat Semantic Diagnostics Refinement

Lines: 141 | Words: 331 | SHA-256: 3683e9edb2b238d317873071ed05a4afd1c0ae2f733e5a15be9ed89aa45df383

Latticra Lat Semantic Diagnostics Refinement

Status: initial Lat semantic diagnostics refinement implementation Scope: deterministic semantic diagnostic classes, category counters, first-diagnostic indices, report fields, invariant tests, guard coverage, and workflow coverage.

Purpose

This document records the Lat semantic diagnostics refinement after the Nucleus task report refinement.

The goal is to make Lat semantic reports easier to audit by classifying diagnostics into stable categories, counting diagnostics by category, and exposing deterministic first-diagnostic indices.

This refinement does not execute Lat, execute LIR, compile Lat, interpret Lat, mutate state, perform I/O, or provide runtime behavior.

Added semantic metadata

The Lat semantic result now records:

```
diagnostic_class
parse_diagnostic_count
declaration_diagnostic_count
reference_diagnostic_count
requirement_diagnostic_count
effect_diagnostic_count
no_effect_diagnostic_count
internal_diagnostic_count
first_diagnostic_declaration_index
first_diagnostic_clause_index
```

The deterministic LAT SEMANTIC REPORT now emits those fields.

Diagnostic classes

Initial diagnostic classes:

```
valid
parse
declaration
reference
requirement
effect
no-effect
internal
```

Class mapping

Initial class mapping:

```
ok -&gt; valid
parse_not_ok -&gt; parse
duplicate_declaration -&gt; declaration
invalid_state_field -&gt; declaration
invalid_clause_for_declaration -&gt; declaration
empty_declaration -&gt; declaration
unknown_transition_source -&gt; reference
invalid_require_left -&gt; requirement
invalid_effect_target -&gt; effect
invalid_effect_value -&gt; effect
effect_requires_gate -&gt; effect
no_effect_violation -&gt; no-effect
null_argument -&gt; internal
capacity_exceeded -&gt; internal
internal_error -&gt; internal
```

First diagnostic indices

When diagnostics are present, the semantic result records the declaration and clause indices of the first emitted diagnostic:

```
first_diagnostic_declaration_index
first_diagnostic_clause_index
```

When the semantic result is valid or has no diagnostic record, both remain zero.

Validation

Run:

```
sh scripts/test-lat-semantic-diagnostics-refinement.sh
sh scripts/test-lat-semantic-validation.sh
```

The focused invariant tests verify:

```
lat_semantic_diagnostic_class_labels_are_stable
lat_semantic_diagnostics_refinement_reports_valid_class
lat_semantic_diagnostics_refinement_reports_parse_class
lat_semantic_diagnostics_refinement_reports_declaration_class
lat_semantic_diagnostics_refinement_reports_reference_class
lat_semantic_diagnostics_refinement_reports_requirement_class
lat_semantic_diagnostics_refinement_reports_effect_class
lat_semantic_diagnostics_refinement_reports_internal_null_argument
```

Compatibility

This refinement preserves existing Lat semantic behavior for:

```
semantic validation outcomes
semantic error labels
diagnostic record content
declaration/state/policy/transition/assertion/effect counts
no-effect flags
small-buffer behavior
null-argument behavior
```

Non-claims

This diagnostics refinement does not provide:

```
Lat execution
Lat compilation
Lat interpretation
LIR execution
runtime behavior
command execution
state mutation
file I/O
network I/O
server interaction
hardware behavior
terminal control
security isolation
sandboxing
malware prevention
ransomware prevention
certification
accreditation
operating-system completeness
```

docs/LAT_SEMANTIC_VALIDATION_CONTRACT.md

Source title: Latticra Lat Semantic Validation Contract

Lines: 313 | Words: 797 | SHA-256: 8ce21bd25f3e62bd2d7102e9510826c246c5051daeb8c72a573038305fc409e3

Latticra Lat Semantic Validation Contract

Status: semantic validation contract proposal Scope: semantic validation after bounded Lat grammar parsing and before Lat-to-LIR lowering, execution, runtime behavior, or operating-system behavior.

Purpose

This contract defines the first semantic validation layer for Lat / Latticra Language.

The layer consumes a successful latticra_lat_parse_result_t and validates declaration identity, cross-declaration references, state-field vocabulary, effect metadata, clause shapes, no-effect preservation, and deterministic report behavior.

This contract does not execute Lat, compile Lat, interpret Lat, lower Lat to LIR, render L-UI, call Nucleus, mutate state, read files, write files, open network connections, call server code, call update code, call recovery code, or touch hardware.

Relationship to previous work

This contract depends on:

```
docs/LAT_LANGUAGE_GRAMMAR_CONTRACT.md
docs/LAT_LANGUAGE_GRAMMAR_IMPLEMENTATION_PLAN.md
docs/LAT_LANGUAGE_GRAMMAR_IMPLEMENTATION.md
docs/LANGUAGE_NAMING_POLICY.md
docs/LANGUAGE_STRATEGY.md
docs/EFFECT_GATES.md
docs/STATE_LATTICE.md
include/latticra/lat_parser.h
include/latticra/state_lattice.h
```

Those files remain the source of truth for naming, parser API, effect vocabulary, state-lattice vocabulary, and no-effect posture.

Semantic validation target

The first target is:

```
Lat-Core semantic validation
```

Lat-Core remains a declaration subset for state, policy, assertion, transition, and effect metadata.

Lat-Orch remains future work.

Input contract

The validator accepts:

```
const latticra_lat_parse_result_t *parse_result
```

The validator must reject or report semantic failure when:

```
parse_result == NULL
parse_result-&gt;error != LATTICRA_LAT_PARSE_OK
```

The validator must not read source bytes directly. It trusts only bounded parser metadata and source spans already produced by the parser.

Output contract

The validator produces:

```
latticra_lat_semantic_result_t
```

The result records:

- status;
- summary semantic error;
- module name;
- semantic validity flag;
- diagnostic count;
- bounded diagnostics;
- declaration counts;
- no-effect flags.

Stable semantic error labels

The first semantic error labels are:

```
ok
null_argument
parse_not_ok
duplicate_declaration
unknown_transition_source
invalid_state_field
invalid_require_left
invalid_effect_target
invalid_effect_value
effect_requires_gate
invalid_clause_for_declaration
empty_declaration
no_effect_violation
capacity_exceeded
internal_error
```

Declaration identity rule

Declaration names must be globally unique inside one Lat module for this slice.

This prevents ambiguity before namespace, import, or qualified-name contracts exist.

State semantic rule

A state declaration may contain only field assignment clauses.

Allowed state fields:

```
origin
route
axis
path
breadcrumb
trace
safe_portal
rollback
health
risk
lock
dark_phase
host_effect
external_effect
```

The fields host_effect and external_effect must use known Lat effect values. This first semantic validation slice accepts only:

```
none
```

as a declared effect value.

Policy semantic rule

A policy declaration may contain only:

```
require
ensure
```

clauses.

A policy must not assign fields or declare direct effects in this slice.

Transition semantic rule

A transition declaration must resolve its from <StateName> reference to a declared state.

Transition clauses may be:

```
require left operator right
effect host = none
effect external = none
```

Unknown effect targets are rejected.

Any non-none declared effect value is rejected until a later effect-gate contract promotes it.

Assertion semantic rule

An assertion declaration may contain only:

```
require
ensure
```

clauses.

Assertions are metadata checks only.

Effect declaration semantic rule

An effect declaration may assign known effect targets:

```
host
external
local
network
hardware
boot
recovery
```

Values must be known Lat effect labels. This first slice accepts only none as a declared effect value.

No-effect preservation

The semantic validator must preserve:

```
no_effect=1
execution_allowed=0
mutation_allowed=0
server_allowed=0
recovery_allowed=0
hardware_allowed=0
```

If the input parse result violates these flags, semantic validation must report no_effect_violation.

Report format

latticra_lat_semantic_report emits a deterministic bounded report beginning with:

```
LAT SEMANTIC REPORT
```

The report includes:

```
status
error
semantic_valid
module
declaration_count
state_count
policy_count
transition_count
assertion_count
effect_count
diagnostic_count
no_effect
execution_allowed
mutation_allowed
server_allowed
recovery_allowed
hardware_allowed
first_diagnostic_error
first_diagnostic_name
first_diagnostic_detail
span_start_offset
span_end_offset
span_start_line
span_start_column
span_end_line
span_end_column
```

Small output buffers must return LATTICRA_STATUS_BUFFER_TOO_SMALL and clear the buffer when possible.

Exact implementation files

The implementation slice should add:

```
include/latticra/lat_semantic.h
src/lat_semantic.c
tests/lat_semantic_validation_invariants.c
scripts/test-lat-semantic-validation.sh
fixtures/lat/foundation_model.lat
docs/LAT_SEMANTIC_VALIDATION_IMPLEMENTATION_PLAN.md
```

and update the C workflow to run the semantic validation test after grammar parser tests.

Required tests

The implementation must include tests for:

```
lat_semantic_accepts_foundation_model
lat_semantic_rejects_parse_error
lat_semantic_rejects_duplicate_declaration
lat_semantic_rejects_unknown_transition_source
lat_semantic_rejects_invalid_state_field
lat_semantic_rejects_invalid_policy_field_assignment
lat_semantic_rejects_invalid_effect_target
lat_semantic_rejects_invalid_effect_value
lat_semantic_rejects_effect_requiring_gate
lat_semantic_preserves_no_effect_flags
lat_semantic_reports_are_deterministic
lat_semantic_report_rejects_small_buffer
lat_semantic_error_labels_are_stable
lat_semantic_is_deterministic
```

Forbidden behavior

Lat semantic validation must not:

- claim plain L as the public language name;
- claim .l as the canonical source extension;
- parse source text directly;
- execute declarations;
- mutate state;
- lower to LIR;
- render L-UI;
- call Nucleus task execution;
- evaluate host state;
- write files;
- read files;
- open network connections;
- call server code;
- call update code;
- call recovery code;
- call hardware code;
- imply a compiler, interpreter, runtime, package manager, sandbox, or operating-system surface.

Non-claims

This contract does not implement Lat execution, Lat compilation, Lat interpretation, LIR lowering, L-UI rendering, command behavior, Nucleus task handling, live movement, state mutation, recovery behavior, server interaction, self-update, hardware support, boot readiness, security isolation, sandboxing, malware prevention, ransomware prevention, or operating-system completeness.

docs/LAT_SEMANTIC_VALIDATION_IMPLEMENTATION_PLAN.md

Source title: Latticra Lat Semantic Validation Implementation Plan

Lines: 300 | Words: 685 | SHA-256: 0adff9c7ef50dc21e530049fd5ee2436b20676e6ebf40993c74aec76e3933773

Latticra Lat Semantic Validation Implementation Plan

Status: implementation planning contract proposal Scope: exact public API, result structs, diagnostics, validation rules, report surface, fixture, tests, compatibility expectations, and non-claims before semantic validation code.

Purpose

This document defines the implementation plan for the first Lat / Latticra Language semantic validation layer.

The existing Lat grammar parser records bounded module, declaration, clause, effect, source-span, and no-effect metadata. The semantic validator will consume that parser result and validate module coherence without executing Lat or lowering it to LIR.

Implementation language decision

The first Lat semantic validator should be implemented in C.

Reason:

- current parser and state-lattice foundations are C;
- validation must remain bounded, deterministic, and no-effect;
- this layer should be usable before constrained C++ authority code grows around it;
- tests and runners already use C and POSIX shell.

Implementation files

Add:

```
include/latticra/lat_semantic.h
src/lat_semantic.c
tests/lat_semantic_validation_invariants.c
scripts/test-lat-semantic-validation.sh
fixtures/lat/foundation_model.lat
```

Update:

```
.github/workflows/c.yml
docs/FOUNDATION_INDEX.md
README.md
STATUS.md
docs/status/CURRENT_STATUS.md
docs/status/ANNOUNCEMENTS.md
docs/project_notes/CURRENT_DIRECTION.md
docs/project_notes/UPCOMING_WORK.md
```

Public API shape

Add public API names:

```
latticra_lat_semantic_error_t
```

```
latticra_lat_semantic_diagnostic_t
latticra_lat_semantic_result_t
latticra_lat_semantic_error_label
latticra_lat_validate_module
latticra_lat_semantic_report
```

Recommended function signatures:

```
const char *latticra_lat_semantic_error_label(latticra_lat_semantic_error_t error);

latticra_status_t latticra_lat_validate_module(
    const latticra_lat_parse_result_t *parse_result,
    latticra_lat_semantic_result_t *result);

latticra_status_t latticra_lat_semantic_report(
    const latticra_lat_semantic_result_t *result,
    char *buffer,
    size_t buffer_len);
```

Capacity constants

Add bounded constants:

```
LATTICRA_LAT_SEMANTIC_DIAGNOSTIC_MAX 32u
LATTICRA_LAT_SEMANTIC_REPORT_MAX 4096u
```

Semantic error enum

Add semantic error enum values:

```
LATTICRA_LAT_SEMANTIC_OK
LATTICRA_LAT_SEMANTIC_NULL_ARGUMENT
LATTICRA_LAT_SEMANTIC_PARSE_NOT_OK
LATTICRA_LAT_SEMANTIC_DUPLICATE_DECLARATION
LATTICRA_LAT_SEMANTIC_UNKNOWN_TRANSITION_SOURCE
LATTICRA_LAT_SEMANTIC_INVALID_STATE_FIELD
LATTICRA_LAT_SEMANTIC_INVALID_REQUIRE_LEFT
LATTICRA_LAT_SEMANTIC_INVALID_EFFECT_TARGET
LATTICRA_LAT_SEMANTIC_INVALID_EFFECT_VALUE
LATTICRA_LAT_SEMANTIC_EFFECT_REQUIRES_GATE
LATTICRA_LAT_SEMANTIC_INVALID_CLAUSE_FOR_DECLARATION
LATTICRA_LAT_SEMANTIC_EMPTY_DECLARATION
LATTICRA_LAT_SEMANTIC_NO_EFFECT_VIOLATION
LATTICRA_LAT_SEMANTIC_CAPACITY_EXCEEDED
LATTICRA_LAT_SEMANTIC_INTERNAL_ERROR
```

Stable labels:

```
ok
null_argument
parse_not_ok
duplicate_declaration
unknown_transition_source
invalid_state_field
invalid_require_left
invalid_effect_target
invalid_effect_value
effect_requires_gate
invalid_clause_for_declaration
empty_declaration
no_effect_violation
capacity_exceeded
internal_error
```

Diagnostic struct

Add diagnostic metadata fields:

```
latticra_lat_semantic_error_t error;
latticra_lat_source_span_t span;
size_t declaration_index;
size_t clause_index;
char name[LATTICRA_LAT_NAME_MAX];
char detail[LATTICRA_LAT_VALUE_MAX];
```

Result struct

Add result metadata fields:

```
latticra_status_t status;
latticra_lat_semantic_error_t error;
latticra_lat_source_span_t span;
char module_name[LATTICRA_LAT_NAME_MAX];
int semantic_valid;
size_t diagnostic_count;
latticra_lat_semantic_diagnostic_t diagnostics[LATTICRA_LAT_SEMANTIC_DIAGNOSTIC_MAX];
size_t declaration_count;
size_t state_count;
size_t policy_count;
size_t transition_count;
size_t assertion_count;
size_t effect_count;
int no_effect;
int execution_allowed;
int mutation_allowed;
int server_allowed;
int recovery_allowed;
int hardware_allowed;
```

Validation algorithm

1. Initialize output deterministically.
2. Reject null arguments with LATTICRA_STATUS_NULL_ARGUMENT.
3. Copy module and count metadata from the parser result when available.
4. If parser error is not ok, record parse_not_ok and stop.
5. Verify no-effect flags.
6. Detect duplicate declaration names.
7. For each declaration:

- reject empty declarations;
- validate declaration-specific clause forms;
- validate known state fields;
- validate known effect targets;
- validate known effect values;
- reject non-none declared effects in this first slice;
- resolve transition source state names.

8. Set semantic_valid=1 only when no diagnostics exist.
9. Emit deterministic bounded reports.

Fixture

Add:

```
fixtures/lat/foundation_model.lat
```

Recommended content:

```
lat module FoundationModule {
  state RootCell {
    origin = &quot;0/0&quot;
    route = &quot;ROOT&quot;
    axis = &quot;ROOT&quot;
    path = &quot;/&quot;
    health = &quot;ok&quot;
    risk = &quot;low&quot;
    lock = &quot;open&quot;
    host_effect = none
    external_effect = none
  }

  effect PreviewOnly {
```

```
    host = none
    external = none
    network = none
    hardware = none
  }

  policy SafePreview {
    require risk != &quot;high&quot;
    require lock == &quot;open&quot;
    ensure host_effect == none
    ensure external_effect == none
  }

  transition MoveRight from RootCell {
    require lock == &quot;open&quot;
    effect host = none
    effect external = none
  }

  assertion RootCellIsSafe {
    require health == &quot;ok&quot;
    require host_effect == none
    require external_effect == none
  }
}
```

Exact test list

Add invariant tests for:

```
lat_semantic_accepts_foundation_model
lat_semantic_rejects_parse_error
lat_semantic_rejects_duplicate_declaration
lat_semantic_rejects_unknown_transition_source
lat_semantic_rejects_invalid_state_field
lat_semantic_rejects_invalid_policy_field_assignment
lat_semantic_rejects_invalid_effect_target
lat_semantic_rejects_invalid_effect_value
lat_semantic_rejects_effect_requiring_gate
lat_semantic_preserves_no_effect_flags
lat_semantic_reports_are_deterministic
lat_semantic_report_rejects_small_buffer
lat_semantic_error_labels_are_stable
lat_semantic_is_deterministic
```

Test command

Add:

```
sh scripts/test-lat-semantic-validation.sh
```

Compile with:

```
-std=c99 -Wall -Wextra -Werror -pedantic
```

and include:

```
src/lat_parser.c
src/lat_semantic.c
tests/lat_semantic_validation_invariants.c
```

Compatibility expectations

This implementation must not change:

```
language naming policy
.lat canonical extension
C/C++ foundation direction
Lat grammar parser behavior
L-UI parser behavior
L-UI semantic validation behavior
LIR shape behavior
state lattice behavior
Nucleus preview behavior
literal source-buffer NUL rejection
no-effect flags
```

Non-claims

This implementation plan does not implement Lat execution, Lat compilation, Lat interpretation, LIR lowering, L-UI rendering, command behavior, Nucleus task handling, live movement, state mutation, recovery behavior, server interaction, self-update, hardware support, boot readiness, security isolation, sandboxing, malware prevention, ransomware prevention, or operating-system completeness.

docs/LAT_SPECIFIC_LIR_REFINEMENT_CONTRACT.md

Source title: Latticra Lat-Specific LIR Refinement Contract

Lines: 83 | Words: 295 | SHA-256: c03b0025250440f22c794f356f4dd6452febdcd1a67c1170cc1bfbe879c0acf2

Latticra Lat-Specific LIR Refinement Contract

Status: Lat-specific LIR refinement contract Scope: explicit Lat declaration and transition metadata in LIR after grammar parsing, semantic validation, Lat-to-LIR lowering, and Lat pipeline composition.

Purpose

This contract defines the first Lat-specific refinement of the Latticra Intermediate Representation.

The existing Lat-to-LIR lowering path materializes a lat_module LIR shape. This refinement makes the Lat origin of key nodes and transition-source edges explicit instead of relying only on generic field, binding, and effect node kinds.

Refinement target

The refinement introduces explicit LIR node kinds for Lat declarations:

```
lat_state
lat_policy
lat_transition
lat_assertion
lat_requirement
lat_effect_declaration
```

and an explicit edge kind for transition source relationships:

```
transitions_from
```

Compatibility policy

The refinement must preserve existing numeric values for already-published LIR enum members.

The generic node kinds and edge kinds remain available for L-UI lowering and existing LIR users.

Required behavior

Lat-to-LIR lowering must map:

```
state declaration      -&gt; lat_state
policy declaration     -&gt; lat_policy
transition declaration -&gt; lat_transition
assertion declaration  -&gt; lat_assertion
effect declaration     -&gt; lat_effect_declaration
require / ensure       -&gt; lat_requirement
transition source edge -&gt; transitions_from
```

The implementation must preserve:

```
source spans
module/declaration/clause counts
node and edge counts
```

```
no_effect=1
execution_allowed=0
mutation_allowed=0
server_allowed=0
recovery_allowed=0
hardware_allowed=0
```

Forbidden behavior

This refinement must not execute Lat, execute LIR, interpret transitions, mutate state, perform effects, perform file I/O, perform network I/O, call server code, call recovery code, touch hardware, or provide runtime behavior.

Validation

The implementation must add focused invariants for:

```
lat_specific_lir_labels_are_stable
lat_specific_lir_uses_lat_declaration_node_kinds
lat_specific_lir_uses_lat_requirement_node_kind
lat_specific_lir_uses_transition_source_edge_kind
lat_specific_lir_preserves_counts_and_no_effect_flags
```

Non-claims

This contract does not implement Lat execution, Lat compilation, Lat interpretation, LIR execution, runtime behavior, command behavior, Nucleus task execution, mutation, file I/O, network I/O, recovery behavior, hardware behavior, sandboxing, malware prevention, ransomware prevention, certification, accreditation, or operating-system completeness.

docs/LAT_SPECIFIC_LIR_REFINEMENT_IMPLEMENTATION.md

Source title: Latticra Lat-Specific LIR Refinement Implementation

Lines: 61 | Words: 245 | SHA-256: f2a67125f5ce6a2f0caf8d1216be78aa44465ab7356322827056236160a72d3e

Latticra Lat-Specific LIR Refinement Implementation

Status: initial implementation contract Scope: first explicit Lat declaration node kinds and transition-source edge kind in LIR.

Purpose

This slice implements the first Lat-specific LIR refinement after the parser, semantic validator, Lat-to-LIR lowering layer, and Lat pipeline foundation.

The refinement makes Lat declaration roles visible in LIR without changing the no-effect posture or introducing execution behavior.

Added behavior

Lat-to-LIR lowering now emits explicit node kinds for:

```
state declarations
policy declarations
transition declarations
assertion declarations
effect declarations
require / ensure clauses
```

Transition source references now use an explicit:

```
transitions_from
```

edge kind.

The later Lat-to-LIR clause metadata refinement preserves clause operators in the LIR node operator_text field while keeping role labels in the existing node binding field.

Validation

Run:

```
sh scripts/test-lat-specific-lir-refinement.sh
```

The test covers stable labels, declaration node kind mapping, requirement node mapping, transition-source edge mapping, counts, and no-effect preservation.

Related operator metadata is covered by:

```
sh scripts/test-lat-to-lir-clause-metadata-refinement.sh
```

Boundary

This implementation remains metadata-only. It does not execute Lat or LIR, interpret transition behavior, mutate state, perform effects, call Nucleus, call runtime code, or perform host operations.

Compatibility

Existing generic LIR node and edge values are preserved. L-UI LIR lowering remains generic and unchanged.

Non-claims

This implementation does not provide a Lat compiler, Lat interpreter, Lat runtime, LIR executor, command system, task executor, production runtime, security boundary, malware prevention guarantee, ransomware prevention guarantee, certification, accreditation, or operating-system replacement.

docs/LAT_SPECIFIC_LIR_REFINEMENT_IMPLEMENTATION_PLAN.md

Source title: Latticra Lat-Specific LIR Refinement Implementation Plan

Lines: 90 | Words: 240 | SHA-256: 565708890724df1586472b5eb85cc3aad6850bb92a7879a5f17fe855698a79e9

Latticra Lat-Specific LIR Refinement Implementation Plan

Status: implementation planning contract Scope: exact enum additions, lowering mappings, labels, tests, workflow, compatibility expectations, and non-claims before Lat-specific LIR refinement implementation.

Purpose

This plan defines the implementation of the first Lat-specific LIR refinement.

The goal is to make Lat declaration semantics more visible in LIR without changing the no-effect boundary or adding execution behavior.

Implementation files

Update:

```
include/latticra/lir.h
src/lir.c
src/lat_to_lir.c
tests/lat_to_lir_lowering_invariants.c
README.md
STATUS.md
docs/status/CURRENT_STATUS.md
docs/status/ANNOUNCEMENTS.md
docs/project_notes/CURRENT_DIRECTION.md
docs/project_notes/UPCOMING_WORK.md
docs/FOUNDATION_INDEX.md
```

Add:

```
tests/lat_specific_lir_refinement_invariants.c
```

```
scripts/test-lat-specific-lir-refinement.sh
.github/workflows/lat-specific-lir-refinement.yml
docs/LAT_SPECIFIC_LIR_REFINEMENT_IMPLEMENTATION.md
```

Public enum additions

Append Lat-specific node kinds without renumbering existing values:

```
LATTICRA_LIR_NODE_LAT_STATE
LATTICRA_LIR_NODE_LAT_POLICY
LATTICRA_LIR_NODE_LAT_TRANSITION
LATTICRA_LIR_NODE_LAT_ASSERTION
LATTICRA_LIR_NODE_LAT_REQUIREMENT
LATTICRA_LIR_NODE_LAT_EFFECT_DECLARATION
```

Append the transition-source edge kind:

```
LATTICRA_LIR_EDGE_TRANSITIONS_FROM
```

Label additions

Add deterministic labels:

```
lat_state
lat_policy
lat_transition
lat_assertion
lat_requirement
lat_effect_declaration
transitions_from
```

Lowering changes

latticra_lir_lower_lat_module should emit Lat-specific declaration node kinds while preserving the existing LIR shape and counts.

The transition source relationship should use transitions_from rather than the generic binds edge.

Test command

```
sh scripts/test-lat-specific-lir-refinement.sh
```

Compatibility expectations

This implementation must not change L-UI lowering, existing generic LIR node kinds, existing generic LIR edge kinds, Lat parser behavior, Lat semantic validation behavior, Lat pipeline behavior, C++ authority behavior, Nucleus behavior, or runtime boundary behavior.

Non-claims

This implementation plan does not implement Lat execution, LIR execution, runtime behavior, command behavior, mutation, file I/O, network I/O, recovery behavior, hardware behavior, sandboxing, malware prevention, ransomware prevention, or operating-system completeness.

docs/LAT_TO_LIR_CLAUSE_METADATA_REFINEMENT.md

Source title: Lat-to-LIR Clause Metadata Refinement

Lines: 82 | Words: 266 | SHA-256: 6472062f7cb1f6cc912772b6abe2d7dd4cf5a591aa0bbdca50e77d8e2cd6c9be

Lat-to-LIR Clause Metadata Refinement

Status: initial no-effect implementation

Scope: preserve Lat clause operator metadata in LIR nodes and expose first-clause lowering metadata in deterministic Lat-to-LIR reports.

Purpose

This slice makes lowered Lat clause metadata more inspectable without changing Lat parsing, semantic validation, normalization, lowering classification, or execution behavior.

Before this refinement, clause nodes preserved clause name, value, role, source span, owner relationship, and node kind. This slice adds a dedicated LIR node operator_text field and records the first lowered clause in the Lat-to-LIR result/report surface.

Added Metadata

LIR nodes now carry:

```
operator_text
```

Lat-to-LIR lowering writes clause operators into that field for:

```
field clauses
require clauses
ensure clauses
effect clauses
```

The Lat-to-LIR result/report now also records:

```
first_clause_node_index
first_clause_role
first_clause_effect
first_clause_name
first_clause_operator
first_clause_value
```

Behavior

The refinement preserves existing mapping behavior:

```
Lat clause name  -&gt; LIR node name
Lat clause value -&gt; LIR node value
Lat clause role  -&gt; LIR node binding
Lat operator     -&gt; LIR node operator_text
```

For example:

```
require risk != &quot;high&quot;
```

lowers into a Lat requirement node with:

```
name=risk
operator_text=!=
value=high
binding=require
```

Validation

Run:

```
sh scripts/test-lat-to-lir-clause-metadata-refinement.sh
sh scripts/test-lat-to-lir-lowering.sh
```

The focused guard verifies field, requirement, and effect clause operator metadata plus first-clause report fields.

The Lat-to-LIR diagnostic refinement also copies these first-clause fields into its diagnostic result/report so operator metadata remains visible from the diagnostic layer.

Boundary

This is metadata-only. It does not execute Lat, interpret requirements, evaluate operators, execute LIR, perform effects, mutate state, perform file I/O, perform network I/O, call runtime behavior, or grant authority.

docs/LAT_TO_LIR_DIAGNOSTIC_REFINEMENT.md

Source title: Lat-to-LIR Diagnostic Refinement

Lines: 101 | Words: 328 | SHA-256: 63d297d6d15ec2bb75c2b2e0c165d144e510c8474c45cfee42fbb4b6934cccb4

Lat-to-LIR Diagnostic Refinement

Status: no-effect implementation with first-declaration and first-clause diagnostic metadata

Scope: deterministic diagnostic classification and reporting for Lat-to-LIR lowering results after model-driven lowering integration.

Purpose

This slice adds a diagnostic surface for the Lat-to-LIR boundary.

It classifies lowering outcomes without changing parser, semantic, model normalization, lowering, LIR, pipeline, runtime, or authority behavior.

Implementation Files

```
include/latticra/lat_to_lir_diagnostics.h
src/lat_to_lir_diagnostics.c
tests/lat_to_lir_diagnostic_refinement.c
scripts/test-lat-to-lir-diagnostic-refinement.sh
```

Public API

The diagnostic API adds:

```
latticra_lat_to_lir_diagnostic_class_t
latticra_lat_to_lir_diagnostic_result_t
latticra_lat_to_lir_diagnostic_class_label
latticra_lat_to_lir_diagnostics_evaluate
latticra_lat_to_lir_diagnostics_report
```

Diagnostic Classes

The evaluator classifies lowering outcomes as:

```
valid
parse
semantic
model
effect-check
capacity
lir
internal
```

It copies lowering error, model error, optional LIR error, model counts, first lowered declaration metadata, first transition source index, first-clause metadata, node and edge counts, no-effect flags, failure flags, no-effect issue flag, and evidence level into a bounded result record.

The diagnostic result preserves the first lowered declaration:

```
first_declaration_node_index
first_declaration_kind
first_declaration_name
first_declaration_source
first_declaration_parse_index
first_declaration_first_clause_index
first_declaration_clause_count
first_declaration_source_index
```

The diagnostic result preserves the first lowered clause:

```
first_clause_node_index
first_clause_role
first_clause_effect
first_clause_name
```

```
first_clause_operator
first_clause_value
```

These fields are copied from lowering metadata only. Operators are not evaluated.

The Lat pipeline diagnostic integration can consume this result through latticra_lat_pipeline_diagnostics_evaluate_with_lowering, preserving the older pipeline diagnostic evaluator for existing callers. Pipeline diagnostics copy the first-clause metadata with lowering_ prefixes so aggregate reports can retain the first lowered clause role, effect, name, operator, value, and node index.

Report Format

latticra_lat_to_lir_diagnostics_report emits a deterministic bounded report beginning with:

```
LAT TO LIR DIAGNOSTIC REPORT
```

Small output buffers return LATTICRA_STATUS_BUFFER_TOO_SMALL and clear the buffer when possible.

Validation

Run:

```
sh scripts/test-lat-to-lir-diagnostic-refinement.sh
```

The invariant suite checks stable labels, valid lowering diagnostics, first-declaration diagnostic metadata, first-clause diagnostic metadata, parse failure diagnostics, model failure diagnostics, no-effect issue diagnostics, null lowering handling, deterministic report fields, and small-buffer rejection.

Non-Claims

This slice does not execute Lat, execute LIR, mutate state, perform file I/O, perform network I/O, perform runtime behavior, grant authority, enforce policy, or change lowering behavior.

docs/LAT_TO_LIR_LOWERING_CONTRACT.md

Source title: Latticra Lat-to-LIR Lowering Contract

Lines: 344 | Words: 1101 | SHA-256: 0788cf4300fc916decd1e0f1ea9b813444ece0a4157668b3fc067df069cf277b

Latticra Lat-to-LIR Lowering Contract

Status: Lat-to-LIR lowering contract Scope: first contract for lowering semantically valid Lat / Latticra Language metadata into LIR shape metadata before implementation code, execution, runtime behavior, or operating-system behavior.

Purpose

This document defines the first contract for:

```
Lat-to-LIR lowering
```

The goal is to define how a semantically valid Lat module may be represented as Latticra Intermediate Representation metadata in a future implementation slice.

This is contract-only work. It does not implement lowering code.

The current Lat lane now has:

```
Lat source -&gt; bounded grammar parser -&gt; Lat semantic validation -&gt; future Lat-to-LIR
lowering
```

The current LIR lane already has a bounded representation shape and reserves lat_module as a source kind. This contract defines the first Lat-specific lowering boundary for that reserved source kind.

Relationship to previous work

This contract depends on:

```
docs/LAT_LANGUAGE_GRAMMAR_CONTRACT.md
docs/LAT_LANGUAGE_GRAMMAR_IMPLEMENTATION_PLAN.md
docs/LAT_LANGUAGE_GRAMMAR_IMPLEMENTATION.md
docs/LAT_SEMANTIC_VALIDATION_CONTRACT.md
docs/LAT_SEMANTIC_VALIDATION_IMPLEMENTATION_PLAN.md
docs/LAT_LANGUAGE_FOUNDATION_ANALYSIS.md
docs/LIR_SHAPE_CONTRACT.md
docs/LIR_SHAPE_IMPLEMENTATION_PLAN.md
docs/LIR_SHAPE_IMPLEMENTATION.md
include/latticra/lat_parser.h
include/latticra/lat_semantic.h
include/latticra/lir.h
```

Those files remain the source of truth for Lat grammar parsing, Lat semantic validation, existing LIR shape, no-effect metadata, report behavior, and current implementation boundaries.

First lowering target

The first target is:

```
Lat-Core semantic module -&gt; LIR module metadata
```

Lat-Core currently includes:

```
state
policy
transition
assertion
effect
```

Lat-Orch remains future work.

Input prerequisite

A future lowering function must accept only parser and semantic results that satisfy:

```
parser_error=ok
semantic_error=ok
semantic_valid=1
no_effect=1
execution_allowed=0
mutation_allowed=0
server_allowed=0
recovery_allowed=0
hardware_allowed=0
```

If semantic validation failed, lowering must not produce a partial LIR module.

Output target

The output target should be the existing LIR module shape:

```
latticra_lir_module_t
```

The source kind should be:

```
lat_module
```

The future implementation should reuse the existing LIR no-effect flags and report model instead of creating a separate executable representation.

Proposed public API boundary

A future implementation plan should define exact C API names. The expected shape is:

```
latticra_status_t latticra_lir_lower_lat_module(
    const latticra_lat_parse_result_t *parse_result,
    const latticra_lat_semantic_result_t *semantic_result,
    latticra_lir_module_t *module);
```

This contract does not add the function.

Node mapping rules

A future Lat-to-LIR lowering implementation should map Lat declarations into deterministic LIR node records.

Suggested mapping:

```
Lat module      -&gt; LIR module node
state           -&gt; LIR node kind field or module child node with declaration role metadata
policy          -&gt; LIR node kind field or module child node with declaration role metadata
transition      -&gt; LIR node kind field or module child node with source-state metadata
assertion       -&gt; LIR node kind field or module child node with assertion metadata
effect          -&gt; LIR effect node
require clause  -&gt; LIR binding or metadata node
ensure clause   -&gt; LIR binding or metadata node
effect clause   -&gt; LIR effect metadata
field assignment -&gt; LIR field metadata
```

Because the current LIR node enum was first shaped for L-UI, the implementation plan must either reuse existing node kinds conservatively or add exact Lat-oriented node kinds through a separate plan before code is added.

Edge mapping rules

A future lowering implementation should use deterministic edges for relationships.

Suggested edge mapping:

```
module contains declaration
declaration contains clause
transition references source state
policy annotates requirement metadata
assertion annotates checked metadata
effect annotates effect boundary metadata
```

If the existing edge enum is not expressive enough, the implementation plan must name any new edge kind before implementation code is added.

Source-span preservation

Every LIR record derived from Lat must carry the source span from parser metadata.

Rules:

- module span comes from the Lat module span;
- declaration span comes from the Lat declaration span;
- clause span comes from the Lat clause span;
- transition source-state metadata should preserve the transition declaration span until a more specific reference span exists;
- effect metadata should preserve the effect clause or effect declaration span;
- lowering must not invent byte offsets.

Effect preservation

Lat semantic validation currently accepts only none effect declarations in this slice.

Lat-to-LIR lowering must preserve:

```
effect=none
no_effect=1
execution_allowed=0
mutation_allowed=0
server_allowed=0
recovery_allowed=0
hardware_allowed=0
```

A future implementation must reject or report unsupported effect values rather than widening behavior.

Report model

A future Lat-to-LIR lowering report should remain deterministic and bounded.

Suggested report fields:

```
LAT TO LIR LOWERING REPORT
status=&lt;status&gt;
source_kind=lat_module
module=&lt;module-name&gt;
declaration_count=&lt;count&gt;
state_count=&lt;count&gt;
policy_count=&lt;count&gt;
transition_count=&lt;count&gt;
assertion_count=&lt;count&gt;
effect_count=&lt;count&gt;
node_count=&lt;count&gt;
edge_count=&lt;count&gt;
no_effect=&lt;0|1&gt;
execution_allowed=&lt;0|1&gt;
mutation_allowed=&lt;0|1&gt;
server_allowed=&lt;0|1&gt;
recovery_allowed=&lt;0|1&gt;
hardware_allowed=&lt;0|1&gt;
```

The future implementation may use latticra_lir_report directly if it can represent all required fields without losing Lat-specific context.

Error model

A future implementation plan should define stable error labels.

Expected labels:

```
ok
null_argument
parse_not_ok
semantic_not_ok
semantic_not_valid
capacity_exceeded
unsupported_declaration_kind
unsupported_clause_kind
unsupported_effect
unsupported_lir_shape
internal_error
```

Capacity policy

The implementation plan must name exact capacity behavior before code is added.

At minimum, it must define how many LIR nodes and edges are required per:

```
module
declaration
clause
transition source reference
effect metadata record
```

If the existing LATTICRA_LIR_NODE_MAX or LATTICRA_LIR_EDGE_MAX is not sufficient, the plan must justify any increase before implementation code is added.

Compatibility expectations

Lat-to-LIR lowering work must not change:

```
Lat parser behavior
Lat semantic validation behavior
L-UI parser behavior
L-UI semantic validation behavior
existing LIR lowering from L-UI
state lattice behavior
source-span behavior
no-effect flags
```

Future implementation gate

Lowering implementation must not begin until a separate implementation plan defines:

1. public API shape;
2. exact error enum labels;
3. exact node mapping;
4. exact edge mapping;
5. exact capacity accounting;
6. source-span mapping;
7. report format;
8. semantic prerequisite behavior;
9. compatibility expectations;
10. exact tests;
11. non-claims.

That next slice should be:

```
LAT_TO_LIR_LOWERING_IMPLEMENTATION_PLAN.md
```

Future test list

The implementation plan should include tests for:

```
lat_to_lir_rejects_parse_error
lat_to_lir_rejects_semantic_error
lat_to_lir_accepts_foundation_model
lat_to_lir_sets_source_kind_lat_module
lat_to_lir_preserves_module_name
lat_to_lir_preserves_declaration_counts
lat_to_lir_preserves_transition_source_metadata
lat_to_lir_preserves_effect_none
lat_to_lir_preserves_source_spans
lat_to_lir_preserves_no_effect_flags
lat_to_lir_report_is_deterministic
lat_to_lir_report_rejects_small_buffer
lat_to_lir_does_not_execute_lat
lat_to_lir_does_not_mutate_state
lat_to_lir_is_deterministic
```

Forbidden behavior

Lat-to-LIR lowering work must not:

- lower parser-failed input;
- lower semantic-failed input;
- execute Lat declarations;
- interpret transition behavior;
- mutate state;
- render L-UI;
- call Nucleus task execution;
- evaluate host state;
- write files;
- read files;

- open network connections;
- call server code;
- call update code;
- call recovery code;
- call hardware code;
- broaden accepted Lat syntax;
- weaken Lat semantic validation;
- weaken existing LIR shape behavior;
- invent source byte offsets;
- imply a compiler, interpreter, runtime, package manager, or operating-system surface.

Current validation command

This contract is guarded by:

```
sh scripts/test-lat-to-lir-lowering-contract.sh
```

The guard is static. It does not implement Lat-to-LIR lowering.

Non-claims

This document does not implement Lat-to-LIR lowering, Lat execution, Lat compilation, Lat interpretation, LIR execution, command behavior, Nucleus task handling, state mutation, runtime behavior, recovery behavior, server interaction, self-update, hardware support, boot readiness, or operating-system completeness.

docs/LAT_TO_LIR_LOWERING_IMPLEMENTATION.md

Source title: Latticra Lat-to-LIR Lowering Implementation

Lines: 263 | Words: 825 | SHA-256: 4b437542840cf2609468adaef54a539ca167a6063d44f536de2a29dd1f96b029

Latticra Lat-to-LIR Lowering Implementation

Status: model-aware implementation record with first-declaration report metadata Scope: bounded no-effect Lat-to-LIR lowering implementation, normalized model entry point, compatibility wrapper, public API, test runner, workflow, report surface, fixture path, and invariants.

Purpose

This implementation adds the bounded Lat-to-LIR lowering surface for semantically valid Lat / Latticra Language metadata.

The primary lowering implementation consumes:

```
latticra_lat_model_t
```

and fills:

```
latticra_lir_module_t
latticra_lat_to_lir_result_t
```

The compatibility wrapper latticra_lir_lower_lat_module still accepts parser and semantic results, normalizes a local Lat model, and delegates to the model-aware lowerer.

The lowering surface is metadata-only. It does not execute Lat, interpret transitions, mutate state, render L-UI, invoke Nucleus behavior, perform runtime behavior, write files, read files, open network connections, call update code, call recovery code, touch hardware, or provide an operating-system surface.

Implementation files

```
include/latticra/lat_to_lir.h
src/lat_to_lir.c
tests/lat_to_lir_lowering_invariants.c
scripts/test-lat-to-lir-lowering.sh
.github/workflows/lat-to-lir-lowering.yml
```

Related diagnostic refinement:

```
include/latticra/lat_to_lir_diagnostics.h
src/lat_to_lir_diagnostics.c
tests/lat_to_lir_diagnostic_refinement.c
scripts/test-lat-to-lir-diagnostic-refinement.sh
docs/LAT_TO_LIR_DIAGNOSTIC_REFINEMENT.md
```

Related clause metadata refinement:

```
tests/lat_to_lir_clause_metadata_refinement.c
scripts/test-lat-to-lir-clause-metadata-refinement.sh
docs/LAT_TO_LIR_CLAUSE_METADATA_REFINEMENT.md
```

Related contract and plan files:

```
docs/LAT_TO_LIR_LOWERING_CONTRACT.md
docs/LAT_TO_LIR_LOWERING_IMPLEMENTATION_PLAN.md
docs/LAT_LANGUAGE_GRAMMAR_IMPLEMENTATION.md
docs/LAT_SEMANTIC_VALIDATION_CONTRACT.md
docs/LIR_SHAPE_IMPLEMENTATION.md
```

Public API

The public API adds:

```
latticra_lat_to_lir_error_t
latticra_lat_to_lir_result_t
latticra_lat_to_lir_error_label
latticra_lir_lower_lat_model
latticra_lir_lower_lat_module
latticra_lat_to_lir_report
```

The model-aware lowering function accepts normalized Lat model metadata, writes a LIR module, and writes a lowering-specific summary result. The wrapper accepts parser and semantic metadata for existing callers.

Accepted input

The lowering implementation accepts only input that satisfies:

```
parse_result-&gt;error == LATTICRA_LAT_PARSE_OK
semantic_result-&gt;error == LATTICRA_LAT_SEMANTIC_OK
semantic_result-&gt;semantic_valid == 1
model-&gt;error == LATTICRA_LAT_MODEL_OK
no_effect == 1
execution_allowed == 0
mutation_allowed == 0
```

The implementation also preserves server, recovery, and hardware denial flags in the generated LIR module.

LIR output shape

On success, the LIR module records:

```
source_kind=lat_module
module=&lt;Lat module name&gt;
card=
effect=none
boundary=lat_semantic_only
node_count=1 + declaration_count + clause_count
edge_count=declaration_count + clause_count + transition_count
binding_count=0
text_count=0
no_effect=1
execution_allowed=0
```

```
mutation_allowed=0
server_allowed=0
recovery_allowed=0
hardware_allowed=0
```

The implementation uses the Lat-specific LIR declaration node kinds and transition source edge kind while preserving the same no-effect metadata boundary.

Mapping summary

```
Lat module      -&gt; LIR module node
state           -&gt; LIR lat_state node
policy          -&gt; LIR lat_policy node
transition      -&gt; LIR lat_transition node with source-state metadata
assertion       -&gt; LIR lat_assertion node
effect          -&gt; LIR lat_effect_declaration node
field clause    -&gt; LIR field node
require clause  -&gt; LIR lat_requirement node metadata
ensure clause   -&gt; LIR lat_requirement node metadata
effect clause   -&gt; LIR effect node metadata
```

Edges use:

```
module contains declaration
declaration contains clause
transition transitions_from source state
```

Source-span behavior

Lat source spans are copied into the compatible LIR source-span shape:

```
start_offset
end_offset
start_line
start_column
end_line
end_column
```

The implementation does not invent byte offsets.

Report surface

latticra_lat_to_lir_report emits a deterministic bounded report beginning with:

```
LAT TO LIR LOWERING REPORT
```

The report records status, lowering error label, model error label, module name, declaration counts, model counts, clause counts, first lowered declaration metadata, first transition source index, node count, edge count, no-effect flags, and source-span fields.

The first lowered declaration metadata includes:

```
first_declaration_node_index
first_declaration_kind
first_declaration_name
first_declaration_source
first_declaration_parse_index
first_declaration_first_clause_index
first_declaration_clause_count
first_declaration_source_index
```

The companion diagnostic refinement can classify those lowering records as valid, parse, semantic, model, effect-check, capacity, LIR, or internal without changing lowering behavior. It also copies first-declaration and first-clause metadata from the lowering result for diagnostic report visibility.

The clause metadata refinement also reports first-clause node index, role, effect label, name, operator, and value so callers can confirm that lowered clause operators remain inspectable.

Small output buffers return:

```
LATTICRA_STATUS_BUFFER_TOO_SMALL
```

and clear the buffer when possible.

Validation

Run:

```
sh scripts/test-lat-to-lir-lowering.sh
sh scripts/test-lat-to-lir-diagnostic-refinement.sh
```

The runner compiles with:

```
-std=c99 -Wall -Wextra -Werror -pedantic
```

and includes:

```
src/lat_parser.c
src/lat_semantic.c
src/lat_model.c
src/lir.c
src/lat_to_lir.c
tests/lat_to_lir_lowering_invariants.c
```

Invariants covered

The invariant suite checks:

```
foundation model lowers successfully
normalized model lowers through the model-aware entry point
source kind is lat_module
declaration and clause counts are preserved
model counts, first declaration metadata, and first transition source index are preserved
first clause role, operator, value, effect, and node index are preserved
node and edge counts are deterministic
module metadata is preserved
transition source metadata is preserved
parse failures are rejected
semantic failures are rejected
no-effect flags are preserved
lowering reports are deterministic
small report buffers are rejected and cleared
error labels are stable
```

Current evidence level

This is an L2 implementation slice:

```
contract + implementation plan + C implementation + invariant tests + workflow coverage
```

It is not a compiler, interpreter, runtime, package system, command surface, or operating-system surface.

Next implementation candidate

The next completed refinement after model-driven diagnostics is:

```
Lat-to-LIR clause metadata refinement
```

Later refinements may broaden clause reporting beyond the first lowered clause or integrate this metadata into higher-level diagnostics only through separate bounded slices.

Non-claims

This implementation does not execute Lat, compile Lat, interpret Lat, execute LIR, perform runtime behavior, mutate state, render L-UI, invoke Nucleus behavior, perform recovery behavior, interact with servers, perform self-update, touch hardware, provide boot readiness, or provide operating-system completeness.

docs/LAT_TO_LIR_LOWERING_IMPLEMENTATION_PLAN.md

Source title: Latticra Lat-to-LIR Lowering Implementation Plan

Lines: 511 | Words: 1384 | SHA-256: 60661766d37e32ec5c9f4a25f77fe0b6a9fa774b76785f4be57822e812f01b6c

Latticra Lat-to-LIR Lowering Implementation Plan

Status: implementation planning contract Scope: exact public API, files, structs, errors, capacity accounting, node mapping, edge mapping, source-span mapping, report format, tests, compatibility expectations, and non-claims before Lat-to-LIR lowering code.

Purpose

This document defines the implementation plan for the first Lat-to-LIR lowering slice.

The existing Lat lane now has a bounded grammar parser and a bounded no-effect semantic validator. The next implementation step must not jump directly into execution or runtime behavior. It must first define the exact lowering API and deterministic mapping from semantically valid Lat metadata into the existing LIR module shape.

This document is plan-only. It does not implement Lat-to-LIR lowering.

Relationship to previous work

This plan depends on:

```
docs/LAT_TO_LIR_LOWERING_CONTRACT.md
docs/LAT_LANGUAGE_GRAMMAR_IMPLEMENTATION.md
docs/LAT_SEMANTIC_VALIDATION_CONTRACT.md
docs/LAT_SEMANTIC_VALIDATION_IMPLEMENTATION_PLAN.md
docs/LAT_LANGUAGE_FOUNDATION_ANALYSIS.md
docs/LIR_SHAPE_CONTRACT.md
docs/LIR_SHAPE_IMPLEMENTATION_PLAN.md
docs/LIR_SHAPE_IMPLEMENTATION.md
include/latticra/lat_parser.h
include/latticra/lat_semantic.h
include/latticra/lir.h
fixtures/lat/foundation_model.lat
```

Those files remain the source of truth for parser metadata, semantic validation, LIR shape, no-effect flags, fixture behavior, and current report boundaries.

Implementation language decision

The first Lat-to-LIR lowering implementation should be written in C.

Reason:

- the existing Lat parser is C;
- the existing Lat semantic validator is C;
- the existing LIR shape is C;
- the lowering layer should remain bounded, deterministic, caller-buffer based, and no-effect;
- constrained C++ authority layers should consume stable C substrate data rather than define the first lowering surface.

Implementation files

The future implementation slice should add:

```
include/latticra/lat_to_lir.h
src/lat_to_lir.c
tests/lat_to_lir_lowering_invariants.c
scripts/test-lat-to-lir-lowering.sh
docs/LAT_TO_LIR_LOWERING_IMPLEMENTATION.md
```

The implementation should reuse:

```
include/latticra/lat_parser.h
include/latticra/lat_semantic.h
include/latticra/lir.h
fixtures/lat/foundation_model.lat
```

The implementation should not add runtime execution, command behavior, file I/O, network I/O, host mutation, recovery behavior, hardware behavior, or a package/runtime surface.

Public API shape

Add public API names:

```
latticra_lat_to_lir_error_t
latticra_lat_to_lir_result_t
latticra_lat_to_lir_error_label
latticra_lir_lower_lat_module
latticra_lat_to_lir_report
```

Recommended function signatures:

```
const char *latticra_lat_to_lir_error_label(latticra_lat_to_lir_error_t error);

latticra_status_t latticra_lir_lower_lat_module(
    const latticra_lat_parse_result_t *parse_result,
    const latticra_lat_semantic_result_t *semantic_result,
    latticra_lir_module_t *module,
    latticra_lat_to_lir_result_t *result);

latticra_status_t latticra_lat_to_lir_report(
    const latticra_lat_to_lir_result_t *result,
    char *buffer,
    size_t buffer_len);
```

The lowering function should fill both the target latticra_lir_module_t and a smaller Lat-to-LIR summary result. The summary result exists so tests can assert lowering-specific counts and errors without parsing the generic LIR report.

Capacity constants

Add exact bounded constants:

```
LATTICRA_LAT_TO_LIR_REPORT_MAX 4096u
LATTICRA_LAT_TO_LIR_MODULE_NODE_COST 1u
LATTICRA_LAT_TO_LIR_DECLARATION_NODE_COST 1u
LATTICRA_LAT_TO_LIR_CLAUSE_NODE_COST 1u
LATTICRA_LAT_TO_LIR_DECLARATION_EDGE_COST 1u
LATTICRA_LAT_TO_LIR_CLAUSE_EDGE_COST 1u
LATTICRA_LAT_TO_LIR_TRANSITION_SOURCE_EDGE_COST 1u
```

Capacity accounting must be deterministic.

Required nodes:

```
1 + declaration_count + clause_count
```

Required edges:

```
declaration_count + clause_count + transition_count
```

If required nodes exceed LATTICRA_LIR_NODE_MAX, return capacity_exceeded.

If required edges exceed LATTICRA_LIR_EDGE_MAX, return capacity_exceeded.

Error enum

Add error enum values:

```
LATTICRA_LAT_TO_LIR_OK
LATTICRA_LAT_TO_LIR_NULL_ARGUMENT
LATTICRA_LAT_TO_LIR_PARSE_NOT_OK
LATTICRA_LAT_TO_LIR_SEMANTIC_NOT_OK
LATTICRA_LAT_TO_LIR_SEMANTIC_NOT_VALID
LATTICRA_LAT_TO_LIR_NO_EFFECT_VIOLATION
LATTICRA_LAT_TO_LIR_CAPACITY_EXCEEDED
LATTICRA_LAT_TO_LIR_UNSUPPORTED_DECLARATION_KIND
LATTICRA_LAT_TO_LIR_UNSUPPORTED_CLAUSE_KIND
LATTICRA_LAT_TO_LIR_UNSUPPORTED_EFFECT
LATTICRA_LAT_TO_LIR_UNSUPPORTED_LIR_SHAPE
LATTICRA_LAT_TO_LIR_INTERNAL_ERROR
```

Stable labels:

```
ok
null_argument
parse_not_ok
semantic_not_ok
semantic_not_valid
no_effect_violation
capacity_exceeded
unsupported_declaration_kind
unsupported_clause_kind
unsupported_effect
unsupported_lir_shape
internal_error
```

Result struct

Add a bounded summary result:

```
latticra_status_t status;
latticra_lat_to_lir_error_t error;
latticra_lat_source_span_t span;
char module_name[LATTICRA_LAT_NAME_MAX];
size_t declaration_count;
size_t state_count;
size_t policy_count;
size_t transition_count;
size_t assertion_count;
size_t effect_count;
size_t clause_count;
size_t node_count;
size_t edge_count;
size_t binding_count;
size_t text_count;
int no_effect;
int execution_allowed;
int mutation_allowed;
int server_allowed;
int recovery_allowed;
int hardware_allowed;
```

The result must be fully initialized on success and failure.

Semantic prerequisite behavior

The lowering function must reject null arguments with LATTICRA_STATUS_NULL_ARGUMENT.

The lowering function must reject parser failure when:

```
parse_result-&gt;error != LATTICRA_LAT_PARSE_OK
```

The lowering function must reject semantic failure when:

```
semantic_result-&gt;error != LATTICRA_LAT_SEMANTIC_OK
semantic_result-&gt;semantic_valid != 1
```

The lowering function must reject no-effect flag violations when any of these differ from the no-effect boundary:

```
no_effect=1
execution_allowed=0
mutation_allowed=0
server_allowed=0
recovery_allowed=0
hardware_allowed=0
```

No partial successful LIR module should be reported for failed prerequisites.

LIR module metadata mapping

On success, the future implementation should set:

```
module-&gt;status = LATTICRA_STATUS_OK
module-&gt;error = LATTICRA_LIR_OK
module-&gt;source_kind = LATTICRA_LIR_SOURCE_LAT_MODULE
module-&gt;module_name = parse_result-&gt;module.module_name
module-&gt;card_name = &quot;&quot;
module-&gt;effect = &quot;none&quot;
module-&gt;boundary = &quot;lat_semantic_only&quot;
module-&gt;source_span = parse_result-&gt;module.span converted to the LIR source-span shape
```

```
module-&gt;no_effect = 1
module-&gt;execution_allowed = 0
module-&gt;mutation_allowed = 0
module-&gt;server_allowed = 0
module-&gt;recovery_allowed = 0
module-&gt;hardware_allowed = 0
```

The implementation plan should not require card_name for Lat modules.

Source-span conversion

The current Lat source span and L-UI source span have compatible fields:

```
start_offset
end_offset
start_line
start_column
end_line
end_column
```

The implementation should use a private conversion helper from latticra_lat_source_span_t to the LIR span type used by latticra_lir_module_t.

The conversion must copy fields exactly and must not invent byte offsets.

Node mapping

The first implementation should not add new LIR node enum values.

Use the existing node kinds conservatively:

```
Lat module declaration -&gt; LATTICRA_LIR_NODE_MODULE
state declaration      -&gt; LATTICRA_LIR_NODE_FIELD with value=&quot;state&quot;
policy declaration     -&gt; LATTICRA_LIR_NODE_FIELD with value=&quot;policy&quot;
transition declaration -&gt; LATTICRA_LIR_NODE_FIELD with value=&quot;transition&quot;
assertion declaration  -&gt; LATTICRA_LIR_NODE_FIELD with value=&quot;assertion&quot;
effect declaration     -&gt; LATTICRA_LIR_NODE_EFFECT with value=&quot;effect&quot;
field clause           -&gt; LATTICRA_LIR_NODE_FIELD
require clause         -&gt; LATTICRA_LIR_NODE_BINDING with value=&quot;require&quot;
ensure clause          -&gt; LATTICRA_LIR_NODE_BINDING with value=&quot;ensure&quot;
effect clause          -&gt; LATTICRA_LIR_NODE_EFFECT
```

Declaration node fields:

```
name = declaration.name
value = declaration kind label
binding = declaration.source_name for transition declarations, otherwise empty
source_span = declaration.span
parent_index = module node index
```

Clause node fields:

```
name = clause.left
value = clause.right
binding = clause.keyword
source_span = clause.span
parent_index = declaration node index
```

Edge mapping

The first implementation should use existing edge kinds:

```
module contains declaration -&gt; LATTICRA_LIR_EDGE_CONTAINS
declaration contains clause -&gt; LATTICRA_LIR_EDGE_CONTAINS
transition references source state -&gt; LATTICRA_LIR_EDGE_BINDS
```

Transition source-reference edges should connect the transition declaration node to the referenced state declaration node when that state exists. Semantic validation is the prerequisite that guarantees the referenced state exists.

Policy and assertion clauses may remain contained child nodes in the first implementation. Additional annotates edges may wait for a later refinement.

Binding and text counts

The first Lat-to-LIR lowering implementation should not populate the LIR text table.

```
text_count=0
```

The first implementation may set binding_count equal to the number of require and ensure clause nodes, or it may keep binding_count=0 if binding references are reserved for L-UI only.

This plan chooses:

```
binding_count=0
```

Reason: Lat requirement and ensure clauses are metadata nodes in this first slice, not resolved L-UI binding references.

Effect handling

The first implementation accepts only semantic output that preserves effect none.

If any Lat effect value maps to LATTICRA_LAT_EFFECT_UNKNOWN or any non-none value reaches lowering, return:

```
unsupported_effect
```

This should be unreachable after successful semantic validation, but the lowering layer must still defend its own boundary.

Report format

latticra_lat_to_lir_report should emit:

```
LAT TO LIR LOWERING REPORT
status=&lt;integer-status&gt;
error=&lt;error-label&gt;
module=&lt;module-name&gt;
declaration_count=&lt;count&gt;
state_count=&lt;count&gt;
policy_count=&lt;count&gt;
transition_count=&lt;count&gt;
assertion_count=&lt;count&gt;
effect_count=&lt;count&gt;
clause_count=&lt;count&gt;
node_count=&lt;count&gt;
edge_count=&lt;count&gt;
binding_count=&lt;count&gt;
text_count=&lt;count&gt;
no_effect=&lt;0|1&gt;
execution_allowed=&lt;0|1&gt;
mutation_allowed=&lt;0|1&gt;
server_allowed=&lt;0|1&gt;
recovery_allowed=&lt;0|1&gt;
hardware_allowed=&lt;0|1&gt;
span_start_offset=&lt;offset&gt;
span_end_offset=&lt;offset&gt;
span_start_line=&lt;line&gt;
span_start_column=&lt;column&gt;
span_end_line=&lt;line&gt;
span_end_column=&lt;column&gt;
```

Small buffers must return LATTICRA_STATUS_BUFFER_TOO_SMALL and clear the output buffer when possible.

Exact test list

The implementation slice should add tests for:

```
lat_to_lir_rejects_null_arguments
lat_to_lir_rejects_parse_error
lat_to_lir_rejects_semantic_error
lat_to_lir_rejects_semantic_not_valid
lat_to_lir_accepts_foundation_model
lat_to_lir_sets_source_kind_lat_module
lat_to_lir_preserves_module_name
lat_to_lir_preserves_declaration_counts
lat_to_lir_preserves_transition_source_metadata
lat_to_lir_preserves_effect_none
lat_to_lir_preserves_source_spans
```

```
lat_to_lir_preserves_no_effect_flags
lat_to_lir_counts_nodes_and_edges_deterministically
lat_to_lir_report_is_deterministic
lat_to_lir_report_rejects_small_buffer
lat_to_lir_error_labels_are_stable
lat_to_lir_does_not_execute_lat
lat_to_lir_does_not_mutate_state
lat_to_lir_is_deterministic
```

Test command

The implementation slice should add:

```
sh scripts/test-lat-to-lir-lowering.sh
```

The test should compile with:

```
-std=c99 -Wall -Wextra -Werror -pedantic
```

and include:

```
src/lat_parser.c
src/lat_semantic.c
src/lat_to_lir.c
src/lir.c
tests/lat_to_lir_lowering_invariants.c
```

Documentation update plan

The implementation slice should update:

```
README.md
STATUS.md
docs/FOUNDATION_INDEX.md
docs/status/CURRENT_STATUS.md
docs/status/ANNOUNCEMENTS.md
docs/project_notes/CURRENT_DIRECTION.md
docs/project_notes/UPCOMING_WORK.md
```

and add:

```
docs/LAT_TO_LIR_LOWERING_IMPLEMENTATION.md
```

Compatibility expectations

The implementation must not change:

```
Lat grammar parser behavior
Lat semantic validation behavior
L-UI parser behavior
L-UI semantic validation behavior
existing LIR lowering from L-UI
state lattice behavior
source-span behavior
no-effect flags
```

Implementation boundary

The implementation must not:

- execute Lat declarations;
- interpret transition behavior;
- mutate state;
- render L-UI;
- call Nucleus task execution;
- evaluate host state;
- write files;
- read files;
- open network connections;

- call update code;
- call recovery code;
- call hardware code;
- broaden accepted Lat syntax;
- weaken Lat semantic validation;
- weaken existing LIR shape behavior;
- invent source byte offsets;
- imply a compiler, interpreter, runtime, package manager, or operating-system surface.

Current validation command

This implementation plan is guarded by:

```
sh scripts/test-lat-to-lir-lowering-implementation-plan.sh
```

The guard is static. It does not implement Lat-to-LIR lowering.

Implementation gate

Lat-to-LIR lowering implementation code may be added only after this plan is merged and guarded.

Non-claims

This document does not implement Lat-to-LIR lowering, Lat execution, Lat compilation, Lat interpretation, LIR execution, command behavior, Nucleus task handling, state mutation, runtime behavior, recovery behavior, server interaction, self-update, hardware support, boot readiness, or operating-system completeness.

docs/LIR_REPORT_REFINEMENT.md

Source title: Latticra LIR Report Refinement

Lines: 140 | Words: 338 | SHA-256: 1dc4f06fb3a9906fe6ee0e33c1720a398dd4801dd04d161a4075d60e77e4afeb

Latticra LIR Report Refinement

Status: initial LIR report refinement implementation Scope: deterministic LIR report classification, graph shape labeling, edge-kind summary counts, no-effect-chain reporting, evidence-level reporting, invariant tests, guard coverage, and workflow coverage.

Purpose

This document records the LIR report refinement after the Lat semantic diagnostics refinement.

The goal is to make LIR reports easier to audit by stating whether a graph was materialized, rejected, invalid, or empty, which graph shape is present, and how edge kinds are distributed.

This refinement does not execute LIR, compile Lat, interpret Lat, mutate state, perform I/O, or provide runtime behavior.

Added LIR report metadata

The LIR module now records:

```
report_classification
shape_kind
contains_edge_count
```

```
binds_edge_count
annotates_edge_count
orders_before_edge_count
transitions_from_edge_count
no_effect_chain_ok
evidence_level
```

The deterministic LATTICRA LIR REPORT now emits those fields.

Report classifications

Initial report classifications:

```
empty
materialized
rejected
invalid
```

Shape kinds

Initial shape kinds:

```
unknown
l-ui-card-graph
lat-module-graph
internal-fixture-graph
```

Edge summary counts

The LIR report now records counts by edge kind:

```
contains_edge_count
binds_edge_count
annotates_edge_count
orders_before_edge_count
transitions_from_edge_count
```

These counts are derived from the existing edge array; they do not change the graph.

Evidence level

The LIR report uses a small deterministic evidence label:

```
0 -&gt; invalid or empty report evidence
1 -&gt; rejected report evidence or materialized graph with no-effect-chain concern
2 -&gt; materialized no-effect graph evidence
```

This is a project-internal evidence label, not a certification, production-readiness claim, or security guarantee.

Validation

Run:

```
sh scripts/test-lir-report-refinement.sh
sh scripts/test-lir-shape.sh
```

The focused invariant tests verify:

```
lir_report_refinement_labels_are_stable
lir_report_refinement_reports_materialized_l_ui_shape
lir_report_refinement_reports_semantic_rejection
lir_report_refinement_report_is_deterministic
```

Compatibility

This refinement preserves existing LIR behavior for:

```
L-UI AST lowering
Lat-to-LIR lowering
node counts
edge counts
binding counts
text counts
binding resolution
source spans
no-effect flags
```

```
small-buffer behavior
semantic-failure behavior
```

Non-claims

This report refinement does not provide:

```
LIR execution
Lat execution
Lat compilation
Lat interpretation
runtime behavior
command execution
state mutation
file I/O
network I/O
server interaction
hardware behavior
terminal control
security isolation
sandboxing
malware prevention
ransomware prevention
certification
accreditation
operating-system completeness
```

docs/LIR_SHAPE_CONTRACT.md

Source title: Latticra LIR Shape Contract

Lines: 459 | Words: 1138 | SHA-256: 89228416e1ca3d820e16884aaa71f44d00a7f31908ae9eeb8569bfd3f6f0bb8c

Latticra LIR Shape Contract

Status: LIR shape contract Scope: first Latticra Intermediate Representation shape before semantic lowering, Lat integration, rendering, execution, or runtime behavior.

Purpose

This document defines the first contract for LIR: the Latticra Intermediate Representation.

LIR is the planned internal representation between validated declarations and later implementation stages.

The current repository has structural L-UI parsing, AST construction, source spans, string handling, source-buffer policies, and semantic validation. LIR shape planning comes next so future lowering has a stable target before code is added.

This document does not implement LIR.

The implementation plan is recorded in:

```
LIR_SHAPE_IMPLEMENTATION_PLAN.md
```

Relationship to previous work

This contract depends on:

```
docs/L_UI_PARSER_AST_IMPLEMENTATION.md
docs/L_UI_AST_DETAILED_REPORT_IMPLEMENTATION.md
docs/L_UI_SOURCE_BUFFER_LITERAL_NUL_POLICY_IMPLEMENTATION.md
docs/L_UI_SEMANTIC_VALIDATION_CONTRACT.md
docs/L_UI_SEMANTIC_VALIDATION_IMPLEMENTATION_PLAN.md
docs/L_UI_SEMANTIC_VALIDATION_IMPLEMENTATION.md
include/latticra/l_ui_parser.h
src/l_ui_parser_ast.c
src/l_ui_parser_semantic.c
```

Those files remain the source of truth for L-UI AST shape, semantic validation, source spans, no-effect metadata, and parser/semantic boundaries.

LIR role

LIR should be a small, explicit representation used after source parsing and semantic validation.

Recommended future pipeline:

```
source bytes
  -&gt; structural parser
  -&gt; AST construction
  -&gt; semantic validation
  -&gt; LIR lowering
  -&gt; future analysis, rendering, planning, or execution only if separately allowed
```

LIR should not bypass parser or semantic validation.

First LIR unit

The first LIR unit should be a module-like object representing one validated L-UI card.

Suggested root object:

```
latticra_lir_module_t
```

Initial fields:

```
status
source_kind
module_name
card_name
effect
boundary
node_count
edge_count
binding_count
text_count
source_span
no_effect
execution_allowed
mutation_allowed
server_allowed
recovery_allowed
hardware_allowed
```

Source kind

Initial source kind labels:

```
unknown
l_ui_card
lat_module
internal_fixture
```

Only l_ui_card is in scope for the first LIR lowering path.

Node kinds

Initial LIR node kinds:

```
module
card
rail
field
text
binding
effect
boundary
```

A future implementation plan may add more node kinds, but this contract keeps the first set minimal.

Node shape

Suggested node shape:

```
kind
```

```
name
value
binding
source_span
parent_index
first_child_index
child_count
flags
```

Rules:

- all nodes have deterministic indexes;
- parent/child relationships are index-based;
- source spans come from parser/AST metadata;
- string values use explicit lengths when needed;
- no node is executable by default.

Edge shape

Suggested edge shape:

```
from_index
to_index
edge_kind
source_span
```

Initial edge kinds:

```
contains
binds
annotates
orders_before
```

Edges are metadata only. They do not execute behavior.

Binding shape

Suggested binding shape:

```
field_node_index
binding_target
binding_prefix
source_span
resolved_kind
```

Initial binding prefixes:

```
state
preview
```

Initial resolved kinds:

```
state_value
preview_value
unsupported
```

Bindings remain symbolic. LIR must not evaluate host state or preview state.

Text shape

Text values should carry explicit byte lengths.

Suggested text shape:

```
text_node_index
value
value_len
escaped_value
source_span
```

value_len remains authoritative for embedded NUL values.

Raw C-string compatibility fields must not be the assertion target for embedded NUL values.

Effect and boundary shape

LIR should carry effect and boundary metadata from validated input.

Initial allowed values:

```
effect=none
boundary=preview_only
```

No other effect or boundary should be accepted into first LIR shape without a separate contract.

Semantic prerequisite

LIR lowering may only operate after semantic validation succeeds:

```
semantic_error=ok
parser_error=ok
no_effect=1
execution_allowed=0
mutation_allowed=0
server_allowed=0
recovery_allowed=0
hardware_allowed=0
```

If semantic validation failed, LIR lowering should not materialize a partial LIR.

Source-span behavior

Every LIR node that comes from source should carry a source span from parser or AST metadata.

Rules:

- module/card spans come from card spans;
- rail spans come from rail spans;
- field spans come from field spans;
- binding spans come from binding spans;
- text spans come from text spans;
- effect and boundary spans may use card metadata until more specific spans exist;
- LIR must not invent byte positions.

Report model

A future LIR report should be deterministic and bounded.

Suggested fields:

```
LATTICRA LIR REPORT
status=&lt;status&gt;
source_kind=&lt;kind&gt;
module=&lt;name&gt;
card=&lt;name&gt;
effect=&lt;effect&gt;
boundary=&lt;boundary&gt;
node_count=&lt;count&gt;
edge_count=&lt;count&gt;
binding_count=&lt;count&gt;
text_count=&lt;count&gt;
no_effect=&lt;0|1&gt;
execution_allowed=&lt;0|1&gt;
mutation_allowed=&lt;0|1&gt;
server_allowed=&lt;0|1&gt;
recovery_allowed=&lt;0|1&gt;
hardware_allowed=&lt;0|1&gt;
```

Detailed reports may later include node and edge tables.

Capacity policy

The first LIR implementation should use fixed capacities aligned with existing AST limits.

Suggested capacities:

```
LATTICRA_LIR_NODE_MAX &gt;= LATTICRA_L_UI_AST_RAIL_MAX + LATTICRA_L_UI_AST_FIELD_MAX +
LATTICRA_L_UI_AST_TEXT_MAX + card/effect/boundary overhead
LATTICRA_LIR_EDGE_MAX bounded and deterministic
LATTICRA_LIR_BINDING_MAX bounded and deterministic
LATTICRA_LIR_TEXT_MAX bounded and deterministic
```

A future implementation plan must name exact constants before code is added.

The exact first implementation-plan constants are recorded in:

```
LIR_SHAPE_IMPLEMENTATION_PLAN.md
```

Error model

LIR should have a separate error space from parser and semantic errors.

Recommended future labels:

```
ok
null_argument
semantic_failed
capacity_exceeded
unsupported_source_kind
unsupported_node_kind
unsupported_effect
unsupported_boundary
internal_error
```

Exact enum names should be defined in the implementation plan.

No-effect rule

LIR shape and reports are metadata-only.

They must preserve:

```
no_effect=1
execution_allowed=0
mutation_allowed=0
server_allowed=0
recovery_allowed=0
hardware_allowed=0
```

LIR work must not render UI, execute bindings, evaluate host state, call Nucleus task code, write files, read files, open network connections, call server code, call update code, call recovery code, or touch hardware.

Compatibility expectations

LIR shape work must not change:

```
existing parser behavior
existing parser diagnostic codes
existing AST construction behavior
existing detailed AST report behavior
existing semantic validation behavior
escaped decoded NUL acceptance
literal source-buffer NUL rejection
source-span byte offset behavior
no-effect flags
current accepted fixture counts
```

The first accepted fixture should still report:

```
rail_count=9
field_count=23
text_count=2
effect=none
```

```
boundary=preview_only
```

Future implementation gate

LIR implementation must not begin until a separate implementation plan defines:

1. public API shape;
2. LIR struct names;
3. capacity constants;
4. node enum labels;
5. edge enum labels;
6. error enum labels;
7. report format;
8. semantic prerequisite behavior;
9. source-span mapping;
10. exact tests;
11. compatibility expectations;
12. non-claims.

That plan is recorded in:

```
LIR_SHAPE_IMPLEMENTATION_PLAN.md
```

Future test list

A future implementation plan should include tests for:

```
lir_shape_accepts_semantically_valid_l_ui_fixture
lir_shape_rejects_parser_failed_ast
lir_shape_rejects_semantic_failed_ast
lir_shape_preserves_card_metadata
lir_shape_preserves_rail_nodes
lir_shape_preserves_field_nodes
lir_shape_preserves_binding_nodes
lir_shape_preserves_text_nodes_with_lengths
lir_shape_preserves_source_spans
lir_shape_preserves_no_effect_flags
lir_shape_report_is_deterministic
lir_shape_report_rejects_small_buffer
lir_shape_does_not_change_ast_report
lir_shape_does_not_change_semantic_report
lir_shape_does_not_change_escaped_x00_acceptance
lir_shape_does_not_change_literal_nul_rejection
lir_shape_is_deterministic
```

The implementation-plan test list is now recorded in:

```
LIR_SHAPE_IMPLEMENTATION_PLAN.md
```

Forbidden behavior

LIR shape work must not:

- lower invalid semantic input;
- execute bindings;
- evaluate host state;
- call Nucleus task execution;
- render L-UI;
- execute Lat;

- mutate state;
- write files;
- read files;
- open network connections;
- call server code;
- call update code;
- call recovery code;
- call hardware code;
- broaden accepted syntax;
- weaken parser diagnostics;
- weaken semantic validation;
- accept literal source-buffer NUL;
- remove escaped decoded NUL support;
- make raw C-string fields authoritative for embedded NUL values.

Current validation command

This contract is guarded by:

```
sh scripts/test-lir-shape-contract.sh
```

The guard is static. It does not implement LIR.

Non-claims

This document does not implement LIR, LIR lowering, L-UI rendering, Lat execution, command behavior, Nucleus task handling, live movement, origin mutation, recovery behavior, server interaction, self-update, hardware support, boot readiness, security isolation, sandboxing, malware prevention, ransomware prevention, or operating-system completeness.

docs/LIR_SHAPE_IMPLEMENTATION.md

Source title: Latticra LIR Shape Implementation

Lines: 320 | Words: 716 | SHA-256: 81d7fd2ebf1e18b8a13f3423824cf3cb1097ca5261734fbbe2fd5425355f79a8

Latticra LIR Shape Implementation

Status: initial implementation contract Scope: bounded no-effect LIR shape API, lowering, report, and invariants for semantically valid L-UI ASTs.

Purpose

This implementation adds the first LIR shape for Latticra.

LIR is the Latticra Intermediate Representation. The first implementation lowers only a semantically valid L-UI AST into a bounded metadata graph.

This implementation does not execute LIR, render L-UI, lower Lat, call Nucleus task behavior, read files, write files, open network connections, mutate state, or touch hardware.

Implementation files

```
include/latticra/lir.h
src/lir.c
tests/lir_shape_invariants.c
scripts/test-lir-shape.sh
.github/workflows/c.yml
```

Related active files:

```
include/latticra/l_ui_parser.h
src/l_ui_parser_ast.c
src/l_ui_parser_semantic.c
docs/LIR_SHAPE_CONTRACT.md
docs/LIR_SHAPE_IMPLEMENTATION_PLAN.md
```

Public API

The public API adds:

```
latticra_lir_source_kind_t
latticra_lir_node_kind_t
latticra_lir_edge_kind_t
latticra_lir_resolved_binding_kind_t
latticra_lir_error_t
latticra_lir_node_t
latticra_lir_edge_t
latticra_lir_binding_ref_t
latticra_lir_text_ref_t
latticra_lir_module_t
latticra_lir_error_label
latticra_lir_source_kind_label
latticra_lir_node_kind_label
latticra_lir_edge_kind_label
latticra_lir_resolved_binding_kind_label
latticra_lir_lower_l_ui_ast
latticra_lir_report
```

The Lat-to-LIR clause metadata refinement adds operator_text to latticra_lir_node_t so Lat-derived clause nodes can preserve =, ==, and != metadata without overloading values or bindings. L-UI lowering leaves this field empty.

Capacity constants

The first LIR implementation uses exact bounded constants:

```
LATTICRA_LIR_NAME_MAX 64u
LATTICRA_LIR_VALUE_MAX 128u
LATTICRA_LIR_BINDING_MAX 96u
LATTICRA_LIR_NODE_MAX 96u
LATTICRA_LIR_EDGE_MAX 128u
LATTICRA_LIR_BINDING_REF_MAX 32u
LATTICRA_LIR_TEXT_MAX 16u
LATTICRA_LIR_REPORT_MAX 8192u
```

Lowering prerequisite

latticra_lir_lower_l_ui_ast requires:

```
ast != NULL
semantic != NULL
module != NULL
ast-&gt;parse_result.error == LATTICRA_L_UI_PARSE_OK
semantic-&gt;error == LATTICRA_L_UI_SEMANTIC_OK
semantic-&gt;parser_error == LATTICRA_L_UI_PARSE_OK
semantic-&gt;no_effect == 1
semantic-&gt;execution_allowed == 0
semantic-&gt;mutation_allowed == 0
semantic-&gt;server_allowed == 0
semantic-&gt;recovery_allowed == 0
semantic-&gt;hardware_allowed == 0
```

If the prerequisite fails, it does not materialize a partial LIR graph.

Expected failure state:

```
module.error=semantic_failed
node_count=0
```

```
edge_count=0
binding_count=0
text_count=0
```

Deterministic node plan

Successful L-UI lowering currently produces deterministic nodes:

```
0: module
1: card
2-10: rails in current L-UI order
11-33: fields in current AST order
34-35: text nodes
36-58: binding nodes
59: effect
60: boundary
```

Expected successful counts:

```
node_count=61
edge_count=60
binding_count=23
text_count=2
```

Source-span mapping

LIR nodes use existing parser/AST spans:

```
module -&gt; ast.card.span
card -&gt; ast.card.span
rail -&gt; ast.rails[index].span
field -&gt; ast.fields[index].span
binding -&gt; ast.fields[index].binding_span
text -&gt; ast.texts[index].span
effect -&gt; ast.card.span
boundary -&gt; ast.card.span
```

LIR does not invent byte offsets.

Text and binding preservation

Text references preserve explicit byte lengths:

```
text_node_index
value
value_len
escaped_value
source_span
```

value_len is authoritative for embedded NUL values.

Binding references preserve symbolic binding metadata:

```
field_node_index
binding_target
binding_prefix
source_span
resolved_kind
```

Initial resolved binding kinds are:

```
state_value
preview_value
unsupported
```

Bindings remain symbolic and are not executed or evaluated.

Report format

latticra_lir_report emits a deterministic bounded report beginning with:

```
LATTICRA LIR REPORT
```

and including:

```
status
error
source_kind
module
```

```
card
effect
boundary
node_count
edge_count
binding_count
text_count
no_effect
execution_allowed
mutation_allowed
server_allowed
recovery_allowed
hardware_allowed
span_start_offset
span_end_offset
span_start_line
span_start_column
span_end_line
span_end_column
```

Small output buffers return:

```
LATTICRA_STATUS_BUFFER_TOO_SMALL
```

and clear the output buffer.

No-effect boundary

LIR shape lowering and reports are metadata-only.

They preserve:

```
no_effect=1
execution_allowed=0
mutation_allowed=0
server_allowed=0
recovery_allowed=0
hardware_allowed=0
```

Test command

Run:

```
sh scripts/test-lir-shape.sh
```

The main C workflow runs this check after the LIR shape implementation-plan guard and before the string-literal escape guards.

Required invariants

The LIR shape tests verify:

```
lir_shape_accepts_semantically_valid_l_ui_fixture
lir_shape_rejects_parser_failed_ast
lir_shape_rejects_semantic_failed_ast
lir_shape_preserves_card_metadata
lir_shape_preserves_rail_nodes
lir_shape_preserves_field_nodes
lir_shape_preserves_binding_nodes
lir_shape_preserves_text_nodes_with_lengths
lir_shape_preserves_source_spans
lir_shape_preserves_no_effect_flags
lir_shape_report_is_deterministic
lir_shape_report_rejects_small_buffer
lir_shape_does_not_change_ast_report
lir_shape_does_not_change_semantic_report
lir_shape_does_not_change_escaped_x00_acceptance
lir_shape_does_not_change_literal_nul_rejection
lir_shape_error_labels_are_stable
lir_shape_kind_labels_are_stable
lir_shape_is_deterministic
```

Compatibility

This implementation does not change:

```
existing parser behavior
existing parser diagnostic codes
```

```
existing AST construction behavior
existing detailed AST report behavior
existing semantic validation behavior
escaped decoded NUL acceptance
literal source-buffer NUL rejection
source-span byte offset behavior
current accepted fixture counts
```

The first accepted fixture still reports:

```
rail_count=9
field_count=23
text_count=2
effect=none
boundary=preview_only
```

Current evidence level

This implementation is an L2 tested intermediate-representation shape for semantically valid L-UI AST fixtures.

It is not LIR execution, L-UI rendering, Lat execution, command behavior, Nucleus task execution, live movement, origin mutation, recovery behavior, server interaction, self-update, hardware support, boot readiness, security isolation, sandboxing, malware prevention, ransomware prevention, or operating-system completeness.

Next implementation step

The next implementation candidate is:

```
Lat language grammar contract
```

That future work should define the first Lat / Latticra Programming Language grammar before implementation.

Non-claims

This document and implementation do not implement LIR execution, L-UI rendering, Lat execution, command behavior, Nucleus task handling, live movement, origin mutation, recovery behavior, server interaction, self-update, hardware support, boot readiness, security isolation, sandboxing, malware prevention, ransomware prevention, or operating-system completeness.

docs/LIR_SHAPE_IMPLEMENTATION_PLAN.md

Source title: Latticra LIR Shape Implementation Plan

Lines: 634 | Words: 1339 | SHA-256: a3c30258f8a31503aeb4c2ef6d0991006b49c36b56d079fc205337ba6af89b42

Latticra LIR Shape Implementation Plan

Status: implementation planning contract Scope: exact API, structs, capacities, enum labels, report format, semantic prerequisite behavior, source-span mapping, tests, compatibility expectations, and non-claims before LIR code.

Purpose

This document defines the implementation plan for the first LIR shape.

The LIR shape contract is already merged and guarded. This plan names exact public API additions, struct names, capacity constants, node enum labels, edge enum labels, error enum labels, report format, semantic prerequisite behavior, source-span mapping, test files, documentation updates, compatibility expectations, and non-claims required before LIR code is added.

This document does not implement LIR.

Relationship to previous work

This plan depends on:

```
docs/LIR_SHAPE_CONTRACT.md
docs/L_UI_SEMANTIC_VALIDATION_IMPLEMENTATION.md
docs/L_UI_SEMANTIC_VALIDATION_IMPLEMENTATION_PLAN.md
docs/L_UI_PARSER_AST_IMPLEMENTATION.md
docs/L_UI_AST_DETAILED_REPORT_IMPLEMENTATION.md
docs/L_UI_SOURCE_BUFFER_LITERAL_NUL_POLICY_IMPLEMENTATION.md
include/latticra/l_ui_parser.h
src/l_ui_parser_ast.c
src/l_ui_parser_semantic.c
```

Those files remain the source of truth for L-UI AST shape, semantic validation, source spans, no-effect metadata, and parser/semantic boundaries.

Implementation language decision

The first LIR shape implementation should be in C.

Reason:

- current L-UI parser, AST, semantic validation, and reports are C;
- the first LIR lowering path consumes C structs;
- tests and runners use C and POSIX shell;
- the first LIR layer should stay deterministic, bounded, and no-effect.

Implementation files

The implementation PR should modify:

```
include/latticra/lir.h
include/latticra/l_ui_parser.h
src/lir.c
.github/workflows/c.yml
```

The implementation PR should add:

```
docs/LIR_SHAPE_IMPLEMENTATION.md
tests/lir_shape_invariants.c
scripts/test-lir-shape.sh
```

The implementation should not add rendering, Lat execution, L-UI execution, Nucleus task execution, file I/O, network I/O, mutation, recovery behavior, update behavior, or hardware behavior.

Public header plan

Add a new public LIR header:

```
include/latticra/lir.h
```

Include it from:

```
include/latticra/l_ui_parser.h
```

only if needed for public lowering declarations.

The header should depend only on stable shared types and L-UI parser types needed for source spans and semantic input.

Capacity constants

Add exact bounded constants:

```
LATTICRA_LIR_NAME_MAX 64u
LATTICRA_LIR_VALUE_MAX 128u
LATTICRA_LIR_BINDING_MAX 96u
LATTICRA_LIR_NODE_MAX 96u
LATTICRA_LIR_EDGE_MAX 128u
LATTICRA_LIR_BINDING_REF_MAX 32u
```

```
LATTICRA_LIR_TEXT_MAX 16u
LATTICRA_LIR_REPORT_MAX 8192u
```

Rationale:

- current AST rail max is 16;
- current AST field max is 64;
- current AST text max is 16;
- 96 nodes gives room for module, card, rails, fields, texts, bindings, effect, and boundary metadata while remaining bounded.

Public API shape

Add public API names:

```
latticra_lir_source_kind_t
latticra_lir_node_kind_t
latticra_lir_edge_kind_t
latticra_lir_resolved_binding_kind_t
latticra_lir_error_t
latticra_lir_node_t
latticra_lir_edge_t
latticra_lir_binding_ref_t
latticra_lir_text_ref_t
latticra_lir_module_t
latticra_lir_error_label
latticra_lir_source_kind_label
latticra_lir_node_kind_label
latticra_lir_edge_kind_label
latticra_lir_resolved_binding_kind_label
latticra_lir_lower_l_ui_ast
latticra_lir_report
```

Recommended function signatures:

```
const char *latticra_lir_error_label(latticra_lir_error_t error);
const char *latticra_lir_source_kind_label(latticra_lir_source_kind_t kind);
const char *latticra_lir_node_kind_label(latticra_lir_node_kind_t kind);
const char *latticra_lir_edge_kind_label(latticra_lir_edge_kind_t kind);
const char *latticra_lir_resolved_binding_kind_label(latticra_lir_resolved_binding_kind_t kind);

latticra_status_t latticra_lir_lower_l_ui_ast(
    const latticra_l_ui_ast_result_t *ast,
    const latticra_l_ui_semantic_result_t *semantic,
    latticra_lir_module_t *module);

latticra_status_t latticra_lir_report(
    const latticra_lir_module_t *module,
    char *buffer,
    size_t buffer_len);
```

Source kind enum

Add source kind enum values:

```
LATTICRA_LIR_SOURCE_UNKNOWN
LATTICRA_LIR_SOURCE_L_UI_CARD
LATTICRA_LIR_SOURCE_LAT_MODULE
LATTICRA_LIR_SOURCE_INTERNAL_FIXTURE
```

Stable labels:

```
unknown
l_ui_card
lat_module
internal_fixture
```

Only LATTICRA_LIR_SOURCE_L_UI_CARD should be produced by the first implementation.

Node kind enum

Add node kind enum values:

```
LATTICRA_LIR_NODE_MODULE
LATTICRA_LIR_NODE_CARD
```

```
LATTICRA_LIR_NODE_RAIL
LATTICRA_LIR_NODE_FIELD
LATTICRA_LIR_NODE_TEXT
LATTICRA_LIR_NODE_BINDING
LATTICRA_LIR_NODE_EFFECT
LATTICRA_LIR_NODE_BOUNDARY
LATTICRA_LIR_NODE_UNKNOWN
```

Stable labels:

```
module
card
rail
field
text
binding
effect
boundary
unknown
```

Edge kind enum

Add edge kind enum values:

```
LATTICRA_LIR_EDGE_CONTAINS
LATTICRA_LIR_EDGE_BINDS
LATTICRA_LIR_EDGE_ANNOTATES
LATTICRA_LIR_EDGE_ORDERS_BEFORE
LATTICRA_LIR_EDGE_UNKNOWN
```

Stable labels:

```
contains
binds
annotates
orders_before
unknown
```

Resolved binding kind enum

Add resolved binding kind enum values:

```
LATTICRA_LIR_BINDING_STATE_VALUE
LATTICRA_LIR_BINDING_PREVIEW_VALUE
LATTICRA_LIR_BINDING_UNSUPPORTED
```

Stable labels:

```
state_value
preview_value
unsupported
```

Bindings remain symbolic and must not evaluate host state.

Error enum

Add LIR error enum values:

```
LATTICRA_LIR_OK
LATTICRA_LIR_NULL_ARGUMENT
LATTICRA_LIR_SEMANTIC_FAILED
LATTICRA_LIR_CAPACITY_EXCEEDED
LATTICRA_LIR_UNSUPPORTED_SOURCE_KIND
LATTICRA_LIR_UNSUPPORTED_NODE_KIND
LATTICRA_LIR_UNSUPPORTED_EFFECT
LATTICRA_LIR_UNSUPPORTED_BOUNDARY
LATTICRA_LIR_INTERNAL_ERROR
```

Stable labels:

```
ok
null_argument
semantic_failed
capacity_exceeded
unsupported_source_kind
unsupported_node_kind
unsupported_effect
unsupported_boundary
internal_error
```

Node struct

Add node struct:

```
latticra_lir_node_kind_t kind;
char name[LATTICRA_LIR_NAME_MAX];
char value[LATTICRA_LIR_VALUE_MAX];
char binding[LATTICRA_LIR_BINDING_MAX];
latticra_l_ui_source_span_t source_span;
size_t parent_index;
size_t first_child_index;
size_t child_count;
unsigned int flags;
```

Rules:

- indexes are deterministic;
- parent and child references use indexes;
- source spans are copied from AST metadata;
- values remain bounded;
- nodes are metadata-only.

Edge struct

Add edge struct:

```
size_t from_index;
size_t to_index;
latticra_lir_edge_kind_t edge_kind;
latticra_l_ui_source_span_t source_span;
```

Edges are metadata only and do not execute behavior.

Binding reference struct

Add binding reference struct:

```
size_t field_node_index;
char binding_target[LATTICRA_LIR_BINDING_MAX];
char binding_prefix[LATTICRA_LIR_NAME_MAX];
latticra_l_ui_source_span_t source_span;
latticra_lir_resolved_binding_kind_t resolved_kind;
```

Only state and preview prefixes are expected from current semantic validation.

Text reference struct

Add text reference struct:

```
size_t text_node_index;
char value[LATTICRA_LIR_VALUE_MAX];
size_t value_len;
char escaped_value[LATTICRA_LIR_VALUE_MAX];
latticra_l_ui_source_span_t source_span;
```

value_len is authoritative.

Module struct

Add module struct:

```
latticra_status_t status;
latticra_lir_error_t error;
latticra_lir_source_kind_t source_kind;
char module_name[LATTICRA_LIR_NAME_MAX];
char card_name[LATTICRA_LIR_NAME_MAX];
char effect[LATTICRA_LIR_NAME_MAX];
char boundary[LATTICRA_LIR_NAME_MAX];
latticra_l_ui_source_span_t source_span;
latticra_lir_node_t nodes[LATTICRA_LIR_NODE_MAX];
latticra_lir_edge_t edges[LATTICRA_LIR_EDGE_MAX];
latticra_lir_binding_ref_t bindings[LATTICRA_LIR_BINDING_REF_MAX];
```

```
latticra_lir_text_ref_t texts[LATTICRA_LIR_TEXT_MAX];
size_t node_count;
size_t edge_count;
size_t binding_count;
size_t text_count;
int no_effect;
int execution_allowed;
int mutation_allowed;
int server_allowed;
int recovery_allowed;
int hardware_allowed;
```

The module must be fully initialized on success and on failure.

L-UI lowering behavior

latticra_lir_lower_l_ui_ast should require:

```
ast != NULL
semantic != NULL
module != NULL
ast-&gt;parse_result.error == LATTICRA_L_UI_PARSE_OK
semantic-&gt;error == LATTICRA_L_UI_SEMANTIC_OK
semantic-&gt;parser_error == LATTICRA_L_UI_PARSE_OK
semantic-&gt;no_effect == 1
semantic-&gt;execution_allowed == 0
semantic-&gt;mutation_allowed == 0
semantic-&gt;server_allowed == 0
semantic-&gt;recovery_allowed == 0
semantic-&gt;hardware_allowed == 0
```

If the prerequisite fails, it should return LATTICRA_STATUS_OK with:

```
module.error = LATTICRA_LIR_SEMANTIC_FAILED
module.node_count = 0
module.edge_count = 0
module.binding_count = 0
module.text_count = 0
```

Initial deterministic node plan

The first implementation should produce deterministic nodes:

```
0: module
1: card
2-10: rails in current L-UI order
11-33: fields in current AST order
34-35: text nodes
36-58: binding nodes
59: effect
60: boundary
```

Expected successful counts:

```
node_count=61
binding_count=23
text_count=2
```

Edge count may be implementation-defined but must be deterministic and bounded. The implementation plan sets expected minimum:

```
edge_count &gt;= 60
```

Report format

latticra_lir_report should produce:

```
LATTICRA LIR REPORT
status=&lt;integer-status&gt;
error=&lt;lir-error-label&gt;
source_kind=&lt;source-kind-label&gt;
module=&lt;module-name&gt;
card=&lt;card-name&gt;
effect=&lt;effect&gt;
boundary=&lt;boundary&gt;
node_count=&lt;count&gt;
edge_count=&lt;count&gt;
binding_count=&lt;count&gt;
text_count=&lt;count&gt;
```

```
no_effect=&lt;0|1&gt;
execution_allowed=&lt;0|1&gt;
mutation_allowed=&lt;0|1&gt;
server_allowed=&lt;0|1&gt;
recovery_allowed=&lt;0|1&gt;
hardware_allowed=&lt;0|1&gt;
span_start_offset=&lt;offset&gt;
span_end_offset=&lt;offset&gt;
span_start_line=&lt;line&gt;
span_start_column=&lt;column&gt;
span_end_line=&lt;line&gt;
span_end_column=&lt;column&gt;
```

Small output buffers should return LATTICRA_STATUS_BUFFER_TOO_SMALL and clear the buffer.

Source-span mapping

Use these source-span mappings:

```
module -&gt; ast.card.span
card -&gt; ast.card.span
rail -&gt; ast.rails[index].span
field -&gt; ast.fields[index].span
binding -&gt; ast.fields[index].binding_span
text -&gt; ast.texts[index].span
effect -&gt; ast.card.span
boundary -&gt; ast.card.span
```

LIR must not invent byte offsets.

No-effect preservation

LIR is metadata-only.

It must preserve:

```
no_effect=1
execution_allowed=0
mutation_allowed=0
server_allowed=0
recovery_allowed=0
hardware_allowed=0
```

Exact implementation test list

The implementation PR should include tests for:

```
lir_shape_accepts_semantically_valid_l_ui_fixture
lir_shape_rejects_parser_failed_ast
lir_shape_rejects_semantic_failed_ast
lir_shape_preserves_card_metadata
lir_shape_preserves_rail_nodes
lir_shape_preserves_field_nodes
lir_shape_preserves_binding_nodes
lir_shape_preserves_text_nodes_with_lengths
lir_shape_preserves_source_spans
lir_shape_preserves_no_effect_flags
lir_shape_report_is_deterministic
lir_shape_report_rejects_small_buffer
lir_shape_does_not_change_ast_report
lir_shape_does_not_change_semantic_report
lir_shape_does_not_change_escaped_x00_acceptance
lir_shape_does_not_change_literal_nul_rejection
lir_shape_error_labels_are_stable
lir_shape_kind_labels_are_stable
lir_shape_is_deterministic
```

Test file plan

Add:

```
tests/lir_shape_invariants.c
scripts/test-lir-shape.sh
```

Wire into:

```
.github/workflows/c.yml
```

Run after:

```
sh scripts/test-lir-shape-contract.sh
```

and before:

```
sh scripts/test-l-ui-string-literal-escape-contract.sh
```

Documentation update plan

The implementation PR should update:

```
README.md
STATUS.md
docs/FOUNDATION_INDEX.md
docs/status/CURRENT_STATUS.md
docs/status/ANNOUNCEMENTS.md
docs/project_notes/CURRENT_DIRECTION.md
docs/project_notes/UPCOMING_WORK.md
docs/strategy/2026-05-15-2249-cdt-national-security-open-system-strategy.md
docs/LIR_SHAPE_CONTRACT.md
scripts/test-project-strategy-status-framework.sh
```

and add:

```
docs/LIR_SHAPE_IMPLEMENTATION.md
```

Compatibility expectations

The implementation must not change:

```
existing parser behavior
existing parser diagnostic codes
existing AST construction behavior
existing detailed AST report behavior
existing semantic validation behavior
escaped decoded NUL acceptance
literal source-buffer NUL rejection
source-span byte offset behavior
current accepted fixture counts
```

The first accepted fixture should still report:

```
rail_count=9
field_count=23
text_count=2
effect=none
boundary=preview_only
```

Forbidden implementation behavior

LIR shape implementation must not:

- lower invalid semantic input;
- execute bindings;
- evaluate host state;
- call Nucleus task execution;
- render L-UI;
- execute Lat;
- mutate state;
- write files;
- read files;
- open network connections;
- call server code;
- call update code;

- call recovery code;
- call hardware code;
- broaden accepted syntax;
- weaken parser diagnostics;
- weaken semantic validation;
- accept literal source-buffer NUL;
- remove escaped decoded NUL support;
- make raw C-string fields authoritative for embedded NUL values.

Current validation command

This implementation plan is guarded by:

```
sh scripts/test-lir-shape-implementation-plan.sh
```

The guard is static. It does not implement LIR.

Implementation gate

LIR shape implementation code may be added only after this plan is merged.

Non-claims

This document does not implement LIR, LIR lowering, L-UI rendering, Lat execution, command behavior, Nucleus task handling, live movement, origin mutation, recovery behavior, server interaction, self-update, hardware support, boot readiness, security isolation, sandboxing, malware prevention, ransomware prevention, or operating-system completeness.

docs/POLYMORPHIC_LANGUAGE_STRATEGY.md

Source title: Polymorphic Language Strategy

Lines: 191 | Words: 682 | SHA-256: 4ba630c06fdc485945c7206d426f21a018545f31e01636cc3cc99de6afc2122a

Polymorphic Language Strategy

Status: active architecture strategy Scope: language placement rules for Latticra, Lat, LIR, Latticra Seal, C, C++, and Rust. This document does not implement runtime execution, runtime authority, policy enforcement, cryptographic verification, operating-system behavior, production readiness, or external endorsement.

Purpose

Latticra should be polymorphic in its use of programming languages without becoming undisciplined.

The project should use each language where it is strongest, keep cross-language interfaces explicit, and avoid language ideology. The goal is a serious systems architecture where C, constrained C++, Rust, Lat, and LIR each have a bounded role.

Core rule

```
C owns the substrate.
C++ owns governed architecture and policy modeling.
Rust owns safe tooling and high-risk input surfaces.
Lat owns Latticra-native declaration and system intent.
LIR owns bounded intermediate representation and evidence-bearing shape.
```

C role

C is the substrate language for Latticra.

Use C for:

```
stable ABI boundaries
small no-effect runtime primitives
state and boundary fixtures
Lat-to-LIR lowering foundations
LIR shape and metadata surfaces
runtime-boundary classification
Seal metadata structs
capability records
evidence receipts
host-neutral invariant tests
```

C code should remain small, auditable, deterministic, and boring. It should not hide policy complexity, own broad orchestration, or become a dumping ground for every subsystem.

C++ role

Constrained C++ is the architecture and policy language for Latticra.

Use C++ for:

```
policy graph modeling
capability graph modeling
Seal decision modeling
tool-boundary planning
Lat semantic architecture experiments
higher-order validation engines
audit and planning reports
future bounded architecture simulators
```

C++ must remain governed by the existing constrained C++ authority-layer direction. It should not bypass C effect gates, grant runtime authority, execute tools, perform host mutation, perform network behavior, or introduce unrestricted ownership and allocation patterns.

Rust role

Rust is the safety-focused tooling and verification language for Latticra.

Use Rust for:

```
CLI tooling
manifest parsing
evidence report generation
signature metadata tooling
future cryptographic verification wrappers
serialization and deserialization
untrusted input handling
safe developer tools
future network-facing user-space tools
```

Rust should not be used to erase the C/C++ architecture. It should protect risky input surfaces and developer-facing tools where memory safety and parser safety are especially valuable.

Lat role

Lat is the Latticra-native language direction.

Use Lat for:

```
system declarations
capability annotations
Seal intent declarations
policy-aware function shape
runtime-boundary descriptions
future Latticra-native system contracts
```

Lat is not currently a compiler product, interpreter product, execution engine, production language, or operating-system replacement layer. Its current valid path is parsing, semantic validation, diagnostics, metadata lowering, and no-effect LIR representation.

LIR role

LIR is the bounded intermediate representation.

Use LIR for:

```
Lat declaration shape
metadata-bearing graph representation
operator-visible reports
semantic lowering evidence
no-effect transition between language and runtime-boundary planning
```

LIR should remain evidence-bearing and bounded before execution is considered.

Boundary interface policy

Cross-language boundaries should use explicit contracts.

Preferred boundary shape:

```
plain C ABI
fixed-capacity structs where practical
explicit ownership
explicit error codes
no hidden runtime dependency
no implicit authority grant
no effect without a named gate
```

Every new cross-language boundary must name:

1. caller language;
2. callee language;
3. ownership rules;
4. error behavior;
5. effect posture;
6. authority posture;
7. test or guard path.

Layer map

```
Lat
  declaration and system intent layer

LIR
  bounded metadata and intermediate representation layer

C substrate
  ABI, fixtures, no-effect primitives, runtime-boundary records

Constrained C++
  policy graph, authority planning, capability graph, decision models

Rust tools
  safe CLI, manifest parsing, evidence processing, verification wrappers

Fedora/Linux
  current host-facing validation lane and integration target
```

Non-claims

This strategy does not claim:

```
Rust implementation present for all named Rust areas
C++ implementation present for all named C++ areas
Lat execution
```

```
LIR execution
runtime authority
policy enforcement
cryptographic verification
tool execution
MCP implementation
production readiness
operating-system replacement
```

Implementation rule

A language should be introduced into a subsystem only when that subsystem has a contract, a boundary, and a test path.

The acceptable question is not "which language is best overall?"

The acceptable question is:

```
Which language is safest, clearest, and most auditable for this specific layer?
```

docs/UI_TERMINAL_LANGUAGE.md

Source title: Latticra UI Terminal Language

Lines: 145 | Words: 405 | SHA-256: 7b5016e4068d2e114c83802bde7a03c74d45595937a1b7fda81735a1d7ac6a59

Latticra UI Terminal Language

Status: initial L-UI design Scope: terminal/operator UI language direction, rails, reports, and non-claims.

Purpose

Latticra should define its terminal and operator interface language before implementation code expands.

The terminal UI should not be a pile of hard-coded strings. It should become a controlled, declarative surface that can render state, effects, gates, evidence, and supervisor reports clearly.

Name

The planned UI language or dialect is:

```
L-UI
```

L-UI is part of the Latticra language family, but it should remain narrower than full Lat.

Role

L-UI describes:

- operator rails;
- state cards;
- evidence reports;
- update reports;
- effect-gate reports;
- policy-denial messages;
- supervisor status panels;
- terminal-safe layouts.

Design principles

1. Declarative before imperative.
2. Terminal-safe before graphical.
3. Text-first before animation.
4. Readable on narrow terminals.
5. Copy-safe command output.
6. No hidden mutation.
7. Effect-free by default.
8. Accessibility and fallback modes from the beginning.

Initial surface vocabulary

```
rail
card
row
field
status
warning
reason
gate
trace
breadcrumb
state
```

Example direction

Example syntax only:

```
card StateOverview {
  row &quot;origin&quot; = state.origin
  row &quot;route&quot; = state.route
  row &quot;axis&quot; = state.axis
  row &quot;host effect&quot; = state.host_effect
  row &quot;external effect&quot; = state.external_effect
}
```

This syntax is not implemented yet.

Operator rails

Initial rail categories:

```
top rail      -&gt; identity, target, architecture, channel
state rail    -&gt; origin, route, axis, path, breadcrumb, trace
safety rail   -&gt; health, risk, lock, gates, effects
bottom rail   -&gt; result, reason, next action, evidence level
```

Required report fields

Every report surface that describes a request should eventually include:

```
request_id
source
effect
policy_result
reason
evidence_level
rollback_state
host_effect
external_effect
```

L-UI and Nucleus

Nucleus supplies state. L-UI renders it.

L-UI should not own policy decisions, effect gates, update behavior, server interaction, or hidden task execution.

L-UI and Lat

Lat may eventually generate or validate L-UI documents.

Early L-UI should be static and fixture-backed.

Color and accessibility

L-UI must support:

- plain text mode;
- no-color mode;
- narrow terminal mode;
- screen-reader-friendly output where possible;
- clear labels independent of color.

First implementation target

The first L-UI implementation target should be a static report fixture for the state lattice.

It must be:

```
deterministic
ASCII-safe
copy-safe
read-only
effect-free
```

Non-claims

This document does not implement L-UI.

It defines the UI language direction and terminal boundary before implementation begins.

docs/NUCLEUS_PREVIEW.md

Source title: Latticra Nucleus Preview Classification

Lines: 169 | Words: 378 | SHA-256: 0f8a8f8936b03035fff5cf1b10644fa4d4a9113e028809db9ed8c06b16fcb788

Latticra Nucleus Preview Classification

Status: initial implementation contract Scope: request classification, effect policy, no-execution flags, operator-visible reports, and preview-only boundaries.

Purpose

Nucleus Preview Classification is the third Latticra implementation unit.

It introduces the first Nucleus-adjacent classifier and operator-visible report surface without task execution, mutation, server interaction, recovery execution, hardware access, or update behavior.

Implementation files

```
include/latticra/nucleus_preview.h
src/nucleus_preview.c
tests/nucleus_preview_invariants.c
scripts/test-nucleus-preview.sh
```

Request kinds

Initial request kinds:

```
state-report
transition-preview
server-interaction
self-update
recovery-action
hardware-action
unknown
```

Policy results

Initial policy results:

```
allow-preview
deny
```

Initial policy reasons:

```
ok
null-argument
unknown-request
effect-blocked
effect-requires-future-gate
```

Allowed preview requests

Only these are allowed in the initial implementation:

```
state-report with effect=none
state-report with effect=read
transition-preview with effect=none
transition-preview with effect=read
```

Future-gated requests

These request kinds are classified but denied:

```
server-interaction
self-update
recovery-action
hardware-action
```

They require future contracts, gates, evidence, and tests before any stronger behavior.

Blocked effects

The initial classifier denies:

```
local_mutation
host_mutation
network
hardware
boot
recovery
external
```

for preview-allowed request kinds.

No-execution boundary

The classifier and report surface must always preserve:

```
executed=0
mutation_allowed=0
server_interaction_allowed=0
recovery_allowed=0
hardware_allowed=0
```

This preserves the preview-only boundary.

Operator-visible report

The preview report renders classifier output as deterministic text.

Required report fields:

```
LATTICRA NUCLEUS PREVIEW
request=&lt;request-kind&gt;
requested_effect=&lt;effect&gt;
policy=&lt;policy-result&gt;
reason=&lt;policy-reason&gt;
executed=0
mutation_allowed=0
server_interaction_allowed=0
recovery_allowed=0
hardware_allowed=0
```

The report must handle both allowed previews and denied previews without changing policy state or performing work.

Public API

Initial API:

```
latticra_request_kind_label
latticra_policy_result_label
latticra_policy_reason_label
latticra_nucleus_classify_preview
latticra_nucleus_preview_report
```

Test command

Run:

```
sh scripts/test-nucleus-preview.sh
```

The main C workflow runs state-lattice, tri-plane transition, and Nucleus preview tests.

Current evidence level

This implementation is an L2 tested model for request/effect classification and operator-visible preview reporting.

It is not live Nucleus orchestration, task execution, server interaction, self-update, recovery behavior, hardware behavior, boot behavior, or a security boundary.

Next implementation step

The next implementation candidate after this model is:

```
L-UI static report fixture
```

That future work should define terminal-facing layout fixtures for these reports while still avoiding live mutation.

Non-claims

This document and implementation do not claim live Nucleus execution, live movement, origin mutation, recovery execution, server interaction, self-update, hardware support, boot readiness, security isolation, sandboxing, or operating-system completeness.

docs/NUCLEUS_TASK_EXECUTION_CONTRACT.md

Source title: Latticra Nucleus Task Execution Contract

Lines: 494 | Words: 1264 | SHA-256: 3974579e0ff518838be53a73b0797a99fef9fc358dc73c9d8b43ec3eaf405615

Latticra Nucleus Task Execution Contract

Status: Nucleus task execution contract Scope: future task execution boundary, prerequisites, authority checks, effect gates, denial behavior, task records, report surfaces, future files, tests, compatibility expectations, and non-claims before any task execution implementation.

Purpose

This document defines the first contract for future Nucleus task execution in Latticra.

Nucleus task execution means a future capability to accept a classified task request, validate every prerequisite, check effect gates and authority, produce a deterministic task record, and only then decide whether the task remains denied, preview-only, or eligible for a later explicitly gated implementation.

This document does not implement Nucleus task execution.

Relationship to previous work

This contract depends on:

```
docs/NUCLEUS_PREVIEW.md
docs/EFFECT_GATES.md
docs/STATE_LATTICE.md
docs/TRI_PLANE_TRANSITION.md
docs/CONSTRAINED_CPP_AUTHORITY_LAYER_CONTRACT.md
docs/CONSTRAINED_CPP_AUTHORITY_LAYER_IMPLEMENTATION_PLAN.md
docs/CONSTRAINED_CPP_AUTHORITY_LAYER_IMPLEMENTATION.md
docs/L_UI_RENDERING_CONTRACT.md
docs/L_UI_RENDERING_IMPLEMENTATION_PLAN.md
docs/L_UI_RENDERING_IMPLEMENTATION.md
docs/LIR_SHAPE_IMPLEMENTATION.md
docs/LAT_LANGUAGE_GRAMMAR_IMPLEMENTATION.md
include/latticra/nucleus_preview.h
include/latticra/state_lattice.h
include/latticra/tri_plane_transition.h
include/latticra/l_ui_renderer.h
include/latticra/lir.h
include/latticra/lat_parser.h
include/latticra/cpp/authority.hpp
src/nucleus_preview.c
src/l_ui_renderer.c
src/lir.c
src/lat_parser.c
src/cpp/authority.cpp
```

Those files remain the source of truth for request classification, effect vocabulary, preview denial behavior, state-lattice vocabulary, transition preview behavior, constrained C++ authority validation, deterministic L-UI rendering, LIR metadata, Lat metadata, and current no-effect boundaries.

Direction checkpoint

```
C is the metal.
C++ is the disciplined structure.
Latticra is the contract.
```

Task execution may not bypass this relationship:

```
Lat / Latticra Language: declares contract and intended effects
LIR: carries validated metadata
C++ authority layer: validates authority and reports decisions
C substrate: owns bounded execution-adjacent records and ABI-compatible surfaces
Nucleus: coordinates only after contracts and gates permit it
```

Current Nucleus boundary

Current Nucleus behavior is preview classification only.

Current Nucleus preview allows only:

```
state-report with effect=none
state-report with effect=read
transition-preview with effect=none
transition-preview with effect=read
```

Current Nucleus preview denies:

```
server-interaction
self-update
recovery-action
hardware-action
unknown request
local_mutation
host_mutation
network
hardware
boot
recovery
external
```

The future task execution contract must preserve this preview-only boundary until a separate implementation plan and implementation explicitly prove otherwise.

First task execution posture

The first future implementation must be denied-by-default.

Initial task execution posture:

```
task execution implemented? no
default policy: deny
preview allowed: yes
mutation allowed: no
network allowed: no
hardware allowed: no
boot allowed: no
recovery allowed: no
server interaction allowed: no
self-update allowed: no
operator confirmation allowed to override: no
```

Operator confirmation may be represented as metadata later, but it must not override policy in the first implementation.

Task request kinds

Future task execution should reuse and extend the existing request vocabulary carefully.

Initial task request kinds:

```
state-report
transition-preview
render-report
```

```
lat-validate
lir-validate
authority-check
server-interaction
self-update
recovery-action
hardware-action
boot-action
unknown
```

Only report/validation/preview-style requests may be eligible for no-effect handling in the first future implementation.

All effect-performing requests remain denied.

Task effects

Task execution must classify effects before task handling.

Initial task effects:

```
none
read
local_mutation
host_mutation
network
hardware
boot
recovery
external
unknown
```

Default policy:

```
none -&gt; preview/report/validation only
read -&gt; approved local metadata only
local_mutation -&gt; deny until explicit local-mutation contract
host_mutation -&gt; deny
network -&gt; deny
hardware -&gt; deny
boot -&gt; deny
recovery -&gt; deny
external -&gt; deny
unknown -&gt; deny
```

Task policy results

Future policy result labels:

```
allow-preview
allow-report
allow-validation
deny
blocked
requires-future-gate
unsupported
internal-error
```

The first future implementation should not produce an executed task result for effect-performing work.

Task denial reasons

Future denial reason labels:

```
ok
null-argument
unknown-request
unknown-effect
unsupported-request
unsupported-effect
parser-failed
semantic-failed
lir-failed
authority-failed
effect-blocked
effect-requires-future-gate
```

```
non-no-effect-flags
operator-confirmation-not-supported
implementation-not-present
internal-error
```

Denial reasons must be stable and report-visible.

Required prerequisites

A future task may be considered only after all relevant prerequisites are explicit.

Possible prerequisites:

```
parser_error=ok
semantic_error=ok
lir_error=ok
authority_status=ok
render_status=ok
preview_policy=allow-preview or allow-report or allow-validation
effect_gate=allowed-preview or allowed-report or allowed-validation
no_effect=1
execution_allowed=0
mutation_allowed=0
server_allowed=0
recovery_allowed=0
hardware_allowed=0
operator_confirmation=not-applicable
```

If any prerequisite fails, the task must be denied and reported.

Required authority checks

Future Nucleus task execution must consult authority metadata before any task is eligible.

Authority checks must include:

```
authority status
authority validator
authority requested effect
authority denial reason
authority no-effect flags
source identity
request kind
effect kind
boundary kind
```

Authority failure must deny the task.

Authority success must not by itself execute a task. It only satisfies one prerequisite.

Required effect-gate checks

Future task execution must consult the effect gate before task handling.

Effect gate checks must classify:

```
requested effect
allowed effect
gate state
policy result
reason
rollback state
```

Initial allowed gate states for first implementation:

```
disabled
blocked
planned
```

The first future implementation must not produce:

```
armed
executed
failed
```

except as literal denied metadata in tests or reports.

Task record shape

A future task record should include:

```
task_id
request_kind
requested_effect
allowed_effect
policy_result
policy_reason
authority_status
authority_validator
authority_reason
gate_state
operator_confirmation
executed
mutation_allowed
server_interaction_allowed
recovery_allowed
hardware_allowed
rollback_state
evidence_level
source_identity
source_span
```

The first future implementation should use fixed-size fields and caller-owned buffers.

Task report format

A future task report should be deterministic and bounded.

Suggested report header:

```
LATTICRA NUCLEUS TASK REPORT
task_id=&lt;id&gt;
request=&lt;request-kind&gt;
requested_effect=&lt;effect&gt;
allowed_effect=&lt;effect&gt;
policy=&lt;policy-result&gt;
reason=&lt;policy-reason&gt;
authority_status=&lt;authority-status&gt;
authority_validator=&lt;authority-validator&gt;
authority_reason=&lt;authority-reason&gt;
gate_state=&lt;gate-state&gt;
operator_confirmation=&lt;confirmation-state&gt;
executed=0
mutation_allowed=0
server_interaction_allowed=0
recovery_allowed=0
hardware_allowed=0
rollback_state=&lt;rollback-state&gt;
evidence_level=&lt;level&gt;
source_identity=&lt;source&gt;
span_start_offset=&lt;offset&gt;
span_end_offset=&lt;offset&gt;
```

Reports must not include secrets, host environment values, filesystem contents, network data, credentials, or hardware identifiers.

First implementation gate

Nucleus task execution implementation must not begin until a separate implementation plan defines:

1. implementation language;
2. public header path;
3. source file path;
4. task request struct;
5. task result struct;
6. task record struct;

7. task policy enum;
8. task denial enum;
9. effect-gate enum usage;
10. authority summary usage;
11. operator-confirmation metadata shape;
12. rollback metadata shape;
13. report format;
14. capacity constants;
15. output-buffer behavior;
16. exact tests;
17. compatibility expectations;
18. non-claims.

That plan should be recorded in:

```
NUCLEUS_TASK_EXECUTION_IMPLEMENTATION_PLAN.md
```

Future file policy

Recommended future files:

```
include/latticra/nucleus_task.h
src/nucleus_task.c
tests/nucleus_task_execution_invariants.c
scripts/test-nucleus-task-execution.sh
docs/NUCLEUS_TASK_EXECUTION_IMPLEMENTATION_PLAN.md
docs/NUCLEUS_TASK_EXECUTION_IMPLEMENTATION.md
```

The implementation plan must confirm exact paths before task execution code is added.

Future test list

A future implementation plan should include tests for:

```
nucleus_task_execution_denies_unknown_request
nucleus_task_execution_denies_unknown_effect
nucleus_task_execution_preserves_preview_only_boundary
nucleus_task_execution_requires_authority_success
nucleus_task_execution_requires_effect_gate_success
nucleus_task_execution_requires_no_effect_flags
nucleus_task_execution_allows_state_report_preview_only
nucleus_task_execution_allows_transition_preview_only
nucleus_task_execution_allows_render_report_only
nucleus_task_execution_allows_lat_validation_only
nucleus_task_execution_allows_lir_validation_only
nucleus_task_execution_denies_server_interaction
nucleus_task_execution_denies_self_update
nucleus_task_execution_denies_recovery_action
nucleus_task_execution_denies_hardware_action
nucleus_task_execution_denies_boot_action
nucleus_task_execution_report_is_deterministic
nucleus_task_execution_report_rejects_small_buffer
nucleus_task_execution_does_not_mutate_state
nucleus_task_execution_does_not_open_network
nucleus_task_execution_does_not_touch_hardware
nucleus_task_execution_does_not_write_files
nucleus_task_execution_does_not_call_recovery
nucleus_task_execution_does_not_override_policy_with_operator_confirmation
```

Compatibility expectations

Future Nucleus task execution work must not change:

```
existing Nucleus preview classification behavior
existing Nucleus preview report behavior
state lattice behavior
```

```
tri-plane transition behavior
L-UI parser behavior
L-UI semantic validation behavior
LIR shape behavior
L-UI rendering behavior
Lat grammar behavior
constrained C++ authority behavior
no-effect flags
current accepted fixture counts
```

Forbidden behavior

Nucleus task execution work must not:

- bypass Nucleus preview classification;
- bypass effect gates;
- bypass constrained C++ authority validation;
- bypass parser, semantic, LIR, or render prerequisites when relevant;
- execute unknown requests;
- execute unknown effects;
- mutate state without a separate mutation contract;
- write files;
- read host files outside approved metadata;
- open network connections;
- call server code;
- call update code;
- call recovery code;
- touch hardware;
- alter boot state;
- perform rollback;
- let operator confirmation override policy;
- hide denial reasons;
- omit task records;
- emit secrets, host environment values, credentials, or hardware identifiers;
- imply a production runtime, sandbox, malware prevention, ransomware prevention, recovery system, update system, or operating-system surface.

Current validation command

This contract is guarded by:

```
sh scripts/test-nucleus-task-execution-contract.sh
```

The guard is static. It does not implement Nucleus task execution.

Non-claims

This document does not implement Nucleus task execution, command behavior, Lat execution, LIR execution, live movement, state mutation, file I/O, network I/O, server interaction, self-update, recovery behavior, rollback, hardware support, boot behavior, terminal control, security isolation, sandboxing, malware prevention, ransomware prevention, or operating-system completeness.

docs/NUCLEUS_TASK_EXECUTION_IMPLEMENTATION.md

Source title: Latticra Nucleus Task Execution Implementation

Lines: 353 | Words: 690 | SHA-256: 768720a80ed9e40bc72e858bbd888742e53d2d95b408d7d9e36c18e4889ee803

Latticra Nucleus Task Execution Implementation

Status: initial implementation contract Scope: first no-effect C Nucleus task classification/report surface, denied-by-default policy, authority prerequisites, effect-gate metadata, caller-provided buffers, deterministic reports, invariant tests, compatibility expectations, and non-claims.

Purpose

This document records the first Nucleus task execution implementation slice.

The implementation follows:

```
docs/NUCLEUS_TASK_EXECUTION_CONTRACT.md
docs/NUCLEUS_TASK_EXECUTION_IMPLEMENTATION_PLAN.md
```

This slice implements task classification and report generation only.

It does not execute tasks.

Implementation files

This slice adds:

```
include/latticra/nucleus_task.h
src/nucleus_task.c
tests/nucleus_task_execution_invariants.c
scripts/test-nucleus-task-execution.sh
```

It also wires the test runner into:

```
.github/workflows/c.yml
```

Public API

The public API is:

```
latticra_nucleus_task_request_kind_t
latticra_nucleus_task_effect_t
latticra_nucleus_task_policy_t
latticra_nucleus_task_denial_t
latticra_nucleus_task_gate_state_t
latticra_nucleus_task_operator_confirmation_t
latticra_nucleus_task_rollback_state_t
latticra_nucleus_task_authority_summary_t
latticra_nucleus_task_request_t
latticra_nucleus_task_record_t
latticra_nucleus_task_result_t
latticra_nucleus_task_request_kind_label
latticra_nucleus_task_effect_label
latticra_nucleus_task_policy_label
latticra_nucleus_task_denial_label
latticra_nucleus_task_gate_state_label
latticra_nucleus_task_operator_confirmation_label
latticra_nucleus_task_rollback_state_label
latticra_nucleus_task_classify
latticra_nucleus_task_report
```

Capacity constants

The implementation defines:

```
LATTICRA_NUCLEUS_TASK_ID_MAX 64u
LATTICRA_NUCLEUS_TASK_LABEL_MAX 64u
LATTICRA_NUCLEUS_TASK_REASON_MAX 128u
LATTICRA_NUCLEUS_TASK_SOURCE_IDENTITY_MAX 128u
LATTICRA_NUCLEUS_TASK_REPORT_MAX 4096u
LATTICRA_NUCLEUS_TASK_RECORD_MAX 16u
```

The task report uses caller-provided buffers and fixed-size task records.

Request kinds

Supported request kind labels:

```
state-report
transition-preview
render-report
lat-validate
lir-validate
authority-check
server-interaction
self-update
recovery-action
hardware-action
boot-action
unknown
```

Effects

Supported task effect labels:

```
none
read
local_mutation
host_mutation
network
hardware
boot
recovery
external
unknown
```

Only none and read may be eligible for no-effect report, preview, or validation classifications.

Policy results

Supported policy labels:

```
allow-preview
allow-report
allow-validation
deny
blocked
requires-future-gate
unsupported
internal-error
```

The implementation does not produce an executed effect-performing task.

Denial reasons

Stable denial labels:

```
ok
null-argument
unknown-request
unknown-effect
unsupported-request
unsupported-effect
parser-failed
semantic-failed
lir-failed
render-failed
authority-failed
effect-blocked
effect-requires-future-gate
non-no-effect-flags
operator-confirmation-not-supported
implementation-not-present
internal-error
```

Classification behavior

Implemented classification behavior:

```
state-report + none -&gt; allow-report
state-report + read -&gt; allow-report
transition-preview + none -&gt; allow-preview
transition-preview + read -&gt; allow-preview
render-report + none -&gt; allow-report
render-report + read -&gt; allow-report
lat-validate + none -&gt; allow-validation
lat-validate + read -&gt; allow-validation
lir-validate + none -&gt; allow-validation
lir-validate + read -&gt; allow-validation
authority-check + none -&gt; allow-validation
authority-check + read -&gt; allow-validation
server-interaction -&gt; requires-future-gate
self-update -&gt; requires-future-gate
recovery-action -&gt; requires-future-gate
hardware-action -&gt; requires-future-gate
boot-action -&gt; requires-future-gate
unknown -&gt; deny
unknown effect -&gt; deny
local_mutation -&gt; deny
host_mutation -&gt; deny
network -&gt; deny
hardware -&gt; deny
boot -&gt; deny
recovery -&gt; deny
external -&gt; deny
```

Allowed classifications still set:

```
executed=0
mutation_allowed=0
server_interaction_allowed=0
recovery_allowed=0
hardware_allowed=0
```

Prerequisite behavior

The implementation checks:

```
request presence
result presence
authority presence
authority status
authority no-effect flags
operator confirmation metadata
Nucleus preview policy for state-report and transition-preview
render status for render-report
Lat parse status for lat-validate
LIR status for lir-validate
source identity capacity
```

Failed prerequisites deny the task and remain visible in the report.

Report format

latticra_nucleus_task_report emits:

```
LATTICRA NUCLEUS TASK REPORT
status=&lt;integer-status&gt;
task_id=&lt;id&gt;
request=&lt;request-kind&gt;
requested_effect=&lt;effect&gt;
allowed_effect=&lt;effect&gt;
policy=&lt;policy-result&gt;
reason=&lt;denial-reason&gt;
authority_status=&lt;authority-status&gt;
authority_validator=&lt;authority-validator&gt;
authority_reason=&lt;authority-reason&gt;
gate_state=&lt;gate-state&gt;
operator_confirmation=&lt;confirmation-state&gt;
executed=0
mutation_allowed=0
server_interaction_allowed=0
recovery_allowed=0
hardware_allowed=0
```

```
rollback_state=&lt;rollback-state&gt;
evidence_level=&lt;level&gt;
source_identity=&lt;source&gt;
span_start_offset=&lt;offset&gt;
span_end_offset=&lt;offset&gt;
```

Small buffers return LATTICRA_STATUS_BUFFER_TOO_SMALL and clear the output buffer.

No-effect behavior

The implementation preserves:

```
no_effect=1
execution_allowed=0
mutation_allowed=0
server_allowed=0
recovery_allowed=0
hardware_allowed=0
```

It does not execute commands, mutate state, open network connections, write files, read host files outside metadata, call server code, call update code, call recovery code, touch hardware, alter boot state, or perform rollback.

Validation

Run:

```
sh scripts/test-nucleus-task-execution.sh
```

The test suite covers:

```
nucleus_task_execution_denies_unknown_request
nucleus_task_execution_denies_unknown_effect
nucleus_task_execution_preserves_preview_only_boundary
nucleus_task_execution_requires_authority_success
nucleus_task_execution_requires_effect_gate_success
nucleus_task_execution_requires_no_effect_flags
nucleus_task_execution_allows_state_report_preview_only
nucleus_task_execution_allows_transition_preview_only
nucleus_task_execution_allows_render_report_only
nucleus_task_execution_allows_lat_validation_only
nucleus_task_execution_allows_lir_validation_only
nucleus_task_execution_denies_server_interaction
nucleus_task_execution_denies_self_update
nucleus_task_execution_denies_recovery_action
nucleus_task_execution_denies_hardware_action
nucleus_task_execution_denies_boot_action
nucleus_task_execution_report_is_deterministic
nucleus_task_execution_report_rejects_small_buffer
nucleus_task_execution_does_not_mutate_state
nucleus_task_execution_does_not_open_network
nucleus_task_execution_does_not_touch_hardware
nucleus_task_execution_does_not_write_files
nucleus_task_execution_does_not_call_recovery
nucleus_task_execution_does_not_override_policy_with_operator_confirmation
```

Compatibility expectations

This implementation must not change:

```
existing Nucleus preview classification behavior
existing Nucleus preview report behavior
state lattice behavior
tri-plane transition behavior
L-UI parser behavior
L-UI semantic validation behavior
LIR shape behavior
L-UI rendering behavior
Lat grammar behavior
constrained C++ authority behavior
no-effect flags
current accepted fixture counts
```

Current boundary

This implementation does not provide:

```
command behavior
Lat execution
LIR execution
live movement
state mutation
file I/O
network I/O
server interaction
self-update
recovery behavior
rollback
hardware support
boot behavior
terminal control
security isolation
sandboxing
malware prevention
ransomware prevention
operating-system completeness
```

Non-claims

This document and implementation do not claim a finished operating system, hardened sandbox, production runtime, production security boundary, malware prevention, ransomware prevention, recovery system, update system, bootable image, public task executor, or public release readiness.

docs/NUCLEUS_TASK_EXECUTION_IMPLEMENTATION_PLAN.md

Source title: Latticra Nucleus Task Execution Implementation Plan

Lines: 700 | Words: 1534 | SHA-256: 7e9e8bca228486dd925162a4dca68a92e223131e193d9d5285d0342c055f586f

Latticra Nucleus Task Execution Implementation Plan

Status: implementation planning contract Scope: exact public API, C implementation files, task request/result/record structs, policy enum, denial enum, effect-gate enum usage, authority summary usage, operator-confirmation metadata, rollback metadata, report format, capacity constants, output-buffer behavior, tests, compatibility expectations, and non-claims before Nucleus task execution code.

Purpose

This document defines the implementation plan for the first Nucleus task execution surface.

The Nucleus task execution contract is already merged and guarded. This plan turns that contract into exact public API, file paths, structures, enums, capacity constants, report rules, prerequisite behavior, effect-gate behavior, authority-summary behavior, task-record behavior, exact tests, compatibility expectations, and non-claims before task execution code is added.

This document does not implement Nucleus task execution.

Relationship to previous work

This plan depends on:

```
docs/NUCLEUS_TASK_EXECUTION_CONTRACT.md
docs/NUCLEUS_PREVIEW.md
docs/EFFECT_GATES.md
docs/STATE_LATTICE.md
docs/TRI_PLANE_TRANSITION.md
docs/CONSTRAINED_CPP_AUTHORITY_LAYER_IMPLEMENTATION.md
docs/L_UI_RENDERING_IMPLEMENTATION.md
docs/LIR_SHAPE_IMPLEMENTATION.md
docs/LAT_LANGUAGE_GRAMMAR_IMPLEMENTATION.md
include/latticra/nucleus_preview.h
include/latticra/state_lattice.h
include/latticra/tri_plane_transition.h
```

```
include/latticra/l_ui_renderer.h
include/latticra/lir.h
include/latticra/lat_parser.h
include/latticra/cpp/authority.hpp
src/nucleus_preview.c
src/l_ui_renderer.c
src/lir.c
src/lat_parser.c
src/cpp/authority.cpp
```

Those files remain the source of truth for preview classification, effect vocabulary, state lattice, transition preview, constrained authority, rendering, LIR metadata, Lat metadata, and no-effect boundaries.

Implementation language decision

The first Nucleus task execution surface should be implemented in C.

Reason:

- current Nucleus preview classification is C;
- state lattice and tri-plane transition are C;
- L-UI rendering and LIR shape are C;
- the task surface should use bounded structs and caller-provided buffers;
- C remains the secure substrate;
- the constrained C++ authority layer remains a validation/report dependency, not the task-record storage substrate.

The first implementation should not include C++ object lifetimes in the public C API.

Implementation files

The implementation PR should add or modify:

```
include/latticra/nucleus_task.h
src/nucleus_task.c
tests/nucleus_task_execution_invariants.c
scripts/test-nucleus-task-execution.sh
.github/workflows/c.yml
docs/NUCLEUS_TASK_EXECUTION_IMPLEMENTATION.md
```

The implementation PR should not add command behavior, Lat execution, LIR execution, live movement, mutation, file I/O, network I/O, server interaction, self-update, recovery behavior, rollback, hardware behavior, boot behavior, terminal control, sandboxing, malware prevention, ransomware prevention, or operating-system behavior.

Public API shape

Add public API names:

```
latticra_nucleus_task_request_kind_t
latticra_nucleus_task_effect_t
latticra_nucleus_task_policy_t
latticra_nucleus_task_denial_t
latticra_nucleus_task_gate_state_t
latticra_nucleus_task_operator_confirmation_t
latticra_nucleus_task_rollback_state_t
latticra_nucleus_task_authority_summary_t
latticra_nucleus_task_request_t
latticra_nucleus_task_record_t
latticra_nucleus_task_result_t
latticra_nucleus_task_request_kind_label
latticra_nucleus_task_effect_label
latticra_nucleus_task_policy_label
latticra_nucleus_task_denial_label
latticra_nucleus_task_gate_state_label
latticra_nucleus_task_operator_confirmation_label
latticra_nucleus_task_rollback_state_label
latticra_nucleus_task_classify
```

```
latticra_nucleus_task_report
```

Recommended function signatures:

```
const char *latticra_nucleus_task_request_kind_label(latticra_nucleus_task_request_kind_t kind);
const char *latticra_nucleus_task_effect_label(latticra_nucleus_task_effect_t effect);
const char *latticra_nucleus_task_policy_label(latticra_nucleus_task_policy_t policy);
const char *latticra_nucleus_task_denial_label(latticra_nucleus_task_denial_t denial);
const char *latticra_nucleus_task_gate_state_label(latticra_nucleus_task_gate_state_t
gate_state);
const char
*latticra_nucleus_task_operator_confirmation_label(latticra_nucleus_task_operator_confirmation_t
 confirmation);
const char *latticra_nucleus_task_rollback_state_label(latticra_nucleus_task_rollback_state_t
rollback_state);

latticra_status_t latticra_nucleus_task_classify(
    const latticra_nucleus_task_request_t *request,
    latticra_nucleus_task_result_t *result);

latticra_status_t latticra_nucleus_task_report(
    const latticra_nucleus_task_result_t *result,
    char *buffer,
    size_t buffer_len);
```

The first implementation should classify and report only. It must not execute work.

Capacity constants

Add exact bounded constants:

```
LATTICRA_NUCLEUS_TASK_ID_MAX 64u
LATTICRA_NUCLEUS_TASK_LABEL_MAX 64u
LATTICRA_NUCLEUS_TASK_REASON_MAX 128u
LATTICRA_NUCLEUS_TASK_SOURCE_IDENTITY_MAX 128u
LATTICRA_NUCLEUS_TASK_REPORT_MAX 4096u
LATTICRA_NUCLEUS_TASK_RECORD_MAX 16u
```

Small output buffers must return LATTICRA_STATUS_BUFFER_TOO_SMALL and clear the output buffer.

Request kind enum

Add request kinds:

```
LATTICRA_NUCLEUS_TASK_STATE_REPORT
LATTICRA_NUCLEUS_TASK_TRANSITION_PREVIEW
LATTICRA_NUCLEUS_TASK_RENDER_REPORT
LATTICRA_NUCLEUS_TASK_LAT_VALIDATE
LATTICRA_NUCLEUS_TASK_LIR_VALIDATE
LATTICRA_NUCLEUS_TASK_AUTHORITY_CHECK
LATTICRA_NUCLEUS_TASK_SERVER_INTERACTION
LATTICRA_NUCLEUS_TASK_SELF_UPDATE
LATTICRA_NUCLEUS_TASK_RECOVERY_ACTION
LATTICRA_NUCLEUS_TASK_HARDWARE_ACTION
LATTICRA_NUCLEUS_TASK_BOOT_ACTION
LATTICRA_NUCLEUS_TASK_UNKNOWN
```

Stable labels:

```
state-report
transition-preview
render-report
lat-validate
lir-validate
authority-check
server-interaction
self-update
recovery-action
hardware-action
boot-action
unknown
```

Effect enum

Add task effects:

```
LATTICRA_NUCLEUS_TASK_EFFECT_NONE
```

```
LATTICRA_NUCLEUS_TASK_EFFECT_READ
LATTICRA_NUCLEUS_TASK_EFFECT_LOCAL_MUTATION
LATTICRA_NUCLEUS_TASK_EFFECT_HOST_MUTATION
LATTICRA_NUCLEUS_TASK_EFFECT_NETWORK
LATTICRA_NUCLEUS_TASK_EFFECT_HARDWARE
LATTICRA_NUCLEUS_TASK_EFFECT_BOOT
LATTICRA_NUCLEUS_TASK_EFFECT_RECOVERY
LATTICRA_NUCLEUS_TASK_EFFECT_EXTERNAL
LATTICRA_NUCLEUS_TASK_EFFECT_UNKNOWN
```

Stable labels:

```
none
read
local_mutation
host_mutation
network
hardware
boot
recovery
external
unknown
```

Policy enum

Add task policies:

```
LATTICRA_NUCLEUS_TASK_POLICY_ALLOW_PREVIEW
LATTICRA_NUCLEUS_TASK_POLICY_ALLOW_REPORT
LATTICRA_NUCLEUS_TASK_POLICY_ALLOW_VALIDATION
LATTICRA_NUCLEUS_TASK_POLICY_DENY
LATTICRA_NUCLEUS_TASK_POLICY_BLOCKED
LATTICRA_NUCLEUS_TASK_POLICY_REQUIRES_FUTURE_GATE
LATTICRA_NUCLEUS_TASK_POLICY_UNSUPPORTED
LATTICRA_NUCLEUS_TASK_POLICY_INTERNAL_ERROR
```

Stable labels:

```
allow-preview
allow-report
allow-validation
deny
blocked
requires-future-gate
unsupported
internal-error
```

The first implementation must not produce an executed effect-performing task.

Denial enum

Add denial reasons:

```
LATTICRA_NUCLEUS_TASK_DENIAL_OK
LATTICRA_NUCLEUS_TASK_DENIAL_NULL_ARGUMENT
LATTICRA_NUCLEUS_TASK_DENIAL_UNKNOWN_REQUEST
LATTICRA_NUCLEUS_TASK_DENIAL_UNKNOWN_EFFECT
LATTICRA_NUCLEUS_TASK_DENIAL_UNSUPPORTED_REQUEST
LATTICRA_NUCLEUS_TASK_DENIAL_UNSUPPORTED_EFFECT
LATTICRA_NUCLEUS_TASK_DENIAL_PARSER_FAILED
LATTICRA_NUCLEUS_TASK_DENIAL_SEMANTIC_FAILED
LATTICRA_NUCLEUS_TASK_DENIAL_LIR_FAILED
LATTICRA_NUCLEUS_TASK_DENIAL_RENDER_FAILED
LATTICRA_NUCLEUS_TASK_DENIAL_AUTHORITY_FAILED
LATTICRA_NUCLEUS_TASK_DENIAL_EFFECT_BLOCKED
LATTICRA_NUCLEUS_TASK_DENIAL_EFFECT_REQUIRES_FUTURE_GATE
LATTICRA_NUCLEUS_TASK_DENIAL_NON_NO_EFFECT_FLAGS
LATTICRA_NUCLEUS_TASK_DENIAL_OPERATOR_CONFIRMATION_NOT_SUPPORTED
LATTICRA_NUCLEUS_TASK_DENIAL_IMPLEMENTATION_NOT_PRESENT
LATTICRA_NUCLEUS_TASK_DENIAL_INTERNAL_ERROR
```

Stable labels:

```
ok
null-argument
unknown-request
unknown-effect
unsupported-request
unsupported-effect
parser-failed
```

```
semantic-failed
lir-failed
render-failed
authority-failed
effect-blocked
effect-requires-future-gate
non-no-effect-flags
operator-confirmation-not-supported
implementation-not-present
internal-error
```

Gate state enum

Add gate states:

```
LATTICRA_NUCLEUS_TASK_GATE_DISABLED
LATTICRA_NUCLEUS_TASK_GATE_BLOCKED
LATTICRA_NUCLEUS_TASK_GATE_PLANNED
LATTICRA_NUCLEUS_TASK_GATE_AVAILABLE
LATTICRA_NUCLEUS_TASK_GATE_ARMED
LATTICRA_NUCLEUS_TASK_GATE_EXECUTED
LATTICRA_NUCLEUS_TASK_GATE_FAILED
```

Stable labels:

```
disabled
blocked
planned
available
armed
executed
failed
```

The first implementation should output only disabled, blocked, or planned for real classifications.

Operator confirmation enum

Add operator-confirmation states:

```
LATTICRA_NUCLEUS_TASK_OPERATOR_NOT_APPLICABLE
LATTICRA_NUCLEUS_TASK_OPERATOR_REQUIRED
LATTICRA_NUCLEUS_TASK_OPERATOR_PRESENT
LATTICRA_NUCLEUS_TASK_OPERATOR_REJECTED
LATTICRA_NUCLEUS_TASK_OPERATOR_NOT_SUPPORTED
```

Stable labels:

```
not-applicable
required
present
rejected
not-supported
```

The first implementation must treat confirmation as metadata only. Confirmation must not override policy.

Rollback state enum

Add rollback states:

```
LATTICRA_NUCLEUS_TASK_ROLLBACK_NOT_APPLICABLE
LATTICRA_NUCLEUS_TASK_ROLLBACK_NOT_AVAILABLE
LATTICRA_NUCLEUS_TASK_ROLLBACK_REQUIRED
LATTICRA_NUCLEUS_TASK_ROLLBACK_READY
LATTICRA_NUCLEUS_TASK_ROLLBACK_BLOCKED
```

Stable labels:

```
not-applicable
not-available
required
ready
blocked
```

The first implementation must not perform rollback.

Authority summary struct

Add a C-compatible authority summary:

```
latticra_status_t status;
char status_label[LATTICRA_NUCLEUS_TASK_LABEL_MAX];
char validator_label[LATTICRA_NUCLEUS_TASK_LABEL_MAX];
char requested_effect_label[LATTICRA_NUCLEUS_TASK_LABEL_MAX];
char denial_reason[LATTICRA_NUCLEUS_TASK_REASON_MAX];
int no_effect;
int execution_allowed;
int mutation_allowed;
int server_allowed;
int recovery_allowed;
int hardware_allowed;
```

This mirrors the renderer authority summary pattern and avoids exposing C++ object lifetimes through the C task API.

Task request struct

Add request fields:

```
char task_id[LATTICRA_NUCLEUS_TASK_ID_MAX];
latticra_nucleus_task_request_kind_t request_kind;
latticra_nucleus_task_effect_t requested_effect;
latticra_nucleus_task_operator_confirmation_t operator_confirmation;
latticra_nucleus_task_rollback_state_t rollback_state;
const latticra_nucleus_task_authority_summary_t *authority;
const latticra_nucleus_preview_t *preview;
const latticra_l_ui_render_result_t *render;
const latticra_lir_module_t *lir;
const latticra_lat_parse_result_t *lat;
const char *source_identity;
size_t source_identity_len;
latticra_l_ui_source_span_t source_span;
```

The implementation must not retain caller-owned pointers after the call returns.

Task record struct

Add task record fields:

```
char task_id[LATTICRA_NUCLEUS_TASK_ID_MAX];
latticra_nucleus_task_request_kind_t request_kind;
latticra_nucleus_task_effect_t requested_effect;
latticra_nucleus_task_effect_t allowed_effect;
latticra_nucleus_task_policy_t policy;
latticra_nucleus_task_denial_t denial;
latticra_nucleus_task_gate_state_t gate_state;
latticra_nucleus_task_operator_confirmation_t operator_confirmation;
latticra_nucleus_task_rollback_state_t rollback_state;
latticra_nucleus_task_authority_summary_t authority;
char source_identity[LATTICRA_NUCLEUS_TASK_SOURCE_IDENTITY_MAX];
latticra_l_ui_source_span_t source_span;
int executed;
int mutation_allowed;
int server_interaction_allowed;
int recovery_allowed;
int hardware_allowed;
unsigned int evidence_level;
```

Task result struct

Add task result fields:

```
latticra_status_t status;
latticra_nucleus_task_record_t record;
size_t record_count;
int no_effect;
int execution_allowed;
int mutation_allowed;
int server_allowed;
int recovery_allowed;
int hardware_allowed;
```

The result must be fully initialized on success and failure.

Classification rules

Initial classification behavior:

```
state-report + none -&gt; allow-report
state-report + read -&gt; allow-report
transition-preview + none -&gt; allow-preview
transition-preview + read -&gt; allow-preview
render-report + none -&gt; allow-report
render-report + read -&gt; allow-report
lat-validate + none -&gt; allow-validation
lat-validate + read -&gt; allow-validation
lir-validate + none -&gt; allow-validation
lir-validate + read -&gt; allow-validation
authority-check + none -&gt; allow-validation
authority-check + read -&gt; allow-validation
server-interaction -&gt; requires-future-gate
self-update -&gt; requires-future-gate
recovery-action -&gt; requires-future-gate
hardware-action -&gt; requires-future-gate
boot-action -&gt; requires-future-gate
unknown -&gt; deny
unknown effect -&gt; deny
local_mutation -&gt; deny
host_mutation -&gt; deny
network -&gt; deny
hardware -&gt; deny
boot -&gt; deny
recovery -&gt; deny
external -&gt; deny
```

Allowed classifications still must set:

```
executed=0
mutation_allowed=0
server_interaction_allowed=0
recovery_allowed=0
hardware_allowed=0
```

Prerequisite behavior

The first implementation must check relevant prerequisites.

Rules:

```
missing request -&gt; null-argument
missing result -&gt; null-argument
missing authority -&gt; authority-failed
non-ok authority -&gt; authority-failed
non-no-effect authority flags -&gt; non-no-effect-flags
operator confirmation present -&gt; operator-confirmation-not-supported
render-report requires render_status=ok
lat-validate requires parser_error=ok
lir-validate requires lir_error=ok
transition-preview requires preview policy allow-preview
state-report requires preview policy allow-preview or allow-report
```

Failed prerequisites deny the task and must be visible in the report.

Report format

latticra_nucleus_task_report should emit:

```
LATTICRA NUCLEUS TASK REPORT
status=&lt;integer-status&gt;
task_id=&lt;id&gt;
request=&lt;request-kind&gt;
requested_effect=&lt;effect&gt;
allowed_effect=&lt;effect&gt;
policy=&lt;policy-result&gt;
reason=&lt;denial-reason&gt;
authority_status=&lt;authority-status&gt;
authority_validator=&lt;authority-validator&gt;
authority_reason=&lt;authority-reason&gt;
gate_state=&lt;gate-state&gt;
operator_confirmation=&lt;confirmation-state&gt;
executed=0
mutation_allowed=0
server_interaction_allowed=0
```

```
recovery_allowed=0
hardware_allowed=0
rollback_state=&lt;rollback-state&gt;
evidence_level=&lt;level&gt;
source_identity=&lt;source&gt;
span_start_offset=&lt;offset&gt;
span_end_offset=&lt;offset&gt;
```

Reports must not include secrets, host environment values, filesystem contents, network data, credentials, or hardware identifiers.

Output buffer behavior

latticra_nucleus_task_report should:

```
write only to caller-provided buffers
require explicit buffer length
NUL-terminate on success
clear the buffer on too-small failure
return LATTICRA_STATUS_BUFFER_TOO_SMALL for small buffers
avoid heap allocation
avoid file output
avoid stdout
avoid stderr
avoid terminal escape control
```

Exact implementation test list

The implementation PR should include tests for:

```
nucleus_task_execution_denies_unknown_request
nucleus_task_execution_denies_unknown_effect
nucleus_task_execution_preserves_preview_only_boundary
nucleus_task_execution_requires_authority_success
nucleus_task_execution_requires_effect_gate_success
nucleus_task_execution_requires_no_effect_flags
nucleus_task_execution_allows_state_report_preview_only
nucleus_task_execution_allows_transition_preview_only
nucleus_task_execution_allows_render_report_only
nucleus_task_execution_allows_lat_validation_only
nucleus_task_execution_allows_lir_validation_only
nucleus_task_execution_denies_server_interaction
nucleus_task_execution_denies_self_update
nucleus_task_execution_denies_recovery_action
nucleus_task_execution_denies_hardware_action
nucleus_task_execution_denies_boot_action
nucleus_task_execution_report_is_deterministic
nucleus_task_execution_report_rejects_small_buffer
nucleus_task_execution_does_not_mutate_state
nucleus_task_execution_does_not_open_network
nucleus_task_execution_does_not_touch_hardware
nucleus_task_execution_does_not_write_files
nucleus_task_execution_does_not_call_recovery
nucleus_task_execution_does_not_override_policy_with_operator_confirmation
```

Test file plan

Add:

```
tests/nucleus_task_execution_invariants.c
scripts/test-nucleus-task-execution.sh
```

Wire into:

```
.github/workflows/c.yml
```

Run after:

```
sh scripts/test-nucleus-task-execution-implementation-plan.sh
```

and before:

```
sh scripts/test-l-ui-static-report.sh
```

Documentation update plan

The implementation PR should update:

```
README.md
STATUS.md
docs/FOUNDATION_INDEX.md
docs/status/CURRENT_STATUS.md
docs/status/ANNOUNCEMENTS.md
docs/project_notes/CURRENT_DIRECTION.md
docs/project_notes/UPCOMING_WORK.md
docs/strategy/2026-05-15-2249-cdt-national-security-open-system-strategy.md
docs/NUCLEUS_TASK_EXECUTION_CONTRACT.md
scripts/test-project-strategy-status-framework.sh
```

and add:

```
docs/NUCLEUS_TASK_EXECUTION_IMPLEMENTATION.md
```

Compatibility expectations

The implementation must not change:

```
existing Nucleus preview classification behavior
existing Nucleus preview report behavior
state lattice behavior
tri-plane transition behavior
L-UI parser behavior
L-UI semantic validation behavior
LIR shape behavior
L-UI rendering behavior
Lat grammar behavior
constrained C++ authority behavior
no-effect flags
current accepted fixture counts
```

Forbidden implementation behavior

The first implementation must not:

- bypass Nucleus preview classification;
- bypass effect gates;
- bypass constrained C++ authority validation;
- bypass parser, semantic, LIR, or render prerequisites when relevant;
- execute unknown requests;
- execute unknown effects;
- mutate state;
- write files;
- read host files outside approved metadata;
- open network connections;
- call server code;
- call update code;
- call recovery code;
- touch hardware;
- alter boot state;
- perform rollback;
- let operator confirmation override policy;
- hide denial reasons;
- omit task records;
- emit secrets, host environment values, credentials, or hardware identifiers;

- imply a production runtime, sandbox, malware prevention, ransomware prevention, recovery system, update system, or operating-system surface.

Current validation command

This implementation plan is guarded by:

```
sh scripts/test-nucleus-task-execution-implementation-plan.sh
```

The guard is static. It does not implement Nucleus task execution.

Implementation gate

Nucleus task execution code may be added only after this plan is merged.

Non-claims

This document does not implement Nucleus task execution, command behavior, Lat execution, LIR execution, live movement, state mutation, file I/O, network I/O, server interaction, self-update, recovery behavior, rollback, hardware support, boot behavior, terminal control, security isolation, sandboxing, malware prevention, ransomware prevention, or operating-system completeness.

docs/NUCLEUS_TASK_NO_EFFECT_REPORT_ALIGNMENT.md

Source title: Nucleus Task No-Effect Report Alignment

Lines: 105 | Words: 251 | SHA-256: b3d30d20b8b05a098890fc3ff5ca71cd642f075c665565f0cbca70e5266f3dc7

Nucleus Task No-Effect Report Alignment

Status: implementation refinement Scope: deterministic no-effect report alignment for Nucleus task records.

Purpose

This refinement makes the existing Nucleus task report surface explicitly state that task output remains aligned with the language-representation review and no-effect policy.

It adds report-only metadata. It does not add task execution behavior.

Implementation files

This slice updates:

```
include/latticra/nucleus_task.h
src/nucleus_task.c
tests/nucleus_task_no_effect_report_alignment.c
scripts/test-nucleus-task-no-effect-report-alignment.sh
scripts/test-nucleus-task-execution.sh
.github/workflows/nucleus-task-no-effect-report-alignment.yml
```

Added report fields

Each Nucleus task record now includes:

```
report_alignment
no_effect_policy
representation_gate
```

Expected values are:

```
report_alignment=no-effect-report-alignment
no_effect_policy=preserved
representation_gate=language-representation-reviewed
```

These fields appear in the deterministic Nucleus task report output.

Boundary

This refinement does not add:

```
effect-performing task execution
runtime behavior
command execution
Lat execution
LIR execution
file I/O
network I/O
state mutation
server interaction
self-update
recovery behavior
hardware behavior
boot behavior
sandboxing
malware prevention
ransomware prevention
operating-system completeness
```

Validation

Run:

```
sh scripts/test-nucleus-task-no-effect-report-alignment.sh
sh scripts/test-nucleus-task-execution.sh
```

The focused test verifies:

```
accepted no-effect reports emit alignment labels
future-gated reports keep alignment labels
invalid reports keep alignment labels
execution and mutation remain disabled
server, recovery, and hardware behavior remain disabled
```

Compatibility expectations

This refinement preserves:

```
existing request-kind labels
existing effect labels
existing policy labels
existing denial labels
existing classification behavior
existing future-gated behavior
existing no-effect flags
existing denied-by-default posture
```

Non-claims

This document and implementation do not claim finished Nucleus execution, runtime behavior, command execution, production security boundary, malware prevention, ransomware prevention, recovery system, update system, bootable image, or public release readiness.

docs/NUCLEUS_TASK_PLAN_IMPLEMENTATION.md

Source title: Latticra Nucleus Task Plan Implementation

Lines: 89 | Words: 291 | SHA-256: abee5e5ae00f03f6b54c10cfa4e04f7832bde2959c4ea3f0848ef4bb182d0bb6

Latticra Nucleus Task Plan Implementation

Status: initial implementation record Scope: bounded C Nucleus task plan API, no-effect task-result sequencing, deterministic plan reports, invariant tests, CI script, no-effect posture, and non-claims.

Purpose

The Nucleus task plan layer evaluates an ordered set of already-classified Nucleus task results and produces a bounded, operator-visible plan report.

This layer does not execute tasks. It does not perform mutation. It does not perform network access. It does not open files. It does not interact with hardware. It does not upgrade future-gated work into runnable behavior.

Its purpose is to make sequencing visible while preserving Latticra's current disabled-by-default runtime posture.

Added files

```
include/latticra/nucleus_task_plan.h
src/nucleus_task_plan.c
tests/nucleus_task_plan_invariants.c
scripts/test-nucleus-task-plan.sh
```

Implementation behavior

The implementation accepts a caller-provided array of latticra_nucleus_task_result_t records and produces one latticra_nucleus_task_plan_result_t.

The evaluator preserves the following rules:

```
bounded task count only
empty plans are denied
oversized plans are denied
only successful task results are accepted
only no-effect task flags are accepted
future-gated tasks block the plan
already-denied tasks block the plan
allowed report, preview, and validation tasks can form a no-effect sequence
```

Report fields

The deterministic report includes:

```
plan_id
record_count
task_count
accepted_count
blocked_count
has_blocked_task
first_blocked_index
policy
reason
no_effect
execution_allowed
mutation_allowed
server_allowed
recovery_allowed
hardware_allowed
evidence_level
```

Covered invariants

The focused test covers:

```
accepted no-effect report/preview/validation sequence
empty plan denial
future-gated task blocks the plan
non-no-effect task flags block the plan
operator-visible report fields
no execution allowed
no mutation allowed
no server interaction allowed
no recovery allowed
no hardware allowed
```

Non-claims

This implementation does not create a scheduler, executor, runtime, command runner, LIR executor, Lat executor, network service, update system, recovery engine, boot path, or hardware control layer.

It is a planning and reporting slice only.

docs/NUCLEUS_TASK_REPORT_ONLY_EXECUTION_REFINEMENT.md

Source title: Nucleus Task Report-Only Execution Refinement

Lines: 107 | Words: 263 | SHA-256: 8a70d30146396eedda4ee13b3553f84789299affa37fca225a18b203ff1f9e64

Nucleus Task Report-Only Execution Refinement

Status: implementation refinement Scope: deterministic report-only execution boundary metadata for Nucleus task records.

Purpose

This refinement makes the Nucleus task report state the execution boundary directly.

It adds report-only metadata labels for execution status, effect status, and runtime status. These labels make it explicit that the task layer still reports classification and policy only.

Implementation files

This slice updates:

```
include/latticra/nucleus_task.h
src/nucleus_task.c
tests/nucleus_task_report_only_execution_refinement.c
scripts/test-nucleus-task-report-only-execution-refinement.sh
scripts/test-nucleus-task-execution.sh
.github/workflows/nucleus-task-report-only-execution-refinement.yml
```

Added report fields

Each Nucleus task record now includes:

```
execution_status
effect_status
runtime_status
```

Expected values are:

```
execution_status=not-executed
effect_status=report-only
runtime_status=not-entered
```

These fields appear in deterministic Nucleus task report output.

Boundary

This refinement does not add:

```
effect-performing task execution
runtime behavior
command execution
Lat execution
LIR execution
file I/O
network I/O
state mutation
server interaction
self-update
recovery behavior
hardware behavior
boot behavior
sandboxing
malware prevention
ransomware prevention
operating-system completeness
```

Validation

Run:

```
sh scripts/test-nucleus-task-report-only-execution-refinement.sh
sh scripts/test-nucleus-task-execution.sh
```

The focused test verifies:

```
accepted reports emit report-only execution labels
future-gated reports remain not executed
invalid reports remain report-only
execution and mutation remain disabled
server, recovery, hardware, and runtime behavior remain disabled
```

Compatibility expectations

This refinement preserves:

```
existing request-kind labels
existing effect labels
existing policy labels
existing denial labels
existing report-alignment labels
existing no-effect-policy labels
existing representation-gate labels
existing future-gated behavior
existing no-effect flags
existing denied-by-default posture
```

Non-claims

This document and implementation do not claim finished Nucleus execution, runtime behavior, command execution, production security boundary, malware prevention, ransomware prevention, recovery system, update system, bootable image, or public release readiness.

docs/NUCLEUS_TASK_REPORT_REFINEMENT.md

Source title: Latticra Nucleus Task Report Refinement

Lines: 164 | Words: 381 | SHA-256: cf73775ddf3b524fdd46198cf3834df8bd7af0e83d751296cf2b4fd9874547e2

Latticra Nucleus Task Report Refinement

Status: initial Nucleus task report refinement implementation Scope: deterministic no-effect task report classification, task-domain labeling, authorization-state labeling, prerequisite reporting, no-effect-chain reporting, invariant tests, and workflow coverage.

Purpose

This document records the Nucleus task report refinement after the runtime boundary policy matrix refinement.

The goal is to make Nucleus task reports more explicit about what kind of task decision was made, which task domain it belongs to, and whether prerequisites and no-effect posture remained intact.

This refinement does not execute tasks, mutate state, perform I/O, open network connections, touch hardware, control a terminal, or provide runtime behavior.

Added report metadata

The Nucleus task record now includes:

```
report_classification
task_domain
authorization_state
prerequisites_satisfied
no_effect_chain_ok
```

The deterministic LATTICRA NUCLEUS TASK REPORT now emits those fields.

Report classifications

Initial report classifications:

```
accepted
```

```
future-gated
denied
invalid
```

Task domains

Initial task domains:

```
state
transition
render
lat
lir
authority
server
update
recovery
hardware
boot
unknown
```

Authorization states

Initial authorization states:

```
not-requested
checked
denied
reserved-for-future
unavailable
```

Deterministic report meaning

The refinement reports:

```
accepted -&gt; task accepted as no-effect report, preview, or validation
future-gated -&gt; operational task remains behind a future gate
denied -&gt; known task rejected by prerequisites, authority, operator, or effect policy
invalid -&gt; null, unknown, or malformed task/effect identity
```

prerequisites_satisfied is true only when the task classification reason is ok.

no_effect_chain_ok is true only when result-level and record-level execution/mutation/server/recovery/hardware flags remain denied and no-effect is preserved.

Implementation files

This slice updates or adds:

```
include/latticra/nucleus_task.h
src/nucleus_task.c
tests/nucleus_task_report_refinement.c
scripts/test-nucleus-task-execution.sh
docs/NUCLEUS_TASK_REPORT_REFINEMENT.md
scripts/test-nucleus-task-report-refinement.sh
.github/workflows/nucleus-task-report-refinement.yml
```

Validation

Run:

```
sh scripts/test-nucleus-task-report-refinement.sh
sh scripts/test-nucleus-task-execution.sh
```

The focused invariant tests verify:

```
nucleus_task_report_refinement_labels_are_stable
nucleus_task_report_refinement_reports_accepted_state_report
nucleus_task_report_refinement_reports_authority_check
nucleus_task_report_refinement_reports_future_gated_task
nucleus_task_report_refinement_reports_denied_prerequisite
nucleus_task_report_refinement_reports_invalid_request
```

Compatibility

This refinement preserves existing Nucleus task behavior for:

```
state-report preview/report behavior
transition-preview behavior
render-report behavior
Lat validation behavior
LIR validation behavior
authority-check behavior
future-gated operational task kinds
unknown request denial
unknown effect denial
operator-confirmation non-override behavior
small-buffer behavior
```

Non-claims

This report refinement does not provide:

```
task execution
runtime behavior
command execution
Lat execution
LIR execution
state mutation
file I/O
network I/O
server interaction
self-update
recovery behavior
rollback behavior
hardware support
boot behavior
terminal control
security isolation
sandboxing
malware prevention
ransomware prevention
certification
accreditation
operating-system completeness
```

docs/RUNTIME_BOUNDARY_ABUSE_CASE_FIXTURES_AFTER_POLICY_EXPANSION.md

Source title: Latticra Runtime Boundary Abuse-Case Fixtures After Policy Expansion

Lines: 143 | Words: 500 | SHA-256: 8c464345ce394fb2071b4509eefa404181fd78d71a859ce6b5cd3b2b7116097d

Latticra Runtime Boundary Abuse-Case Fixtures After Policy Expansion

Status: runtime boundary abuse-case fixture expansion after policy expansion Source: local follow-up slice Scope: deterministic runtime-boundary abuse-case fixtures, report assertions, policy-matrix assertions, domain-matrix assertions, guard coverage, public entry-point updates, and no-claim preservation. This document does not implement runtime execution, effect execution, capability enforcement, cryptographic verification, signing, host behavior, network behavior, MCP behavior, AI agent execution, model execution, tool execution, shell execution, production protection, sandboxing, malware prevention, ransomware prevention, certification, compliance, or runtime authority.

Purpose

This record closes the next evidence gap named by the runtime boundary policy expansion:

```
abuse-case mapping needs broader fixture coverage
```

The expansion is fixture coverage only.

It turns the abuse-case map from documentation-only policy evidence into deterministic C fixtures that exercise the current runtime-boundary classifier and report surface.

Relationship to previous work

This fixture expansion depends on:

```
docs/DEFENSIVE_THREAT_MODEL_VALIDATION_REFINEMENT.md
docs/RUNTIME_BOUNDARY_POLICY_EXPANSION_AFTER_THREAT_MODEL.md
docs/RUNTIME_BOUNDARY_POLICY_MATRIX_REFINEMENT.md
docs/RUNTIME_BOUNDARY_DOMAIN_MATRIX_REFINEMENT.md
docs/RUNTIME_BOUNDARY_DOMAIN_MATRIX_REPORT_INTEGRATION.md
include/latticra/runtime_boundary.h
include/latticra/runtime_boundary_domain_matrix.h
src/runtime_boundary.c
src/runtime_boundary_domain_matrix_eval.c
tests/runtime_boundary_abuse_case_fixtures.c
scripts/test-runtime-boundary-abuse-case-fixtures.sh
scripts/test-runtime-boundary-policy-expansion-after-threat-model.sh
scripts/test-runtime-boundary.sh
```

Those files remain no-effect and report/classification oriented.

Current checkpoint

Current runtime-boundary abuse-case fixture posture:

```
runtime_boundary_abuse_case_fixture_expansion_present=1
runtime_boundary_abuse_case_fixture_guard_present=1
runtime_boundary_abuse_case_c_fixtures_present=1
runtime_boundary_abuse_case_fixture_count=8

denial_reason_report_fixture_present=1
authority_failure_abuse_fixture_present=1
invalid_lir_prerequisite_fixture_present=1
blocked_effect_abuse_fixture_present=1
report_reason_assertions_present=1
policy_matrix_assertions_present=1
domain_matrix_assertions_present=1
implementation_behavior_changed=0
runtime_execution_added=0
effect_execution_added=0
capability_enforcement_added=0
cryptographic_verification_added=0
signing_added=0
host_behavior_changed=0
network_behavior_changed=0
mcp_behavior_changed=0
agent_execution_added=0
model_execution_added=0
tool_execution_added=0
shell_execution_added=0
runtime_authority_granted=0
production_protection_claim_allowed=0
runtime_protection_claim_allowed=0
malware_prevention_claim_allowed=0
ransomware_prevention_claim_allowed=0
sandbox_claim_allowed=0
certification_claim_allowed=0
compliance_claim_allowed=0
external_endorsement_claimed=0
completion_estimate_review_required=0
```

Fixture map

The new C fixture table covers:

```
| Fixture id | Abuse case | Expected current posture |
| --- | --- | --- |
| unknown-request-is-not-allowed | unknown request is treated as allowed | deny,
```

```
unknown-request, invalid matrix |
| unknown-effect-is-not-allowed | unknown effect is treated as allowed | deny, unknown-effect, invalid matrix |
| future-gated-execution-is-not-executable | future-gated request is treated as executable | future-gated, planned gate, no execution |
| operator-confirmation-cannot-override-policy | operator confirmation overrides policy | deny, operator-confirmation-not-supported |
| denial-reason-stays-rendered | report omits denial reason | report includes deterministic denial reason |
| authority-failure-is-not-allowed | failed authority metadata is treated as allowed | deny, authority/prerequisite failure |
| invalid-lir-prerequisite-stays-denied | invalid LIR input reaches later behavior | deny, LIR prerequisite failure |
| blocked-effect-stays-blocked | blocked effect is treated as no-effect | deny, blocked-effect policy matrix |
```

Each fixture also asserts:

```
no_effect=1
execution_allowed=0
mutation_allowed=0
file_io_allowed=0
network_allowed=0
server_allowed=0
recovery_allowed=0
rollback_allowed=0
hardware_allowed=0
boot_allowed=0
record_executed=0
```

Validation

This fixture expansion is guarded by:

```
sh scripts/test-runtime-boundary-abuse-case-fixtures.sh
```

The guard verifies the documentation checkpoint, the fixture source, public entry points, and the runtime-boundary C test runner.

Expected focused fixture output:

```
runtime_boundary_abuse_case_fixtures: ok
```

Boundary

This expansion adds fixtures and guard coverage only.

It does not add runtime behavior, command execution, Lat execution, LIR execution, task effect execution, state mutation, file I/O, network I/O, server interaction, self-update, recovery behavior, rollback behavior, hardware support, boot behavior, terminal control, security isolation, sandboxing, malware prevention, ransomware prevention, certification, accreditation, compliance, production protection, operating-system completeness, or runtime authority.

The next valid work should remain completion-estimate review only if capability posture changes; otherwise continue small guarded report/status alignment only when drift appears.

docs/RUNTIME_BOUNDARY_CONTRACT.md

Source title: Latticra Runtime Boundary Contract

Lines: 569 | Words: 1465 | SHA-256: 9e54ce479d635eb9831a6b2150f639383541ad12e01ee31fab59746c9cb8edac

Latticra Runtime Boundary Contract

Status: Runtime boundary contract Scope: first runtime boundary definition before runtime implementation, command behavior, Lat execution, LIR execution, task effect execution, file I/O, network I/O, server interaction, self-update, recovery behavior, rollback, hardware behavior, boot behavior, terminal control, sandboxing, malware prevention, ransomware prevention, or operating-system behavior.

Purpose

This document defines the first runtime boundary contract for Latticra.

Runtime boundary means the line between validated metadata/report/classification surfaces and any future behavior that could execute, mutate, interact with a host, contact a network, affect recovery, affect hardware, affect boot state, or claim runtime authority.

This document does not implement a runtime.

Relationship to previous work

This contract depends on:

```
docs/EFFECT_GATES.md
docs/SUPERVISOR_ARCHITECTURE.md
docs/NUCLEUS_PREVIEW.md
docs/NUCLEUS_TASK_EXECUTION_CONTRACT.md
docs/NUCLEUS_TASK_EXECUTION_IMPLEMENTATION_PLAN.md
docs/NUCLEUS_TASK_EXECUTION_IMPLEMENTATION.md
docs/CONSTRAINED_CPP_AUTHORITY_LAYER_IMPLEMENTATION.md
docs/L_UI_RENDERING_IMPLEMENTATION.md
docs/LIR_SHAPE_IMPLEMENTATION.md
docs/LAT_LANGUAGE_GRAMMAR_IMPLEMENTATION.md
docs/STATE_LATTICE.md
docs/TRI_PLANE_TRANSITION.md
include/latticra/nucleus_preview.h
include/latticra/nucleus_task.h
include/latticra/l_ui_renderer.h
include/latticra/lir.h
include/latticra/lat_parser.h
include/latticra/cpp/authority.hpp
src/nucleus_preview.c
src/nucleus_task.c
src/l_ui_renderer.c
src/lir.c
src/lat_parser.c
src/cpp/authority.cpp
```

Those files remain the source of truth for effect vocabulary, Nucleus preview behavior, task classification/reporting, constrained authority, rendering, LIR metadata, Lat metadata, state lattice, tri-plane transition, and current no-effect boundaries.

Direction checkpoint

```
C is the metal.
C++ is the disciplined structure.
Latticra is the contract.
```

Runtime work may not bypass this relationship:

```
Lat / Latticra Language: declares contracts and intended effects
LIR: carries validated metadata
C++ authority layer: validates authority and reports decisions
C substrate: owns bounded runtime-adjacent records and ABI-compatible surfaces
Nucleus: coordinates only after contracts and gates permit it
Runtime: remains disabled until explicit boundaries, authority, tests, and evidence exist
```

Current runtime boundary

Current Latticra behavior includes no production runtime.

Current implemented behavior is limited to:

```
parsing
```

```
validation
classification
preview
reporting
rendering metadata
no-effect task classification
```

Current implemented behavior does not include:

```
command execution
Lat execution
LIR execution
runtime scheduling
process launching
plugin loading
file I/O
network I/O
server interaction
self-update
recovery behavior
rollback
hardware access
boot behavior
terminal control
sandbox enforcement
malware prevention
ransomware prevention
operating-system behavior
```

Runtime posture

The first runtime posture is disabled-by-default.

Initial runtime posture:

```
runtime implemented? no
default policy: deny
report-only allowed: yes
validation-only allowed: yes
preview-only allowed: yes
classification-only allowed: yes
command execution allowed: no
Lat execution allowed: no
LIR execution allowed: no
mutation allowed: no
file I/O allowed: no
network I/O allowed: no
server interaction allowed: no
self-update allowed: no
recovery allowed: no
rollback allowed: no
hardware allowed: no
boot behavior allowed: no
operator confirmation allowed to override: no
```

Operator confirmation may be represented as metadata later, but it must not override runtime policy in the first implementation.

Runtime boundary modes

Future runtime boundary work should use explicit modes.

Initial mode labels:

```
disabled
report-only
validation-only
preview-only
classification-only
deny-all
requires-future-gate
```

The first runtime implementation plan must choose exact enum names.

No mode may imply command execution, Lat execution, LIR execution, mutation, file I/O, network I/O, recovery, hardware, boot behavior, or sandboxing.

Runtime request kinds

Future runtime request kinds should include:

```
parse-only
validate-only
classify-only
render-report
nucleus-task-report
lat-validate
lir-validate
authority-check
runtime-execute
command-execute
lat-execute
lir-execute
file-read
file-write
network-open
server-interaction
self-update
recovery-action
rollback-action
hardware-action
boot-action
unknown
```

Only parse, validate, classify, render/report, and authority-check requests may be considered for first no-effect runtime handling.

All effect-performing requests remain denied.

Runtime effects

Runtime boundary work must classify effects before handling.

Initial runtime effects:

```
none
read
local_mutation
host_mutation
network
hardware
boot
recovery
external
unknown
```

Default policy:

```
none -&gt; report/validation/classification only
read -&gt; approved local metadata only
local_mutation -&gt; deny until explicit local-mutation contract
host_mutation -&gt; deny
network -&gt; deny
hardware -&gt; deny
boot -&gt; deny
recovery -&gt; deny
external -&gt; deny
unknown -&gt; deny
```

Runtime policy results

Future runtime policy labels:

```
allow-report
allow-validation
allow-classification
allow-preview
deny
blocked
requires-future-gate
unsupported
internal-error
```

The first future implementation must not produce an executed result for effect-performing work.

Runtime denial reasons

Future denial labels:

```
ok
null-argument
unknown-request
unknown-effect
unsupported-request
unsupported-effect
parser-failed
semantic-failed
lir-failed
render-failed
authority-failed
task-failed
runtime-disabled
effect-blocked
effect-requires-future-gate
non-no-effect-flags
operator-confirmation-not-supported
implementation-not-present
internal-error
```

Denial reasons must be stable and report-visible.

Required prerequisites

A future runtime request may be considered only after relevant prerequisites are explicit.

Possible prerequisites:

```
parser_error=ok
semantic_error=ok
lir_error=ok
render_status=ok
authority_status=ok
task_policy=allow-report or allow-validation or allow-classification or allow-preview
runtime_mode=report-only or validation-only or classification-only or preview-only
effect_gate=allowed-report or allowed-validation or allowed-classification or allowed-preview
no_effect=1
execution_allowed=0
mutation_allowed=0
server_allowed=0
recovery_allowed=0
hardware_allowed=0
operator_confirmation=not-applicable
```

If any prerequisite fails, the runtime boundary must deny the request and produce a deterministic report.

Authority requirements

Future runtime boundary work must consult authority metadata before any request is eligible.

Authority checks must include:

```
authority status
authority validator
authority requested effect
authority denial reason
authority no-effect flags
source identity
runtime request kind
runtime effect kind
runtime boundary mode
```

Authority failure must deny the request.

Authority success must not by itself execute a request. It only satisfies one prerequisite.

Task requirements

Future runtime boundary work must use Nucleus task classification/reporting before runtime handling.

Task requirements must include:

```
task policy
task denial reason
task requested effect
task allowed effect
task executed flag
task mutation_allowed flag
task server_interaction_allowed flag
task recovery_allowed flag
task hardware_allowed flag
```

If the task record indicates execution, mutation, server interaction, recovery, or hardware behavior, the first runtime boundary must reject it.

Runtime record shape

A future runtime boundary record should include:

```
runtime_id
request_kind
requested_effect
allowed_effect
runtime_mode
policy_result
denial_reason
authority_status
task_policy
task_reason
effect_gate_state
operator_confirmation
executed
mutation_allowed
file_io_allowed
network_allowed
server_interaction_allowed
recovery_allowed
rollback_allowed
hardware_allowed
boot_allowed
evidence_level
source_identity
source_span
```

The first future implementation should use fixed-size fields and caller-owned buffers.

Runtime report format

A future runtime boundary report should be deterministic and bounded.

Suggested report header:

```
LATTICRA RUNTIME BOUNDARY REPORT
runtime_id=&lt;id&gt;
request=&lt;request-kind&gt;
requested_effect=&lt;effect&gt;
allowed_effect=&lt;effect&gt;
mode=&lt;runtime-mode&gt;
policy=&lt;policy-result&gt;
reason=&lt;denial-reason&gt;
authority_status=&lt;authority-status&gt;
task_policy=&lt;task-policy&gt;
task_reason=&lt;task-reason&gt;
effect_gate_state=&lt;gate-state&gt;
operator_confirmation=&lt;confirmation-state&gt;
executed=0
mutation_allowed=0
file_io_allowed=0
network_allowed=0
server_interaction_allowed=0
recovery_allowed=0
rollback_allowed=0
```

```
hardware_allowed=0
boot_allowed=0
evidence_level=&lt;level&gt;
source_identity=&lt;source&gt;
span_start_offset=&lt;offset&gt;
span_end_offset=&lt;offset&gt;
```

Reports must not include secrets, host environment values, filesystem contents, network data, credentials, tokens, keys, hardware identifiers, or process information.

Output buffer policy

Runtime boundary reports must:

```
write only to caller-provided buffers
require explicit buffer length
NUL-terminate on success
clear the buffer on too-small failure
avoid heap allocation
avoid file output
avoid stdout
avoid stderr
avoid terminal escape control
```

First implementation gate

Runtime boundary implementation must not begin until a separate implementation plan defines:

1. implementation language;
2. public header path;
3. source file path;
4. runtime request struct;
5. runtime record struct;
6. runtime result struct;
7. runtime mode enum;
8. runtime policy enum;
9. runtime denial enum;
10. authority summary usage;
11. Nucleus task result usage;
12. effect-gate state usage;
13. operator-confirmation metadata shape;
14. report format;
15. capacity constants;
16. output-buffer behavior;
17. exact tests;
18. compatibility expectations;
19. non-claims.

That plan should be recorded in:

```
RUNTIME_BOUNDARY_IMPLEMENTATION_PLAN.md
```

Future file policy

Recommended future files:

```
include/latticra/runtime_boundary.h
src/runtime_boundary.c
tests/runtime_boundary_invariants.c
scripts/test-runtime-boundary.sh
docs/RUNTIME_BOUNDARY_IMPLEMENTATION_PLAN.md
docs/RUNTIME_BOUNDARY_IMPLEMENTATION.md
```

The implementation plan must confirm exact paths before runtime boundary code is added.

Future test list

A future implementation plan should include tests for:

```
runtime_boundary_denies_unknown_request
runtime_boundary_denies_unknown_effect
runtime_boundary_denies_runtime_execute
runtime_boundary_denies_command_execute
runtime_boundary_denies_lat_execute
runtime_boundary_denies_lir_execute
runtime_boundary_denies_file_read
runtime_boundary_denies_file_write
runtime_boundary_denies_network_open
runtime_boundary_denies_server_interaction
runtime_boundary_denies_self_update
runtime_boundary_denies_recovery_action
runtime_boundary_denies_rollback_action
runtime_boundary_denies_hardware_action
runtime_boundary_denies_boot_action
runtime_boundary_requires_authority_success
runtime_boundary_requires_task_success
runtime_boundary_requires_no_effect_flags
runtime_boundary_allows_parse_only_report_only
runtime_boundary_allows_validate_only
runtime_boundary_allows_classify_only
runtime_boundary_allows_render_report_only
runtime_boundary_report_is_deterministic
runtime_boundary_report_rejects_small_buffer
runtime_boundary_does_not_mutate_state
runtime_boundary_does_not_write_files
runtime_boundary_does_not_open_network
runtime_boundary_does_not_touch_hardware
runtime_boundary_does_not_call_recovery
runtime_boundary_does_not_override_policy_with_operator_confirmation
```

Compatibility expectations

Future runtime boundary work must not change:

```
existing Nucleus preview classification behavior
existing Nucleus task classification behavior
existing Nucleus task report behavior
state lattice behavior
tri-plane transition behavior
L-UI parser behavior
L-UI semantic validation behavior
LIR shape behavior
L-UI rendering behavior
Lat grammar behavior
constrained C++ authority behavior
no-effect flags
current accepted fixture counts
```

Forbidden behavior

Runtime boundary work must not:

- bypass Nucleus task classification;
- bypass effect gates;
- bypass constrained C++ authority validation;
- bypass parser, semantic, LIR, render, or task prerequisites when relevant;
- execute unknown requests;
- execute unknown effects;

- execute commands;
- execute Lat;
- execute LIR;
- launch processes;
- load plugins;
- mutate state;
- write files;
- read host files outside approved metadata;
- open network connections;
- call server code;
- call update code;
- call recovery code;
- perform rollback;
- touch hardware;
- alter boot state;
- use terminal control;
- let operator confirmation override policy;
- hide denial reasons;
- omit runtime records;
- emit secrets, host environment values, credentials, tokens, keys, hardware identifiers, or process information;
- imply a production runtime, sandbox, malware prevention, ransomware prevention, recovery system, update system, or operating-system surface.

Current validation command

This contract is guarded by:

```
sh scripts/test-runtime-boundary-contract.sh
```

The guard is static. It does not implement runtime behavior.

Non-claims

This document does not implement runtime behavior, command behavior, Lat execution, LIR execution, task effect execution, live movement, state mutation, file I/O, network I/O, server interaction, self-update, recovery behavior, rollback, hardware support, boot behavior, terminal control, security isolation, sandboxing, malware prevention, ransomware prevention, or operating-system completeness.

docs/RUNTIME_BOUNDARY_DOMAIN_MATRIX_MAIN_TEST_INTEGRATION_AUDIT.md

Source title: Runtime Boundary Domain Matrix Main Test Integration Audit

Lines: 23 | Words: 70 | SHA-256: b09447eb38409f253a150aab2dffc9d4b7b04696d4140e290ec183f9cbf6b3e3

Runtime Boundary Domain Matrix Main Test Integration Audit

Status: initial audit guard

This record verifies that the RBDM report integration is covered by the main runtime-boundary test runner, not only by its focused runner.

Audit expectations:

```
scripts/test-runtime-boundary.sh compiles tests/runtime_boundary_*.c
scripts/test-runtime-boundary.sh links src/runtime_boundary_domain_matrix_report.c
tests/runtime_boundary_domain_matrix_report_integration.c is included by the
runtime_boundary_*.c glob
.github/workflows/runtime-boundary.yml runs scripts/test-runtime-boundary.sh
```

Validation:

```
sh scripts/test-runtime-boundary-domain-matrix-main-test-integration-audit.sh
sh scripts/test-runtime-boundary.sh
```

Boundary: audit/guard only. No runtime behavior is added.

Lines: 145 | Words: 840 | SHA-256: 6c4a745f3ee32cabaefe87c940e6622111d0a9dea6e3df0a478ea6fe032f3280

Latticra Runtime Boundary Implementation

Status: initial implementation record Scope: C runtime boundary API surface, deterministic labels, default-deny classification, no-effect allow-mode classification, allowed-effect report field, authority prerequisites, authority flag report fields, authority label report fields, Nucleus task prerequisites and happy path, Nucleus task flag report fields, render/Lat/LIR prerequisite status report fields, render/Lat/LIR prerequisite denials and happy paths, runtime identity copying, source metadata copying, future-gate classification, expanded report fields, invariant tests, caller-provided report buffer, no-effect posture, and non-claims.

Purpose

This document records the first runtime boundary implementation surface.

The implementation follows:

```
docs/RUNTIME_BOUNDARY_CONTRACT.md
docs/RUNTIME_BOUNDARY_IMPLEMENTATION_PLAN.md
```

This slice adds the public runtime boundary API, source file, invariant tests, and test runner.

The current source is no-effect and disabled-by-default. It does not implement operational runtime behavior.

Implementation files

This slice includes:

```
include/latticra/runtime_boundary.h
src/runtime_boundary.c
tests/runtime_boundary_invariants.c
tests/runtime_boundary_effect_flag_report.c
tests/runtime_boundary_allowed_effect_report.c
tests/runtime_boundary_authority_flag_report.c
tests/runtime_boundary_authority_label_report.c
tests/runtime_boundary_abuse_case_fixtures.c
tests/runtime_boundary_task_flag_report.c
tests/runtime_boundary_prerequisite_status_report.c
tests/runtime_boundary_prerequisite_denial.c
tests/runtime_boundary_allow_modes.c
tests/runtime_boundary_prerequisite_happy_paths.c
tests/runtime_boundary_task_report_happy_path.c
scripts/test-runtime-boundary.sh
docs/RUNTIME_BOUNDARY_IMPLEMENTATION.md
```

Implemented surface

The public API defines request kinds, effects, modes, policies, denial labels, gate states, operator-confirmation metadata, authority summary metadata, request records, result records, classifier entry point, and report entry point.

The source provides:

```
deterministic request/effect/mode/policy/denial/gate/operator labels
default-deny classification
no-effect report-mode allow classification
no-effect validation-mode allow classification
no-effect classification-mode allow classification
allowed-effect report visibility
runtime_id copying
record_count initialization and report visibility
authority presence and status checks
authority no-effect flag checks
authority execution/mutation/server/recovery/hardware flag report visibility
authority status label, validator label, requested-effect label, and denial-reason report
visibility
Nucleus task-result prerequisite checks for task-report requests
Nucleus task-report happy path when task metadata is OK and report mode matches
task policy and task reason metadata copying
task executed/mutation/server/recovery/hardware flag copying and report visibility
render status/error metadata copying and report visibility
render-report prerequisite denial when render metadata is missing or failed
render-report happy path when render metadata is OK and report mode matches
Lat parser status/error metadata copying and report visibility
Lat validation prerequisite denial when Lat metadata is missing or failed
Lat validation happy path when Lat metadata is OK and validation mode matches
LIR status/error metadata copying and report visibility
LIR validation prerequisite denial when LIR metadata is missing or failed
LIR validation happy path when LIR metadata is OK and validation mode matches
source identity copying
source span metadata copying
unknown request denial
unknown effect denial
future-gate classification for operational request kinds
operator-confirmation non-override behavior
bounded report output with policy, reason, and gate state
expanded report output for runtime_id, record_count, request, requested effect, allowed effect,
mode, operator confirmation, authority status, authority label strings, authority no-effect
state, authority effect flags, task policy, task reason, task effect flags, render prerequisite
status, Lat prerequisite status, LIR prerequisite status, no-effect flag, execution flag,
mutation flag, file I/O flag, network flag, server flag, recovery flag, rollback flag, hardware
flag, boot flag, source identity, and source span metadata
small-buffer rejection and clearing
```

Validation

Run:

```
sh scripts/test-runtime-boundary.sh
```

The runtime boundary tests verify:

```
runtime boundary classification initializes a no-effect result
runtime boundary abuse-case fixtures deny unknown request, unknown effect, future-gated
execution, operator override, missing task metadata, missing authority metadata, invalid LIR
prerequisites, and blocked effects
runtime_id is copied from request to record
record_count is initialized
runtime_id and record_count report fields are present
requested-effect and allowed-effect report fields are present
matched no-effect report mode allows report requests
matched no-effect validation mode allows validation requests
matched no-effect classification mode allows classification requests
valid render metadata allows render-report in report mode
valid Lat parser metadata allows Lat validation in validation mode
valid LIR metadata allows LIR validation in validation mode
valid Nucleus task metadata allows task-report in report mode
mismatched modes remain denied
default policy denies
source identity metadata is copied
source span metadata is copied
missing authority is denied
failed authority status is denied
non-no-effect authority flags are denied
authority effect flags are present and zero in reports
authority label strings are present in reports
missing Nucleus task metadata is denied for task reports
valid Nucleus task metadata is copied for task reports
Nucleus task effect flags are copied and visible in reports
render/Lat/LIR prerequisite status fields are visible in reports
failed render metadata is denied with render-failed
failed Lat metadata is denied with parser-failed
failed LIR metadata is denied with lir-failed
```

```
unknown requests are denied
unknown effects are denied
operational request kinds require a future gate
operator confirmation does not override policy
runtime boundary reports are bounded
expanded report fields are present
source identity and source span report fields are present
file I/O, network, server, recovery, rollback, hardware, and boot report flags are present and
zero
small buffers are rejected and cleared
null arguments are handled safely
```

Boundary

This implementation does not provide runtime behavior, command behavior, Lat execution, LIR execution, task effect execution, live movement, state mutation, file I/O, network I/O, server interaction, self-update, recovery behavior, rollback, hardware support, boot behavior, terminal control, security isolation, sandboxing, malware prevention, ransomware prevention, or operating-system completeness.

Note

The fuller classification policy remains specified in the contract and implementation plan. This source slice expands the public C API behavior while preserving the denied-by-default runtime boundary.

docs/RUNTIME_BOUNDARY_IMPLEMENTATION_PLAN.md

Source title: Latticra Runtime Boundary Implementation Plan

Lines: 790 | Words: 1759 | SHA-256: 7c0afd077d15226f1329e42ea62111b03ac78faa5552a43887d2ebb5bcec68ba

Latticra Runtime Boundary Implementation Plan

Status: implementation planning contract Scope: exact public API, C implementation files, runtime request/record/result structs, runtime mode enum, runtime policy enum, runtime denial enum, effect enum, authority summary usage, Nucleus task result usage, effect-gate state usage, operator-confirmation metadata, report format, capacity constants, output-buffer behavior, tests, compatibility expectations, and non-claims before runtime boundary code.

Purpose

This document defines the implementation plan for the first runtime boundary surface.

The Runtime boundary contract is already merged and guarded. This plan turns that contract into exact public API, file paths, data structures, enums, capacity constants, report rules, prerequisite behavior, task-result behavior, authority behavior, exact tests, compatibility expectations, and non-claims before runtime boundary code is added.

This document does not implement runtime behavior.

Relationship to previous work

This plan depends on:

```
docs/RUNTIME_BOUNDARY_CONTRACT.md
docs/EFFECT_GATES.md
docs/SUPERVISOR_ARCHITECTURE.md
docs/NUCLEUS_TASK_EXECUTION_IMPLEMENTATION.md
docs/NUCLEUS_PREVIEW.md
docs/CONSTRAINED_CPP_AUTHORITY_LAYER_IMPLEMENTATION.md
docs/L_UI_RENDERING_IMPLEMENTATION.md
docs/LIR_SHAPE_IMPLEMENTATION.md
docs/LAT_LANGUAGE_GRAMMAR_IMPLEMENTATION.md
include/latticra/nucleus_task.h
include/latticra/nucleus_preview.h
include/latticra/l_ui_renderer.h
```

```
include/latticra/lir.h
include/latticra/lat_parser.h
include/latticra/cpp/authority.hpp
src/nucleus_task.c
src/nucleus_preview.c
src/l_ui_renderer.c
src/lir.c
src/lat_parser.c
src/cpp/authority.cpp
```

Those files remain the source of truth for task classification, preview classification, constrained authority, rendering, LIR metadata, Lat metadata, and no-effect boundaries.

Implementation language decision

The first runtime boundary surface should be implemented in C.

Reason:

- Nucleus preview is C;
- Nucleus task classification/reporting is C;
- L-UI rendering, LIR shape, and Lat grammar are C;
- the boundary should use bounded structs and caller-provided buffers;
- C remains the secure substrate;
- the constrained C++ authority layer remains a validation/report dependency, not the runtime boundary storage substrate.

The first implementation must not expose C++ object lifetimes through the public C runtime boundary API.

Implementation files

The implementation PR should add or modify:

```
include/latticra/runtime_boundary.h
src/runtime_boundary.c
tests/runtime_boundary_invariants.c
scripts/test-runtime-boundary.sh
.github/workflows/c.yml
docs/RUNTIME_BOUNDARY_IMPLEMENTATION.md
```

The implementation PR should not add command behavior, Lat execution, LIR execution, task effect execution, live movement, mutation, file I/O, network I/O, server interaction, self-update, recovery behavior, rollback, hardware behavior, boot behavior, terminal control, sandboxing, malware prevention, ransomware prevention, or operating-system behavior.

Public API shape

Add public API names:

```
latticra_runtime_boundary_request_kind_t
latticra_runtime_boundary_effect_t
latticra_runtime_boundary_mode_t
latticra_runtime_boundary_policy_t
latticra_runtime_boundary_denial_t
latticra_runtime_boundary_gate_state_t
latticra_runtime_boundary_operator_confirmation_t
latticra_runtime_boundary_authority_summary_t
latticra_runtime_boundary_request_t
latticra_runtime_boundary_record_t
latticra_runtime_boundary_result_t
latticra_runtime_boundary_request_kind_label
latticra_runtime_boundary_effect_label
latticra_runtime_boundary_mode_label
latticra_runtime_boundary_policy_label
latticra_runtime_boundary_denial_label
latticra_runtime_boundary_gate_state_label
latticra_runtime_boundary_operator_confirmation_label
```

```
latticra_runtime_boundary_classify
latticra_runtime_boundary_report
```

Recommended function signatures:

```
const char
*latticra_runtime_boundary_request_kind_label(latticra_runtime_boundary_request_kind_t kind);
const char *latticra_runtime_boundary_effect_label(latticra_runtime_boundary_effect_t effect);
const char *latticra_runtime_boundary_mode_label(latticra_runtime_boundary_mode_t mode);
const char *latticra_runtime_boundary_policy_label(latticra_runtime_boundary_policy_t policy);
const char *latticra_runtime_boundary_denial_label(latticra_runtime_boundary_denial_t denial);
const char *latticra_runtime_boundary_gate_state_label(latticra_runtime_boundary_gate_state_t
gate_state);
const char *latticra_runtime_boundary_operator_confirmation_label(latticra_runtime_boundary_oper
ator_confirmation_t confirmation);

latticra_status_t latticra_runtime_boundary_classify(
    const latticra_runtime_boundary_request_t *request,
    latticra_runtime_boundary_result_t *result);

latticra_status_t latticra_runtime_boundary_report(
    const latticra_runtime_boundary_result_t *result,
    char *buffer,
    size_t buffer_len);
```

The first implementation should classify and report only. It must not execute runtime behavior.

Capacity constants

Add exact bounded constants:

```
LATTICRA_RUNTIME_BOUNDARY_ID_MAX 64u
LATTICRA_RUNTIME_BOUNDARY_LABEL_MAX 64u
LATTICRA_RUNTIME_BOUNDARY_REASON_MAX 128u
LATTICRA_RUNTIME_BOUNDARY_SOURCE_IDENTITY_MAX 128u
LATTICRA_RUNTIME_BOUNDARY_REPORT_MAX 4096u
LATTICRA_RUNTIME_BOUNDARY_RECORD_MAX 16u
```

Small output buffers must return LATTICRA_STATUS_BUFFER_TOO_SMALL and clear the output buffer.

Request kind enum

Add request kinds:

```
LATTICRA_RUNTIME_BOUNDARY_PARSE_ONLY
LATTICRA_RUNTIME_BOUNDARY_VALIDATE_ONLY
LATTICRA_RUNTIME_BOUNDARY_CLASSIFY_ONLY
LATTICRA_RUNTIME_BOUNDARY_RENDER_REPORT
LATTICRA_RUNTIME_BOUNDARY_NUCLEUS_TASK_REPORT
LATTICRA_RUNTIME_BOUNDARY_LAT_VALIDATE
LATTICRA_RUNTIME_BOUNDARY_LIR_VALIDATE
LATTICRA_RUNTIME_BOUNDARY_AUTHORITY_CHECK
LATTICRA_RUNTIME_BOUNDARY_RUNTIME_EXECUTE
LATTICRA_RUNTIME_BOUNDARY_COMMAND_EXECUTE
LATTICRA_RUNTIME_BOUNDARY_LAT_EXECUTE
LATTICRA_RUNTIME_BOUNDARY_LIR_EXECUTE
LATTICRA_RUNTIME_BOUNDARY_FILE_READ
LATTICRA_RUNTIME_BOUNDARY_FILE_WRITE
LATTICRA_RUNTIME_BOUNDARY_NETWORK_OPEN
LATTICRA_RUNTIME_BOUNDARY_SERVER_INTERACTION
LATTICRA_RUNTIME_BOUNDARY_SELF_UPDATE
LATTICRA_RUNTIME_BOUNDARY_RECOVERY_ACTION
LATTICRA_RUNTIME_BOUNDARY_ROLLBACK_ACTION
LATTICRA_RUNTIME_BOUNDARY_HARDWARE_ACTION
LATTICRA_RUNTIME_BOUNDARY_BOOT_ACTION
LATTICRA_RUNTIME_BOUNDARY_UNKNOWN
```

Stable labels:

```
parse-only
validate-only
classify-only
render-report
nucleus-task-report
lat-validate
lir-validate
```

```
authority-check
runtime-execute
command-execute
lat-execute
lir-execute
file-read
file-write
network-open
server-interaction
self-update
recovery-action
rollback-action
hardware-action
boot-action
unknown
```

Effect enum

Add runtime effects:

```
LATTICRA_RUNTIME_BOUNDARY_EFFECT_NONE
LATTICRA_RUNTIME_BOUNDARY_EFFECT_READ
LATTICRA_RUNTIME_BOUNDARY_EFFECT_LOCAL_MUTATION
LATTICRA_RUNTIME_BOUNDARY_EFFECT_HOST_MUTATION
LATTICRA_RUNTIME_BOUNDARY_EFFECT_NETWORK
LATTICRA_RUNTIME_BOUNDARY_EFFECT_HARDWARE
LATTICRA_RUNTIME_BOUNDARY_EFFECT_BOOT
LATTICRA_RUNTIME_BOUNDARY_EFFECT_RECOVERY
LATTICRA_RUNTIME_BOUNDARY_EFFECT_EXTERNAL
LATTICRA_RUNTIME_BOUNDARY_EFFECT_UNKNOWN
```

Stable labels:

```
none
read
local_mutation
host_mutation
network
hardware
boot
recovery
external
unknown
```

Only none and read may be eligible for no-effect report, validation, classification, or preview boundary handling.

Runtime mode enum

Add runtime modes:

```
LATTICRA_RUNTIME_BOUNDARY_MODE_DISABLED
LATTICRA_RUNTIME_BOUNDARY_MODE_REPORT_ONLY
LATTICRA_RUNTIME_BOUNDARY_MODE_VALIDATION_ONLY
LATTICRA_RUNTIME_BOUNDARY_MODE_PREVIEW_ONLY
LATTICRA_RUNTIME_BOUNDARY_MODE_CLASSIFICATION_ONLY
LATTICRA_RUNTIME_BOUNDARY_MODE_DENY_ALL
LATTICRA_RUNTIME_BOUNDARY_MODE_REQUIRES_FUTURE_GATE
```

Stable labels:

```
disabled
report-only
validation-only
preview-only
classification-only
deny-all
requires-future-gate
```

No mode may imply execution, mutation, file I/O, network I/O, recovery, hardware, boot behavior, or sandboxing.

Policy enum

Add runtime policies:

```
LATTICRA_RUNTIME_BOUNDARY_POLICY_ALLOW_REPORT
LATTICRA_RUNTIME_BOUNDARY_POLICY_ALLOW_VALIDATION
```

```
LATTICRA_RUNTIME_BOUNDARY_POLICY_ALLOW_CLASSIFICATION
LATTICRA_RUNTIME_BOUNDARY_POLICY_ALLOW_PREVIEW
LATTICRA_RUNTIME_BOUNDARY_POLICY_DENY
LATTICRA_RUNTIME_BOUNDARY_POLICY_BLOCKED
LATTICRA_RUNTIME_BOUNDARY_POLICY_REQUIRES_FUTURE_GATE
LATTICRA_RUNTIME_BOUNDARY_POLICY_UNSUPPORTED
LATTICRA_RUNTIME_BOUNDARY_POLICY_INTERNAL_ERROR
```

Stable labels:

```
allow-report
allow-validation
allow-classification
allow-preview
deny
blocked
requires-future-gate
unsupported
internal-error
```

The first implementation must not produce an executed effect-performing result.

Denial enum

Add denial reasons:

```
LATTICRA_RUNTIME_BOUNDARY_DENIAL_OK
LATTICRA_RUNTIME_BOUNDARY_DENIAL_NULL_ARGUMENT
LATTICRA_RUNTIME_BOUNDARY_DENIAL_UNKNOWN_REQUEST
LATTICRA_RUNTIME_BOUNDARY_DENIAL_UNKNOWN_EFFECT
LATTICRA_RUNTIME_BOUNDARY_DENIAL_UNSUPPORTED_REQUEST
LATTICRA_RUNTIME_BOUNDARY_DENIAL_UNSUPPORTED_EFFECT
LATTICRA_RUNTIME_BOUNDARY_DENIAL_PARSER_FAILED
LATTICRA_RUNTIME_BOUNDARY_DENIAL_SEMANTIC_FAILED
LATTICRA_RUNTIME_BOUNDARY_DENIAL_LIR_FAILED
LATTICRA_RUNTIME_BOUNDARY_DENIAL_RENDER_FAILED
LATTICRA_RUNTIME_BOUNDARY_DENIAL_AUTHORITY_FAILED
LATTICRA_RUNTIME_BOUNDARY_DENIAL_TASK_FAILED
LATTICRA_RUNTIME_BOUNDARY_DENIAL_RUNTIME_DISABLED
LATTICRA_RUNTIME_BOUNDARY_DENIAL_EFFECT_BLOCKED
LATTICRA_RUNTIME_BOUNDARY_DENIAL_EFFECT_REQUIRES_FUTURE_GATE
LATTICRA_RUNTIME_BOUNDARY_DENIAL_NON_NO_EFFECT_FLAGS
LATTICRA_RUNTIME_BOUNDARY_DENIAL_OPERATOR_CONFIRMATION_NOT_SUPPORTED
LATTICRA_RUNTIME_BOUNDARY_DENIAL_IMPLEMENTATION_NOT_PRESENT
LATTICRA_RUNTIME_BOUNDARY_DENIAL_INTERNAL_ERROR
```

Stable labels:

```
ok
null-argument
unknown-request
unknown-effect
unsupported-request
unsupported-effect
parser-failed
semantic-failed
lir-failed
render-failed
authority-failed
task-failed
runtime-disabled
effect-blocked
effect-requires-future-gate
non-no-effect-flags
operator-confirmation-not-supported
implementation-not-present
internal-error
```

Gate state enum

Add gate states:

```
LATTICRA_RUNTIME_BOUNDARY_GATE_DISABLED
LATTICRA_RUNTIME_BOUNDARY_GATE_BLOCKED
LATTICRA_RUNTIME_BOUNDARY_GATE_PLANNED
LATTICRA_RUNTIME_BOUNDARY_GATE_AVAILABLE
LATTICRA_RUNTIME_BOUNDARY_GATE_ARMED
LATTICRA_RUNTIME_BOUNDARY_GATE_EXECUTED
LATTICRA_RUNTIME_BOUNDARY_GATE_FAILED
```

Stable labels:

```
disabled
blocked
planned
available
armed
executed
failed
```

The first implementation should output only disabled, blocked, or planned for real classifications.

Operator confirmation enum

Add operator-confirmation states:

```
LATTICRA_RUNTIME_BOUNDARY_OPERATOR_NOT_APPLICABLE
LATTICRA_RUNTIME_BOUNDARY_OPERATOR_REQUIRED
LATTICRA_RUNTIME_BOUNDARY_OPERATOR_PRESENT
LATTICRA_RUNTIME_BOUNDARY_OPERATOR_REJECTED
LATTICRA_RUNTIME_BOUNDARY_OPERATOR_NOT_SUPPORTED
```

Stable labels:

```
not-applicable
required
present
rejected
not-supported
```

Confirmation is metadata only. It must not override policy.

Authority summary struct

Add a C-compatible authority summary:

```
latticra_status_t status;
char status_label[LATTICRA_RUNTIME_BOUNDARY_LABEL_MAX];
char validator_label[LATTICRA_RUNTIME_BOUNDARY_LABEL_MAX];
char requested_effect_label[LATTICRA_RUNTIME_BOUNDARY_LABEL_MAX];
char denial_reason[LATTICRA_RUNTIME_BOUNDARY_REASON_MAX];
int no_effect;
int execution_allowed;
int mutation_allowed;
int server_allowed;
int recovery_allowed;
int hardware_allowed;
```

This mirrors existing authority summary patterns and avoids exposing C++ object lifetimes through the C runtime boundary API.

Runtime request struct

Add request fields:

```
char runtime_id[LATTICRA_RUNTIME_BOUNDARY_ID_MAX];
latticra_runtime_boundary_request_kind_t request_kind;
latticra_runtime_boundary_effect_t requested_effect;
latticra_runtime_boundary_mode_t mode;
latticra_runtime_boundary_operator_confirmation_t operator_confirmation;
const latticra_runtime_boundary_authority_summary_t *authority;
const latticra_nucleus_task_result_t *task;
const latticra_l_ui_render_result_t *render;
const latticra_lir_module_t *lir;
const latticra_lat_parse_result_t *lat;
const char *source_identity;
size_t source_identity_len;
latticra_l_ui_source_span_t source_span;
```

The implementation must not retain caller-owned pointers after the call returns.

Runtime record struct

Add record fields:

```
char runtime_id[LATTICRA_RUNTIME_BOUNDARY_ID_MAX];
```

```
latticra_runtime_boundary_request_kind_t request_kind;
latticra_runtime_boundary_effect_t requested_effect;
latticra_runtime_boundary_effect_t allowed_effect;
latticra_runtime_boundary_mode_t mode;
latticra_runtime_boundary_policy_t policy;
latticra_runtime_boundary_denial_t denial;
latticra_runtime_boundary_gate_state_t gate_state;
latticra_runtime_boundary_operator_confirmation_t operator_confirmation;
latticra_runtime_boundary_authority_summary_t authority;
latticra_nucleus_task_policy_t task_policy;
latticra_nucleus_task_denial_t task_reason;
char source_identity[LATTICRA_RUNTIME_BOUNDARY_SOURCE_IDENTITY_MAX];
latticra_l_ui_source_span_t source_span;
int executed;
int mutation_allowed;
int file_io_allowed;
int network_allowed;
int server_interaction_allowed;
int recovery_allowed;
int rollback_allowed;
int hardware_allowed;
int boot_allowed;
unsigned int evidence_level;
```

Runtime result struct

Add result fields:

```
latticra_status_t status;
latticra_runtime_boundary_record_t record;
size_t record_count;
int no_effect;
int execution_allowed;
int mutation_allowed;
int file_io_allowed;
int network_allowed;
int server_allowed;
int recovery_allowed;
int rollback_allowed;
int hardware_allowed;
int boot_allowed;
```

The result must be fully initialized on success and failure.

Classification rules

Initial classification behavior:

```
parse-only + none -&gt; allow-report
parse-only + read -&gt; allow-report
validate-only + none -&gt; allow-validation
validate-only + read -&gt; allow-validation
classify-only + none -&gt; allow-classification
classify-only + read -&gt; allow-classification
render-report + none -&gt; allow-report
render-report + read -&gt; allow-report
nucleus-task-report + none -&gt; allow-report
nucleus-task-report + read -&gt; allow-report
lat-validate + none -&gt; allow-validation
lat-validate + read -&gt; allow-validation
lir-validate + none -&gt; allow-validation
lir-validate + read -&gt; allow-validation
authority-check + none -&gt; allow-validation
authority-check + read -&gt; allow-validation
runtime-execute -&gt; requires-future-gate
command-execute -&gt; requires-future-gate
lat-execute -&gt; requires-future-gate
lir-execute -&gt; requires-future-gate
file-read -&gt; requires-future-gate
file-write -&gt; requires-future-gate
network-open -&gt; requires-future-gate
server-interaction -&gt; requires-future-gate
self-update -&gt; requires-future-gate
recovery-action -&gt; requires-future-gate
rollback-action -&gt; requires-future-gate
hardware-action -&gt; requires-future-gate
boot-action -&gt; requires-future-gate
unknown -&gt; deny
unknown effect -&gt; deny
```

```
local_mutation -&gt; deny
host_mutation -&gt; deny
network -&gt; deny
hardware -&gt; deny
boot -&gt; deny
recovery -&gt; deny
external -&gt; deny
```

Allowed classifications still must set:

```
executed=0
mutation_allowed=0
file_io_allowed=0
network_allowed=0
server_interaction_allowed=0
recovery_allowed=0
rollback_allowed=0
hardware_allowed=0
boot_allowed=0
```

Prerequisite behavior

The first implementation must check relevant prerequisites.

Rules:

```
missing request -&gt; null-argument
missing result -&gt; null-argument
missing authority -&gt; authority-failed
non-ok authority -&gt; authority-failed
non-no-effect authority flags -&gt; non-no-effect-flags
operator confirmation present -&gt; operator-confirmation-not-supported
runtime mode disabled -&gt; runtime-disabled unless request is report-only metadata
render-report requires render_status=ok
nucleus-task-report requires task policy allow-report or allow-validation or
allow-classification or allow-preview
lat-validate requires parser_error=ok
lir-validate requires lir_error=ok
runtime-execute requires future gate
command-execute requires future gate
lat-execute requires future gate
lir-execute requires future gate
file-read requires future gate
file-write requires future gate
network-open requires future gate
server-interaction requires future gate
self-update requires future gate
recovery-action requires future gate
rollback-action requires future gate
hardware-action requires future gate
boot-action requires future gate
```

Failed prerequisites deny the request and must be visible in the report.

Report format

latticra_runtime_boundary_report should emit:

```
LATTICRA RUNTIME BOUNDARY REPORT
status=&lt;integer-status&gt;
runtime_id=&lt;id&gt;
request=&lt;request-kind&gt;
requested_effect=&lt;effect&gt;
allowed_effect=&lt;effect&gt;
mode=&lt;runtime-mode&gt;
policy=&lt;policy-result&gt;
reason=&lt;denial-reason&gt;
authority_status=&lt;authority-status&gt;
authority_validator=&lt;authority-validator&gt;
authority_reason=&lt;authority-reason&gt;
task_policy=&lt;task-policy&gt;
task_reason=&lt;task-reason&gt;
effect_gate_state=&lt;gate-state&gt;
operator_confirmation=&lt;confirmation-state&gt;
executed=0
mutation_allowed=0
file_io_allowed=0
network_allowed=0
server_interaction_allowed=0
```

```
recovery_allowed=0
rollback_allowed=0
hardware_allowed=0
boot_allowed=0
evidence_level=&lt;level&gt;
source_identity=&lt;source&gt;
span_start_offset=&lt;offset&gt;
span_end_offset=&lt;offset&gt;
```

Reports must not include secrets, host environment values, filesystem contents, network data, credentials, tokens, keys, hardware identifiers, or process information.

Output buffer behavior

latticra_runtime_boundary_report should:

```
write only to caller-provided buffers
require explicit buffer length
NUL-terminate on success
clear the buffer on too-small failure
return LATTICRA_STATUS_BUFFER_TOO_SMALL for small buffers
avoid heap allocation
avoid file output
avoid stdout
avoid stderr
avoid terminal escape control
```

Exact implementation test list

The implementation PR should include tests for:

```
runtime_boundary_denies_unknown_request
runtime_boundary_denies_unknown_effect
runtime_boundary_denies_runtime_execute
runtime_boundary_denies_command_execute
runtime_boundary_denies_lat_execute
runtime_boundary_denies_lir_execute
runtime_boundary_denies_file_read
runtime_boundary_denies_file_write
runtime_boundary_denies_network_open
runtime_boundary_denies_server_interaction
runtime_boundary_denies_self_update
runtime_boundary_denies_recovery_action
runtime_boundary_denies_rollback_action
runtime_boundary_denies_hardware_action
runtime_boundary_denies_boot_action
runtime_boundary_requires_authority_success
runtime_boundary_requires_task_success
runtime_boundary_requires_no_effect_flags
runtime_boundary_allows_parse_only_report_only
runtime_boundary_allows_validate_only
runtime_boundary_allows_classify_only
runtime_boundary_allows_render_report_only
runtime_boundary_report_is_deterministic
runtime_boundary_report_rejects_small_buffer
runtime_boundary_does_not_mutate_state
runtime_boundary_does_not_write_files
runtime_boundary_does_not_open_network
runtime_boundary_does_not_touch_hardware
runtime_boundary_does_not_call_recovery
runtime_boundary_does_not_override_policy_with_operator_confirmation
```

Test file plan

Add:

```
tests/runtime_boundary_invariants.c
scripts/test-runtime-boundary.sh
```

Wire into:

```
.github/workflows/c.yml
```

Run after:

```
sh scripts/test-runtime-boundary-implementation-plan.sh
```

and before:

```
sh scripts/test-l-ui-static-report.sh
```

Documentation update plan

The implementation PR should update:

```
README.md
STATUS.md
docs/FOUNDATION_INDEX.md
docs/status/CURRENT_STATUS.md
docs/status/ANNOUNCEMENTS.md
docs/project_notes/CURRENT_DIRECTION.md
docs/project_notes/UPCOMING_WORK.md
docs/strategy/2026-05-15-2249-cdt-national-security-open-system-strategy.md
docs/RUNTIME_BOUNDARY_CONTRACT.md
scripts/test-project-strategy-status-framework.sh
```

and add:

```
docs/RUNTIME_BOUNDARY_IMPLEMENTATION.md
```

Compatibility expectations

The implementation must not change:

```
existing Nucleus preview classification behavior
existing Nucleus task classification behavior
existing Nucleus task report behavior
state lattice behavior
tri-plane transition behavior
L-UI parser behavior
L-UI semantic validation behavior
LIR shape behavior
L-UI rendering behavior
Lat grammar behavior
constrained C++ authority behavior
no-effect flags
current accepted fixture counts
```

Forbidden implementation behavior

The first implementation must not:

- bypass Nucleus task classification;
- bypass effect gates;
- bypass constrained C++ authority validation;
- bypass parser, semantic, LIR, render, or task prerequisites when relevant;
- execute unknown requests;
- execute unknown effects;
- execute commands;
- execute Lat;
- execute LIR;
- launch processes;
- load plugins;
- mutate state;
- write files;
- read host files outside approved metadata;
- open network connections;
- call server code;
- call update code;

- call recovery code;
- perform rollback;
- touch hardware;
- alter boot state;
- use terminal control;
- let operator confirmation override policy;
- hide denial reasons;
- omit runtime records;
- emit secrets, host environment values, credentials, tokens, keys, hardware identifiers, or process information;
- imply a production runtime, sandbox, malware prevention, ransomware prevention, recovery system, update system, or operating-system surface.

Current validation command

This implementation plan is guarded by:

```
sh scripts/test-runtime-boundary-implementation-plan.sh
```

The guard is static. It does not implement runtime boundary behavior.

Implementation gate

Runtime boundary code may be added only after this plan is merged.

Non-claims

This document does not implement runtime behavior, command behavior, Lat execution, LIR execution, task effect execution, live movement, state mutation, file I/O, network I/O, server interaction, self-update, recovery behavior, rollback, hardware support, boot behavior, terminal control, security isolation, sandboxing, malware prevention, ransomware prevention, or operating-system completeness.

docs/RUNTIME_BOUNDARY_POLICY_EXPANSION_AFTER_THREAT_MODEL.md

Source title: Latticra Runtime Boundary Policy Expansion After Threat-Model Validation

Lines: 247 | Words: 1333 | SHA-256: a8e2b18941575a015f4784be55aa6624811993509113fb0e71a45a9618ae0a35

Latticra Runtime Boundary Policy Expansion After Threat-Model Validation

Status: runtime boundary policy expansion after threat-model validation Source: local follow-up slice Scope: post-threat-model runtime-boundary policy expansion, request-family mapping, effect mapping, authority-prerequisite mapping, future-gate mapping, abuse-case mapping, evidence-gap mapping, public entry-point updates, and no-claim preservation. This document does not implement runtime execution, effect execution, capability enforcement, cryptographic verification, signing, host behavior, network behavior, MCP behavior, AI agent execution, model execution, tool execution, shell execution, production protection, sandboxing, malware prevention, ransomware prevention, certification, compliance, or runtime authority.

Purpose

This record closes the next evidence gap named by the defensive threat model validation refinement:

```
runtime boundary source needs fuller policy expansion after threat-model validation
```

The expansion is policy and evidence mapping only.

It makes the runtime boundary policy vocabulary more explicit before any future runtime behavior is considered.

Relationship to previous work

This policy expansion depends on:

```
docs/DEFENSIVE_THREAT_MODEL_VALIDATION_REFINEMENT.md
docs/RUNTIME_BOUNDARY_CONTRACT.md
docs/RUNTIME_BOUNDARY_IMPLEMENTATION_PLAN.md
docs/RUNTIME_BOUNDARY_IMPLEMENTATION.md
docs/RUNTIME_BOUNDARY_POLICY_MATRIX_REFINEMENT.md
docs/RUNTIME_BOUNDARY_DOMAIN_MATRIX_REFINEMENT.md
docs/RUNTIME_BOUNDARY_DOMAIN_MATRIX_REPORT_INTEGRATION.md
scripts/test-defensive-threat-model-validation-refinement.sh
scripts/test-runtime-boundary.sh
scripts/test-runtime-boundary-policy-matrix-refinement.sh
scripts/test-runtime-boundary-domain-matrix-refinement.sh
scripts/test-runtime-boundary-domain-matrix-report-integration.sh
```

Those files remain the source of truth for current runtime-boundary API behavior, matrix labels, domain labels, reports, and no-effect invariants.

Current checkpoint

Current runtime-boundary policy-expansion posture:

```

completion_estimate_review_required=0
```

Request-family policy map

Current request families:

```
| Request family | Examples | Current policy posture | Required evidence before promotion |
| --- | --- | --- | --- |
```

no-effect report	render-report, nucleus-task-report	allow only under report-only mode with satisfied prerequisites	report tests, prerequisite tests, no-effect flags
no-effect validation	parse-only, validate-only, lat-validate, lir-validate	allow only under validation-only mode with satisfied prerequisites	parser, Lat, LIR, and runtime-boundary tests
no-effect classification	classify-only, authority-check	allow only under classification-only mode with satisfied prerequisites	authority/status tests and runtime-boundary tests
operational runtime	runtime-execute, command-execute, lat-execute, lir-execute	requires future gate and remains denied	separate runtime contract, plan, implementation, negative tests, and non-claim review
host interaction	file-read, file-write, server-interaction	requires future gate and remains denied	separate host/file/network authority contract and evidence
network interaction	network-open	requires future gate and remains denied	separate network authority contract and evidence
recovery/update/rollback	self-update, recovery-action, rollback-action	requires future gate and remains denied	separate recovery/update contract and evidence
hardware/boot	hardware-action, boot-action	requires future gate and remains denied	separate hardware/boot contract and evidence
unknown	unknown or malformed request kind	deny	negative tests and deterministic denial report

Future authority-bearing families must also preserve distinct operator identity, workload or service identity, and host or device integrity context before promotion.

Effect policy map

Current effect families:

Effect family	Current policy posture	Promotion blocker
none	allowed only for report, validation, preview, or classification metadata	no operational behavior may be attached
read	limited to approved local metadata references only	no host file read authority exists
local_mutation	denied until explicit local-mutation contract exists	mutation evidence and rollback policy absent
host_mutation	denied	host authority absent
network	denied	network authority absent
hardware	denied	hardware authority absent
boot	denied	boot authority absent
recovery	denied	recovery authority absent
external	denied	external authority absent
unknown	denied	request/effect identity invalid

Authority prerequisite map

No future runtime request may be promoted unless every relevant prerequisite is represented:

```
contract identity present
request kind known
requested effect known
caller identity known
operator identity known when operator context exists
workload or service identity known when tool, MCP, model, runtime, updater, signer, or installer authority is requested
asset or resource identity known
host or device integrity context known when host, network, update, recovery, boot, or hardware authority is requested
mode matches request family
authority summary present
authority status ok
authority no-effect flags preserved
operator confirmation recorded as metadata only
operator confirmation cannot override policy
least-privilege scope recorded for the exact requested effect
Nucleus task record denies effect behavior unless a future contract changes it
runtime report names policy, denial reason, gate state, matrix cell, domain cell, and evidence level
negative tests exist for unknown request, unknown effect, future-gated operation, blocked effect, prerequisite denial, and operator confirmation non-override
```

Future-gate policy map

Future-gated request families must stay behind explicit contracts:

```
command execution -&gt; future command/runtime contract
Lat execution -&gt; future Lat runtime contract
LIR execution -&gt; future LIR execution contract
file read/write -&gt; future host I/O authority contract
network open -&gt; future network authority contract
server interaction -&gt; future server/MCP authority contract
self-update signer or update payload acceptance -&gt; future signed update contract with
integrity,
 authenticity, and rollback evidence
tool, MCP, model, or runtime workload invocation -&gt; future workload-identity-aware authority
contract
self-update -&gt; future signed update contract
recovery or rollback -&gt; future recovery contract
hardware or boot -&gt; future hardware/boot contract
```

No future-gated family may be promoted by status text alone.

Abuse-case runtime policy map

Threat-model abuse cases map to current runtime-boundary policy evidence as follows:

```
unknown request is treated as allowed -&gt; runtime-boundary unknown request denial tests
unknown effect is treated as allowed -&gt; runtime-boundary unknown effect denial tests
future-gated request is treated as executable -&gt; future-gate classification tests
operator confirmation overrides policy -&gt; operator confirmation non-override tests
future workload or service authority lacks distinct workload identity -&gt; zero-trust
workload-identity gap remains open
future host, network, update, recovery, boot, or hardware authority lacks host or device
integrity context -&gt; zero-trust host-integrity gap remains open
future tool or command path reaches a shell boundary without dedicated command-boundary review
-&gt; command-boundary gap remains open
report omits denial reason -&gt; runtime-boundary report fields and report-refinement tests
failed authority metadata is treated as allowed -&gt; authority prerequisite denial tests
invalid LIR input reaches rendering -&gt; LIR prerequisite denial tests
status documentation overclaims implementation state -&gt; this guard plus status guards
external standard is referenced as if it were certification -&gt; defensive threat model
refinement
 non-claim guard
outdated external guidance remains marked current -&gt; defensive threat model external-source
checkpoint
```

Evidence gap map

This slice closes only the policy-expansion documentation gap.

The abuse-case fixture expansion gap is now addressed by:

```
docs/RUNTIME_BOUNDARY_ABUSE_CASE_FIXTURES_AFTER_POLICY_EXPANSION.md
tests/runtime_boundary_abuse_case_fixtures.c
scripts/test-runtime-boundary-abuse-case-fixtures.sh
```

Still open:

```
runtime boundary source code still performs no operational behavior
no host I/O authority exists
no network authority exists
no MCP behavior exists
no workload/service identity-aware runtime authority profile exists
no host/device integrity-aware authority profile exists
no production protection claim exists
no certification or compliance mapping exists
```

The next evidence gap should remain completion-estimate review only if capability posture changes; otherwise continue small guarded report/status alignment only when drift appears.

Validation

This policy expansion is guarded by:

```
sh scripts/test-runtime-boundary-policy-expansion-after-threat-model.sh
```

The underlying runtime and threat-model chain remains covered by:

```
sh scripts/test-defensive-threat-model-validation-refinement.sh
```

```
sh scripts/test-runtime-boundary.sh
sh scripts/test-runtime-boundary-policy-matrix-refinement.sh
sh scripts/test-runtime-boundary-domain-matrix-refinement.sh
sh scripts/test-runtime-boundary-domain-matrix-report-integration.sh
```

Expected output:

```
runtime_boundary_policy_expansion_after_threat_model: ok
```

Boundary

This expansion is documentation/status/guard alignment only.

It does not add runtime behavior, command execution, Lat execution, LIR execution, task effect execution, state mutation, file I/O, network I/O, server interaction, self-update, recovery behavior, rollback behavior, hardware support, boot behavior, terminal control, security isolation, sandboxing, malware prevention, ransomware prevention, certification, accreditation, compliance, production protection, operating-system completeness, or runtime authority.

Subsequent slice

The abuse-case fixture expansion after runtime-boundary policy expansion is now recorded separately in docs/RUNTIME_BOUNDARY_ABUSE_CASE_FIXTURES_AFTER_POLICY_EXPANSION.md.

That subsequent fixture slice preserves the no-effect posture and does not implement runtime execution, effect execution, capability enforcement, cryptographic verification, signing, host behavior, network behavior, MCP behavior, AI agent execution, model execution, tool execution, shell execution, production protection, or runtime authority.

docs/RUNTIME_BOUNDARY_POLICY_MATRIX_REFINEMENT.md

Source title: Latticra Runtime Boundary Policy Matrix Refinement

Lines: 153 | Words: 409 | SHA-256: a2c974ba730b3d02ff1425df98a369052a402f08776d13a8f119f09e19a1649f

Latticra Runtime Boundary Policy Matrix Refinement

Status: initial runtime boundary policy matrix refinement implementation Scope: deterministic no-effect policy matrix metadata for runtime-boundary classification and reporting.

Purpose

This document records the runtime-boundary policy matrix refinement after runtime-boundary report refinement and Lat pipeline report refinement.

The goal is to make the runtime-boundary decision shape easier to audit by reporting the matrix cell that a request falls into, along with stable booleans for effect, mode, authority, and future-gate posture.

This refinement does not grant authority, execute a request, mutate state, perform I/O, open network connections, touch hardware, control a terminal, or provide runtime behavior.

Added report metadata

The runtime boundary record now includes:

```
policy_matrix_cell
matrix_effect_allowed
matrix_mode_allowed
matrix_requires_authority
matrix_requires_future_gate
```

The deterministic runtime boundary report now emits those fields.

Policy matrix cells

Initial policy matrix cells:

```
no-effect-report
no-effect-validation
no-effect-classification
future-gated-operation
blocked-effect
prerequisite-denied
invalid
unsupported
```

no-effect-report

A no-effect report request with the correct report-only mode and satisfied prerequisites.

no-effect-validation

A no-effect validation request with the correct validation-only mode and satisfied prerequisites.

no-effect-classification

A no-effect classification request with the correct classification-only mode and satisfied prerequisites.

future-gated-operation

An operational request kind that remains behind the future gate.

blocked-effect

A known request whose requested effect is outside the current no-effect/read-only boundary.

prerequisite-denied

A known request whose effect and mode shape are acceptable but whose prerequisites are not satisfied.

invalid

A null, unknown, or malformed request/effect identity.

unsupported

A reserved fallback cell for future matrix expansion.

Matrix booleans

The matrix report includes:

```
matrix_effect_allowed      -&gt; requested effect is currently no-effect/read-only
matrix_mode_allowed        -&gt; mode matches the request-family expectation
matrix_requires_authority  -&gt; runtime boundary authority summary is expected
matrix_requires_future_gate -&gt; request kind is operational/future-gated
```

Validation

Run:

```
sh scripts/test-runtime-boundary-policy-matrix-refinement.sh
sh scripts/test-runtime-boundary.sh
```

The focused invariant tests verify:

```
runtime_boundary_policy_matrix_labels_are_stable
runtime_boundary_policy_matrix_reports_validation_cell
runtime_boundary_policy_matrix_reports_future_gate_cell
runtime_boundary_policy_matrix_reports_blocked_effect_cell
```

```
runtime_boundary_policy_matrix_reports_prerequisite_denial_cell
runtime_boundary_policy_matrix_reports_invalid_cell
```

Compatibility

This refinement preserves existing runtime-boundary behavior for:

```
allow-report
allow-validation
allow-classification
future-gated operational requests
unknown request denial
unknown effect denial
prerequisite denial
operator confirmation non-override behavior
small-buffer behavior
runtime-boundary report-refinement fields
Lat pipeline evidence fields
Lat pipeline line-comment evidence fields
Lat-specific LIR evidence fields
```

Non-claims

This report refinement does not provide:

```
runtime behavior
command execution
Lat execution
LIR execution
task effect execution
state mutation
file I/O
network I/O
server interaction
self-update
recovery behavior
rollback behavior
hardware support
boot behavior
terminal control
security isolation
sandboxing
malware prevention
ransomware prevention
certification
accreditation
operating-system completeness
```

docs/RUNTIME_BOUNDARY_REFINEMENT_IMPLEMENTATION.md

Source title: Latticra Runtime Boundary Refinement Implementation

Lines: 289 | Words: 1032 | SHA-256: 78d1b8bacb61b1e412fbd860b7ab9617f1409571704477f6cd6538242f005853

Latticra Runtime Boundary Refinement Implementation

Status: runtime boundary refinement implementation with Lat pipeline clause, declaration, module/count, stage-summary, parse-error, semantic-error, downstream-stage-error, span, comment, Lat LIR module-summary, Lat LIR source-span, Lat LIR node-kind, Lat LIR first-node, Lat LIR first-node span, Lat LIR first transition-node, Lat LIR first transition-node span, Lat LIR first-edge, Lat LIR first-edge span, Lat LIR first transition-source edge, Lat LIR first transition-source edge endpoint, Lat LIR first transition-source edge span, Lat LIR no-effect, and Lat LIR edge-kind evidence Scope: no-effect runtime-boundary evidence reporting for Lat pipeline metadata, Lat pipeline first-clause metadata, Lat pipeline first-declaration metadata, Lat pipeline module/count metadata, Lat pipeline stage-summary metadata, Lat pipeline parse-error metadata, Lat pipeline semantic-error metadata, Lat pipeline downstream stage-error metadata, Lat pipeline span metadata, Lat pipeline line-comment metadata, Lat-specific LIR module-summary metadata, Lat-specific LIR source-span metadata, Lat-specific LIR node-kind metadata, Lat-specific LIR first-node metadata, Lat-specific LIR first-node span metadata, Lat-specific LIR first transition-node metadata, Lat-specific LIR first transition-node span metadata, Lat-specific LIR first-edge metadata, Lat-specific LIR first-edge span metadata, Lat-specific LIR first transition-source edge metadata, Lat-specific LIR first transition-source edge endpoint metadata, Lat-specific LIR first transition-source edge span metadata, Lat-specific LIR no-effect metadata, and Lat-specific LIR edge-kind metadata.

Purpose

This implementation slice refines the runtime boundary so it can classify and report Lat pipeline evidence and Lat-specific LIR evidence without executing Lat, executing LIR, mutating state, performing I/O, opening network connections, touching hardware, or enabling runtime behavior.

The implementation follows:

```
docs/RUNTIME_BOUNDARY_REFINEMENT_PLAN.md
```

Added / changed files

```
include/latticra/runtime_boundary.h
src/runtime_boundary.c
tests/runtime_boundary_lat_pipeline_evidence.c
docs/RUNTIME_BOUNDARY_REFINEMENT_IMPLEMENTATION.md
```

The existing runtime boundary test runner automatically includes the new invariant file:

```
scripts/test-runtime-boundary.sh
```

Public API refinement

The runtime boundary request now accepts optional Lat pipeline metadata:

```
const latticra_lat_pipeline_result_t *lat_pipeline
```

The runtime boundary request kinds now include:

```
LATTICRA_RUNTIME_BOUNDARY_LAT_PIPELINE_VALIDATE
```

The runtime boundary record now carries no-effect evidence fields for:

```
lat_pipeline_status
lat_pipeline_error
lat_pipeline_parse_error
lat_pipeline_span_start_offset
lat_pipeline_span_end_offset
lat_pipeline_span_start_line
lat_pipeline_span_start_column
lat_pipeline_span_end_line
lat_pipeline_span_end_column
lat_pipeline_semantic_error
lat_pipeline_model_error
lat_pipeline_lowering_error
```

```
lat_pipeline_lir_error
lat_pipeline_last_completed_stage
lat_pipeline_failed_stage
lat_pipeline_parse_ok
lat_pipeline_semantic_ok
lat_pipeline_model_ok
lat_pipeline_lowering_ok

lat_lir_first_transition_source_edge_span_start_column
lat_lir_first_transition_source_edge_span_end_line
lat_lir_first_transition_source_edge_span_end_column
lat_lir_has_lat_state_nodes
lat_lir_has_lat_transition_nodes
lat_lir_has_transition_source_edges
```

Behavior

The new lat-pipeline-validate request is allowed only when:

```
mode == validation-only
requested effect is none or read
authority metadata is present and no-effect
Lat pipeline metadata is present and OK
Lat pipeline semantic_valid is true
Lat pipeline no-effect flags are preserved
```

Failed Lat pipeline metadata is denied with the closest existing runtime-boundary denial label:

```
parse_not_ok -&gt; parser-failed
semantic_not_ok / semantic_not_valid -&gt; semantic-failed
no_effect_violation -&gt; non-no-effect-flags
other pipeline failure -&gt; lir-failed
```

Lat execution and LIR execution remain future-gated.

Report surface

latticra_runtime_boundary_report now includes deterministic report fields for Lat pipeline evidence, Lat pipeline first-clause evidence, Lat pipeline first-declaration evidence, Lat pipeline module/count evidence, Lat pipeline stage-summary evidence, Lat pipeline parse-error evidence, Lat pipeline semantic-error evidence, Lat pipeline downstream stage-error evidence, Lat pipeline span evidence, Lat pipeline line-comment evidence, Lat-specific LIR module-summary evidence, Lat-specific LIR source-span evidence, Lat-specific LIR node-kind evidence, Lat-specific LIR first-node evidence, Lat-specific LIR first-node span evidence, Lat-specific LIR first transition-node evidence, Lat-specific LIR first transition-node span evidence, Lat-specific LIR first-edge evidence, Lat-specific LIR first-edge span evidence, Lat-specific LIR first transition-source edge evidence, Lat-specific LIR first transition-source edge endpoint evidence, Lat-specific LIR first transition-source edge span evidence, Lat-specific LIR no-effect evidence, and Lat-specific LIR edge-kind evidence.

The runtime boundary report capacity is increased to preserve bounded output with the expanded report surface.

Validation

Run:

```
sh scripts/test-runtime-boundary.sh
```

The focused evidence tests verify:

```
runtime_boundary_allows_valid_lat_pipeline_metadata
runtime_boundary_denies_failed_lat_pipeline_metadata
runtime_boundary_denies_parse_failed_lat_pipeline_metadata
runtime_boundary_denies_model_failed_lat_pipeline_metadata
runtime_boundary_reports_lat_pipeline_evidence
runtime_boundary_keeps_lat_lir_execution_future_gated
```

The Lat pipeline evidence invariants also verify that parser error metadata, semantic error metadata, downstream model/lowering/LIR error metadata, first-clause metadata, first-declaration metadata, module/count metadata, stage-summary metadata, parser diagnostic/module span metadata, line-comment count, first-comment span metadata, Lat-specific LIR module-summary metadata, Lat-specific LIR source-span metadata, Lat-specific LIR node-kind counts, Lat-specific LIR first-node identity, Lat-specific LIR first-node span metadata, Lat-specific LIR first transition-node identity, Lat-specific LIR first transition-node span metadata, Lat-specific LIR first-edge identity, Lat-specific LIR first-edge span metadata, Lat-specific LIR first transition-source edge identity, Lat-specific LIR first transition-source edge endpoint metadata, Lat-specific LIR first transition-source edge span metadata, Lat-specific LIR no-effect flags, and Lat-specific LIR edge-kind counts are copied into runtime-boundary records and reports, including denied records for failed Lat pipeline metadata.

Compatibility

This refinement preserves existing runtime boundary behavior for:

```
parse-only
validate-only
classify-only
render-report
nucleus-task-report
lat-validate
lir-validate
authority-check

Boundary

This implementation does not provide runtime behavior, command execution, Lat execution, LIR execution, task effect execution, live movement, state mutation, file I/O, network I/O, server interaction, self-update, recovery behavior, rollback, hardware support, boot behavior, terminal control, security isolation, sandboxing, malware prevention, ransomware prevention, certification, accreditation, or operating-system completeness.

docs/RUNTIME_BOUNDARY_REFINEMENT_PLAN.md

Source title: Latticra Runtime Boundary Refinement Plan

Lines: 118 | Words: 422 | SHA-256: bc2c215143cb935a6dcbeaae1f6d15707b76f9042b96f7dbb7e26107a32aed08

Latticra Runtime Boundary Refinement Plan

Status: refinement planning contract Scope: planning-only refinement for integrating Lat pipeline and Lat-specific LIR metadata into the no-effect runtime boundary classification/report surface.

Purpose

This document defines the next runtime boundary refinement before any new runtime behavior is added.

The current runtime boundary already classifies no-effect report, validation, and classification requests while preserving disabled-by-default operational behavior. The next refinement should make the boundary aware of the newer Lat pipeline and Lat-specific LIR metadata surfaces without promoting execution, mutation, command behavior, file I/O, network I/O, recovery, hardware, boot, or operating-system claims.

Relationship to current work

This plan depends on:

```
docs/RUNTIME_BOUNDARY_CONTRACT.md
docs/RUNTIME_BOUNDARY_IMPLEMENTATION_PLAN.md
docs/RUNTIME_BOUNDARY_IMPLEMENTATION.md
docs/LAT_PIPELINE_CONTRACT.md
docs/LAT_PIPELINE_IMPLEMENTATION_PLAN.md
docs/LAT_PIPELINE_IMPLEMENTATION.md
docs/LAT_SPECIFIC_LIR_REFINEMENT_CONTRACT.md
docs/LAT_SPECIFIC_LIR_REFINEMENT_IMPLEMENTATION_PLAN.md
docs/LAT_SPECIFIC_LIR_REFINEMENT_IMPLEMENTATION.md
include/latticra/runtime_boundary.h
include/latticra/lat_pipeline.h
include/latticra/lat_to_lir.h
```

```
include/latticra/lir.h
```

Refinement goal

The refinement should let runtime-boundary records and reports summarize the newer Lat pipeline chain:

```
Lat parser metadata
Lat semantic metadata
Lat-to-LIR lowering metadata
Lat-specific LIR metadata
Lat pipeline aggregate metadata
```

The runtime boundary should remain a classifier and reporter, not an executor.

Planned metadata additions

A future implementation slice may add report fields for:

```
lat_pipeline_status
lat_pipeline_error
lat_pipeline_semantic_valid
lat_pipeline_source_len
lat_pipeline_node_count
lat_pipeline_edge_count
lat_lir_source_kind
lat_lir_module_node_count
lat_lir_transition_edge_count
lat_lir_has_lat_state_nodes
lat_lir_has_lat_transition_nodes
lat_lir_has_transition_source_edges
```

The exact names may be adjusted during implementation, but the implementation must stay deterministic, bounded, and no-effect.

Planned request handling

The next implementation slice may add or refine no-effect request classification for:

```
Lat pipeline report validation
Lat-specific LIR metadata validation
Runtime boundary report over Lat pipeline evidence
```

Any operational request remains denied or future-gated.

Planned tests

The implementation slice should add focused tests for:

```
runtime_boundary_reports_lat_pipeline_status
runtime_boundary_denies_failed_lat_pipeline_metadata
runtime_boundary_allows_valid_lat_pipeline_metadata_in_report_mode
runtime_boundary_reports_lat_specific_lir_node_evidence
runtime_boundary_reports_transition_source_edge_evidence
runtime_boundary_preserves_no_effect_for_lat_pipeline_evidence
runtime_boundary_keeps_lat_and_lir_execute_future_gated
runtime_boundary_refinement_report_is_deterministic
runtime_boundary_refinement_rejects_small_buffer
```

Compatibility expectations

The refinement must not change existing behavior for:

```
unknown request denial
unknown effect denial
operator confirmation non-override behavior
future-gated operational requests
existing Lat validation prerequisites
existing LIR validation prerequisites
existing render report prerequisites
existing Nucleus task report prerequisites
existing runtime report fields
existing small-buffer behavior
```

Status and evidence rule

This plan is not implementation evidence by itself. It permits the next implementation slice to add bounded API/report fields and focused tests. Status percentages may only increase modestly from this planning milestone and should increase more substantially only after implementation and CI evidence merge.

Non-claims

This plan does not implement runtime behavior, command execution, Lat execution, LIR execution, task effect execution, live movement, state mutation, file I/O, network I/O, server interaction, self-update, recovery behavior, rollback, hardware support, boot behavior, terminal control, security isolation, sandboxing, malware prevention, ransomware prevention, certification, accreditation, or operating-system completeness.

docs/RUNTIME_BOUNDARY_REPORT_REFINEMENT.md

Source title: Latticra Runtime Boundary Report Refinement

Lines: 235 | Words: 730 | SHA-256: a092c1bd6a4b93f64d3b0fb6147f3b72564bea63c66df6990b29583f7c1c677c

Latticra Runtime Boundary Report Refinement

Status: initial runtime boundary report refinement implementation Scope: deterministic no-effect runtime-boundary report classification, boundary-domain labeling, authorization-state labeling, evidence-level reporting, invariant tests, and guard coverage.

Purpose

This document records the runtime-boundary report refinement that follows the Lat pipeline and Lat-specific LIR evidence reporting slice.

The refinement makes runtime boundary reports more explicit about what a request represents before any operational runtime authority exists.

Runtime boundary reporting remains a classifier and evidence surface. It is not a kernel interface, sandbox, permission system, process supervisor, boot layer, device layer, filesystem layer, network layer, or authority grant.

Boundary principle

Latticra runtime authority is denied by default.

A runtime-boundary request may be reported as declarative, boundary-seeking, denied, or invalid. No report classification executes the request, mutates state, performs I/O, opens a network connection, touches hardware, controls a terminal, starts a process, boots a system, or grants runtime authority.

Added report fields

The runtime boundary record now includes explicit report-refinement fields:

```
report_classification
boundary_domain
authorization_state
evidence_level
```

The deterministic text report now emits:

```
report_classification=&lt;label&gt;
boundary_domain=&lt;label&gt;
authorization_state=&lt;label&gt;
evidence_level=&lt;number&gt;
```

Report classifications

Initial report classifications:

```
declarative
boundary-seeking
denied
invalid
```

declarative

The request is a no-effect report, validation, classification, or metadata surface that can be accepted under the current disabled-by-default runtime boundary.

boundary-seeking

The request attempts to cross toward operational runtime authority or a future-gated operational domain.

Boundary-seeking does not mean the request is executed. It means the report identified the request as runtime-authority-seeking and kept it behind the future gate.

denied

The request is understood but not accepted under the current prerequisites, authority summary, effect posture, operator-confirmation state, or no-effect requirements.

invalid

The request cannot be classified as a valid boundary request because it is null, unknown, malformed, or carries unknown effect identity.

Boundary domains

Initial report domains:

```
memory
filesystem
network
process
device
clock
randomness
host
external-call
persistence
scheduler
unknown
```

Operational request kinds map to the clearest current domain:

```
file-read / file-write -&gt; filesystem
network-open / server-interaction -&gt; network
runtime-execute / command-execute / lat-execute / lir-execute -&gt; process
hardware-action / boot-action -&gt; device
self-update / recovery-action / rollback-action -&gt; persistence
nucleus-task-report -&gt; scheduler
authority-check -&gt; host
```

No-effect declarative requests that do not cross a specific operational surface remain unknown unless their requested effect provides a clearer domain.

Authorization states

Initial authorization states:

```
not-requested
requested
denied
unavailable
reserved-for-future
```

The current implementation uses:

```
not-requested -&gt; accepted no-effect report / validation / classification surfaces
denied -&gt; known request rejected by current prerequisites or policy
unavailable -&gt; null or unknown request/effect identity
reserved-for-future -&gt; future-gated operational runtime request
```

requested is reserved as an explicit report-state label for future slices that need to distinguish request capture from denial or future reservation.

Evidence level

The runtime boundary now records a small deterministic evidence level:

```
0 -&gt; invalid or unavailable boundary evidence
1 -&gt; denied or future-gated boundary evidence
2 -&gt; accepted no-effect declarative report / validation / classification evidence
```

This is an internal project evidence label, not a maturity certification, security level, or production-readiness score.

Happy path

The current report-refinement happy path is:

```
source -&gt; parse / validate / lower -&gt; classify -&gt; report classification -&gt; report
domain -&gt;
report authorization state -&gt; emit deterministic evidence
```

No unauthorized effect is executed during this path.

Implementation files

This slice updates or adds:

```
include/latticra/runtime_boundary.h
src/runtime_boundary.c
tests/runtime_boundary_report_refinement.c
docs/RUNTIME_BOUNDARY_REPORT_REFINEMENT.md
scripts/test-runtime-boundary-report-refinement.sh
.github/workflows/runtime-boundary-report-refinement.yml
```

The full C workflow also runs the new guard.

Validation

Run:

```
sh scripts/test-runtime-boundary-report-refinement.sh
sh scripts/test-runtime-boundary.sh
```

The focused invariant tests verify:

```
runtime_boundary_report_refinement_classifies_declarative_pipeline
runtime_boundary_report_refinement_marks_future_gate_boundary_seeking
runtime_boundary_report_refinement_maps_effect_domains
runtime_boundary_report_refinement_marks_invalid_unknown_request
runtime_boundary_report_refinement_marks_denied_prerequisite
```

The guard verifies that documentation, header declarations, implementation labels, report fields, focused tests, and workflow wiring remain present.

Compatibility

This refinement preserves the existing runtime boundary behavior for:

```
parse-only
validate-only
classify-only
render-report
nucleus-task-report
lat-validate
lir-validate
authority-check
lat-pipeline-validate
future-gated operational request kinds
unknown request denial
unknown effect denial
```

```
operator-confirmation non-override behavior
small-buffer behavior
Lat pipeline evidence fields
Lat pipeline line-comment evidence fields
Lat-specific LIR evidence fields
```

Non-claims

This report refinement does not provide:

```
runtime behavior
command execution
Lat execution
LIR execution
task effect execution
live movement
state mutation
file I/O
network I/O
server interaction
self-update
recovery behavior
rollback behavior
hardware support
boot behavior
terminal control
security isolation
sandboxing
malware prevention
ransomware prevention
certification
accreditation
operating-system completeness
```

docs/STATE_LATTICE.md

Source title: Latticra State Lattice

Lines: 123 | Words: 364 | SHA-256: a6e5bfba635487ea564f7535838f51a3f156d384449d739c21cde6f7339c41a3

Latticra State Lattice

Status: initial implementation contract Scope: first C state fixture, invariant tests, report surface, and no-effect boundary.

Purpose

The State Lattice is the first real Latticra implementation unit.

It provides a deterministic, fixed-size, no-effect C fixture that represents the starting state vocabulary inherited from the Phase1 evidence path and translated into Latticra architecture terms.

Implementation files

```
include/latticra/state_lattice.h
src/state_lattice.c
tests/state_lattice_invariants.c
scripts/test-state-lattice.sh
```

Default fixture

The default state lattice fixture must preserve:

```
origin=0/0
route=ROOT
axis=ROOT
path=ROOT&gt;0/0
breadcrumb=ROOT
trace=trace-preview
safe_portal=planned
rollback=available
health=nominal
risk=low
```

```
lock=open
dark_phase=off
host_effect=none
external_effect=none
```

Effect boundary

The initial state lattice fixture is no-effect.

It must not:

- mutate host state;
- use networking;
- touch hardware;
- perform boot behavior;
- perform recovery behavior;
- perform external effects;
- allocate hidden dynamic state;
- depend on server interaction.

C policy

The first implementation uses C because the State Lattice is intended to become a portable low-level representation.

Rules:

- fixed-size fields;
- explicit enum values;
- no hidden allocation;
- no host-specific APIs;
- no network APIs;
- no hardware APIs;
- no file writes;
- deterministic report output.

Public API

Initial API:

```
latticra_state_lattice_default
latticra_effect_label
latticra_state_lattice_is_no_effect
latticra_state_lattice_report
```

Test command

Run:

```
sh scripts/test-state-lattice.sh
```

The test builds the C fixture with a strict warning policy and runs invariant checks.

Required invariants

The tests must verify:

- default labels match the contract;

- host effect is none;
- external effect is none;
- default fixture is no-effect;
- report output exposes operator-visible labels;
- bad report arguments are rejected;
- small report buffers are rejected.

Current evidence level

This implementation is an L2 tested model for the initial state fixture.

It is not a runtime supervisor, transition engine, update engine, server client, boot component, hardware component, or recovery system.

Next implementation step

The next implementation candidate after this fixture is:

```
tri-plane transition model
```

That future work must remain pure and preview-only until evidence supports stronger behavior.

Non-claims

This document and implementation do not claim live lattice movement, origin mutation, recovery execution, server interaction, self-update, hardware support, boot readiness, security isolation, sandboxing, or operating-system completeness.

docs/TRI_PLANE_TRANSITION.md

Source title: Latticra Tri-Plane Transition Model

Lines: 164 | Words: 414 | SHA-256: abedf7fbe118a0763607716dbfe1fb6b3febe5c6a65a0512a57b43a1e2d11b97

Latticra Tri-Plane Transition Model

Status: initial implementation contract Scope: pure preview transitions across spatial, state, and safety planes.

Purpose

The Tri-Plane Transition Model is the second Latticra implementation unit.

It models lattice movement as a pure preview transition. It accepts a current state lattice and a movement request, then returns a preview result and next-state copy without mutating the input state.

Implementation files

```
include/latticra/tri_plane_transition.h
src/tri_plane_transition.c
tests/tri_plane_transition_invariants.c
scripts/test-tri-plane-transition.sh
```

Planes

A transition is evaluated across three conceptual planes:

```
Spatial plane
  origin / route / axis / path

State plane
  breadcrumb / trace / current state labels
```

```
Safety plane
  safe_portal / rollback / health / risk / lock / dark_phase / host_effect / external_effect
```

Movement vocabulary

Initial movement values:

```
up
down
left
right
enter
back
root
unknown
```

Result vocabulary

Initial transition results:

```
allowed-preview
denied
```

Initial denial/decision reasons:

```
ok
null-argument
unknown-direction
lock-closed
risk-high
rollback-unavailable
```

Preview-only boundary

The model is preview-only.

It must not:

- mutate the input state;
- mutate origin;
- execute recovery;
- touch host state;
- use networking;
- touch hardware;
- change boot state;
- perform external effects;
- perform hidden allocation;
- depend on server interaction.

Default safe preview

A safe right preview from the default state may produce a next-state copy like:

```
axis=RIGHT
path=ROOT&gt;0/1
breadcrumb=ROOT&gt;RIGHT
host_effect=none
external_effect=none
origin_mutated=0
recovery_executed=0
```

Denial behavior

Denied transitions preserve the current state as the returned next-state copy.

Denied transitions must keep:

```
host_effect=none
external_effect=none
origin_mutated=0
recovery_executed=0
```

Required denial cases

The initial tests must verify:

- unknown direction is denied;
- closed lock denies transition;
- high risk denies transition;
- back requires rollback=available;
- denied transitions preserve no-effect state.

Public API

Initial API:

```
latticra_movement_label
latticra_transition_result_label
latticra_transition_reason_label
latticra_tri_plane_preview
```

Test command

Run:

```
sh scripts/test-tri-plane-transition.sh
```

The main C workflow runs both state-lattice and tri-plane transition tests.

Current evidence level

This implementation is an L2 tested model for pure preview transitions.

It is not live lattice movement, Nucleus execution, server interaction, self-update, recovery behavior, hardware behavior, boot behavior, or a security boundary.

Next implementation step

The next implementation candidate after this model is:

```
Nucleus preview request classification
```

That future work should classify requests and effects, but still avoid live mutation.

Non-claims

This document and implementation do not claim live movement, origin mutation, recovery execution, server interaction, self-update, hardware support, boot readiness, security isolation, sandboxing, or operating-system completeness.

docs/demos/LATTICRA_SEAL_DEMO_v0_1.md

Source title: Latticra Seal Demo v0.1

Lines: 59 | Words: 192 | SHA-256: 3c245f8556499eb3d47550b090e4f23d3be480f39d9509c6871e5d03b95985f6

Latticra Seal Demo v0.1

This demo shows the first working trust loop for Latticra Seal.

Latticra Seal currently supports:

- reading the root latticra.seal manifest
- checking manifest shape
- checking required project files
- generating SHA-256 file digests
- writing a saved baseline to latticra.seal.lock
- verifying the current project state against that saved baseline
- reporting added, removed, or modified files

Demo Commands

Build the Seal CLI:

make seal-cli

Print the version:

./build/latticra-seal version

Inspect the manifest:

./build/latticra-seal manifest

Run a full check:

./build/latticra-seal check

Create or refresh the trusted baseline:

./build/latticra-seal baseline

Verify the current project state:

./build/latticra-seal verify

Run the demo script:

./scripts/demo-latticra-seal.sh

What the baseline means

The saved baseline does not prove the project is perfect or externally certified.

It means the current project files match the file-state previously recorded in latticra.seal.lock.

A precise public statement is:

Latticra Seal verifies that the current project state matches a previously recorded trusted baseline.

Current Status

This is an early local-integrity prototype.

It is not yet a full cryptographic attestation system. Future versions should add signed manifests, public-key verification, stronger proof bundles, and Latticra Panel integration.

docs/latticra-seal/ARCHITECTURE.md

Source title: Latticra Seal Architecture

Lines: 100 | Words: 305 | SHA-256: 4156d911d6274f3d542357c3534d525d5b5995d5e8434578f942fa1aeb49dd16

Latticra Seal Architecture

Latticra Seal is organized around bounded evidence.

It does not begin with enforcement. It begins with describing what exists, measuring what exists, reporting what changed, and refusing to claim authority it does not yet have.

Core model

```
source tree
    |
    v
manifest / seal config
    |
    v
hash baseline
    |
    v
policy checks
    |
    v
report-only evidence
    |
    v
Panel / CLI / future runtime boundary handoff
```

Primary components

Manifest layer

The manifest layer defines what Seal is allowed to inspect.

Expected files may include:

```
latticra.seal
latticra.seal.lock
```

The manifest should describe scope, included paths, excluded paths, policy expectations, and report behavior.

Measurement layer

The measurement layer computes local evidence.

Initial measurement should remain read-only.

Expected behavior:

- read local files
- compute hashes
- compare against saved baseline
- record changed/missing/new files
- avoid mutation unless explicitly running an update/baseline command

Policy layer

The policy layer decides whether the current state is acceptable.

Initial policy behavior should be conservative:

- fail closed on malformed policy
- fail closed on denied paths
- fail closed on unsupported authority claims
- report why a decision was denied

Report layer

The report layer emits human-readable evidence.

Reports should clearly show:

- mode
- timestamp
- host OS
- prefix
- hash status
- policy status
- warnings
- failures
- non-authority declarations

Panel bridge

The Panel bridge should expose Seal through a safe interface.

Panel should be able to:

- run report-only checks
- display Seal status
- show policy results
- show generated reports
- avoid granting runtime/root/network authority

Future runtime-boundary handoff

Future runtime integration must remain gated.

Seal may eventually produce metadata for runtime-boundary decisions, but documentation must not claim runtime enforcement until the enforcement path exists and has tests.

docs/latticra-seal/BOUNDARIES.md

Source title: Latticra Seal Boundaries

Lines: 68 | Words: 165 | SHA-256: 90aeac26b2b3f523add60f3aeb76fed168f9a7969ac03376773ec0c81c32851f

Latticra Seal Boundaries

This document defines what Latticra Seal does not claim.

Seal is

Latticra Seal is:

- a Latticra substructure
- a local evidence layer
- a report-only verification surface
- a policy-boundary testing target
- a manifest/hash baseline mechanism
- a future bridge toward stronger runtime-boundary work

Seal is not currently

Latticra Seal is not currently:

- a production security product
- a malware prevention system
- a ransomware prevention system
- a sandbox
- a kernel module
- an SELinux policy system
- a systemd enforcement system
- a root installer
- a network authority
- a runtime enforcement authority
- a certified host protection system
- a Fedora-approved package
- an OS replacement

Required public caution

Use language like:

```
early
local
report-only
bounded
evidence-bound
verification-oriented
policy-regression-backed
```

Avoid language like:

```
unbreakable
production-ready
military-grade
ransomware-proof
malware-proof
kernel-enforced
runtime-enforced
certified
guaranteed secure
```

Rule

No claim without evidence.

No evidence without test.

No test without documentation.

docs/latticra-seal/POLICY.md

Source title: Latticra Seal Policy

Lines: 67 | Words: 209 | SHA-256: a0d95e62396dccb0ee485b761ba4995d6b30f29494cc9360addea9b7045a4d3d

Latticra Seal Policy

Latticra Seal policy exists to define what Seal is allowed to inspect, verify, report, deny, or pass.

The policy layer should be conservative by default.

Policy goals

Seal policy should:

- make allowed scope explicit
- reject unsupported authority
- deny unsafe assumptions
- produce readable denial reasons
- support regression testing
- keep Latticra evidence-bound

Fail-closed principle

When policy input is malformed, incomplete, unsupported, or contradictory, Seal should fail closed.

Failing closed means:

```
do not silently pass
do not guess intent
do not grant authority
do not claim enforcement
emit a clear denial reason
```

Denial examples

Policy should deny:

- unknown authority modes
- network authority requests
- runtime enforcement claims
- root installation claims
- paths outside declared scope
- malformed manifests
- missing required metadata
- unsupported cryptographic claims

Policy regression

The policy regression lane should prove that unsafe or unsupported states are denied.

Expected local command:

```
make seal-policy-denials
```

Expected CI lane:

```
Latticra Seal Policy
```

Correct policy wording

Seal policy verifies whether local evidence matches declared expectations.

Incorrect policy wording

Seal policy does not currently enforce runtime behavior, block malware, isolate processes, protect the kernel, or provide production host security.

docs/latticra-seal/PRODUCT.md

Source title: Latticra Seal Product Spine

Lines: 184 | Words: 748 | SHA-256: 41fadbbc9e6cd54d9111d200f66f6d205bc7efbd86ce8b9c7635906f6baeba41

Latticra Seal Product Spine

Status: product spine for Latticra Seal security-product direction Scope: product direction, operating model, and earned-capability path for Latticra Seal. This document does not implement runtime enforcement, malware prevention, ransomware prevention, sandboxing, endpoint detection, kernel enforcement, network authority, root authority, cloud trust services, production cryptographic authority, capability enforcement, effect execution, AI-agent execution control, or production security readiness.

Product Thesis

Latticra Seal should become a local-first trust-boundary product for software, operators, and agentic toolchains.

The product promise to earn is:

```
Every security-relevant request should have explicit identity, capability, policy, measurement,
verification, dry-run decision, and receipt evidence before any effect is allowed.
```

Current Seal does not yet allow effects. That is a strength of the present foundation: the product can mature from visible evidence to verified decisions to future enforcement without hiding authority jumps.

Current Truth

Seal currently has an evidence-bound base:

```
manifest_hash_baseline=1
report_only_runtime_gate_path=1
guarded_allowlist_metadata=1
capability_metadata=1
request_freshness_metadata=1
signed_request_metadata=1
policy_decision_metadata=1
verification_policy_metadata=1
verification_receipt_metadata=1
runtime_dry_run_metadata=1
runtime_handoff_metadata=1
operator_receipt_report_metadata=1
operator_receipt_report_surface=1
local_capability_registry_schema_contract=1
local_capability_registry_schema_implementation_plan=1
local_capability_registry_schema_implementation=1
operator_visible_reports=1
production_security_product=0
runtime_authority_granted=0
```

Product Modes

Seal should mature through explicit modes.

```
observe_mode=current
verify_mode=partial-local
decide_mode=metadata-only
handoff_mode=metadata-only
enforce_mode=future-closed
```

Observe

Observe mode describes local state, manifests, baselines, request posture, capability candidates, and denial reasons.

Current status: present through report-only surfaces.

Verify

Verify mode should bind artifacts, identities, signatures, and receipts to deterministic verification outcomes.

Current status: partial local verification primitives exist, but no production trust root, no trust-store behavior, no revocation lookup, and no production cryptography claim exist.

Decide

Decide mode should combine request, capability, policy, freshness, signature, receipt, allowlist, and operator-review posture into a deterministic allow/deny/review decision.

Current status: metadata-only and denied by default.

Handoff

Handoff mode should create explicit runtime-boundary evidence for a future effect-capable layer.

Current status: metadata-only and inactive.

Enforce

Enforce mode is the future production boundary. It must remain closed until implementation, tests, threat-model evidence, operator controls, failure behavior, and security review exist.

Current status: not implemented.

Product Pillars

Evidence Graph

Seal should connect manifests, file hashes, request records, capability metadata, policy decisions, verification receipts, dry-run decisions, and handoff reports into one inspectable evidence graph.

Capability Intent

Seal should make every requested capability explicit before a tool, agent, script, package, installer, or runtime component can move toward effects.

Verification Receipts

Seal should produce receipts that are deterministic, machine-readable, human-readable, signed when future prerequisites exist, and traceable to input evidence.

Deny-By-Default Decisions

Seal should treat unknown, unsigned, stale, replayed, malformed, or unsupported requests as denied unless a guarded future authority path proves otherwise.

Operator Review

Seal should make review easy: what was requested, what evidence exists, what policy decided, what would happen, what remains blocked, and what authority is still absent.

Local-First Control

Seal should preserve local operation by default. Future cloud or network trust features, if ever introduced, must be optional, signed, inspectable, and disabled unless explicitly authorized.

Product Surfaces

Near-term product surfaces should be:

```
seal_cli_report=1
seal_cli_manifest_hash_baseline=1
seal_capability_metadata_report=1
seal_policy_decision_report=1
seal_runtime_dry_run_report=1
seal_operator_receipt_report=1
seal_local_capability_registry_schema=implemented-no-effect
seal_panel_status_surface=planned
seal_receipt_bundle=partial-local
seal_operator_review_queue=planned
```

Near-Term Build Queue

Completed recent checkpoints:

1. Capability metadata report status/index alignment.
2. A Seal product-spine status record and guard.
3. A bundled operator receipt report that ties capability metadata, policy decision, request freshness, signed request metadata, runtime dry-run, and denial reason into one local artifact.
4. A local capability registry schema contract before any production registry loader exists.
5. A no-effect local capability registry schema implementation plan before any schema C code exists.
6. A no-effect local capability registry schema implementation with bounded entries, deterministic validation, and zero authority.

The product path should now prioritize:

1. A deterministic local capability registry schema report surface and status checkpoint.
2. A Panel-visible Seal dashboard that renders current reports without root, network, or runtime authority.
3. A signed receipt proof path that remains verification-only until trust-root and revocation boundaries are implemented.
4. A future enforcement preflight contract that keeps enforce mode closed until all predecessor evidence is present.

Current completed product-spine checkpoint:

```
seal_product_spine_status_present=1
product_spine_changes_authority=0
```

```
operator_receipt_report_contract_present=1
operator_receipt_report_implementation_plan_present=1
operator_receipt_report_implementation_present=1
operator_receipt_report_surface_present=1
operator_receipt_report_status_present=1
local_capability_registry_schema_contract_present=1
local_capability_registry_schema_implementation_plan_present=1
local_capability_registry_schema_implementation_present=1
```

Non-Claims

The product target does not change current authority.

```
production_security_product=0
malware_prevention=0
ransomware_prevention=0
runtime_enforcement=0
kernel_enforcement=0
root_authority=0
network_authority=0
capability_enforcement=0
effect_execution=0
ai_agent_execution_control=0
runtime_authority_granted=0
```

Definition Of Earned Progress

Seal becomes more product-real only when a new slice adds reproducible evidence, tests, failure behavior, public status alignment, and a narrower authority boundary.

Security language must follow evidence. The product can aim high, but every claim must stay attached to code, tests, reports, and explicit non-claims.

docs/latticra-seal/README.md

Source title: Latticra Seal Documentation

Lines: 58 | Words: 319 | SHA-256: 02e2a2a8dff4d7442e046ef28ec4bb67d18db01ce9d1f0e766e3dfebb3f95234

Latticra Seal Documentation

Documentation update: The former standalone Latticra Seal handbook has been superseded as the main project book by The Latticra System Substrate: An Effect at Modern Security.

- System Substrate documentation landing page
- System Substrate PDF
- System Substrate DOCX

The file latticra-seal-handbook.pdf is retained as a compatibility path, but it now points to the System Substrate PDF content.

Latticra Seal is the verification, reporting, and policy-boundary layer inside the Latticra ecosystem.

It is designed to help Latticra describe, inspect, and verify local project/system state through bounded evidence such as manifests, hashes, receipts, policy checks, status reports, and no-effect runtime-boundary metadata.

Latticra Seal is not a separate production security product. It is not currently a malware prevention system, ransomware prevention system, sandbox, kernel enforcement layer, root installer, network authority, or runtime enforcement authority.

Current role

Latticra Seal currently serves as:

- a local integrity and evidence surface
- a report-only verification lane
- a policy regression target
- a manifest/hash baseline mechanism
- a bridge between Latticra CLI, Latticra Panel, and future runtime-boundary work

Documentation map

Document	Purpose
`STATUS.md`	Current readiness and evidence status
`ARCHITECTURE.md`	Internal structure and subsystem model
`USAGE.md`	User-facing command guide
`POLICY.md`	Policy-denial and fail-closed behavior
`REPORTS.md`	Report format and interpretation
`BOUNDARIES.md`	Non-claims and authority limits
`ROADMAP.md`	Future implementation path
`PRODUCT.md`	Security-product spine, modes, product surfaces, and earned-capability path

Canonical boundary

Seal documentation must remain evidence-bound.

Do not claim:

- production security readiness
- runtime enforcement
- network authority
- root authority
- kernel integration
- SELinux integration
- systemd enforcement
- Fedora approval
- malware or ransomware prevention
- broad host protection

until those claims are implemented, tested, and documented with reproducible evidence.

docs/latticra-seal/REPORTS.md

Source title: Latticra Seal Reports

Lines: 83 | Words: 248 | SHA-256: 88c8dae2d44ad09cf12f72369ff15f5c196f3b2a9ab93c7a30f8c4c852f0cc7c

Latticra Seal Reports

Latticra Seal reports are evidence records.

A report should be readable by a human and stable enough for future tooling.

Report goals

A Seal report should answer:

- what was checked
- when it was checked

- where it was checked
- what mode was used
- what passed
- what failed
- what changed
- what authority was not used

Required report fields

Recommended fields:

```
timestamp_utc=
mode=
prefix=
kernel=
os=
network_authority=
runtime_enforcement_authority=
root_authority=
manifest_present=
lock_present=
hashes_checked=
hashes_changed=
warnings=
failures=
status=
```

Current Seal report surfaces

Current report-only Seal surfaces include:

```
seal_capability_metadata_report=1
seal_policy_decision_report=1
seal_runtime_dry_run_report=1
seal_operator_receipt_report=1
```

The operator receipt report is a bundled denied metadata receipt. It does not grant authority, execute tools, read or write host data, use the network, or perform effects.

Report modes

report-only

The default safe mode.

Report-only mode may inspect and describe local state, but should not enforce runtime behavior or mutate system state.

verification

Verification mode compares current state against declared expectations.

Verification may fail when files are missing, changed, malformed, or outside policy.

future enforcement

Future enforcement must not be claimed until implemented and tested.

PASS meaning

PASS means the checked evidence matched the declared local expectations for that command.

PASS does not mean the host is secure.

FAIL meaning

FAIL means the checked evidence did not match expectations, policy denied the state, or Seal could not safely complete the check.

FAIL should include a reason.

docs/latticra-seal/STATUS.md

Source title: Latticra Seal Status

Lines: 73 | Words: 268 | SHA-256: f44cb47ee57d59ff621982aa9efc96ac8dab2a87dd08ae537b54953d814f6287

Latticra Seal Status

Status: early evidence-bound verification layer Scope: local report-only verification, manifest/hash baseline, policy regression, and Panel integration planning.

Current classification

Latticra Seal is currently a bounded local evidence subsystem.

It may describe local state, generate reports, compare hash baselines, and participate in policy-denial tests.

It must not be described as a production enforcement layer.

Current evidence

Known current evidence includes:

- latticra-seal command wrapper installed in the local user path
- local Fedora Workstation report generation
- report-only mode
- installed component marker for latticra-seal
- hash lock material in latticra.seal.lock
- policy regression workflow through GitHub Actions
- policy-denial testing through make seal-policy-denials
- product-spine direction for an earned security-product path
- no-effect operator receipt report implementation for bundled denied metadata
- operator-visible receipt report surface and status checkpoint
- local capability registry schema contract before any registry loader exists
- local capability registry schema implementation plan before any schema C code exists
- no-effect local capability registry schema implementation with bounded entries and denied defaults

Current authority limits

```
network_authority=0
runtime_enforcement_authority=0
root_authority=0
kernel_modification_performed=0
systemd_modification_performed=0
selinux_modification_performed=0
production_security_product=0
next_generation_security_product_target=1
```

Current readiness

```
local_report_generation=1
manifest_hash_baseline=1
policy_regression_lane=1
product_spine_present=1
product_spine_status_present=1
operator_receipt_report_implementation_present=1
operator_receipt_report_surface_present=1
operator_receipt_report_status_present=1
local_capability_registry_schema_contract_present=1
local_capability_registry_schema_implementation_plan_present=1
local_capability_registry_schema_implementation_present=1
panel_bridge_planning=1
runtime_enforcement=0
network_operation=0
root_installation=0
kernel_enforcement=0
production_readiness=0
```

Correct public wording

Latticra Seal is an early verification and reporting layer inside Latticra. It focuses on local evidence, policy boundaries, manifest/hash baselines, and report-only system state inspection.

Incorrect public wording

Do not say that Latticra Seal protects production systems, prevents malware, prevents ransomware, enforces runtime isolation, modifies the kernel, installs system services, or provides certified host security.

docs/latticra-seal/USAGE.md

Source title: Latticra Seal Usage

Lines: 64 | Words: 168 | SHA-256: af11d55c1b1fd5b93268ad3e9fd0634073841dc183e5a90caa92d6a9b06f529c

Latticra Seal Usage

This document describes the intended user-facing shape of Latticra Seal commands.

Some commands may be planned, experimental, or partially implemented. Treat the local repository and current tests as the source of truth.

Check local command availability

```
which latticra-seal
```

Generate a local report

```
latticra-seal report
```

Expected report behavior:

- report-only
- no network authority
- no runtime enforcement authority
- no root authority
- local evidence only

Run the Seal smoke lane

```
make seal
```

Run policy-denial regression checks

```
make seal-policy-denials
```

Inspect Seal lock material

```
head -40 latticra.seal.lock
```

Recommended local verification sequence

```
make seal
make seal-policy-denials
latticra-seal report
```

Expected documentation posture

Every command should be documented with:

- what it reads
- what it writes
- what it refuses to do
- whether it is report-only
- whether it requires root
- whether it uses the network
- what counts as PASS
- what counts as FAIL

docs/LATTICRA_SEAL_AGENTIC_AUTOMATION_SECURITY_CONTRACT.md

Source title: Latticra Seal Agentic Automation Security Contract

Lines: 227 | Words: 688 | SHA-256: 1c0f0e6ddc96f84f984adcec249704ed67aef28f8726c331a1936f3ded6bdc22

Latticra Seal Agentic Automation Security Contract

Status: Latticra Seal agentic automation security contract Scope: contract for future agentic automation security alignment after Seal status rollup metadata. This document does not implement runtime execution, runtime authority, effect execution, capability enforcement, cryptographic verification, verified receipts, public-key parsing, public-key trust stores, key generation, private-key storage, hardware key use, network trust lookup, revocation lookup, object sealing, host reads, host writes, kernel behavior, Fedora approval claims, production readiness, MCP protocol implementation, AI agent execution, model execution, tool execution, or operating-system behavior.

Purpose

This document defines the first Latticra Seal agentic automation security contract.

The purpose of this layer is to align the existing Seal chain with a future AI-era automation boundary:

```
report -&gt; measurement -&gt; manifest -&gt; signature policy -&gt; signature metadata -&gt;
verification
policy -&gt; verification receipt -&gt; capability gate -&gt; effect decision -&gt; runtime
handoff -&gt;
status rollup -&gt; agentic automation security planning
```

This document does not implement agentic automation behavior.

Design thesis

Latticra Seal is the trust and verification subsystem for Latticra.

For agentic automation, Seal should eventually help answer:

```
who requested the action
which tool or automation module is being invoked
```

```
whether the tool is known
whether a manifest exists
whether the manifest is signed
which filesystem, command, network, or runtime capabilities are requested
whether parameters match a declared schema
whether the request is fresh and non-replayed
whether runtime authority is actually granted
whether an audit receipt was generated
```

The initial posture remains conservative and report-only.

Required predecessors

This contract depends on:

```
docs/LATTICRA_SEAL_CONTRACT.md
docs/LATTICRA_SEAL_REPORT_IMPLEMENTATION.md
docs/LATTICRA_SEAL_MEASUREMENT_IMPLEMENTATION.md
docs/LATTICRA_SEAL_SIGNED_MANIFEST_IMPLEMENTATION.md
docs/LATTICRA_SEAL_SIGNATURE_POLICY_IMPLEMENTATION.md
docs/LATTICRA_SEAL_SIGNATURE_IMPLEMENTATION.md
docs/LATTICRA_SEAL_VERIFICATION_POLICY_IMPLEMENTATION.md
docs/LATTICRA_SEAL_VERIFICATION_RECEIPT_IMPLEMENTATION.md
docs/LATTICRA_SEAL_CAPABILITY_GATE_IMPLEMENTATION.md
docs/LATTICRA_SEAL_EFFECT_DECISION_IMPLEMENTATION.md
docs/LATTICRA_SEAL_RUNTIME_HANDOFF_CONTRACT.md
docs/LATTICRA_SEAL_RUNTIME_HANDOFF_IMPLEMENTATION.md
docs/LATTICRA_SEAL_STATUS_ROLLUP_CONTRACT.md
docs/LATTICRA_SEAL_STATUS_ROLLUP_IMPLEMENTATION.md
include/latticra/seal_status_rollup.h
src/seal_status_rollup.c
scripts/test-latticra-seal-status-rollup-contract.sh
scripts/test-latticra-seal-status-rollup.sh
```

The status rollup metadata surface remains metadata-only until runtime-boundary behavior exists and is guarded.

Agentic automation boundary

The agentic automation security layer may describe trust boundaries for AI-assisted tools, local automation, model-context tool invocation, shell helpers, package actions, repository helpers, and operator-approved workflows.

The layer may not convert unsupported, unverified, denied, inactive, or metadata-only Seal records into authority.

Allowed in this contract slice:

```
agentic security vocabulary
trust-boundary vocabulary
MCP-alignment vocabulary
request identity field planning
tool identity field planning
parameter validation field planning
freshness and replay-prevention field planning
receipt field planning
report-only status planning
non-claims
static guard validation
```

Forbidden in this contract slice:

```
runtime execution
AI agent execution
model execution
tool execution
shell command execution
runtime authority grants
effect execution
host reads
host writes
network access
capability enforcement
cryptographic verification
verified receipt generation
public-key parsing
public-key trust store loading
```

```
private-key handling
key generation
signature generation
revocation lookup
object sealing
kernel interaction
MCP server implementation
MCP client implementation
```

Initial agentic policy

The initial policy is report-only and deny-by-default.

```
agentic_automation_security_declared=1
mode=report-only
mcp_alignment_declared=1
mcp_implementation_supported=0
agent_execution_supported=0
model_execution_supported=0
tool_execution_supported=0
shell_execution_supported=0
cryptographic_verification_supported=0
verified_receipt_supported=0
parameter_schema_validation_supported=0
freshness_validation_supported=0
replay_protection_supported=0
capability_enforcement_supported=0
runtime_authority_granted=0
unknown_tool_allowed=0
unsigned_manifest_allowed=0
network_access_allowed=0
private_key_access_allowed=0
system_mutation_allowed=0
host_read_performed=0
host_write_performed=0
network_performed=0
```

Planned request fields

Future agentic security records should be bounded and deterministic.

Planned fields:

```
agentic_profile
request_id
caller_id
tool_id
automation_context
manifest_present
manifest_signed
capability_scope_declared
parameter_schema_present
parameter_schema_valid
request_timestamp_present
request_expiration_present
nonce_present
context_hash_present
parameter_hash_present
signature_present
freshness_valid
replay_detected
receipt_required
receipt_generated
runtime_authority_requested
runtime_authority_granted
decision
reason
mode
status
```

Initial values before real authority:

```
agentic_profile=latticra-seal-agentic-automation-security/0.1
manifest_present=0
manifest_signed=0
parameter_schema_present=0
parameter_schema_valid=0
freshness_valid=0
replay_detected=0
```

```
receipt_generated=0
runtime_authority_requested=0
runtime_authority_granted=0
decision=report-only
reason=planning-contract-only
mode=report-only
status=agentic-automation-security-contract-only
```

Promotion rules

Agentic automation security may only advance from contract to implementation when the next slice remains bounded, deterministic, and no-effect.

The first implementation may add metadata fields and deterministic rendering only.

It must not perform runtime behavior, tool execution, shell execution, AI agent execution, model execution, host reads, host writes, network access, signature verification, key handling, or authority grants.

Non-endorsement rule

This contract may align Latticra terminology with public security design concerns around AI-driven automation and model-context tool invocation.

It must not claim endorsement, certification, approval, deployment, or validation by any outside agency, vendor, distribution, or standards body.

Required non-claim:

```
external_endorsement_claimed=0
NSA_endorsement_claimed=0
Fedora_approval_claimed=0
production_readiness_claimed=0
```

Next valid slice

The next valid Latticra Seal slice is MCP alignment planning.

That future slice must remain documentation-only or metadata-only and must not change runtime behavior, host behavior, network behavior, capability enforcement, cryptographic verification, or authority posture.

docs/LATTICRA_SEAL_AGENTIC_AUTOMATION_SECURITY_IMPLEMENTATION.md

Source title: Latticra Seal Agentic Automation Security Implementation

Lines: 160 | Words: 617 | SHA-256: 3101a5e272e787a33d71e1832e3165aba5890ed2d1f768abc1e4dfefa264fd21

Latticra Seal Agentic Automation Security Implementation

Status: initial agentic automation security metadata implementation Scope: bounded C metadata surface for report-only agentic automation security posture after Seal status rollup metadata. This slice does not implement runtime execution, runtime authority, effect execution, capability enforcement, cryptographic verification, verified receipts, public-key parsing, public-key trust stores, key generation, private-key storage, hardware key use, network trust lookup, revocation lookup, object sealing, host reads, host writes, kernel behavior, Fedora approval claims, production readiness, MCP protocol implementation, MCP server behavior, MCP client behavior, AI agent execution, model execution, tool execution, shell execution, or operating-system behavior.

Purpose

This document records the first Latticra Seal agentic automation security metadata implementation.

The implementation accepts an existing Seal status rollup metadata record and produces deterministic report-only metadata for AI-era/local automation security posture.

Added files

```
include/latticra/seal_agentic_automation_security.h
src/seal_agentic_automation_security.c
tests/seal_agentic_automation_security_invariants.c
scripts/test-latticra-seal-agentic-automation-security.sh
```

API summary

The agentic automation security metadata surface adds:

```
latticra_seal_agentic_automation_security_t
latticra_seal_agentic_automation_security_error_t
latticra_seal_agentic_automation_security_error_label
latticra_seal_agentic_automation_security_from_rollup
latticra_seal_agentic_automation_security_is_report_only
latticra_seal_agentic_automation_security_report
```

Metadata behavior

The implementation:

```
accepts a valid metadata-only Seal status rollup record
sets agentic_profile=latticra-seal-agentic-automation-security/0.1
sets request_id=unset
sets caller_id=unset
sets tool_id=unset
sets automation_context=local-report-only
sets mcp_alignment_declared=1
sets mcp_protocol_implemented=0
sets mcp_server_implemented=0
sets mcp_client_implemented=0
sets agent_execution_supported=0
sets model_execution_supported=0
sets tool_execution_supported=0
sets shell_execution_supported=0
copies manifest_present from status rollup metadata
sets manifest_signed=0
sets parameter_schema_present=0
sets parameter_schema_valid=0
sets freshness_valid=0
sets replay_detected=0
sets receipt_required=1
sets receipt_generated=0
copies cryptographic_verification_supported from status rollup metadata
sets capability_enforcement_supported=0
sets runtime_authority_requested=0
copies runtime_authority_granted from status rollup metadata
sets unknown_tool_allowed=0
sets unsigned_manifest_allowed=0
sets network_access_allowed=0
sets private_key_access_allowed=0
sets system_mutation_allowed=0
copies host_read_performed from status rollup metadata
copies host_write_performed from status rollup metadata
copies network_performed from status rollup metadata
sets mode=report-only
sets decision=report-only
sets reason=metadata-only
renders deterministic agentic automation security metadata
```

Boundary

This implementation does not implement MCP protocol behavior, MCP server behavior, MCP client behavior, AI agent execution, model execution, tool execution, shell execution, runtime behavior, host reads, host writes, network behavior, cryptographic verification, key handling, signature verification, receipt verification, capability enforcement, or authority grants.

It is metadata only.

Failure behavior

The implementation fails closed:

```
null output -&gt; LATTICRA_STATUS_NULL_ARGUMENT
null status rollup metadata input -&gt; invalid-input
invalid status rollup metadata -&gt; invalid-rollup
non-metadata-only status rollup input -&gt; invalid-rollup
small report buffer -&gt; LATTICRA_STATUS_BUFFER_TOO_SMALL
```

Failures do not parse keys, create keys, persist secrets, contact networks, verify records, sign records, read host files, write host files, enforce capabilities, execute tools, perform effects, call runtime components, or grant runtime authority.

Invariants

The invariant test verifies:

```
valid metadata-only status rollup produces deterministic agentic automation security metadata
agentic_profile is stable
request_id remains unset
caller_id remains unset
tool_id remains unset
automation_context remains local-report-only
mcp_alignment_declared is one
mcp_protocol_implemented remains zero
mcp_server_implemented remains zero
mcp_client_implemented remains zero
agent_execution_supported remains zero
model_execution_supported remains zero
tool_execution_supported remains zero
shell_execution_supported remains zero
manifest_present is copied from status rollup metadata
manifest_signed remains zero
parameter_schema_present remains zero
parameter_schema_valid remains zero
freshness_valid remains zero
replay_detected remains zero
receipt_required is one
receipt_generated remains zero
cryptographic_verification_supported remains zero
capability_enforcement_supported remains zero
runtime_authority_requested remains zero
runtime_authority_granted remains zero
unknown_tool_allowed remains zero
unsigned_manifest_allowed remains zero
network_access_allowed remains zero
private_key_access_allowed remains zero
system_mutation_allowed remains zero
host_read_performed remains zero
host_write_performed remains zero
network_performed remains zero
mode remains report-only
decision remains report-only
reason remains metadata-only
small report buffer fails closed
null inputs fail closed
invalid status rollup metadata fails closed
```

Validation

Run:

```
sh scripts/test-latticra-seal-agentic-automation-security-contract.sh
sh scripts/test-latticra-seal-mcp-alignment-plan.sh
sh scripts/test-latticra-seal-agentic-automation-security.sh
```

Next valid slice

The next valid Latticra Seal slice is policy decision status/public-entry alignment.

That future slice must preserve the no-effect posture and must not implement real policy evaluation, policy enforcement, runtime execution, effect execution, capability enforcement, cryptographic verification, signature verification, freshness validation, replay detection, authority grants, host behavior, network behavior, MCP behavior, AI agent execution, model execution, tool execution, or shell execution.

docs/LATTICRA_SEAL_AGENTIC_AUTOMATION_SECURITY_REPORT_SURFACE.md

Source title: Latticra Seal Agentic Automation Security Report Surface

Lines: 83 | Words: 348 | SHA-256: 90158a8282fe65319edd8e3c2b5a8f159dee1a30c3f9ed312520c35f5e7d5674

Latticra Seal Agentic Automation Security Report Surface

Status: report surface for Latticra Seal agentic automation security metadata Scope: no-effect report-surface fixture and shell runner for deterministic Seal agentic automation security metadata. This slice does not implement runtime execution, runtime authority, effect execution, capability enforcement, cryptographic verification, verified receipts, public-key parsing, public-key trust stores, key generation, private-key storage, hardware key use, network trust lookup, revocation lookup, object sealing, host reads, host writes, kernel behavior, Fedora approval claims, production readiness, MCP protocol implementation, MCP server behavior, MCP client behavior, AI agent execution, model execution, tool execution, shell execution, or operating-system behavior.

Purpose

This document records the first dedicated report surface for Latticra Seal agentic automation security metadata.

The report surface exists so operators and contributors can render the current report-only Seal agentic automation security posture without adding runtime behavior or authority.

Added files

```
tests/seal_agentic_automation_security_report_surface.c
scripts/latticra-seal-agentic-automation-security-report.sh
scripts/test-latticra-seal-agentic-automation-security-report-surface.sh
```

Behavior

The report surface:

```
builds a metadata-only Seal status rollup fixture
constructs Seal agentic automation security metadata from that fixture
renders the deterministic Seal agentic automation security report
prints the report to stdout
```

The guard verifies report output fields including:

```
agentic_profile=latticra-seal-agentic-automation-security/0.1
automation_context=local-report-only
mcp_alignment_declared=1
mcp_protocol_implemented=0
agent_execution_supported=0
model_execution_supported=0
tool_execution_supported=0
shell_execution_supported=0
cryptographic_verification_supported=0
capability_enforcement_supported=0
runtime_authority_requested=0
runtime_authority_granted=0
unknown_tool_allowed=0
unsigned_manifest_allowed=0
network_access_allowed=0
private_key_access_allowed=0
system_mutation_allowed=0
host_read_performed=0
host_write_performed=0
network_performed=0
mode=report-only
decision=report-only
status=agentic-automation-security-metadata
```

Validation

Run:

```
sh scripts/test-latticra-seal-agentic-automation-security-report-surface.sh
```

The underlying metadata implementation remains covered by:

```
sh scripts/test-latticra-seal-agentic-automation-security.sh
```

Boundary

This report surface does not execute tools, execute shell commands on behalf of a model, contact networks, read host files, write host files, parse keys, verify signatures, create receipts, enforce capabilities, call runtime components, or grant runtime authority.

It compiles and runs a local deterministic fixture only.

Next valid slice

The next valid Latticra Seal slice is policy decision status/public-entry alignment.

That future slice must preserve the no-effect posture and must not implement real policy evaluation, policy enforcement, runtime execution, effect execution, capability enforcement, cryptographic verification, signature verification, freshness validation, replay detection, authority grants, host behavior, network behavior, MCP behavior, AI agent execution, model execution, tool execution, or shell execution.

docs/LATTICRA_SEAL_CAPABILITY_GATE_CONTRACT.md

Source title: Latticra Seal Capability Gate Contract

Lines: 213 | Words: 615 | SHA-256: d7898bc1c6021ed052fc45e1e2ffbe5cbeddffbf665c9d9e070624059e1b7f3c

Latticra Seal Capability Gate Contract

Status: Latticra Seal capability gate contract Scope: contract for future capability gate metadata after verification receipt metadata. This document does not implement capability enforcement, runtime authority, cryptographic verification, verified receipts, public-key parsing, public-key trust stores, key generation, private-key storage, hardware key use, network trust lookup, revocation lookup, object sealing, host writes, kernel behavior, Fedora approval claims, production readiness, or operating-system behavior.

Purpose

This document defines the Latticra Seal capability gate layer.

The purpose of this layer is to decide how a future receipt may be evaluated before any capability, effect, or authority request can become eligible for execution.

This document does not implement capability gates.

Required predecessors

This contract depends on:

```
docs/LATTICRA_SEAL_CONTRACT.md
docs/LATTICRA_SEAL_MEASUREMENT_IMPLEMENTATION.md
docs/LATTICRA_SEAL_SIGNED_MANIFEST_IMPLEMENTATION.md
docs/LATTICRA_SEAL_SIGNATURE_POLICY_IMPLEMENTATION.md
docs/LATTICRA_SEAL_SIGNATURE_IMPLEMENTATION.md
docs/LATTICRA_SEAL_VERIFICATION_POLICY_IMPLEMENTATION.md
docs/LATTICRA_SEAL_VERIFICATION_RECEIPT_CONTRACT.md
docs/LATTICRA_SEAL_VERIFICATION_RECEIPT_IMPLEMENTATION.md
include/latticra/seal_measurement.h
include/latticra/seal_manifest.h
include/latticra/seal_signature_policy.h
include/latticra/seal_signature.h
```

```
include/latticra/seal_verification_policy.h
include/latticra/seal_verification_receipt.h
src/seal_measurement.c
src/seal_manifest.c
src/seal_signature_policy.c
src/seal_signature.c
src/seal_verification_policy.c
src/seal_verification_receipt.c
scripts/test-latticra-seal-measurement.sh
scripts/test-latticra-seal-manifest.sh
scripts/test-latticra-seal-signature-policy.sh
scripts/test-latticra-seal-signature.sh
scripts/test-latticra-seal-verification-policy.sh
scripts/test-latticra-seal-verification-receipt-contract.sh
scripts/test-latticra-seal-verification-receipt.sh
```

The verification receipt metadata surface remains unverified metadata until cryptographic verification and verified receipt behavior exist.

Gate boundary

No receipt becomes authority without a capability gate.

No capability gate may allow authority from an unverified receipt.

No capability gate may grant runtime authority until cryptographic verification, verified receipts, and runtime-boundary enforcement exist.

Allowed in this contract slice:

```
capability gate vocabulary
gate-state labels
requested capability metadata planning
requested effect metadata planning
deny-by-default rule planning
failure-state planning
promotion rules
non-claims
static guard validation
```

Forbidden in this contract slice:

```
capability enforcement
runtime authority grants
host effect execution
host writes
network access
cryptographic verification
verified receipt generation
public-key parsing
public-key trust store loading
private-key handling
key generation
signature generation
revocation lookup
object sealing
kernel interaction
```

Initial gate policy

The initial capability gate policy is denied by default.

```
unverified receipt metadata may be inspected
unverified receipt metadata may not authorize capability use
verified=0 must deny capability gates
authority_usable=0 must deny capability gates
capability_gate_allowed=0 must deny effects
runtime_authority_granted=0 must remain zero
unknown requested capability must deny
unknown requested effect must deny
```

The first implementation after this contract may only add metadata fields and denied-state handling. It must not enforce real capabilities or grant authority.

Planned gate states

Future records should use explicit labels:

```
gate_state=unsupported
gate_state=denied-unverified
gate_state=denied-unsupported
gate_state=denied-policy
gate_state=allowed-metadata-only
gate_state=allowed-runtime-gated
gate_state=revoked
gate_state=expired
```

For the next implementation, the expected state is:

```
gate_state=denied-unverified
```

Planned gate fields

A future capability gate record should be bounded and deterministic.

Planned fields:

```
gate_profile
receipt_profile
verification_policy_profile
artifact_digest_algorithm
artifact_digest_hex
signer_identity_label
public_key_identity_label
receipt_state
verification_state
requested_capability
requested_effect
requested_scope
verified
authority_usable
receipt_capability_gate_allowed
gate_allowed
gate_state
runtime_authority_granted
status
```

Initial values before real capability enforcement:

```
receipt_state=unverified-metadata
verification_state=unsupported
verified=0
authority_usable=0
receipt_capability_gate_allowed=0
gate_allowed=0
gate_state=denied-unverified
runtime_authority_granted=0
status=capability-gate-contract-only
```

Failure behavior

Future capability gate handling must fail closed.

Required failure states:

```
null receipt metadata -&gt; invalid
invalid receipt metadata -&gt; invalid
missing artifact digest -&gt; invalid
missing signer identity -&gt; invalid
missing public-key identity -&gt; invalid
missing requested capability -&gt; denied
missing requested effect -&gt; denied
unknown requested capability -&gt; denied
unknown requested effect -&gt; denied
unverified receipt -&gt; denied-unverified
unsupported verification -&gt; denied-unsupported
runtime authority request -&gt; rejected
```

Failures must not parse keys, create keys, persist secrets, contact networks, query revocation status, verify records, sign records, write host files, enforce capabilities, execute effects, or grant runtime authority.

Promotion rule

This contract permits only the next implementation slice:

```
capability gate metadata implementation
```

It does not permit capability enforcement, runtime authority, cryptographic verification, verified receipt generation, key handling, trust-store behavior, revocation lookup, object sealing, network behavior, host writes, or kernel behavior.

After capability gate metadata exists and is guarded, the next valid planning slice is an effect authorization contract.

Validation

This contract is validated by:

```
sh scripts/test-latticra-seal-capability-gate-contract.sh
```

docs/LATTICRA_SEAL_CAPABILITY_GATE_IMPLEMENTATION.md

Source title: Latticra Seal Capability Gate Implementation

Lines: 144 | Words: 564 | SHA-256: dce1c7ca960ce5755e94ab161562ddd3e7570b5845d895853455ae06ad6fe85c

Latticra Seal Capability Gate Implementation

Status: initial capability gate metadata implementation Scope: bounded C metadata surface for capability gate posture after verification receipt metadata. This slice does not implement capability enforcement, runtime authority, cryptographic verification, verified receipts, public-key parsing, public-key trust stores, key generation, private-key storage, hardware key use, network trust lookup, revocation lookup, object sealing, host writes, kernel behavior, Fedora approval claims, production readiness, or operating-system behavior.

Purpose

This document records the first Latticra Seal capability gate metadata implementation.

The implementation accepts an existing verification receipt metadata record plus requested capability, effect, and scope labels. It produces deterministic gate metadata that remains denied by default.

Added files

```
include/latticra/seal_capability_gate.h
src/seal_capability_gate.c
tests/seal_capability_gate_invariants.c
scripts/test-latticra-seal-capability-gate.sh
```

API summary

The capability gate metadata surface adds:

```
latticra_seal_capability_gate_t
latticra_seal_capability_gate_error_t
latticra_seal_capability_gate_error_label
latticra_seal_capability_gate_from_receipt
latticra_seal_capability_gate_is_denied_metadata
latticra_seal_capability_gate_report
```

Gate behavior

The implementation:

```
accepts a valid verification receipt metadata record
copies receipt profile metadata
copies verification policy profile metadata
copies artifact digest algorithm metadata
```

```
copies artifact digest hex metadata
copies signer identity metadata
copies public-key identity metadata
copies receipt_state
copies verification_state
records requested capability metadata
records requested effect metadata
records requested scope metadata, defaulting to unspecified-scope
copies verified from the receipt
copies authority_usable from the receipt
copies receipt capability_gate_allowed from the receipt
sets gate_allowed=0
sets gate_state=denied-unverified
sets runtime_authority_granted=0
renders deterministic capability gate metadata
```

Boundary

This implementation does not verify signatures, parse public keys, create keys, store keys, contact networks, query revocation status, persist capability decisions, seal objects, enforce capabilities, execute effects, write host files, or grant runtime authority.

It is metadata only.

Failure behavior

The implementation fails closed:

```
null capability gate output -&gt; LATTICRA_STATUS_NULL_ARGUMENT
null verification receipt metadata input -&gt; invalid-input
invalid verification receipt metadata -&gt; invalid-receipt
missing artifact digest -&gt; missing-digest
missing signer identity -&gt; missing-signer
missing public-key identity -&gt; missing-public-key-identity
missing requested capability -&gt; missing-requested-capability
missing requested effect -&gt; missing-requested-effect
small report buffer -&gt; LATTICRA_STATUS_BUFFER_TOO_SMALL
```

Failures do not parse keys, create keys, persist secrets, contact networks, verify records, sign records, write host files, enforce capabilities, execute effects, or grant runtime authority.

Invariants

The invariant test verifies:

```
valid verification receipt metadata plus requested capability/effect produces deterministic gate
 metadata
receipt profile is copied
verification policy profile is copied
artifact digest algorithm is copied
artifact digest hex is copied
signer identity label is copied
public-key identity label is copied
receipt_state is copied
verification_state is copied
requested capability is recorded
requested effect is recorded
requested scope is recorded
missing requested scope defaults to unspecified-scope
verified remains zero
authority_usable remains zero
receipt_capability_gate_allowed remains zero
gate_allowed remains zero
gate_state remains denied-unverified
runtime_authority_granted remains zero
small report buffer fails closed
null inputs fail closed
invalid verification receipt metadata fails closed
missing digest fails closed
missing signer fails closed
missing public-key identity fails closed
missing requested capability fails closed
missing requested effect fails closed
```

Validation

Run:

```
sh scripts/test-latticra-seal-capability-gate-contract.sh
sh scripts/test-latticra-seal-capability-gate.sh
sh scripts/test-latticra-seal-capability-gate-status.sh
sh scripts/test-latticra-seal-effect-decision-status.sh
sh scripts/test-latticra-seal-runtime-handoff-status.sh
```

Expected output:

```
seal capability gate contract: ok
seal capability gate invariants: ok
seal capability gate status: ok
seal effect decision status: ok
seal runtime handoff status: ok
```

Next valid slice

The next valid Latticra Seal slice is status rollup status/public-entry alignment.

That future slice must not add runtime execution, effect execution, capability enforcement, runtime authority, cryptographic verification, verified receipt authority, signing, host behavior, network behavior, or object sealing unless separately implemented and guarded.

docs/LATTICRA_SEAL_CAPABILITY_METADATA_CONTRACT.md

Source title: Latticra Seal Capability Metadata Contract

Lines: 257 | Words: 745 | SHA-256: 11364eef44da03b7726e42ebd332c81a43bc0f7d1e6145a55a41d1af8c560532

Latticra Seal Capability Metadata Contract

Status: planning contract for a future Latticra Seal capability metadata surface Scope: contract-only planning for a future no-effect capability metadata layer after the completed Latticra Seal guarded allowlist public-entrypoint alignment. This document does not implement runtime behavior, runtime execution, runtime authority, effect execution, policy enforcement, capability enforcement, cryptographic verification, signature verification, freshness validation, replay detection, tool execution, AI agent execution, model execution, MCP protocol behavior, MCP server behavior, MCP client behavior, host reads, host writes, network behavior, operating-system behavior, production readiness, external endorsement, or authority grants.

Purpose

This contract defines the next safe Latticra Seal step after guarded allowlist candidate reporting became public-entrypoint visible.

The future capability metadata surface should answer one question:

```
If a tool request names a capability, can Latticra Seal describe that capability as metadata
without granting the authority to use it?
```

The answer must remain no-effect, deterministic, local, planning-only, and report-only.

Required prerequisites

A future implementation plan may begin only after these existing layers remain present and guarded:

```
seal_agentic_automation_metadata_present=1
seal_parameter_schema_metadata_present=1
seal_request_freshness_metadata_present=1
seal_signed_request_metadata_present=1
seal_policy_decision_metadata_present=1
seal_runtime_gate_metadata_present=1
seal_runtime_dry_run_metadata_present=1
```

```
seal_runtime_dry_run_report_surface_present=1
seal_guarded_allowlist_metadata_present=1
seal_guarded_allowlist_report_surface_present=1
seal_guarded_allowlist_report_surface_status_present=1
seal_guarded_allowlist_status_index_alignment_present=1
seal_guarded_allowlist_public_entrypoint_alignment_present=1
operator_visible_guarded_allowlist_report=1
core_blocked_case_set_complete=1
```

Future record shape

A future capability metadata record should expose bounded metadata fields similar to:

```
capability_metadata_profile=latticra-seal-capability-metadata/0.1
capability_contract_present
capability_metadata_planning_only
capability_name_present
capability_name
capability_scope
capability_effect_class
capability_known
capability_unknown
capability_candidate
capability_requires_guarded_allowlist
capability_requires_policy_decision
capability_requires_runtime_gate
capability_requires_runtime_dry_run
capability_requires_operator_review
capability_grants_authority
capability_executes_tool
capability_reads_host
capability_writes_host
capability_uses_network
default_action
would_allow
would_deny
would_require_operator_review
blocked_reason
report_only
mode
status
```

Required defaults

The initial implementation, if added later, must default to:

```
capability_metadata_planning_only=1
capability_name_present=0
capability_known=0
capability_unknown=1
capability_candidate=0
capability_requires_guarded_allowlist=1
capability_requires_policy_decision=1
capability_requires_runtime_gate=1
capability_requires_runtime_dry_run=1
capability_requires_operator_review=1
capability_grants_authority=0
capability_executes_tool=0
capability_reads_host=0
capability_writes_host=0
capability_uses_network=0
default_action=deny
would_allow=0
would_deny=1
would_require_operator_review=1
blocked_reason=default-deny-capability-metadata
report_only=1
mode=report-only
status=capability-metadata
```

Capability candidate rule

A known capability name may only become a candidate classification.

A known capability candidate must still report:

```
capability_known=1
capability_candidate=1
capability_grants_authority=0
```

```
capability_executes_tool=0
capability_reads_host=0
capability_writes_host=0
capability_uses_network=0
would_allow=0
would_deny=1
would_require_operator_review=1
```

This means a future capability match can improve reporting, but cannot authorize execution or effects.

Capability scope vocabulary

The initial planning vocabulary should stay small and explicit:

```
capability_scope=tool-boundary
capability_scope=request-boundary
capability_scope=policy-boundary
capability_scope=runtime-boundary
capability_scope=evidence-boundary
```

Capability effect vocabulary

The initial planning vocabulary should separate effect classes from authority:

```
capability_effect_class=none
capability_effect_class=tool
capability_effect_class=host-read
capability_effect_class=host-write
capability_effect_class=network
capability_effect_class=runtime-authority
```

Any effect class other than none remains descriptive only.

It must not make the effect available.

Required denied cases

The capability metadata surface must preserve the existing core blocked-request vocabulary:

```
unknown_tool_denied=1
unsigned_request_denied=1
invalid_schema_denied=1
stale_request_denied=1
replayed_request_denied=1
invalid_signature_denied=1
unknown_capability_denied=1
missing_capability_denied=1
invalid_capability_denied=1
```

Forbidden behavior

The capability metadata layer must not:

```
load production capability files
evaluate real policy files
enforce policy
enforce capabilities
execute tools
execute shell commands
call a runtime executor
read host files
write host files
perform network operations
verify signatures
validate freshness against live time
perform replay-cache mutation
generate keys
load private keys
load trust stores
query revocation services
grant runtime authority
turn capability matches into execution grants
turn capability matches into effect grants
claim production readiness
claim AI-agent security
```

```
claim MCP implementation
```

Required future report surface

A future implementation must include a deterministic report renderer and a local fixture runner.

Required future files:

```
include/latticra/seal_capability_metadata.h
src/seal_capability_metadata.c
tests/seal_capability_metadata_invariants.c
tests/seal_capability_metadata_report_surface.c
scripts/test-latticra-seal-capability-metadata.sh
scripts/latticra-seal-capability-metadata-report.sh
docs/LATTICRA_SEAL_CAPABILITY_METADATA_IMPLEMENTATION.md
```

Required future tests

A future implementation must prove:

```
missing capability remains denied
unknown capability remains denied
invalid capability remains denied
known capability only becomes a candidate
known capability candidate grants no authority
known capability candidate performs no effect
known capability candidate does not execute tools
known capability candidate does not read host state
known capability candidate does not write host state
known capability candidate does not use the network
capability effect class is descriptive only
report rendering is deterministic
small buffers fail closed
null inputs fail closed
invalid upstream metadata fails closed
```

Promotion rule

This contract does not authorize capability enforcement.

Capability metadata may be considered only as report-only metadata until a future implementation plan, implementation, report surface, status record, status-index alignment, public-entrypoint alignment, and negative-case evidence all remain merged and guarded.

Even after that sequence, a separate runtime authority contract would be required before any execution or effect path could be considered.

Boundary

This is a contract-only planning slice.

It does not change implementation behavior, add runtime behavior, grant authority, or change public readiness.

Current next valid slice

The next valid slice is a no-effect capability metadata implementation plan.

That future slice must still avoid implementation behavior and must specify exact structs, fields, APIs, report format, fixtures, tests, and failure behavior before any C code is added.

docs/LATTICRA_SEAL_CAPABILITY_METADATA_IMPLEMENTATION.md

Source title: Latticra Seal Capability Metadata Implementation

Lines: 192 | Words: 576 | SHA-256: 3ba53535593fc618d8cb0c2ee9e74f79c757d4e8bd1e9b545f96d68fa57a5ae9

Latticra Seal Capability Metadata Implementation

Status: no-effect implementation record for the Latticra Seal capability metadata surface Source: follows docs/LATTICRA_SEAL_CAPABILITY_METADATA_IMPLEMENTATION_PLAN.md Scope: deterministic local capability metadata only. This implementation does not implement runtime behavior, runtime execution, runtime authority, effect execution, policy enforcement, capability enforcement, cryptographic verification, signature verification, freshness validation, replay detection, tool execution, AI agent execution, model execution, MCP protocol behavior, MCP server behavior, MCP client behavior, host reads, host writes, network behavior, operating-system behavior, production readiness, external endorsement, or authority grants.

Purpose

This implementation adds a small, deterministic, local capability metadata surface.

The capability metadata surface can classify a known local fixture capability name as a candidate for later review, but it still denies execution, host access, network use, effects, and runtime authority.

Added files

```
include/latticra/seal_capability_metadata.h
src/seal_capability_metadata.c
tests/seal_capability_metadata_invariants.c
scripts/test-latticra-seal-capability-metadata.sh
docs/LATTICRA_SEAL_CAPABILITY_METADATA_IMPLEMENTATION.md
```

Deterministic local fixture

The implementation uses only this local fixture set:

```
seal.capability.inspect
seal.capability.report
seal.capability.dry_run
```

The fixture is compiled into the local C implementation.

It is not loaded from host files, policy files, network sources, MCP servers, tools, trust stores, or external services.

Missing capability posture

Missing capability names remain denied:

```
capability_metadata_profile=latticra-seal-capability-metadata/0.1
capability_fixture_source=deterministic-local-fixture
capability_fixture_entry_count=3
capability_lookup_performed=1
capability_name_present=0
capability_known=0
capability_unknown=1
capability_candidate=0
capability_grants_authority=0
capability_executes_tool=0
capability_reads_host=0
capability_writes_host=0
capability_uses_network=0
default_action_deny=1
would_allow=0
would_deny=1
would_require_operator_review=1
unknown_capability_denied=1
missing_capability_denied=1
blocked_reason=missing-capability-denied
report_only=1
mode=report-only
status=capability-metadata
```

Unknown capability posture

Unknown capability names remain denied:

```
capability_name_present=1
capability_known=0
capability_unknown=1
capability_candidate=0
capability_grants_authority=0
capability_executes_tool=0
capability_reads_host=0
capability_writes_host=0
capability_uses_network=0
would_allow=0
would_deny=1
would_require_operator_review=1
unknown_capability_denied=1
blocked_reason=default-deny-capability-metadata
report_only=1
mode=report-only
status=capability-metadata
```

Known capability candidate posture

Known fixture capabilities become candidates only:

```
capability_name_present=1
capability_known=1
capability_unknown=0
capability_candidate=1
capability_grants_authority=0
capability_executes_tool=0
capability_reads_host=0
capability_writes_host=0
capability_uses_network=0
would_allow=0
would_deny=1
would_require_operator_review=1
blocked_reason=known-capability-candidate-still-denied
report_only=1
mode=report-only
status=capability-metadata
```

A known fixture capability improves reporting but does not authorize execution or effects.

API surface

The implementation exposes:

```
latticra_seal_capability_metadata_error_label
latticra_seal_capability_metadata_fixture
latticra_seal_capability_metadata_result_missing
latticra_seal_capability_metadata_result_unknown
latticra_seal_capability_metadata_result_candidate
latticra_seal_capability_metadata_evaluate
latticra_seal_capability_metadata_is_report_only
latticra_seal_capability_metadata_report
```

Report format

The report begins with:

```
LATTICRA SEAL CAPABILITY METADATA
```

It renders deterministic key=value metadata, including missing/unknown/known/candidate state, authority-denial state, effect-denial state, core blocked-case state, report-only state, error label, and status.

Validation

Run:

```
sh scripts/test-latticra-seal-capability-metadata.sh
```

Expected output:

```
seal capability metadata invariants: ok
```

The invariant test proves:

```
missing capability remains denied
missing capability is not a candidate
unknown capability remains denied
unknown capability is not a candidate
known capability becomes candidate only
known capability remains denied
known capability grants no authority
known capability executes no tools
known capability reads no host state
known capability writes no host state
known capability uses no network
capability effect class is descriptive only
capability lookup uses deterministic local fixture
capability fixture entry count is stable
profile is stable
status remains capability-metadata
report_only remains one
mode remains report-only
small report buffers fail closed
null output fails closed
empty capability name fails closed as missing capability
oversized capability name fails closed
```

Boundary

This implementation is metadata-only and no-effect.

It does not execute tools, execute shell commands, read host files, write host files, use the network, evaluate external policies, load policy files, load production capability files, load production allowlist files, verify signatures, validate freshness against live time, mutate replay caches, grant authority, turn capability matches into execution grants, turn capability matches into effect grants, claim production readiness, claim AI-agent security, or claim MCP implementation.

Current next valid slice

The next valid Latticra Seal slice is a capability metadata report surface.

That future slice must render the current deterministic metadata through a local fixture runner and must not perform effects or grant authority.

docs/LATTICRA_SEAL_CAPABILITY_METADATA_IMPLEMENTATION_PLAN.md

Source title: Latticra Seal Capability Metadata Implementation Plan

Lines: 367 | Words: 909 | SHA-256: 3bbebad6cf6efb9e028d490e2f6a65ee4b602da25652241e68a053695a3c4044

Latticra Seal Capability Metadata Implementation Plan

Status: implementation planning contract for a future no-effect Latticra Seal capability metadata surface Scope: implementation plan only after the Latticra Seal capability metadata contract. This document does not implement runtime behavior, runtime execution, runtime authority, effect execution, policy enforcement, capability enforcement, cryptographic verification, signature verification, freshness validation, replay detection, tool execution, AI agent execution, model execution, MCP protocol behavior, MCP server behavior, MCP client behavior, host reads, host writes, network behavior, operating-system behavior, production readiness, external endorsement, or authority grants.

Purpose

This plan defines the exact future implementation shape for a no-effect Seal capability metadata layer.

The future implementation should classify whether a requested capability name is known only as descriptive metadata, while still denying execution, host access, network access, effects, and runtime authority.

Required contract

The implementation plan depends on:

```
docs/LATTICRA_SEAL_CAPABILITY_METADATA_CONTRACT.md
scripts/test-latticra-seal-capability-metadata-contract.sh
```

The contract must remain merged and guarded before implementation code is added.

Future files

The future implementation slice should add:

```
include/latticra/seal_capability_metadata.h
src/seal_capability_metadata.c
tests/seal_capability_metadata_invariants.c
scripts/test-latticra-seal-capability-metadata.sh
docs/LATTICRA_SEAL_CAPABILITY_METADATA_IMPLEMENTATION.md
```

A later report-surface slice may add:

```
tests/seal_capability_metadata_report_surface.c
scripts/latticra-seal-capability-metadata-report.sh
scripts/test-latticra-seal-capability-metadata-report-surface.sh
```

Header API plan

The future header should define:

```
LATTICRA_SEAL_CAPABILITY_METADATA_PROFILE_MAX
LATTICRA_SEAL_CAPABILITY_METADATA_NAME_MAX
LATTICRA_SEAL_CAPABILITY_METADATA_SCOPE_MAX
LATTICRA_SEAL_CAPABILITY_METADATA_EFFECT_MAX
LATTICRA_SEAL_CAPABILITY_METADATA_REASON_MAX
LATTICRA_SEAL_CAPABILITY_METADATA_STATUS_MAX
LATTICRA_SEAL_CAPABILITY_METADATA_REPORT_MAX
LATTICRA_SEAL_CAPABILITY_METADATA_ENTRY_MAX
latticra_seal_capability_metadata_error_t
latticra_seal_capability_metadata_entry_t
latticra_seal_capability_metadata_fixture_t
latticra_seal_capability_metadata_result_t
latticra_seal_capability_metadata_error_label
latticra_seal_capability_metadata_fixture
latticra_seal_capability_metadata_result_missing
latticra_seal_capability_metadata_result_unknown
latticra_seal_capability_metadata_result_candidate
latticra_seal_capability_metadata_evaluate
latticra_seal_capability_metadata_is_report_only
latticra_seal_capability_metadata_report
```

Error model

The future error enum should include:

```
LATTICRA_SEAL_CAPABILITY_METADATA_OK
LATTICRA_SEAL_CAPABILITY_METADATA_INVALID_INPUT
LATTICRA_SEAL_CAPABILITY_METADATA_INVALID_CAPABILITY_NAME
LATTICRA_SEAL_CAPABILITY_METADATA_INVALID_FIXTURE
LATTICRA_SEAL_CAPABILITY_METADATA_BUFFER_TOO_SMALL
```

Planned static fixture

The first implementation must use only a deterministic local fixture.

Initial fixture entries may include placeholder capability names such as:

```
seal.capability.inspect
seal.capability.report
seal.capability.dry_run
```

These entries are capability candidate names only.

They must not become authority grants, execution grants, or effect grants.

Record fields

The future result record should include:

```
capability_metadata_profile
capability_name
capability_scope
capability_effect_class
capability_fixture_source
capability_fixture_entry_count
capability_lookup_performed
capability_name_present
capability_known
capability_unknown
capability_candidate
capability_requires_guarded_allowlist
capability_requires_policy_decision
capability_requires_runtime_gate
capability_requires_runtime_dry_run
capability_requires_operator_review
capability_grants_authority
capability_executes_tool
capability_reads_host
capability_writes_host
capability_uses_network
default_action_deny
would_allow
would_deny
would_require_operator_review
unknown_tool_denied
unsigned_request_denied
invalid_schema_denied
stale_request_denied
replayed_request_denied
invalid_signature_denied
unknown_capability_denied
missing_capability_denied
invalid_capability_denied
blocked_reason
report_only
mode
status
error
```

Initial constants

The initial future implementation should emit for missing capability names:

```
capability_metadata_profile=latticra-seal-capability-metadata/0.1
capability_fixture_source=deterministic-local-fixture
capability_fixture_entry_count=3
capability_lookup_performed=1
capability_name_present=0
capability_known=0
capability_unknown=1
capability_candidate=0
capability_requires_guarded_allowlist=1
capability_requires_policy_decision=1
capability_requires_runtime_gate=1
capability_requires_runtime_dry_run=1
capability_requires_operator_review=1
capability_grants_authority=0
capability_executes_tool=0
capability_reads_host=0
capability_writes_host=0
capability_uses_network=0
default_action_deny=1
would_allow=0
would_deny=1
would_require_operator_review=1
unknown_capability_denied=1
missing_capability_denied=1
invalid_capability_denied=1
blocked_reason=missing-capability-denied
report_only=1
mode=report-only
status=capability-metadata
```

The initial future implementation should emit for unknown capability names:

```
capability_name_present=1
capability_known=0
capability_unknown=1
capability_candidate=0
capability_grants_authority=0
capability_executes_tool=0
capability_reads_host=0
capability_writes_host=0
capability_uses_network=0
would_allow=0
would_deny=1
would_require_operator_review=1
unknown_capability_denied=1
blocked_reason=default-deny-capability-metadata
report_only=1
mode=report-only
status=capability-metadata
```

The initial future implementation should emit for known fixture capability names:

```
capability_name_present=1
capability_known=1
capability_unknown=0
capability_candidate=1
capability_grants_authority=0
capability_executes_tool=0
capability_reads_host=0
capability_writes_host=0
capability_uses_network=0
would_allow=0
would_deny=1
would_require_operator_review=1
blocked_reason=known-capability-candidate-still-denied
report_only=1
mode=report-only
status=capability-metadata
```

Function behavior

The future builder should:

```
accept a requested capability name string
accept a deterministic local capability fixture
reject null output
classify null capability names as missing capability
classify empty capability names as missing capability
reject oversized capability names
reject invalid capability fixture metadata
classify unknown capabilities as denied
classify known capabilities as candidates only
set no authority fields to zero
set all effect fields to zero
render deterministic metadata only
```

Required report format

The report should begin with:

```
LATTICRA SEAL CAPABILITY METADATA
```

It should render all fields as stable key=value lines.

Required report fields:

```
capability_metadata_profile=latticra-seal-capability-metadata/0.1
capability_name
capability_scope
capability_effect_class
capability_fixture_source=deterministic-local-fixture
capability_lookup_performed=1
capability_known
capability_unknown
capability_candidate
capability_grants_authority=0
capability_executes_tool=0
capability_reads_host=0
capability_writes_host=0
```

```
capability_uses_network=0
default_action_deny=1
would_allow=0
would_deny=1
would_require_operator_review=1
unknown_capability_denied=1
missing_capability_denied=1
invalid_capability_denied=1
report_only=1
mode=report-only
status=capability-metadata
```

Required invariant tests

The future invariant test should verify:

```
missing capability remains denied
missing capability is not a candidate
unknown capability remains denied
unknown capability is not a candidate
known capability becomes candidate only
known capability remains denied
known capability grants no authority
known capability executes no tools
known capability reads no host state
known capability writes no host state
known capability uses no network
capability effect class is descriptive only
capability lookup uses deterministic local fixture
capability fixture entry count is stable
profile is stable
status remains capability-metadata
report_only remains one
mode remains report-only
small report buffers fail closed
null output fails closed
empty capability name fails closed as missing capability
oversized capability name fails closed
invalid fixture metadata fails closed
```

Required build runner

The future test runner should compile only local C sources and fixtures.

Planned runner:

```
sh scripts/test-latticra-seal-capability-metadata.sh
```

It should compile:

```
src/seal_capability_metadata.c
tests/seal_capability_metadata_invariants.c
```

If the implementation later depends on upstream Seal metadata records, the runner may also compile local Seal sources, but still must not call tools, read host files, write host files, use the network, or grant authority.

Explicit non-goals

The future implementation must not:

```
execute tools
execute shell commands
read host files
write host files
use the network
evaluate external policies
load policy files
load production capability files
load production allowlist files
verify signatures
validate freshness against live time
mutate replay caches
grant authority
turn capability matches into execution grants
turn capability matches into effect grants
claim production readiness
claim AI-agent security
```

```
claim MCP implementation
```

Promotion rule

No capability enforcement work may begin from this plan alone.

A future C implementation must first be merged with tests, a report surface, status record, status-index alignment, public-entrypoint alignment, and negative-case evidence while preserving the report-only boundary.

Even then, runtime authority would require a separate contract and evidence path.

Current next valid slice

The next valid Latticra Seal slice is the no-effect capability metadata implementation.

That future slice must implement only deterministic metadata, local fixtures, fail-closed behavior, and report rendering. It must not perform effects or grant authority.

docs/LATTICRA_SEAL_CAPABILITY_METADATA_REPORT_SURFACE.md

Source title: Latticra Seal Capability Metadata Report Surface

Lines: 101 | Words: 401 | SHA-256: 83868a9fbf6d96431333d064ef7970965e952860a4cc15d460094e1d2c70dc1c

Latticra Seal Capability Metadata Report Surface

Status: report surface for the Latticra Seal capability metadata layer Scope: deterministic local report surface after the no-effect capability metadata implementation. This document does not implement runtime behavior, runtime execution, runtime authority, effect execution, policy enforcement, capability enforcement, cryptographic verification, signature verification, freshness validation, replay detection, tool execution, AI agent execution, model execution, MCP protocol behavior, MCP server behavior, MCP client behavior, host reads, host writes, network behavior, operating-system behavior, production readiness, external endorsement, or authority grants.

Purpose

This document records the first operator-visible report surface for Latticra Seal capability metadata.

The report surface renders whether a deterministic local fixture capability name is known only as a candidate while still denying execution, host access, network use, effects, and runtime authority.

Added files

```
tests/seal_capability_metadata_report_surface.c
scripts/latticra-seal-capability-metadata-report.sh
```

Report runner

```
sh scripts/latticra-seal-capability-metadata-report.sh
```

Expected report posture

The report surface renders the current capability metadata posture for a known local fixture capability candidate, including:

```
LATTICRA SEAL CAPABILITY METADATA
capability_metadata_profile=latticra-seal-capability-metadata/0.1
capability_name=seal.capability.report
capability_scope=evidence-boundary
capability_effect_class=none
capability_fixture_source=deterministic-local-fixture
capability_fixture_entry_count=3
capability_lookup_performed=1
```

```
capability_name_present=1
capability_known=1
capability_unknown=0
capability_candidate=1
capability_requires_guarded_allowlist=1
capability_requires_policy_decision=1
capability_requires_runtime_gate=1
capability_requires_runtime_dry_run=1
capability_requires_operator_review=1
capability_grants_authority=0
capability_executes_tool=0
capability_reads_host=0
capability_writes_host=0
capability_uses_network=0
default_action_deny=1
would_allow=0
would_deny=1
would_require_operator_review=1
unknown_capability_denied=1
missing_capability_denied=0
invalid_capability_denied=0
blocked_reason=known-capability-candidate-still-denied
report_only=1
mode=report-only
status=capability-metadata
```

Boundary

This report surface compiles and runs a local deterministic fixture only.

It does not execute tools, execute shell commands beyond compiling and running the local test fixture, read host files beyond the repository sources needed for local compilation, write host files beyond the temporary test binary/report path, use the network, evaluate external policies, load policy files, load production capability files, load production allowlist files, verify signatures, validate freshness against live time, mutate replay caches, grant authority, turn capability matches into execution grants, turn capability matches into effect grants, claim production readiness, claim AI-agent security, or claim MCP implementation.

Validation

Run:

```
sh scripts/test-latticra-seal-capability-metadata-report-surface.sh
```

Expected output:

```
latticra seal capability metadata report surface: ok
```

The underlying capability metadata implementation remains covered by:

```
sh scripts/test-latticra-seal-capability-metadata.sh
```

Claim boundary

This report surface does not justify the public claim that Latticra secures AI agents.

It makes the capability candidate denial posture easier to inspect before any future capability enforcement or runtime authority path is considered.

Next valid slice

The next valid Latticra Seal slice is capability metadata report status alignment.

That future slice must preserve the no-effect posture and must not perform effects or grant authority.

docs/LATTICRA_SEAL_CONTRACT.md

Source title: Latticra Seal Contract

Lines: 326 | Words: 1098 | SHA-256: 74eead41457c8082ce488496fad3f3e1004e0885b118347b1df5402156a618e6

Latticra Seal Contract

Status: Latticra Seal contract Scope: cryptographic evidence and capability substrate definition before signing implementation, encryption implementation, key management, post-quantum implementation, TPM integration, Linux integrity integration, Fedora integration, artifact measurement, runtime enforcement, network behavior, host mutation, kernel behavior, certification, or operating-system behavior.

Purpose

This document defines the first Latticra Seal contract.

Latticra Seal is the cryptographic evidence and capability substrate direction for Latticra. Its purpose is to bind contracts, state transitions, authority decisions, artifact identities, reports, and future operational gates to verifiable evidence before they are allowed to become runtime behavior.

This document does not implement cryptographic enforcement.

Relationship to current Latticra posture

Latticra is contract-first, report-oriented, denied-by-default, and explicit about non-claims.

Latticra Seal depends on the existing project posture:

```
docs/REAL_SYSTEM_CONTRACT.md
docs/EVIDENCE_LADDER.md
docs/EFFECT_GATES.md
docs/RUNTIME_BOUNDARY_CONTRACT.md
docs/RUNTIME_BOUNDARY_IMPLEMENTATION.md
docs/RUNTIME_BOUNDARY_REPORT_REFINEMENT.md
docs/RUNTIME_BOUNDARY_DOMAIN_MATRIX_REPORT_INTEGRATION.md
docs/CONSTRAINED_CPP_AUTHORITY_LAYER_CONTRACT.md
docs/CONSTRAINED_CPP_AUTHORITY_LAYER_IMPLEMENTATION.md
docs/CPP_AUTHORITY_IMPLEMENTATION_REVIEW.md
docs/NUCLEUS_TASK_EXECUTION_CONTRACT.md
docs/NUCLEUS_TASK_REPORT_ONLY_EXECUTION_REFINEMENT.md
docs/LAT_PIPELINE_IMPLEMENTATION.md
docs/LIR_SHAPE_IMPLEMENTATION.md
```

Those files remain the source of truth for the current no-effect, metadata-only, authority, runtime-boundary, Nucleus, Lat, and LIR behavior.

Latticra Seal adds a cryptographic evidence direction. It does not bypass existing gates.

Direction checkpoint

```
C is the metal.
C++ is the disciplined structure.
Latticra is the contract.
Latticra Seal is the evidence boundary.
```

Latticra Seal must preserve this relationship:

```
Lat / Latticra Language: declares contracts, authority requests, and intended effects
LIR: carries validated metadata and evidence labels
C substrate: owns bounded records and ABI-compatible report surfaces
Constrained C++ authority layer: validates authority policy and produces denied-by-default
decisions
Nucleus: coordinates only after contracts, authority, and gates are satisfied
Latticra Seal: binds reports, contracts, artifacts, and authority envelopes to evidence
Runtime boundary: remains disabled until explicit cryptographic and authority gates exist
```

Core rule

```
No contract without identity.
No authority without a capability.
No effect without a signed gate.
No promotion without verifiable evidence.
```

This rule is directional. It is not yet implemented runtime behavior.

Current Seal posture

Current Latticra Seal behavior includes no implemented cryptographic enforcement.

Current allowed work:

```
contract definition
implementation planning
report-field design
capability-envelope design
evidence-record design
primitive-policy planning
status/index alignment
guard-script validation
```

Current forbidden claims:

```
signing implemented
encryption implemented
key generation implemented
key storage implemented
capability enforcement implemented
artifact measurement implemented
sealed objects implemented
post-quantum implementation completed
TPM-backed identity implemented
Linux integrity enforcement implemented
Fedora approval or distribution readiness
runtime enforcement
production hardening
certification
```

Seal layers

Latticra Seal is divided into explicit layers.

```
Seal contract layer
  Defines vocabulary, evidence boundaries, non-claims, and promotion rules.

Seal report layer
  Emits deterministic no-effect status records about what Seal supports.

Seal evidence layer
  Defines evidence records for contracts, reports, artifacts, state transitions, and authority
decisions.

Seal capability layer
  Defines narrow, inspectable, future signed capability envelopes.

Seal signature layer
  Future layer for signing manifests, reports, releases, gates, and authority decisions.

Seal object layer
  Future layer for sealed/encrypted objects.

Seal integrity bridge
  Future layer for Linux/Fedora integrity evidence, package evidence, and measured host-facing
validation.
```

Each layer must have its own implementation plan before code is added.

Primitive policy

Latticra Seal does not invent cryptographic primitives.

Initial policy:

```
new cipher design: forbidden
custom cryptographic primitive design: forbidden
standard primitive use: allowed only after exact implementation plan
primitive claims: forbidden until tests and evidence exist
post-quantum claims: forbidden until implementation and validation exist
```

Planned primitive families may include:

```
SHA-256 / SHA-384 for official artifact and record digests
Ed25519 for future development signing
ML-KEM for future post-quantum key establishment profiles
ML-DSA for future post-quantum signature profiles
```

```
SLH-DSA for future conservative/offline signature profiles
HPKE for future object sealing
TLS 1.3 or Noise-style channels for future authenticated transport
TPM2-backed sealed identity for future machine-bound evidence
Linux integrity mechanisms for future host-facing evidence bridges
```

These are planning targets only. This contract does not implement or certify them.

Effect boundary

First Latticra Seal effect posture:

```
contract writing allowed: yes
implementation planning allowed: yes
static report design allowed: yes
static guard validation allowed: yes
host file reads allowed: no
host file writes allowed: no
network access allowed: no
key generation allowed: no
private key storage allowed: no
signature generation allowed: no
encryption allowed: no
artifact hashing allowed: not until exact measurement plan and tests exist
runtime authority allowed: no
capability enforcement allowed: no
kernel interaction allowed: no
```

Future artifact measurement must be explicitly classified as read-only evidence work before it is implemented.

Evidence record shape

Future evidence records should be bounded and deterministic.

Initial planned fields:

```
record_version
record_kind
subject_kind
subject_label
contract_id
contract_digest
artifact_label
artifact_digest
state_before_label
state_after_label
requested_effect
allowed_effect_scope
authority_state
capability_id
signature_state
sealed_state
runtime_boundary_state
evidence_level
non_claims
```

The first report implementation may include these fields as labels without computing cryptographic values.

Capability envelope shape

Future capability envelopes should be narrow, explicit, inspectable, and expiring.

Initial planned fields:

```
capability_version
issuer_id
subject_id
action
object_scope
effect_scope
authority_state
valid_from
valid_until
revocation_state
signature_state
```

An unsigned capability envelope is metadata only. It grants no authority.

A signed capability envelope grants no authority unless a later runtime-boundary implementation explicitly recognizes and enforces it.

Failure behavior

Latticra Seal must fail closed.

Initial failure rules:

```
unknown record kind -&gt; deny / report invalid
unknown effect -&gt; deny / report invalid
unknown authority -&gt; deny / report invalid
missing capability -&gt; deny / report missing
unsigned future gate -&gt; deny / report unsigned
invalid digest -&gt; deny / report invalid
unsupported primitive -&gt; deny / report unsupported
runtime request -&gt; deny / report future-gated
```

Promotion gates

Latticra Seal may only advance through evidence-backed stages.

```
contract -&gt; implementation plan -&gt; no-effect report -&gt; fixture evidence -&gt; read-
only artifact
measurement -&gt; signed manifest -&gt; capability envelope -&gt; sealed object -&gt; Linux/
Fedora integrity
 bridge -&gt; runtime authority gate
```

Skipping stages is forbidden.

First implementation target

The first implementation target is report-only.

It should add no signing, no encryption, no key generation, no artifact reading, no network access, no runtime authority, and no host mutation.

The first report should be able to state:

```
seal_profile
contract_present
implementation_plan_present
report_only_supported
artifact_measurement_supported
signature_supported
capability_enforcement_supported
sealed_objects_supported
effect_performed
host_read_performed
host_mutation_performed
network_performed
runtime_authority_granted
status
non_claims
```

Non-claims

Latticra Seal does not currently provide:

```
cryptographic enforcement
secure boot
measured boot
file integrity enforcement
package-signature enforcement
runtime authorization
capability enforcement
key management
encryption at rest
encrypted transport
post-quantum security
TPM-backed identity
Linux integrity integration
Fedora approval
production hardening
```

```
certification
```

Validation path

This contract is validated by a static guard script that verifies the contract, implementation plan, status record, and non-claim posture remain present.

The guard does not prove cryptographic security. It only prevents the first Seal foundation from being represented as implemented enforcement.

docs/LATTICRA_SEAL_CORE_EVIDENCE_REPORT.md

Source title: Latticra Seal Core Evidence Report

Lines: 70 | Words: 227 | SHA-256: b62c071c6d4a309bb0eef4ded0b48af3b686f7a3d86ce557c49051e9de974d43

Latticra Seal Core Evidence Report

Status: operator-visible evidence report for the Latticra Seal report-only runtime gate chain Scope: report-only evidence summary after the completed core blocked-request case set. This document does not implement runtime behavior, execution, effects, host operations, network operations, policy enforcement, or authority grants.

Purpose

This document records the first operator-visible evidence report for the Latticra Seal core runtime gate path.

The report summarizes the merged report-only metadata chain and the completed core blocked-request case set.

Report runner

```
scripts/latticra-seal-core-evidence-report.sh
```

Covered chain

```

ai_agent_security_claimed=0
```

Recommended public claim

```
Latticra Seal now has a report-only runtime gate path with core negative-test evidence for
AI-era tool-boundary planning.
```

Claim boundary

This is a real milestone, but it remains report-only.

It is accurate to say that Latticra Seal has built an evidence-bound report-only trust boundary for AI-era tool-boundary planning.

It is not yet accurate to claim that Latticra broadly secures AI agents or enforces AI-agent tool execution in production.

Next valid slice

The next valid slice is public status alignment for this evidence report, followed by a future operator-visible report surface integrated into the broader project status path.

docs/LATTICRA_SEAL_CRYPTO_GRADUATION_GATE_IMPLEMENTATION.md

Source title: Latticra Seal Crypto Graduation Gate Implementation

Lines: 186 | Words: 515 | SHA-256: 24e0b4f1aa4000994bf936f42f7d28494b22ea0855f3cb0e7b887dc89de03c81

Latticra Seal Crypto Graduation Gate Implementation

Status: authority-neutral Latticra Seal crypto graduation gate implementation Scope: bounded C gate over the existing local Ed25519 verify-only result and verified receipt promotion metadata. This implementation does not add signing, key generation, key storage, private-key handling, trust-store loading, revocation lookup, network lookup, FIPS validation, CMVP submission, production cryptography claims, capability enforcement, effect execution, host behavior, or runtime authority.

Purpose

This implementation graduates the current Seal cryptographic layer from isolated local verification evidence into an explicit standards-gated checkpoint.

It consumes:

```
local provider-backed Ed25519 verify-only result
verified receipt promotion metadata
cryptographic assurance and key-management baseline expectations
```

The result can record that the current cryptographic operation met the local gate, while still keeping authority, capability-gate allowance, production crypto claims, FIPS claims, key storage, key generation, signing authority, revocation lookup, network lookup, host behavior, and runtime authority closed.

Files

```
include/latticra/seal_crypto_graduation_gate.h
src/seal_crypto_graduation_gate.c
tests/seal_crypto_graduation_gate_invariants.c
scripts/test-latticra-seal-crypto-graduation-gate.sh
docs/LATTICRA_SEAL_CRYPTO_GRADUATION_GATE_IMPLEMENTATION.md
docs/status/SEAL_CRYPTO_GRADUATION_GATE_STATUS.md
```

Standards Tracked

This gate records standards expectations from the project cryptographic assurance baseline:

```
RFC 8032 Ed25519 test vector evidence
NIST FIPS 186-5 digital signature standard tracking
NIST FIPS 180-4 SHA-256 digest standard tracking
NIST FIPS 140-3 claim gate before cryptographic module claims
NIST SP 800-57 Part 1 Rev. 5 key-management requirements
NIST SP 800-131A Rev. 2 algorithm transition review requirements
NIST FIPS 204 ML-DSA post-quantum planning
NIST FIPS 205 SLH-DSA post-quantum planning
```

Tracked source URLs:

```
https://www.rfc-editor.org/rfc/rfc8032

sp_800_57_key_management_required=1
sp_800_131a_transition_review_required=1
fips_204_ml_dsa_planning_tracked=1
fips_205_slh_dsa_planning_tracked=1
cryptographic_verification_supported=1
cryptographic_verification_performed=1
verified=1
invalid=0
local_verify_graduated=1
receipt_promotion_graduated=1
standard_expectations_met=1
production_crypto_claim_allowed=0
fips_claim_allowed=0
signing_authority_granted=0
key_generation_allowed=0
key_storage_allowed=0
revocation_lookup_allowed=0
network_lookup_allowed=0
authority_usable=0
authority_promotion_allowed=0
capability_gate_allowed=0
runtime_authority_granted=0
gate_state=graduated-authority-neutral
blocked_reason=authority-remains-denied
status=crypto-graduation-gate-passed
```

Fail-Closed Behavior

The gate blocks:

```
missing verify result
missing verified receipt
invalid or unperformed verification
invalid receipt promotion
unsupported algorithm
missing or malformed SHA-256 digest metadata
missing public-key identity
wrong Ed25519 public-key or signature size
any authority-bearing verify result or receipt
```

Blocked records preserve:

```
local_verify_graduated=0
receipt_promotion_graduated=0
standard_expectations_met=0
production_crypto_claim_allowed=0
fips_claim_allowed=0
signing_authority_granted=0
key_generation_allowed=0
key_storage_allowed=0
revocation_lookup_allowed=0
network_lookup_allowed=0
authority_usable=0
authority_promotion_allowed=0
capability_gate_allowed=0
runtime_authority_granted=0
gate_state=blocked
```

Validation

Current guard:

```
sh scripts/test-latticra-seal-crypto-graduation-gate.sh
```

Expected output:

```
seal crypto graduation gate invariants: ok
latticra seal crypto graduation gate: ok
```

The guard compiles the Ed25519 verify-only implementation, verified receipt promotion implementation, crypto graduation gate implementation, and deterministic invariants. It verifies the RFC 8032 test vector path, tampered-signature denial, malformed metadata denial, authority-bearing metadata denial, null handling, and small-buffer handling.

Current Next Valid Slice

The next valid Latticra Seal cryptographic slice is to carry crypto-graduation-gated runtime handoff evaluation evidence into the runtime handoff report and policy decision report chains as read-only evidence.

That future slice must still not add signing, key generation, key storage, private-key handling, trust-store loading, revocation lookup, network lookup, capability enforcement, effect execution, host behavior, FIPS claims, production cryptography claims, or runtime authority unless separately implemented and guarded.

docs/LATTICRA_SEAL_CRYPTO_VERIFY_BACKEND_CONTRACT.md

Source title: Latticra Seal Crypto Verify Backend Contract

Lines: 200 | Words: 588 | SHA-256: 18835aeafbeaf1a275598765d8acfed9745e54be5c62be793cded98b8b2965b9

Latticra Seal Crypto Verify Backend Contract

Status: Latticra Seal crypto verify backend contract Scope: contract for future cryptographic verification backend behavior after signature metadata, verification policy metadata, verification receipt metadata, and capability gate metadata. This document does not implement cryptographic verification, signing, key generation, private-key storage, public-key trust stores, network trust lookup, revocation lookup, object sealing, capability enforcement, runtime authority, host reads, host writes, kernel behavior, Fedora approval claims, production readiness, or operating-system behavior.

Purpose

This document defines the Latticra Seal crypto verify backend layer.

The purpose of this layer is to introduce a bounded, verify-only cryptographic boundary that can later verify signature material without immediately granting capability, effect, or runtime authority.

This document does not implement cryptographic verification.

Required predecessors

This contract depends on:

```
docs/LATTICRA_SEAL_CONTRACT.md
docs/LATTICRA_SEAL_SIGNED_MANIFEST_IMPLEMENTATION.md
docs/LATTICRA_SEAL_SIGNATURE_IMPLEMENTATION.md
docs/LATTICRA_SEAL_VERIFICATION_POLICY_IMPLEMENTATION.md
docs/LATTICRA_SEAL_VERIFICATION_RECEIPT_IMPLEMENTATION.md
docs/LATTICRA_SEAL_CAPABILITY_GATE_IMPLEMENTATION.md
include/latticra/seal_manifest.h
include/latticra/seal_signature.h
include/latticra/seal_verification_policy.h
include/latticra/seal_verification_receipt.h
include/latticra/seal_capability_gate.h
src/seal_manifest.c
src/seal_signature.c
src/seal_verification_policy.c
src/seal_verification_receipt.c
src/seal_capability_gate.c
scripts/test-latticra-seal-manifest.sh
scripts/test-latticra-seal-signature.sh
scripts/test-latticra-seal-verification-policy.sh
scripts/test-latticra-seal-verification-receipt.sh
scripts/test-latticra-seal-capability-gate.sh
```

The verification receipt metadata surface remains the authority boundary until a later verified receipt implementation explicitly consumes cryptographic verification results.

Backend boundary

The crypto verify backend may only evaluate verification input and produce bounded verification-result metadata.

A successful verification result may not directly grant authority.

A failed verification result must fail closed.

Allowed in this contract slice:

```
verification backend vocabulary
algorithm labels
verification input metadata planning
verification result-state planning
public-key identity metadata planning
trust-source metadata planning
failure-state planning
promotion rules
non-claims
static guard validation
```

Forbidden in this contract slice:

```
cryptographic verification implementation
signature generation
private-key handling
key generation
network trust lookup
revocation lookup
public-key trust store loading
capability enforcement
effect execution
runtime authority grants
host reads
host writes
kernel interaction
```

Planned algorithm policy

Initial planned verification families:

```
Ed25519-development for local development verification
ML-DSA-planned for future post-quantum signature verification
SLH-DSA-planned for future conservative offline/root signature verification
```

No custom cryptographic primitive may be introduced.

The first implementation after this contract may only add backend metadata and unsupported verification-state handling unless a separate implementation contract authorizes real Ed25519 verification.

Planned verification states

Future records should use explicit labels:

```
crypto_verify_state=unsupported
crypto_verify_state=unverified-metadata
crypto_verify_state=verified
crypto_verify_state=invalid-signature
crypto_verify_state=unsupported-algorithm
crypto_verify_state=missing-public-key
crypto_verify_state=policy-denied
```

For the next metadata implementation, the expected state is:

```
crypto_verify_state=unsupported
```

Planned fields

A future crypto verification backend record should be bounded and deterministic.

Planned fields:

```
backend_profile
signature_profile
manifest_profile
artifact_digest_algorithm
artifact_digest_hex
signer_identity_label
signature_algorithm
public_key_identity_label
trust_source
crypto_verify_state
cryptographic_verification_supported
cryptographic_verification_performed
verified
invalid
authority_usable
capability_gate_allowed
runtime_authority_granted
status
```

Initial values before real verification:

```
crypto_verify_state=unsupported
cryptographic_verification_supported=0
cryptographic_verification_performed=0
verified=0
invalid=0
authority_usable=0
capability_gate_allowed=0
```

```
runtime_authority_granted=0
status=crypto-verify-backend-contract-only
```

Failure behavior

Future crypto verify backend handling must fail closed.

Required failure states:

```
null backend output -&gt; invalid
null signature metadata -&gt; invalid
invalid signature metadata -&gt; invalid
missing artifact digest -&gt; invalid
missing signer identity -&gt; invalid
missing public-key identity -&gt; invalid
unsupported algorithm -&gt; unsupported-algorithm
verification requested before support -&gt; unsupported
authority request -&gt; rejected
capability gate request -&gt; rejected
runtime authority request -&gt; rejected
```

Failures must not create keys, store keys, contact networks, query revocation status, sign records, write host files, enforce capabilities, perform effects, or grant runtime authority.

Promotion rule

This contract permits only the next implementation slice:

```
crypto verification backend metadata implementation
```

It does not permit real cryptographic verification, key handling, trust-store behavior, revocation lookup, object sealing, capability enforcement, network behavior, host reads, host writes, or runtime authority.

After crypto verification backend metadata exists and is guarded, the next valid planning slice is an Ed25519 verify-only implementation contract.

Validation

This contract is validated by:

```
sh scripts/test-latticra-seal-crypto-verify-backend-contract.sh
```

docs/LATTICRA_SEAL_CRYPTO_VERIFY_BACKEND_IMPLEMENTATION.md

Source title: Latticra Seal Crypto Verify Backend Implementation

Lines: 143 | Words: 545 | SHA-256: 357337a093e9b23c20e871bfd16d565c260ceeaf17569790bd2acf45f40df6fa

Latticra Seal Crypto Verify Backend Implementation

Status: initial crypto verify backend metadata implementation Scope: bounded C metadata surface for crypto verification backend posture after verification policy metadata. This slice does not implement real cryptographic verification, signing, key generation, private-key storage, public-key trust stores, network trust lookup, revocation lookup, object sealing, capability enforcement, runtime authority, host reads, host writes, kernel behavior, Fedora approval claims, production readiness, or operating-system behavior.

Purpose

This document records the first Latticra Seal crypto verify backend metadata implementation.

The implementation accepts an existing verification policy metadata record and produces deterministic crypto verify backend metadata. It does not verify signatures and does not treat metadata as authority.

Added files

```
include/latticra/seal_crypto_verify_backend.h
src/seal_crypto_verify_backend.c
tests/seal_crypto_verify_backend_invariants.c
```

The intended local runner is:

```
scripts/test-latticra-seal-crypto-verify-backend.sh
```

API summary

The crypto verify backend metadata surface adds:

```
latticra_seal_crypto_verify_backend_t
latticra_seal_crypto_verify_backend_error_t
latticra_seal_crypto_verify_backend_error_label
latticra_seal_crypto_verify_backend_from_policy
latticra_seal_crypto_verify_backend_is_metadata_only
latticra_seal_crypto_verify_backend_report
```

Backend behavior

The implementation:

```
accepts a valid verification policy metadata record
copies verification policy profile metadata
copies signature profile metadata
copies manifest profile metadata
copies artifact digest algorithm metadata
copies artifact digest hex metadata
copies signer identity metadata
copies signature algorithm metadata
copies public-key identity metadata
copies trust-source metadata
accepts only the Ed25519-development signature algorithm label
sets crypto_verify_state=unsupported
sets cryptographic_verification_supported=0
sets cryptographic_verification_performed=0
sets verified=0
sets invalid=0
sets authority_usable=0
sets capability_gate_allowed=0
sets runtime_authority_granted=0
renders deterministic crypto verify backend metadata
```

Boundary

This implementation does not verify signatures, parse public keys, create keys, store keys, contact networks, query revocation status, persist verification decisions, seal objects, enforce capabilities, read host files, write host files, execute network behavior, call runtime components, or grant runtime authority.

It is metadata only.

Failure behavior

The implementation fails closed:

```
null crypto verify backend output -&gt; LATTICRA_STATUS_NULL_ARGUMENT
null verification policy metadata input -&gt; invalid-input
invalid verification policy metadata -&gt; invalid-policy
missing artifact digest -&gt; missing-digest
missing signer identity -&gt; missing-signer
missing public-key identity -&gt; missing-public-key-identity
unsupported algorithm label -&gt; unsupported-algorithm
small report buffer -&gt; LATTICRA_STATUS_BUFFER_TOO_SMALL
```

Failures do not create keys, store secrets, contact networks, verify records, sign records, read host files, write host files, enforce capabilities, perform effects, or grant runtime authority.

Invariants

The invariant test verifies:

```
valid verification policy metadata produces deterministic crypto verify backend metadata
backend profile is set
verification policy profile is copied
signature profile is copied
manifest profile is copied
artifact digest algorithm is copied
artifact digest hex is copied
signer identity label is copied
signature algorithm label is copied
public-key identity label is copied
trust source is copied
crypto_verify_state remains unsupported
cryptographic_verification_supported remains zero
cryptographic_verification_performed remains zero
verified remains zero
invalid remains zero
authority_usable remains zero
capability_gate_allowed remains zero
runtime_authority_granted remains zero
small report buffer fails closed
null inputs fail closed
invalid verification policy metadata fails closed
missing digest fails closed
missing signer fails closed
missing public-key identity fails closed
unsupported algorithm fails closed
```

Validation

Run locally:

```
tmpdir=&quot;$(mktemp -d &quot;${TMPDIR:-/tmp}/latticra-seal-crypto.XXXXXX&quot;)&quot;
trap &#x27;rm -rf &quot;$tmpdir&quot;&#x27; EXIT INT HUP TERM
cc -std=c99 -Wall -Wextra -Werror -pedantic -Iinclude src/seal_crypto_verify_backend.c
tests/seal_crypto_verify_backend_invariants.c -o
&quot;$tmpdir/latticra-seal-crypto-verify-backend-invariants&quot;
&quot;$tmpdir/latticra-seal-crypto-verify-backend-invariants&quot;
```

Expected output:

```
seal crypto verify backend invariants: ok
```

Next valid slice

The next valid Latticra Seal slice is an Ed25519 verify-only implementation contract.

That future slice must be contract-first and must not be added directly to this metadata implementation.

docs/LATTICRA_SEAL_ED25519_VERIFY_IMPLEMENTATION.md

Source title: Latticra Seal Ed25519 Verify-Only Implementation

Lines: 78 | Words: 222 | SHA-256: beb8c344125f14c46b683db50ad367cb6f0561a40578ffb7dc1124833fbd8db2

Latticra Seal Ed25519 Verify-Only Implementation

Status: initial Ed25519 verify-only local implementation Scope: provider-backed local Ed25519 verification result surface after the Ed25519 verify-only contract.

Purpose

This document records the first local Ed25519 verify-only implementation for Latticra Seal.

The implementation accepts caller-supplied message bytes, caller-supplied public key bytes, caller-supplied signature bytes, and an existing crypto verify backend metadata record.

It produces bounded verification result metadata.

Added files

```
include/latticra/seal_ed25519_verify.h
src/seal_ed25519_verify.c
tests/seal_ed25519_verify_invariants.c
scripts/test-latticra-seal-ed25519-verify.sh
```

Provider boundary

The implementation uses OpenSSL EVP Ed25519 verification and does not implement custom curve arithmetic.

The test runner links with:

```
-lcrypto
```

Behavior

The implementation:

```
accepts a valid crypto verify backend metadata record
accepts Ed25519-development as the only supported algorithm label
accepts caller-supplied message bytes
accepts caller-supplied 32-byte Ed25519 public key bytes
accepts caller-supplied 64-byte Ed25519 signature bytes
computes a SHA-256 digest of the message for reporting
calls the OpenSSL EVP Ed25519 verify provider
records crypto_verify_state=verified on success
records crypto_verify_state=invalid-signature on signature failure
renders deterministic verification result metadata
```

Authority boundary

A successful verification result remains authority-neutral.

These fields remain zero:

```
authority_usable=0
capability_gate_allowed=0
runtime_authority_granted=0
```

Validation

Run locally:

```
sh scripts/test-latticra-seal-ed25519-verify.sh
```

Expected output:

```
seal ed25519 verify invariants: ok
```

Next valid slice

The next valid Latticra Seal slice is verified receipt promotion from a successful verify-only result.

docs/LATTICRA_SEAL_ED25519_VERIFY_ONLY_CONTRACT.md

Source title: Latticra Seal Ed25519 Verify-Only Contract

Lines: 215 | Words: 582 | SHA-256: 2c299533676dc18c7833729a8dad5ac32442d80fb628b8155d416a06b5fe3794

Latticra Seal Ed25519 Verify-Only Contract

Status: Latticra Seal Ed25519 verify-only implementation contract Scope: contract for a future Ed25519 verify-only implementation after the crypto verify backend metadata surface. This document does not implement verification. It does not implement signing, key generation, private-key storage, public-key trust stores, network lookup, revocation lookup, object sealing, capability enforcement, runtime authority, host effects, kernel behavior, Fedora approval claims, production readiness, or operating-system behavior.

Purpose

This document defines the first real cryptographic operation that may become valid inside Latticra Seal: local Ed25519 signature verification.

The purpose of this layer is narrow:

```
caller-supplied manifest bytes
caller-supplied Ed25519 public key bytes
caller-supplied Ed25519 signature bytes
local verify-only operation
bounded verification result metadata
```

A successful Ed25519 verification result may not directly grant capability, effect, or runtime authority.

Required predecessors

This contract depends on:

```
docs/LATTICRA_SEAL_CRYPTO_VERIFY_BACKEND_CONTRACT.md
include/latticra/seal_crypto_verify_backend.h
src/seal_crypto_verify_backend.c
tests/seal_crypto_verify_backend_invariants.c
include/latticra/seal_verification_policy.h
src/seal_verification_policy.c
include/latticra/seal_signature.h
src/seal_signature.c
```

The crypto verify backend metadata surface remains the source of truth until a separate implementation slice adds actual Ed25519 verification.

Verify-only boundary

Allowed in the next implementation slice:

```
accept caller-supplied message bytes
accept caller-supplied Ed25519 public key bytes
accept caller-supplied Ed25519 signature bytes
validate bounded input lengths
call a reviewed Ed25519 verification provider
record verification attempted
record verification success or failure
render deterministic verification result metadata
```

Forbidden in the next implementation slice:

```
signature generation
private-key input
private-key storage
key generation
custom curve math
network lookup
revocation lookup
trust-store loading
capability enforcement
effect execution
host reads
host writes
runtime authority grants
kernel interaction
```

Primitive policy

The implementation must use Ed25519 verification only.

Required labels:

```
signature_algorithm=Ed25519-development
crypto_verify_state=verified
crypto_verify_state=invalid-signature
crypto_verify_state=unsupported-algorithm
```

No custom cryptographic primitive may be introduced.

The implementation must not contain handwritten Ed25519 curve arithmetic. It must use a reviewed provider boundary selected in the implementation plan.

Planned input policy

The future implementation should use bounded input records.

Planned constants:

```
ed25519_public_key_bytes=32
ed25519_signature_bytes=64
message_size_max=65536
```

Planned input fields:

```
message_label
message_size_bytes
message_digest_algorithm
message_digest_hex
public_key_identity_label
public_key_size_bytes
signature_algorithm
signature_size_bytes
trust_source
```

Planned result fields

A future Ed25519 verify-only result should be bounded and deterministic.

Planned fields:

```
ed25519_verify_profile
backend_profile
verification_policy_profile
message_label
message_size_bytes
message_digest_algorithm
message_digest_hex
public_key_identity_label
public_key_size_bytes
signature_algorithm
signature_size_bytes
trust_source
crypto_verify_state
cryptographic_verification_supported
cryptographic_verification_performed
verified
invalid
authority_usable
capability_gate_allowed
runtime_authority_granted
status
```

A successful verification result may set:

```
cryptographic_verification_supported=1
cryptographic_verification_performed=1
verified=1
invalid=0
crypto_verify_state=verified
```

Even after success, these must remain zero:

```
authority_usable=0
capability_gate_allowed=0
runtime_authority_granted=0
```

A failed verification result must set:

```
cryptographic_verification_supported=1
cryptographic_verification_performed=1
verified=0
invalid=1
crypto_verify_state=invalid-signature
```

Failure behavior

Future Ed25519 verify-only handling must fail closed.

Required failure states:

```
null output -&gt; invalid
null message -&gt; invalid
empty message -&gt; invalid
message too large -&gt; invalid
null public key -&gt; missing-public-key
wrong public key size -&gt; invalid-public-key-size
null signature -&gt; missing-signature
wrong signature size -&gt; invalid-signature-size
unsupported algorithm -&gt; unsupported-algorithm
provider failure -&gt; verification-provider-failure
private-key input -&gt; rejected
runtime authority request -&gt; rejected
```

Failures must not create keys, store keys, contact networks, query revocation status, sign records, read host files, write host files, enforce capabilities, perform effects, or grant runtime authority.

Promotion rule

This contract permits only the next implementation slice:

```
Ed25519 verify-only local implementation
```

It does not permit signing, key generation, private-key handling, trust-store behavior, revocation lookup, object sealing, capability enforcement, network behavior, host effects, or runtime authority.

After Ed25519 verify-only implementation exists and is guarded, the next valid planning slice is verified receipt promotion from a successful verify-only result.

Validation

This contract is validated by:

```
sh scripts/test-latticra-seal-ed25519-verify-only-contract.sh
```

docs/LATTICRA_SEAL_EFFECT_DECISION_CONTRACT.md

Source title: Latticra Seal Effect Decision Contract

Lines: 213 | Words: 624 | SHA-256: c0cb5354512888b7872eb327648bc0ea5add1b4ad4be9dc1eb11e0fdcedac6ea

Latticra Seal Effect Decision Contract

Status: Latticra Seal effect decision contract Scope: contract for future effect decision metadata after capability gate metadata. This document does not implement effect execution, capability enforcement, runtime authority, cryptographic verification, verified receipts, public-key parsing, public-key trust stores, key generation, private-key storage, hardware key use, network trust lookup, revocation lookup, object sealing, host reads, host writes, kernel behavior, Fedora approval claims, production readiness, or operating-system behavior.

Purpose

This document defines the Latticra Seal effect decision layer.

The purpose of this layer is to decide how a future capability gate record may be represented as an effect decision before any requested effect can become eligible for execution.

This document does not implement effect decisions.

Required predecessors

This contract depends on:

```
docs/LATTICRA_SEAL_CONTRACT.md
docs/LATTICRA_SEAL_MEASUREMENT_IMPLEMENTATION.md
docs/LATTICRA_SEAL_SIGNED_MANIFEST_IMPLEMENTATION.md
docs/LATTICRA_SEAL_SIGNATURE_POLICY_IMPLEMENTATION.md

```

The capability gate metadata surface remains denied metadata until cryptographic verification, verified receipt behavior, and real capability enforcement exist.

Effect boundary

No gate becomes an executable effect.

No denied gate may produce an allowed effect decision.

No effect decision may perform host reads, host writes, network access, kernel interaction, or runtime authority until a later runtime-boundary implementation explicitly permits and guards those behaviors.

Allowed in this contract slice:

```
effect decision vocabulary
decision-state labels
requested effect metadata planning
requested capability metadata planning
no-effect posture planning
failure-state planning
promotion rules
non-claims
static guard validation
```

Forbidden in this contract slice:

```
effect execution
host reads
host writes
network access
runtime authority grants
capability enforcement
cryptographic verification
verified receipt generation
public-key parsing
public-key trust store loading
private-key handling
key generation
signature generation
revocation lookup
object sealing
kernel interaction
```

Initial decision policy

The initial effect decision policy is denied by default.

```
denied gate metadata may be inspected
gate_allowed=0 must deny effect decisions
runtime_authority_granted=0 must remain zero
unknown requested effect must deny
unknown requested capability must deny
effect_performed must remain zero
host_read_performed must remain zero
host_write_performed must remain zero
network_performed must remain zero
```

The first implementation after this contract may only add metadata fields and denied-state handling. It must not perform effects.

Planned decision states

Future records should use explicit labels:

```
decision_state=unsupported
decision_state=denied-gate
decision_state=denied-unverified
decision_state=denied-unsupported
decision_state=denied-policy
decision_state=allowed-metadata-only
decision_state=allowed-runtime-gated
```

For the next implementation, the expected state is:

```
decision_state=denied-gate
```

Planned decision fields

A future effect decision record should be bounded and deterministic.

Planned fields:

```
decision_profile
gate_profile
receipt_profile
artifact_digest_algorithm
artifact_digest_hex
requested_capability
requested_effect
requested_scope
gate_state
gate_allowed
effect_allowed
effect_performed
host_read_performed
host_write_performed
network_performed
runtime_authority_granted
status
```

Initial values before real effect handling:

```
gate_allowed=0
effect_allowed=0
effect_performed=0
host_read_performed=0
host_write_performed=0
network_performed=0
runtime_authority_granted=0
decision_state=denied-gate
status=effect-decision-contract-only
```

Failure behavior

Future effect decision handling must fail closed.

Required failure states:

```
null capability gate metadata -&gt; invalid
invalid capability gate metadata -&gt; invalid
missing artifact digest -&gt; invalid
```

```
missing requested capability -&gt; denied
missing requested effect -&gt; denied
unknown requested capability -&gt; denied
unknown requested effect -&gt; denied
gate_allowed=0 -&gt; denied-gate
runtime authority request -&gt; rejected
```

Failures must not parse keys, create keys, persist secrets, contact networks, query revocation status, verify records, sign records, read host files, write host files, enforce capabilities, execute effects, or grant runtime authority.

Promotion rule

This contract permits only the next implementation slice:

```
effect decision metadata implementation
```

It does not permit effect execution, capability enforcement, runtime authority, cryptographic verification, verified receipt generation, key handling, trust-store behavior, revocation lookup, object sealing, network behavior, host reads, host writes, or kernel behavior.

After effect decision metadata exists and is guarded, the next valid planning slice is a runtime handoff contract.

Validation

This contract is validated by:

```
sh scripts/test-latticra-seal-effect-decision-contract.sh
```

docs/LATTICRA_SEAL_EFFECT_DECISION_IMPLEMENTATION.md

Source title: Latticra Seal Effect Decision Implementation

Lines: 135 | Words: 516 | SHA-256: e5b9f0976000e0bf80bfdfc2fbdf6c000e13f8581f9251f6a93fb53e5b69d779

Latticra Seal Effect Decision Implementation

Status: initial effect decision metadata implementation Scope: bounded C metadata surface for effect decision posture after capability gate metadata. This slice does not implement effect execution, capability enforcement, runtime authority, cryptographic verification, verified receipts, public-key parsing, public-key trust stores, key generation, private-key storage, hardware key use, network trust lookup, revocation lookup, object sealing, host reads, host writes, kernel behavior, Fedora approval claims, production readiness, or operating-system behavior.

Purpose

This document records the first Latticra Seal effect decision metadata implementation.

The implementation accepts an existing capability gate metadata record and produces deterministic effect decision metadata. It does not perform effects and does not treat a denied gate as authority.

Added files

```
include/latticra/seal_effect_decision.h
src/seal_effect_decision.c
tests/seal_effect_decision_invariants.c
scripts/test-latticra-seal-effect-decision.sh
```

API summary

The effect decision metadata surface adds:

```
latticra_seal_effect_decision_t
latticra_seal_effect_decision_error_t
```

```
latticra_seal_effect_decision_error_label
latticra_seal_effect_decision_from_gate
latticra_seal_effect_decision_is_denied_metadata
latticra_seal_effect_decision_report
```

Decision behavior

The implementation:

```
accepts a valid capability gate metadata record
copies gate profile metadata
copies receipt profile metadata
copies artifact digest algorithm metadata
copies artifact digest hex metadata
copies requested capability metadata
copies requested effect metadata
copies requested scope metadata
copies gate_state
sets decision_state=denied-gate
copies gate_allowed from the gate
sets effect_allowed=0
sets effect_performed=0
sets host_read_performed=0
sets host_write_performed=0
sets network_performed=0
sets runtime_authority_granted=0
renders deterministic effect decision metadata
```

Boundary

This implementation does not verify signatures, parse public keys, create keys, store keys, contact networks, query revocation status, persist decisions, enforce capabilities, perform host reads, perform host writes, execute network behavior, or grant runtime authority.

It is metadata only.

Failure behavior

The implementation fails closed:

```
null effect decision output -&gt; LATTICRA_STATUS_NULL_ARGUMENT
null capability gate metadata input -&gt; invalid-input
invalid capability gate metadata -&gt; invalid-gate
missing artifact digest -&gt; missing-digest
missing requested capability -&gt; missing-requested-capability
missing requested effect -&gt; missing-requested-effect
small report buffer -&gt; LATTICRA_STATUS_BUFFER_TOO_SMALL
```

Failures do not parse keys, create keys, persist secrets, contact networks, verify records, sign records, read host files, write host files, enforce capabilities, perform effects, or grant runtime authority.

Invariants

The invariant test verifies:

```
valid capability gate metadata produces deterministic effect decision metadata
gate profile is copied
receipt profile is copied
artifact digest algorithm is copied
artifact digest hex is copied
requested capability is copied
requested effect is copied
requested scope is copied
gate_state is copied
decision_state remains denied-gate
gate_allowed remains zero
effect_allowed remains zero
effect_performed remains zero
host_read_performed remains zero
host_write_performed remains zero
network_performed remains zero
runtime_authority_granted remains zero
small report buffer fails closed
```

```
null inputs fail closed
invalid capability gate metadata fails closed
missing digest fails closed
missing requested capability fails closed
missing requested effect fails closed
```

Validation

Run:

```
sh scripts/test-latticra-seal-effect-decision-contract.sh
sh scripts/test-latticra-seal-effect-decision.sh
sh scripts/test-latticra-seal-effect-decision-status.sh
sh scripts/test-latticra-seal-runtime-handoff-status.sh
```

Expected output:

```
seal effect decision contract: ok
seal effect decision invariants: ok
seal effect decision status: ok
seal runtime handoff status: ok
```

Next valid slice

The next valid Latticra Seal slice is status rollup status/public-entry alignment.

That future slice must not add runtime execution, effect execution, capability enforcement, runtime authority, cryptographic verification, verified receipt authority, signing, host behavior, network behavior, or object sealing unless separately implemented and guarded.

docs/LATTICRA_SEAL_FUTURE_KEY_PARSING_IMPLEMENTATION.md

Source title: Latticra Seal Future Key Parsing Implementation

Lines: 221 | Words: 599 | SHA-256: 7a8a60e002fa53f6959c762b53b3a56ac8f1a6203873279ccce8f0eb14356ab7

Latticra Seal Future Key Parsing Implementation

Status: initial bounded no-effect key parsing implementation Scope: bounded C metadata surface for parsing caller-provided public-key bytes after ready public-key parsing metadata. This slice does not load key material, handle private keys, generate keys, use hardware keys, load trust stores, perform revocation lookup, sign, verify signatures, invoke a signer, execute a signer process, seal objects, perform runtime handoff, grant runtime authority, read host files, write host files, use networks, execute shells, execute tools, enforce capabilities, persist policy, interact with kernels, claim Fedora approval, claim production readiness, or change operating-system behavior.

Purpose

This document records the first Latticra Seal key parsing implementation.

The implementation consumes ready public-key parsing metadata and caller-provided public-key bytes.

It parses only fixed-size public-key byte forms into metadata.

It does not load key material.

It does not handle private keys.

It does not sign.

It does not verify signatures.

Files

```
include/latticra/seal_key_parsing.h
src/seal_key_parsing.c
tests/seal_key_parsing_invariants.c
scripts/test-latticra-seal-key-parsing.sh
docs/LATTICRA_SEAL_FUTURE_KEY_PARSING_IMPLEMENTATION.md
```

Required predecessors

This implementation depends on the future key parsing implementation plan, the future key parsing implementation contract, and the public-key parsing metadata/status surface:

```
docs/LATTICRA_SEAL_FUTURE_KEY_PARSING_IMPLEMENTATION_PLAN.md
docs/LATTICRA_SEAL_FUTURE_KEY_PARSING_IMPLEMENTATION_CONTRACT.md
docs/LATTICRA_SEAL_PUBLIC_KEY_PARSING_CONTRACT.md
docs/LATTICRA_SEAL_PUBLIC_KEY_PARSING_IMPLEMENTATION.md
docs/status/SEAL_PUBLIC_KEY_PARSING_STATUS.md
include/latticra/seal_public_key_parsing.h
src/seal_public_key_parsing.c
tests/seal_public_key_parsing_invariants.c
scripts/test-latticra-seal-future-key-parsing-implementation-plan.sh
scripts/test-latticra-seal-future-key-parsing-implementation-contract.sh
scripts/test-latticra-seal-public-key-parsing-contract.sh
scripts/test-latticra-seal-public-key-parsing.sh
scripts/test-latticra-seal-public-key-parsing-status.sh
```

Implemented surface

The key parsing metadata surface adds:

```
latticra_seal_key_parsing_error_t
latticra_seal_key_parsing_format_t
latticra_seal_key_parsing_input_t
latticra_seal_key_parsing_result_t
latticra_seal_key_parsing_error_label
latticra_seal_key_parsing_format_label
latticra_seal_key_parsing_from_public_key_bytes
latticra_seal_key_parsing_is_no_effect
latticra_seal_key_parsing_render
```

The implementation accepts:

```
LATTICRA_SEAL_KEY_PARSING_FORMAT_ED25519_RAW_PUBLIC_KEY_32
LATTICRA_SEAL_KEY_PARSING_FORMAT_ED25519_HEX_PUBLIC_KEY_64
```

It records PEM and DER public-key input as unsupported until a separate parser contract exists.

It denies private-key formats and private-key markers.

Even when key_parsing_ready=1, these fields remain zero:

```
key_material_loaded=0
private_key_handling=0
key_generation_performed=0
hardware_key_used=0
trust_store_loaded=0
revocation_lookup_performed=0
signature_performed=0
verification_performed=0
signer_invoked=0
handoff_performed=0
effect_performed=0
runtime_authority_granted=0
host_read_performed=0
host_write_performed=0
network_performed=0
```

Current metadata output

The successful raw Ed25519 public-key byte path renders:

```
key_parsing_profile=latticra-seal-key-parsing/0.1
public_key_parsing_profile=latticra-seal-public-key-parsing/0.1
key_material_profile=latticra-seal-key-material/0.1
requested_key_parsing=public-key-bytes-only
requested_public_key_parsing=metadata-only
```

```
key_parsing_input_format=ed25519-raw-public-key-32
key_parsing_input_length=32
key_parsing_algorithm=Ed25519-development
key_parsing_state=public-key-parsed-metadata-only
key_parsing_ready=1
public_key_parsing_state=public-key-parsing-metadata-only
public_key_parsing_ready=1
public_key_parsed=1
key_material_loaded=0
private_key_handling=0
key_generation_performed=0
hardware_key_used=0
trust_store_loaded=0
revocation_lookup_performed=0
signature_performed=0
verification_performed=0
signer_invoked=0
handoff_performed=0
effect_performed=0
runtime_authority_granted=0
host_read_performed=0
host_write_performed=0
network_performed=0
blocked_reason=none
mode=metadata-only
status=key-parsing-metadata
error=ok
```

The successful hex Ed25519 public-key byte path uses:

```
key_parsing_input_format=ed25519-hex-public-key-64
key_parsing_input_length=64
status=key-parsing-metadata
```

Failure behavior

The implementation fails closed for:

```
null output
null predecessor metadata
invalid predecessor metadata
predecessor public_key_parsing_ready=0
predecessor public_key_parsing_state not public-key-parsing-metadata-only
predecessor requested_public_key_parsing not metadata-only
predecessor public_key_parsed=1
predecessor key_material_loaded=1
predecessor private_key_handling=1
predecessor key_generation_performed=1
predecessor hardware_key_used=1
predecessor trust_store_loaded=1
predecessor revocation_lookup_performed=1
predecessor signature_performed=1
predecessor verification_performed=1
predecessor signer_invoked=1
predecessor handoff_performed=1
predecessor effect_performed=1
predecessor runtime_authority_granted=1
predecessor host_read_performed=1
predecessor host_write_performed=1
predecessor network_performed=1
missing public-key bytes
empty public-key bytes
oversized public-key bytes
raw Ed25519 public-key input not exactly 32 bytes
hex Ed25519 public-key input not exactly 64 ASCII hex bytes
PEM public-key input
DER public-key input
private-key format requests
private key markers
small report buffers
```

Failure records keep authority and effect fields at zero. Denial details are represented by error, key_parsing_state, status, and blocked_reason.

Validation

The implementation is covered by:

```
sh scripts/test-latticra-seal-future-key-parsing-implementation-plan.sh
```

```
sh scripts/test-latticra-seal-key-parsing.sh
sh scripts/test-latticra-seal-key-parsing-status.sh
sh scripts/test-latticra-seal-verification-policy-status.sh
sh scripts/test-latticra-seal-verification-receipt-status.sh
sh scripts/test-latticra-seal-capability-gate-status.sh
sh scripts/test-latticra-seal-effect-decision-status.sh
sh scripts/test-latticra-seal-runtime-handoff-status.sh
sh scripts/test-latticra-seal-public-key-parsing-status.sh
```

Expected output:

```
seal future key parsing implementation plan: ok
seal key parsing invariants: ok
seal key parsing status: ok
seal verification policy status: ok
seal verification receipt status: ok
seal capability gate status: ok
seal effect decision status: ok
seal runtime handoff status: ok
seal public-key parsing status: ok
```

Current next valid slice

The next valid Latticra Seal slice is status rollup status/public-entry alignment or another narrow status/index alignment follow-up.

That future slice must not add runtime execution, effect execution, cryptographic verification, signing, key material loading, private-key handling, key generation, hardware-key use, trust-store behavior, revocation lookup, signer invocation behavior, host behavior, network behavior, runtime authority, capability enforcement, object sealing, or kernel behavior unless separately implemented and guarded.

docs/LATTICRA_SEAL_FUTURE_KEY_PARSING_IMPLEMENTATION_CONTRACT.md

Source title: Latticra Seal Future Key Parsing Implementation Contract

Lines: 197 | Words: 655 | SHA-256: 7a51beb70eab10941a8f32c8cb9a6230541f8f9979d232c6496e7ba5009d7c7f

Latticra Seal Future Key Parsing Implementation Contract

Status: Latticra Seal future key parsing implementation contract Scope: contract for a future Latticra Seal key parsing implementation path after public-key parsing metadata/status readiness. This document is an implementation contract, not implementation. This document does not implement public-key parsing, parse key bytes, load key material, handle private keys, generate keys, use hardware keys, load trust stores, perform revocation lookup, sign, verify signatures, invoke a signer, execute a signer process, seal objects, perform runtime handoff, grant runtime authority, read host files, write host files, use networks, execute shells, execute tools, enforce capabilities, persist policy, interact with kernels, claim Fedora approval, claim production readiness, or change operating-system behavior.

Purpose

This document defines the next Latticra Seal planning boundary after the public-key parsing metadata implementation and status/public-entry alignment.

The purpose of this layer is to require a narrow implementation plan before any future parser is added.

This document does not implement public-key parsing.

It records that the current repository is ready to plan a future key parsing implementation only because the previous no-effect public-key parsing metadata status exists and is guarded.

Required Predecessors

This contract depends on the public-key parsing metadata checkpoint:

```
docs/LATTICRA_SEAL_PUBLIC_KEY_PARSING_CONTRACT.md
docs/LATTICRA_SEAL_PUBLIC_KEY_PARSING_IMPLEMENTATION.md
docs/status/SEAL_PUBLIC_KEY_PARSING_STATUS.md
include/latticra/seal_public_key_parsing.h
src/seal_public_key_parsing.c
tests/seal_public_key_parsing_invariants.c
scripts/test-latticra-seal-public-key-parsing-contract.sh
scripts/test-latticra-seal-public-key-parsing.sh
scripts/test-latticra-seal-public-key-parsing-status.sh
```

It also depends on the key-material metadata predecessor:

```
docs/LATTICRA_SEAL_KEY_MATERIAL_CONTRACT.md
docs/LATTICRA_SEAL_KEY_MATERIAL_IMPLEMENTATION.md
docs/status/SEAL_KEY_MATERIAL_STATUS.md
include/latticra/seal_key_material.h
src/seal_key_material.c
tests/seal_key_material_invariants.c
scripts/test-latticra-seal-key-material-contract.sh
scripts/test-latticra-seal-key-material.sh
scripts/test-latticra-seal-key-material-status.sh
```

Current Evidence Gate

The future implementation path may only start from these existing metadata facts:

```
seal_public_key_parsing_status_present=1
seal_public_key_parsing_metadata_present=1
public_key_parsing_profile=latticra-seal-public-key-parsing/0.1
requested_public_key_parsing=metadata-only
public_key_parsing_state=public-key-parsing-metadata-only
public_key_parsing_ready=1
key_material_profile=latticra-seal-key-material/0.1
requested_key_material=metadata-only
key_material_state=key-material-metadata-only
key_material_ready=1
```

The current checkpoint remains no-effect:

```
public_key_parsed=0
key_material_loaded=0
private_key_handling=0
key_generation_performed=0
hardware_key_used=0
trust_store_loaded=0
revocation_lookup_performed=0
signature_performed=0
verification_performed=0
signer_invoked=0
handoff_performed=0
effect_performed=0
runtime_authority_granted=0
host_read_performed=0
host_write_performed=0
network_performed=0
```

Future Implementation Contract

A future key parsing implementation plan may define:

```
bounded public-key input representation
bounded parser result representation
deterministic parser status labels
fixed input-size limits
explicit accepted encoding labels
explicit denied encoding labels
fail-closed invalid-input behavior
rendered no-effect parser evidence
focused invariants before parser behavior merges
public status alignment before parser behavior is claimed
```

The next planning slice must still keep:

```
future_key_parsing_contract_present=1
future_key_parsing_implementation_plan_present=1
```

```
future_key_parsing_implementation_present=0
public_key_parser_implementation_present=0
public_key_parsed=0
key_material_loaded=0
private_key_handling=0
signature_performed=0
verification_performed=0
signer_invoked=0
runtime_authority_granted=0
host_read_performed=0
host_write_performed=0
network_performed=0
```

No public_key_parsed=1 status may appear until a separate implementation slice adds parser code, parser invariants, public docs, and explicit guard coverage.

Forbidden In This Contract

This contract does not permit:

```
public-key parsing implementation
public-key byte parsing
public-key file loading
key material loading
private-key handling
key generation
hardware-key use
trust-store loading
revocation lookup
cryptographic signing
signature verification
signer process invocation
runtime handoff execution
runtime authority grants
host reads
host writes
network access
shell execution
tool execution
capability enforcement
policy persistence
object sealing
kernel interaction
```

Failure Boundary

Future implementation planning must fail closed if any predecessor metadata reports an effect or any requested path exceeds metadata-only readiness.

Denied predecessor signals include:

```
public_key_parsing_ready=0
public_key_parsing_state not public-key-parsing-metadata-only
requested_public_key_parsing not metadata-only
key_material_ready=0
key_material_state not key-material-metadata-only
requested_key_material not metadata-only
public_key_parsed=1
key_material_loaded=1
private_key_handling=1
signature_performed=1
verification_performed=1
signer_invoked=1
runtime_authority_granted=1
host_read_performed=1
host_write_performed=1
network_performed=1
```

Failures must not sign, verify signatures, invoke a signer, parse public keys, load key material, handle private keys, generate keys, use hardware keys, load trust stores, look up revocation status, read host files, write host files, contact networks, execute tools, execute shells, enforce capabilities, perform runtime handoff, persist policy, seal objects, or grant runtime authority.

Validation

This contract is validated by:

```
sh scripts/test-latticra-seal-future-key-parsing-implementation-contract.sh
```

Expected output:

```
seal future key parsing implementation contract: ok
```

Next Valid Slice

After the future key parsing implementation plan exists and is guarded, the next valid Latticra Seal slice is bounded no-effect key parsing implementation or another narrow status/index alignment follow-up.

That future implementation slice may add guarded public-key byte parsing metadata only. It must not add key material loading, private-key handling, key generation, hardware-key use, trust-store behavior, signing, verification, signer invocation behavior, host behavior, network behavior, runtime authority, capability enforcement, object sealing, or kernel behavior.

docs/LATTICRA_SEAL_FUTURE_KEY_PARSING_IMPLEMENTATION_PLAN.md

Source title: Latticra Seal Future Key Parsing Implementation Plan

Lines: 387 | Words: 1015 | SHA-256: e0dadfd87639750ac2e4651a23a72de2402cb1ea165ac2c7c9d92ba91cd8c368

Latticra Seal Future Key Parsing Implementation Plan

Status: implementation planning contract for a future bounded no-effect Latticra Seal key parsing surface Scope: implementation plan only after the Latticra Seal future key parsing implementation contract. This document does not implement public-key parsing, parse key bytes, load key material, handle private keys, generate keys, use hardware keys, load trust stores, perform revocation lookup, sign, verify signatures, invoke a signer, execute a signer process, seal objects, perform runtime handoff, grant runtime authority, read host files, write host files, use networks, execute shells, execute tools, enforce capabilities, persist policy, interact with kernels, claim Fedora approval, claim production readiness, or change operating-system behavior.

Purpose

This plan defines the exact future implementation shape for a bounded no-effect Seal key parsing layer.

The future implementation may parse caller-provided public-key bytes into metadata only. It must not load key material from files, handle private keys, consult trust stores, verify signatures, perform signing, contact networks, or grant authority.

This document is a plan, not parser code.

Required Contract

The implementation plan depends on:

```
docs/LATTICRA_SEAL_FUTURE_KEY_PARSING_IMPLEMENTATION_CONTRACT.md
scripts/test-latticra-seal-future-key-parsing-implementation-contract.sh
docs/LATTICRA_SEAL_PUBLIC_KEY_PARSING_CONTRACT.md
docs/LATTICRA_SEAL_PUBLIC_KEY_PARSING_IMPLEMENTATION.md
docs/status/SEAL_PUBLIC_KEY_PARSING_STATUS.md
include/latticra/seal_public_key_parsing.h
src/seal_public_key_parsing.c
tests/seal_public_key_parsing_invariants.c
scripts/test-latticra-seal-public-key-parsing-contract.sh
scripts/test-latticra-seal-public-key-parsing.sh
scripts/test-latticra-seal-public-key-parsing-status.sh
```

The contract and predecessor metadata/status guards must remain merged and green before implementation code is added.

Future Files

The future implementation slice should add:

```
include/latticra/seal_key_parsing.h
src/seal_key_parsing.c
tests/seal_key_parsing_invariants.c
scripts/test-latticra-seal-key-parsing.sh
docs/LATTICRA_SEAL_FUTURE_KEY_PARSING_IMPLEMENTATION.md
```

A later status/public-entry slice may add:

```
docs/status/SEAL_KEY_PARSING_STATUS.md
scripts/test-latticra-seal-key-parsing-status.sh
```

Header API Plan

The future header should define:

```
LATTICRA_SEAL_KEY_PARSING_PROFILE_MAX
LATTICRA_SEAL_KEY_PARSING_LABEL_MAX
LATTICRA_SEAL_KEY_PARSING_FORMAT_MAX
LATTICRA_SEAL_KEY_PARSING_ALGORITHM_MAX
LATTICRA_SEAL_KEY_PARSING_REASON_MAX
LATTICRA_SEAL_KEY_PARSING_STATUS_MAX
LATTICRA_SEAL_KEY_PARSING_INPUT_MAX 4096u
LATTICRA_SEAL_KEY_PARSING_REPORT_MAX 8192u
latticra_seal_key_parsing_error_t
latticra_seal_key_parsing_format_t
latticra_seal_key_parsing_input_t
latticra_seal_key_parsing_result_t
latticra_seal_key_parsing_error_label
latticra_seal_key_parsing_format_label
latticra_seal_key_parsing_from_public_key_bytes
latticra_seal_key_parsing_is_no_effect
latticra_seal_key_parsing_render
```

Recommended function signatures:

```
const char *latticra_seal_key_parsing_error_label(latticra_seal_key_parsing_error_t error);
const char *latticra_seal_key_parsing_format_label(latticra_seal_key_parsing_format_t format);

latticra_status_t latticra_seal_key_parsing_from_public_key_bytes(
    const latticra_seal_public_key_parsing_t *predecessor,
    const unsigned char *public_key_bytes,
    size_t public_key_len,
    latticra_seal_key_parsing_format_t requested_format,
    latticra_seal_key_parsing_result_t *out);

int latticra_seal_key_parsing_is_no_effect(
    const latticra_seal_key_parsing_result_t *key_parsing);

latticra_status_t latticra_seal_key_parsing_render(
    const latticra_seal_key_parsing_result_t *key_parsing,
    char *buffer,
    size_t buffer_len);
```

The first implementation should parse and report public-key byte metadata only. It must not open files or load key material.

Format Model

The future format enum should include:

```
LATTICRA_SEAL_KEY_PARSING_FORMAT_ED25519_RAW_PUBLIC_KEY_32
LATTICRA_SEAL_KEY_PARSING_FORMAT_ED25519_HEX_PUBLIC_KEY_64
LATTICRA_SEAL_KEY_PARSING_FORMAT_PEM_PUBLIC_KEY_UNSUPPORTED
LATTICRA_SEAL_KEY_PARSING_FORMAT_DER_PUBLIC_KEY_UNSUPPORTED
LATTICRA_SEAL_KEY_PARSING_FORMAT_PRIVATE_KEY_DENIED
LATTICRA_SEAL_KEY_PARSING_FORMAT_UNKNOWN
```

Stable labels:

```
ed25519-raw-public-key-32
ed25519-hex-public-key-64
```

```
pem-public-key-unsupported
der-public-key-unsupported
private-key-denied
unknown
```

The first implementation may accept only fixed-size Ed25519 public-key byte forms. PEM and DER are explicitly planned as unsupported until a separate parser contract exists.

Error Model

The future error enum should include:

```
LATTICRA_SEAL_KEY_PARSING_OK
LATTICRA_SEAL_KEY_PARSING_INVALID_INPUT
LATTICRA_SEAL_KEY_PARSING_INVALID_PREDECESSOR
LATTICRA_SEAL_KEY_PARSING_PREDECESSOR_NOT_READY
LATTICRA_SEAL_KEY_PARSING_UNSUPPORTED_FORMAT
LATTICRA_SEAL_KEY_PARSING_OVERSIZED_INPUT
LATTICRA_SEAL_KEY_PARSING_INVALID_PUBLIC_KEY_BYTES
LATTICRA_SEAL_KEY_PARSING_PRIVATE_KEY_DENIED
LATTICRA_SEAL_KEY_PARSING_KEY_MATERIAL_LOADING_DENIED
LATTICRA_SEAL_KEY_PARSING_TRUST_STORE_DENIED
LATTICRA_SEAL_KEY_PARSING_REVOCATION_DENIED
LATTICRA_SEAL_KEY_PARSING_EFFECT_DENIED
LATTICRA_SEAL_KEY_PARSING_BUFFER_TOO_SMALL
```

Record Fields

The future result record should include:

```
key_parsing_profile
public_key_parsing_profile
key_material_profile
requested_key_parsing
requested_public_key_parsing
key_parsing_input_format
key_parsing_input_length
key_parsing_algorithm
key_parsing_state
key_parsing_ready
public_key_parsing_state
public_key_parsing_ready
public_key_parsed
key_material_loaded
private_key_handling
key_generation_performed
hardware_key_used
trust_store_loaded
revocation_lookup_performed
signature_performed
verification_performed
signer_invoked
handoff_performed
effect_performed
runtime_authority_granted
host_read_performed
host_write_performed
network_performed
blocked_reason
mode
status
error
```

Plan-Time Checkpoint

This planning slice kept the repository in a no-parser state before the implementation slice was added:

```
future_key_parsing_contract_present=1
future_key_parsing_implementation_plan_present=1
future_key_parsing_implementation_present=0
public_key_parser_implementation_present=0
key_parsing_header_present=0
key_parsing_source_present=0
key_parsing_invariant_test_present=0
public_key_parsed=0
key_material_loaded=0
private_key_handling=0
```

```
signature_performed=0
verification_performed=0
signer_invoked=0
runtime_authority_granted=0
host_read_performed=0
host_write_performed=0
network_performed=0
```

Future Successful Result

The future implementation may emit for a valid caller-provided 32-byte Ed25519 public key:

```
key_parsing_profile=latticra-seal-key-parsing/0.1
requested_key_parsing=public-key-bytes-only
key_parsing_input_format=ed25519-raw-public-key-32
key_parsing_input_length=32
key_parsing_algorithm=Ed25519-development
key_parsing_state=public-key-parsed-metadata-only
key_parsing_ready=1
public_key_parsing_state=public-key-parsing-metadata-only
public_key_parsing_ready=1
public_key_parsed=1
key_material_loaded=0
private_key_handling=0
key_generation_performed=0
hardware_key_used=0
trust_store_loaded=0
revocation_lookup_performed=0
signature_performed=0
verification_performed=0
signer_invoked=0
handoff_performed=0
effect_performed=0
runtime_authority_granted=0
host_read_performed=0
host_write_performed=0
network_performed=0
blocked_reason=none
mode=metadata-only
status=key-parsing-metadata
```

The future implementation must never set key_material_loaded=1, private_key_handling=1, signature_performed=1, verification_performed=1, host_read_performed=1, host_write_performed=1, network_performed=1, or runtime_authority_granted=1.

Failure Behavior

The future builder should:

```
reject null output
reject null predecessor metadata
reject predecessor public_key_parsing_ready=0
reject predecessor public_key_parsing_state not public-key-parsing-metadata-only
reject predecessor requested_public_key_parsing not metadata-only
reject predecessor public_key_parsed=1
reject predecessor key_material_loaded=1
reject predecessor private_key_handling=1
reject predecessor signature_performed=1
reject predecessor verification_performed=1
reject predecessor signer_invoked=1
reject predecessor runtime_authority_granted=1
reject predecessor host_read_performed=1
reject predecessor host_write_performed=1
reject predecessor network_performed=1
reject null public-key bytes
reject zero-length public-key bytes
reject oversized public-key bytes
reject unsupported format labels
reject PEM private-key markers
reject DER private-key requests
reject trust-store requests
reject revocation lookup requests
clear output on small report buffers
render deterministic metadata only
```

Failures must not sign, verify signatures, invoke a signer, load key material, handle private keys, generate keys, use hardware keys, load trust stores, look up revocation status, read host files, write host files, contact networks, execute tools, execute shells, enforce capabilities, perform runtime handoff, persist policy, seal objects, or grant runtime authority.

Required Report Format

The report should begin with:

```
LATTICRA SEAL KEY PARSING
```

It should render all fields as stable key=value lines.

Required report fields:

```
key_parsing_profile=latticra-seal-key-parsing/0.1
requested_key_parsing
key_parsing_input_format
key_parsing_input_length
key_parsing_algorithm=Ed25519-development
key_parsing_state
key_parsing_ready
public_key_parsed
key_material_loaded=0
private_key_handling=0
signature_performed=0
verification_performed=0
signer_invoked=0
runtime_authority_granted=0
host_read_performed=0
host_write_performed=0
network_performed=0
blocked_reason
mode=metadata-only
status=key-parsing-metadata
```

Small report buffers fail closed and clear the output buffer.

Exact Implementation Test List

The future implementation test should prove:

```
ed25519 raw public key bytes parse as metadata only
ed25519 hex public key bytes parse as metadata only
public_key_parsed=1 only for valid public-key byte inputs
key_material_loaded=0 after successful parsing
private_key_handling=0 after successful parsing
signature_performed=0 after successful parsing
verification_performed=0 after successful parsing
signer_invoked=0 after successful parsing
runtime_authority_granted=0 after successful parsing
host_read_performed=0 after successful parsing
host_write_performed=0 after successful parsing
network_performed=0 after successful parsing
predecessor not ready fails closed
unsupported format fails closed
private key marker fails closed
oversized input fails closed
small report buffers fail closed
```

Documentation Update Plan

The implementation slice should update:

```
README.md
STATUS.md
docs/FOUNDATION_INDEX.md
docs/status/README.md
docs/status/CURRENT_STATUS.md
docs/project_notes/CURRENT_DIRECTION.md
docs/project_notes/UPCOMING_WORK.md
docs/status/SEAL_PUBLIC_KEY_PARSING_STATUS.md
```

and add:

```
docs/LATTICRA_SEAL_FUTURE_KEY_PARSING_IMPLEMENTATION.md
```

Implementation Gate

Bounded no-effect key parsing implementation code may be added only after this plan is merged.

No key material loading, private-key handling, trust-store behavior, revocation lookup, signing, verification, signer invocation behavior, runtime authority, host behavior, network behavior, capability enforcement, object sealing, or kernel behavior may begin from this plan alone.

Validation

This implementation plan is guarded by:

```
sh scripts/test-latticra-seal-future-key-parsing-implementation-plan.sh
```

Expected output:

```
seal future key parsing implementation plan: ok
```

Next Valid Slice

The next valid Latticra Seal slice after the implementation is key parsing status/public-entry alignment.

That future status slice may publish guarded public-key byte parsing metadata only. It must not add key material loading, private-key handling, key generation, hardware-key use, trust-store behavior, revocation lookup, signing, verification, signer invocation behavior, host behavior, network behavior, runtime authority, capability enforcement, object sealing, or kernel behavior.

docs/LATTICRA_SEAL_GUARDED_ALLOWLIST_CONTRACT.md

Source title: Latticra Seal Guarded Allowlist Contract

Lines: 225 | Words: 685 | SHA-256: fc2374a64d132efccea610757855c0bbe8fb94d639f03869faf6e2950aa1e36a

Latticra Seal Guarded Allowlist Contract

Status: planning contract for a future Latticra Seal guarded allowlist surface Scope: contract-only planning for a future no-effect guarded allowlist layer after the completed Latticra Seal runtime dry-run public-entrypoint alignment. This document does not implement runtime behavior, runtime execution, runtime authority, effect execution, policy enforcement, capability enforcement, cryptographic verification, signature verification, freshness validation, replay detection, tool execution, AI agent execution, model execution, MCP protocol behavior, MCP server behavior, MCP client behavior, host reads, host writes, network behavior, operating-system behavior, production readiness, external endorsement, or authority grants.

Purpose

This contract defines the next safe Latticra Seal step after the runtime dry-run lane became public-entrypoint visible.

The future guarded allowlist surface should answer one question:

```
If a tool name is known to Latticra Seal, can the boundary report that it is only a candidate
for later review while still denying every effect?
```

The answer must remain no-effect, deterministic, local, planning-only, and report-only.

Required prerequisites

A future implementation plan may begin only after these existing layers remain present and guarded:

```
seal_agentic_automation_metadata_present=1
seal_parameter_schema_metadata_present=1
seal_request_freshness_metadata_present=1
seal_signed_request_metadata_present=1
seal_policy_decision_metadata_present=1
seal_policy_decision_report_surface_present=1
seal_runtime_gate_metadata_present=1
seal_runtime_dry_run_metadata_present=1
seal_runtime_dry_run_report_surface_present=1
seal_runtime_dry_run_report_surface_status_present=1
seal_runtime_dry_run_status_index_alignment_present=1
seal_runtime_dry_run_public_entrypoint_alignment_present=1
operator_visible_runtime_dry_run_report=1
core_blocked_case_set_complete=1
```

Future record shape

A future guarded allowlist record should expose bounded metadata fields similar to:

```
guarded_allowlist_profile=latticra-seal-guarded-allowlist/0.1
allowlist_contract_present
allowlist_planning_only
allowlist_source
allowlist_entry_count
allowlist_lookup_performed
requested_tool_name_present
requested_tool_known
requested_tool_unknown
requested_tool_candidate
requested_tool_allow_candidate
allow_candidate_requires_policy_decision
allow_candidate_requires_runtime_gate
allow_candidate_requires_runtime_dry_run
allow_candidate_requires_operator_review
allow_candidate_grants_authority
allow_candidate_executes_tool
allow_candidate_reads_host
allow_candidate_writes_host
allow_candidate_uses_network
default_action
would_allow
would_deny
would_require_operator_review
blocked_reason
report_only
mode
status
```

Required defaults

The initial implementation, if added later, must default to:

```
allowlist_planning_only=1
allowlist_lookup_performed=1
requested_tool_known=0
requested_tool_unknown=1
requested_tool_candidate=0
requested_tool_allow_candidate=0
allow_candidate_requires_policy_decision=1
allow_candidate_requires_runtime_gate=1
allow_candidate_requires_runtime_dry_run=1
allow_candidate_requires_operator_review=1
allow_candidate_grants_authority=0
allow_candidate_executes_tool=0
allow_candidate_reads_host=0
allow_candidate_writes_host=0
allow_candidate_uses_network=0
default_action=deny
would_allow=0
would_deny=1
would_require_operator_review=1
blocked_reason=default-deny-guarded-allowlist
report_only=1
mode=report-only
status=guarded-allowlist-metadata
```

Required denied cases

The guarded allowlist surface must preserve the existing core blocked-request vocabulary:

```
unknown_tool_denied=1
unsigned_request_denied=1
invalid_schema_denied=1
stale_request_denied=1
replayed_request_denied=1
invalid_signature_denied=1
```

Known-tool candidate rule

A known tool name may only become a candidate classification.

A known-tool candidate must still report:

```
requested_tool_known=1
requested_tool_candidate=1
requested_tool_allow_candidate=1
allow_candidate_grants_authority=0
allow_candidate_executes_tool=0
allow_candidate_reads_host=0
allow_candidate_writes_host=0
allow_candidate_uses_network=0
would_allow=0
would_deny=1
would_require_operator_review=1
```

This means a future allowlist match can improve reporting, but cannot authorize execution.

Forbidden behavior

The guarded allowlist layer must not:

```
load production allowlist files
evaluate real policy files
enforce policy
execute tools
execute shell commands
call a runtime executor
read host files
write host files
perform network operations
verify signatures
validate freshness against live time
perform replay-cache mutation
generate keys
load private keys
load trust stores
query revocation services
grant runtime authority
turn allowlist matches into execution grants
claim production readiness
claim AI-agent security
claim MCP implementation
```

Required future report surface

A future implementation must include a deterministic report renderer and a local fixture runner.

Required future files:

```
include/latticra/seal_guarded_allowlist.h
src/seal_guarded_allowlist.c
tests/seal_guarded_allowlist_invariants.c
tests/seal_guarded_allowlist_report_surface.c
scripts/test-latticra-seal-guarded-allowlist.sh
scripts/latticra-seal-guarded-allowlist-report.sh
docs/LATTICRA_SEAL_GUARDED_ALLOWLIST_IMPLEMENTATION.md
```

Required future tests

A future implementation must prove:

```
unknown tool remains denied
```

```
known tool only becomes a candidate
known tool candidate grants no authority
known tool candidate performs no effect
known tool candidate does not execute tools
known tool candidate does not read host state
known tool candidate does not write host state
known tool candidate does not use the network
unsigned request remains denied
invalid schema remains denied
stale request remains denied
replayed request remains denied
invalid signature remains denied
report rendering is deterministic
small buffers fail closed
null inputs fail closed
invalid upstream metadata fails closed
```

Promotion rule

This contract does not authorize runtime enforcement.

A guarded allowlist may be considered only as report-only metadata until a future implementation plan, implementation, report surface, status record, status-index alignment, public-entrypoint alignment, and negative-case evidence all remain merged and guarded.

Even after that sequence, a separate runtime authority contract would be required before any execution or effect path could be considered.

Boundary

This is a contract-only planning slice.

It does not change implementation behavior, add runtime behavior, grant authority, or change public readiness.

Current next valid slice

The next valid slice is a no-effect guarded allowlist implementation plan.

That future slice must still avoid implementation behavior and must specify exact structs, fields, APIs, report format, fixtures, tests, and failure behavior before any C code is added.

docs/LATTICRA_SEAL_GUARDED_ALLOWLIST_IMPLEMENTATION.md

Source title: Latticra Seal Guarded Allowlist Implementation

Lines: 167 | Words: 512 | SHA-256: 700a90e6b3bcc9bb779c080e4fb1228cb48ef8c2b13b1e97e4bb99a3facfc2f2

Latticra Seal Guarded Allowlist Implementation

Status: no-effect implementation record for the Latticra Seal guarded allowlist surface Source: follows docs/LATTICRA_SEAL_GUARDED_ALLOWLIST_IMPLEMENTATION_PLAN.md Scope: deterministic local guarded allowlist metadata only. This implementation does not implement runtime behavior, runtime execution, runtime authority, effect execution, policy enforcement, capability enforcement, cryptographic verification, signature verification, freshness validation, replay detection, tool execution, AI agent execution, model execution, MCP protocol behavior, MCP server behavior, MCP client behavior, host reads, host writes, network behavior, operating-system behavior, production readiness, external endorsement, or authority grants.

Purpose

This implementation adds a small, deterministic, local guarded allowlist metadata surface.

The allowlist can classify a known local fixture tool name as a candidate for later review, but it still denies execution and grants no authority.

Added files

```
include/latticra/seal_guarded_allowlist.h
src/seal_guarded_allowlist.c
tests/seal_guarded_allowlist_invariants.c
scripts/test-latticra-seal-guarded-allowlist.sh
docs/LATTICRA_SEAL_GUARDED_ALLOWLIST_IMPLEMENTATION.md
```

Deterministic local fixture

The implementation uses only this local fixture set:

```
latticra.seal.inspect
latticra.seal.report
latticra.seal.dry_run
```

The fixture is compiled into the local C implementation.

It is not loaded from host files, policy files, network sources, MCP servers, tools, trust stores, or external services.

Unknown-tool posture

Unknown tools remain denied:

```
guarded_allowlist_profile=latticra-seal-guarded-allowlist/0.1
allowlist_source=deterministic-local-fixture
allowlist_entry_count=3
allowlist_lookup_performed=1
requested_tool_known=0
requested_tool_unknown=1
requested_tool_candidate=0
requested_tool_allow_candidate=0
allow_candidate_requires_policy_decision=1
allow_candidate_requires_runtime_gate=1
allow_candidate_requires_runtime_dry_run=1
allow_candidate_requires_operator_review=1
allow_candidate_grants_authority=0
allow_candidate_executes_tool=0
allow_candidate_reads_host=0
allow_candidate_writes_host=0
allow_candidate_uses_network=0
default_action_deny=1
would_allow=0
would_deny=1
would_require_operator_review=1
blocked_reason=default-deny-guarded-allowlist
report_only=1
mode=report-only
status=guarded-allowlist-metadata
```

Known-tool candidate posture

Known fixture tools become candidates only:

```
requested_tool_known=1
requested_tool_unknown=0
requested_tool_candidate=1
requested_tool_allow_candidate=1
allow_candidate_grants_authority=0
allow_candidate_executes_tool=0
allow_candidate_reads_host=0
allow_candidate_writes_host=0
allow_candidate_uses_network=0
would_allow=0
would_deny=1
would_require_operator_review=1
blocked_reason=known-tool-candidate-still-denied
report_only=1
mode=report-only
status=guarded-allowlist-metadata
```

A known fixture tool improves reporting but does not authorize execution.

API surface

The implementation exposes:

```
latticra_seal_guarded_allowlist_error_label
latticra_seal_guarded_allowlist_fixture
latticra_seal_guarded_allowlist_result_unknown
latticra_seal_guarded_allowlist_result_candidate
latticra_seal_guarded_allowlist_evaluate
latticra_seal_guarded_allowlist_is_report_only
latticra_seal_guarded_allowlist_report
```

Report format

The report begins with:

```
LATTICRA SEAL GUARDED ALLOWLIST
```

It renders deterministic key=value metadata, including known/unknown/candidate state, authority-denial state, effect-denial state, report-only state, error label, and status.

Validation

Run:

```
sh scripts/test-latticra-seal-guarded-allowlist.sh
```

Expected output:

```
seal guarded allowlist invariants: ok
```

The invariant test proves:

```
unknown tool remains denied
unknown tool is not a candidate
known tool becomes candidate only
known tool remains denied
known tool grants no authority
known tool executes no tools
known tool reads no host state
known tool writes no host state
known tool uses no network
allowlist lookup uses deterministic local fixture
allowlist entry count is stable
profile is stable
status remains guarded-allowlist-metadata
report_only remains one
mode remains report-only
small report buffers fail closed
null output fails closed
null tool name fails closed
empty tool name fails closed
oversized tool name fails closed
```

Boundary

This implementation is metadata-only and no-effect.

It does not execute tools, execute shell commands, read host files, write host files, use the network, evaluate external policies, load policy files, load production allowlist files, verify signatures, validate freshness against live time, mutate replay caches, grant authority, turn allowlist matches into execution grants, claim production readiness, claim AI-agent security, or claim MCP implementation.

Current next valid slice

The next valid Latticra Seal slice is a guarded allowlist report surface.

That future slice must render the current deterministic metadata through a local fixture runner and must not perform effects or grant authority.

docs/LATTICRA_SEAL_GUARDED_ALLOWLIST_IMPLEMENTATION_PLAN.md

Source title: Latticra Seal Guarded Allowlist Implementation Plan

Lines: 316 | Words: 816 | SHA-256: ae57bfd2e096bd264557ea60105e5f9e5d302815734ef46ebedefea5934eddd0

Latticra Seal Guarded Allowlist Implementation Plan

Status: implementation planning contract for a future no-effect Latticra Seal guarded allowlist surface Scope: implementation plan only after the Latticra Seal guarded allowlist contract. This document does not implement runtime behavior, runtime execution, runtime authority, effect execution, policy enforcement, capability enforcement, cryptographic verification, signature verification, freshness validation, replay detection, tool execution, AI agent execution, model execution, MCP protocol behavior, MCP server behavior, MCP client behavior, host reads, host writes, network behavior, operating-system behavior, production readiness, external endorsement, or authority grants.

Purpose

This plan defines the exact future implementation shape for a no-effect Seal guarded allowlist layer.

The future implementation should classify whether a requested tool name is known only as a planning candidate, while still denying execution, host access, network access, and runtime authority.

Required contract

The implementation plan depends on:

```
docs/LATTICRA_SEAL_GUARDED_ALLOWLIST_CONTRACT.md
scripts/test-latticra-seal-guarded-allowlist-contract.sh
```

The contract must remain merged and guarded before implementation code is added.

Future files

The future implementation slice should add:

```
include/latticra/seal_guarded_allowlist.h
src/seal_guarded_allowlist.c
tests/seal_guarded_allowlist_invariants.c
scripts/test-latticra-seal-guarded-allowlist.sh
docs/LATTICRA_SEAL_GUARDED_ALLOWLIST_IMPLEMENTATION.md
```

A later report-surface slice may add:

```
tests/seal_guarded_allowlist_report_surface.c
scripts/latticra-seal-guarded-allowlist-report.sh
scripts/test-latticra-seal-guarded-allowlist-report-surface.sh
```

Header API plan

The future header should define:

```
LATTICRA_SEAL_GUARDED_ALLOWLIST_PROFILE_MAX
LATTICRA_SEAL_GUARDED_ALLOWLIST_TOOL_NAME_MAX
LATTICRA_SEAL_GUARDED_ALLOWLIST_REASON_MAX
LATTICRA_SEAL_GUARDED_ALLOWLIST_STATUS_MAX
LATTICRA_SEAL_GUARDED_ALLOWLIST_REPORT_MAX
latticra_seal_guarded_allowlist_error_t
latticra_seal_guarded_allowlist_entry_t
latticra_seal_guarded_allowlist_t
latticra_seal_guarded_allowlist_result_t
latticra_seal_guarded_allowlist_error_label
latticra_seal_guarded_allowlist_result_unknown
latticra_seal_guarded_allowlist_result_candidate
latticra_seal_guarded_allowlist_is_report_only
latticra_seal_guarded_allowlist_report
```

Error model

The future error enum should include:

```
LATTICRA_SEAL_GUARDED_ALLOWLIST_OK
LATTICRA_SEAL_GUARDED_ALLOWLIST_INVALID_INPUT
LATTICRA_SEAL_GUARDED_ALLOWLIST_INVALID_TOOL_NAME
LATTICRA_SEAL_GUARDED_ALLOWLIST_INVALID_ALLOWLIST
LATTICRA_SEAL_GUARDED_ALLOWLIST_BUFFER_TOO_SMALL
```

Planned static fixture

The first implementation must use only a deterministic local fixture.

Initial fixture entries may include placeholder tool names such as:

```
latticra.seal.inspect
latticra.seal.report
latticra.seal.dry_run
```

These entries are candidate names only.

They must not become execution grants.

Record fields

The future result record should include:

```
guarded_allowlist_profile
tool_name
allowlist_source
allowlist_entry_count
allowlist_lookup_performed
requested_tool_name_present
requested_tool_known
requested_tool_unknown
requested_tool_candidate
requested_tool_allow_candidate
allow_candidate_requires_policy_decision
allow_candidate_requires_runtime_gate
allow_candidate_requires_runtime_dry_run
allow_candidate_requires_operator_review
allow_candidate_grants_authority
allow_candidate_executes_tool
allow_candidate_reads_host
allow_candidate_writes_host
allow_candidate_uses_network
default_action_deny
would_allow
would_deny
would_require_operator_review
blocked_reason
report_only
mode
status
error
```

Initial constants

The initial future implementation should emit for unknown tools:

```
guarded_allowlist_profile=latticra-seal-guarded-allowlist/0.1
allowlist_source=deterministic-local-fixture
allowlist_entry_count=3
allowlist_lookup_performed=1
requested_tool_name_present=1
requested_tool_known=0
requested_tool_unknown=1
requested_tool_candidate=0
requested_tool_allow_candidate=0
allow_candidate_requires_policy_decision=1
allow_candidate_requires_runtime_gate=1
allow_candidate_requires_runtime_dry_run=1
allow_candidate_requires_operator_review=1
allow_candidate_grants_authority=0
allow_candidate_executes_tool=0
allow_candidate_reads_host=0
allow_candidate_writes_host=0
```

```
allow_candidate_uses_network=0
default_action_deny=1
would_allow=0
would_deny=1
would_require_operator_review=1
blocked_reason=default-deny-guarded-allowlist
report_only=1
mode=report-only
status=guarded-allowlist-metadata
```

The initial future implementation should emit for known fixture tools:

```
requested_tool_known=1
requested_tool_unknown=0
requested_tool_candidate=1
requested_tool_allow_candidate=1
allow_candidate_grants_authority=0
allow_candidate_executes_tool=0
allow_candidate_reads_host=0
allow_candidate_writes_host=0
allow_candidate_uses_network=0
would_allow=0
would_deny=1
would_require_operator_review=1
blocked_reason=known-tool-candidate-still-denied
report_only=1
mode=report-only
status=guarded-allowlist-metadata
```

Function behavior

The future builder should:

```
accept a requested tool name string
accept a deterministic local allowlist fixture
reject null output
reject null tool names
reject empty tool names
reject oversized tool names
reject invalid allowlist fixture metadata
classify unknown tools as denied
classify known tools as candidates only
set no authority fields to zero
set all effect fields to zero
render deterministic metadata only
```

Required report format

The report should begin with:

```
LATTICRA SEAL GUARDED ALLOWLIST
```

It should render all fields as stable key=value lines.

Required report fields:

```
guarded_allowlist_profile=latticra-seal-guarded-allowlist/0.1
allowlist_source=deterministic-local-fixture
allowlist_lookup_performed=1
requested_tool_known
requested_tool_unknown
requested_tool_candidate
requested_tool_allow_candidate
allow_candidate_grants_authority=0
allow_candidate_executes_tool=0
allow_candidate_reads_host=0
allow_candidate_writes_host=0
allow_candidate_uses_network=0
default_action_deny=1
would_allow=0
would_deny=1
would_require_operator_review=1
report_only=1
mode=report-only
status=guarded-allowlist-metadata
```

Required invariant tests

The future invariant test should verify:

```
unknown tool remains denied
unknown tool is not a candidate
known tool becomes candidate only
known tool remains denied
known tool grants no authority
known tool executes no tools
known tool reads no host state
known tool writes no host state
known tool uses no network
allowlist lookup uses deterministic local fixture
allowlist entry count is stable
profile is stable
status remains guarded-allowlist-metadata
report_only remains one
mode remains report-only
small report buffers fail closed
null output fails closed
null tool name fails closed
empty tool name fails closed
oversized tool name fails closed
invalid allowlist metadata fails closed
```

Required build runner

The future test runner should compile only local C sources and fixtures.

Planned runner:

```
sh scripts/test-latticra-seal-guarded-allowlist.sh
```

It should compile:

```
src/seal_guarded_allowlist.c
tests/seal_guarded_allowlist_invariants.c
```

If the implementation later depends on upstream Seal metadata records, the runner may also compile local Seal sources, but still must not call tools, read host files, write host files, use the network, or grant authority.

Explicit non-goals

The future implementation must not:

```
execute tools
execute shell commands
read host files
write host files
use the network
evaluate external policies
load policy files
load production allowlist files
verify signatures
validate freshness against live time
mutate replay caches
grant authority
turn allowlist matches into execution grants
claim production readiness
claim AI-agent security
claim MCP implementation
```

Promotion rule

No runtime enforcement work may begin from this plan alone.

A future C implementation must first be merged with tests, a report surface, status record, status-index alignment, public-entrypoint alignment, and negative-case evidence while preserving the report-only boundary.

Even then, runtime authority would require a separate contract and evidence path.

Current next valid slice

The next valid Latticra Seal slice is the no-effect guarded allowlist implementation.

That future slice must implement only deterministic metadata, local fixtures, fail-closed behavior, and report rendering. It must not perform effects or grant authority.

docs/LATTICRA_SEAL_GUARDED_ALLOWLIST_REPORT_SURFACE.md

Source title: Latticra Seal Guarded Allowlist Report Surface

Lines: 96 | Words: 385 | SHA-256: 6a2e30396a37dd107f73b89e0d3ba9d1f3b44649fabca4589bcabd1e56baa190

Latticra Seal Guarded Allowlist Report Surface

Status: report surface for the Latticra Seal guarded allowlist metadata layer Scope: deterministic local report surface after the no-effect guarded allowlist metadata implementation. This document does not implement runtime behavior, runtime execution, runtime authority, effect execution, policy enforcement, capability enforcement, cryptographic verification, signature verification, freshness validation, replay detection, tool execution, AI agent execution, model execution, MCP protocol behavior, MCP server behavior, MCP client behavior, host reads, host writes, network behavior, operating-system behavior, production readiness, external endorsement, or authority grants.

Purpose

This document records the first operator-visible report surface for Latticra Seal guarded allowlist metadata.

The report surface renders whether a deterministic local fixture tool name is known only as a candidate while still denying execution, host access, network use, and runtime authority.

Added files

```
tests/seal_guarded_allowlist_report_surface.c
scripts/latticra-seal-guarded-allowlist-report.sh
```

Report runner

```
sh scripts/latticra-seal-guarded-allowlist-report.sh
```

Expected report posture

The report surface renders the current guarded allowlist posture for a known local fixture tool candidate, including:

```
LATTICRA SEAL GUARDED ALLOWLIST
guarded_allowlist_profile=latticra-seal-guarded-allowlist/0.1
tool_name=latticra.seal.report
allowlist_source=deterministic-local-fixture
allowlist_entry_count=3
allowlist_lookup_performed=1
requested_tool_name_present=1
requested_tool_known=1
requested_tool_unknown=0
requested_tool_candidate=1
requested_tool_allow_candidate=1
allow_candidate_requires_policy_decision=1
allow_candidate_requires_runtime_gate=1
allow_candidate_requires_runtime_dry_run=1
allow_candidate_requires_operator_review=1
allow_candidate_grants_authority=0
allow_candidate_executes_tool=0
allow_candidate_reads_host=0
allow_candidate_writes_host=0
allow_candidate_uses_network=0
default_action_deny=1
would_allow=0
would_deny=1
would_require_operator_review=1
blocked_reason=known-tool-candidate-still-denied
```

```
report_only=1
mode=report-only
status=guarded-allowlist-metadata
```

Boundary

This report surface compiles and runs a local deterministic fixture only.

It does not execute tools, execute shell commands beyond compiling and running the local test fixture, read host files beyond the repository sources needed for local compilation, write host files beyond the temporary test binary/report path, use the network, evaluate external policies, load policy files, load production allowlist files, verify signatures, validate freshness against live time, mutate replay caches, grant authority, turn allowlist matches into execution grants, claim production readiness, claim AI-agent security, or claim MCP implementation.

Validation

Run:

```
sh scripts/test-latticra-seal-guarded-allowlist-report-surface.sh
```

Expected output:

```
latticra seal guarded allowlist report surface: ok
```

The underlying guarded allowlist implementation remains covered by:

```
sh scripts/test-latticra-seal-guarded-allowlist.sh
```

Claim boundary

This report surface does not justify the public claim that Latticra secures AI agents.

It makes the allowlist candidate denial posture easier to inspect before any future runtime authority path is considered.

Next valid slice

The next valid Latticra Seal slice is guarded allowlist report status alignment.

That future slice must preserve the no-effect posture and must not perform effects or grant authority.

docs/LATTICRA_SEAL_IMPLEMENTATION_PLAN.md

Source title: Latticra Seal Implementation Plan

Lines: 220 | Words: 620 | SHA-256: 6386e67e600d2d60db0de608c125e3f43a826c9bcf7240ca9c1f9795984b7584

Latticra Seal Implementation Plan

Status: Latticra Seal implementation planning contract Scope: exact first implementation plan for a no-effect Seal report surface before artifact reads, signing, encryption, key management, post-quantum implementation, Linux integrity integration, Fedora integration, runtime enforcement, network behavior, host mutation, or kernel behavior.

Purpose

This document defines the first implementation plan for Latticra Seal.

This plan is intentionally narrow. The first implementation must produce deterministic report metadata only. It must not perform cryptographic enforcement.

Required predecessor

The first Seal implementation must follow:

```
docs/LATTICRA_SEAL_CONTRACT.md
```

No implementation code should be added unless the Seal contract remains present and guarded.

First implementation name

```
Latticra Seal report surface
```

First implementation goal

Add a no-effect report surface that makes the Latticra Seal posture inspectable.

The first report answers:

```
Is the Seal contract present?
Is the Seal implementation plan present?
Is Seal still report-only?
Does Seal currently support artifact measurement?
Does Seal currently support signing?
Does Seal currently support capability enforcement?
Does Seal currently support sealed objects?
Did the report perform effects?
Did the report grant authority?
```

Non-goals

The first implementation must not add:

```
artifact hashing
file reads
file writes
network access
key generation
key storage
signature generation
signature verification
encryption
decryption
capability enforcement
runtime execution
host mutation
kernel interaction
Fedora approval claims
production-readiness claims
```

Proposed files

The first implementation should use bounded C surfaces consistent with the repository direction.

```
include/latticra/seal_report.h
src/seal_report.c
tests/seal_report_invariants.c
scripts/test-latticra-seal-report.sh
docs/LATTICRA_SEAL_REPORT_IMPLEMENTATION.md
```

The implementation may also add status/index alignment files after the report exists.

Public C API shape

The first public API should be small and deterministic.

```
typedef struct latticra_seal_report {
    unsigned contract_present;
    unsigned implementation_plan_present;
    unsigned report_only_supported;
    unsigned artifact_measurement_supported;
    unsigned signature_supported;
    unsigned capability_enforcement_supported;
    unsigned sealed_objects_supported;
    unsigned effect_performed;
    unsigned host_read_performed;
    unsigned host_mutation_performed;
    unsigned network_performed;
    unsigned runtime_authority_granted;
    unsigned evidence_level;
```

```
    const char *seal_profile;
    const char *status;
    const char *non_claims;
} latticra_seal_report_t;

latticra_seal_report_t latticra_seal_report_default(void);
int latticra_seal_report_render(
    const latticra_seal_report_t *report,
    char *out,
    unsigned out_capacity
);
```

Required default values

The default report must state:

```
contract_present=1
implementation_plan_present=1
report_only_supported=1
artifact_measurement_supported=0
signature_supported=0
capability_enforcement_supported=0
sealed_objects_supported=0
effect_performed=0
host_read_performed=0
host_mutation_performed=0
network_performed=0
runtime_authority_granted=0
evidence_level=2
status=report-only
```

Evidence level 2 means contract plus implementation planning and deterministic report design. It does not mean cryptographic security.

Rendered report requirements

The report renderer must emit deterministic text.

Required labels:

```
LATTICRA SEAL REPORT
seal_profile=
contract_present=
implementation_plan_present=
report_only_supported=
artifact_measurement_supported=
signature_supported=
capability_enforcement_supported=
sealed_objects_supported=
effect_performed=
host_read_performed=
host_mutation_performed=
network_performed=
runtime_authority_granted=
evidence_level=
status=
non_claims=
```

The renderer must not allocate dynamically.

The renderer must return failure if the output buffer is null or too small.

Invariant tests

The first invariant tests must verify:

```
default report is report-only
default report performs no effects
default report performs no host reads
default report performs no host mutation
default report performs no network behavior
default report grants no runtime authority
artifact measurement remains unsupported
signature support remains unsupported
capability enforcement remains unsupported
sealed objects remain unsupported
rendered report contains all required labels
small render buffer fails closed
```

Guard script requirements

The first guard script must check:

```
docs/LATTICRA_SEAL_CONTRACT.md exists
docs/LATTICRA_SEAL_IMPLEMENTATION_PLAN.md exists
docs/status/LATTICRA_SEAL_FOUNDATION_STATUS.md exists
Seal contract says this is not cryptographic enforcement
Seal plan forbids artifact hashing in the first implementation
Seal plan forbids signing in the first implementation
Seal plan forbids encryption in the first implementation
Seal plan forbids capability enforcement in the first implementation
```

Promotion path

After this implementation plan is merged, the next allowed implementation is:

```
no-effect Seal report implementation
```

After the report implementation is guarded, the next allowed contract is:

```
read-only artifact measurement contract
```

Artifact measurement must not be added directly to the first report implementation.

Current status

This file is only an implementation plan. It does not implement Seal.

docs/LATTICRA_SEAL_KEY_HANDLING_CONTRACT.md

Source title: Latticra Seal Key-Handling Boundary Contract

Lines: 325 | Words: 1010 | SHA-256: 7c6d7ab5e7e86c9c54b7c252bb1e523923cd94ed4a93b6068866d31e6612fb66

Latticra Seal Key-Handling Boundary Contract

Status: Latticra Seal key-handling boundary contract Scope: contract for a future metadata-only key-handling surface after Seal signing operation metadata. This document does not implement cryptographic signing, signature verification, signer invocation behavior, signer process execution, public-key parsing, key material loading, private-key handling, key generation, hardware-key use, trust-store loading, revocation lookup, object sealing, runtime handoff execution, runtime authority, host reads, host writes, network behavior, shell execution, tool execution, capability enforcement, policy persistence, kernel behavior, Fedora approval claims, production readiness, or operating-system behavior.

Purpose

This document defines the first Latticra Seal key-handling boundary after ready signing operation metadata.

The purpose of this layer is to decide whether a ready metadata-only signing operation record may be represented as eligible for a future metadata-only key-handling request before any public-key parser, key material, private key, signer process, trust store, hardware key, runtime bridge, host authority, or signature generation exists.

The key-handling surface is key-handling path classification, not key handling, not signing, not verification, and not trust-store behavior.

This document does not handle keys.

This document does not handle private keys.

Relationship to signing operation

Latticra Seal signing operation metadata already records a no-effect eligibility checkpoint for the future signing path:

```
docs/LATTICRA_SEAL_SIGNING_OPERATION_CONTRACT.md
docs/LATTICRA_SEAL_SIGNING_OPERATION_IMPLEMENTATION.md
docs/status/SEAL_SIGNING_OPERATION_STATUS.md
```

This key-handling boundary contract starts from that checkpoint. It does not replace signing operation metadata, parse public keys, load key material, handle private keys, route to runtime behavior, invoke a signer, perform signing, verify signatures, load trust stores, persist policy, or grant runtime authority.

Required predecessors

This contract depends on:

```
docs/LATTICRA_SEAL_SIGNING_OPERATION_CONTRACT.md
docs/LATTICRA_SEAL_SIGNING_OPERATION_IMPLEMENTATION.md
docs/status/SEAL_SIGNING_OPERATION_STATUS.md
include/latticra/seal_signing_operation.h
src/seal_signing_operation.c
tests/seal_signing_operation_invariants.c
scripts/test-latticra-seal-signing-operation-contract.sh
scripts/test-latticra-seal-signing-operation.sh
scripts/test-latticra-seal-signing-operation-status.sh
```

The signing operation metadata surface remains the source of readiness evidence for this key-handling surface.

Key-Handling Boundary

Allowed in the next implementation slice:

```
accept signing operation metadata
require signing_operation_ready=1
require signing_operation_state=operation-metadata-only
require requested_signature=Ed25519-development
require requested_signing_authorization=metadata-only
require requested_signer_handoff=metadata-only
require requested_signer_invocation=metadata-only
require requested_signing_operation=metadata-only
require signature_performed=0
require verification_performed=0
require signer_invoked=0
require private_key_handling=0
require key_generation_performed=0
require trust_store_loaded=0
require revocation_lookup_performed=0
require handoff_performed=0
require effect_performed=0
require runtime_authority_granted=0
require host_read_performed=0
require host_write_performed=0
require network_performed=0
accept requested_key_handling=metadata-only
classify metadata-only as key_handling_state=key-handling-metadata-only
produce deterministic key-handling metadata
```

Forbidden in the next implementation slice:

```
cryptographic signing
signature verification
signer process invocation
public-key parsing
key material loading
private-key handling
key generation
hardware-key use
trust-store loading
revocation lookup
runtime handoff execution
runtime authority grants
host reads
host writes
```

```
network access
shell execution
tool execution
capability enforcement
policy persistence
object sealing
kernel interaction
```

Initial Key Policy

Allowed signing operation state:

```
signing_operation_state=operation-metadata-only
```

Allowed requested signing operation label:

```
metadata-only
```

Allowed requested key-handling label:

```
metadata-only
```

These labels are metadata labels only. They do not mean Ed25519 signing, Ed25519 verification, signer invocation, public-key parsing, key material loading, key generation, private-key handling, hardware-key use, trust establishment, trust-store behavior, revocation lookup, runtime handoff, host behavior, network behavior, or capability enforcement exists in this path.

Planned key-handling states:

```
key_handling_state=key-handling-metadata-only
key_handling_state=denied-signing-operation
key_handling_state=denied-signer-invocation
key_handling_state=denied-signer-handoff
key_handling_state=denied-signing-authorization
key_handling_state=denied-signature-algorithm
key_handling_state=denied-key-handling
key_handling_state=denied-key-material
key_handling_state=denied-private-key
key_handling_state=denied-trust-store
key_handling_state=denied-runtime-authority
key_handling_state=denied-host-effect
key_handling_state=denied-network-effect
```

The first implementation may set:

```
key_handling_ready=1
```

only for ready metadata-only signing operation metadata, the allowed development signature label, the metadata-only signing operation label, and the metadata-only key-handling label.

Even when key_handling_ready=1, these must remain zero:

```
signature_performed=0
verification_performed=0
signer_invoked=0
public_key_parsed=0
key_material_loaded=0
private_key_handling=0
key_generation_performed=0
hardware_key_used=0
trust_store_loaded=0
revocation_lookup_performed=0
handoff_performed=0
effect_performed=0
runtime_authority_granted=0
host_read_performed=0
host_write_performed=0
network_performed=0
```

Planned Fields

A future key-handling record should be bounded and deterministic.

Planned fields:

```
key_handling_profile
signing_operation_profile
signer_invocation_profile
signer_handoff_profile
signing_authorization_profile
signature_request_profile
envelope_profile
report_profile
handoff_profile
decision_profile
gate_profile
receipt_profile
verify_profile
message_digest_algorithm
message_digest_hex
public_key_identity_label
requested_capability
requested_effect
requested_handoff
requested_report
requested_envelope
requested_signature
requested_signing_authorization
requested_signer_handoff
requested_signer_invocation
requested_signing_operation
requested_key_handling
requested_scope
signing_authorization_state
signing_authorization_ready
signer_handoff_state
signer_handoff_ready
signer_invocation_state
signer_invocation_ready
signing_operation_state
signing_operation_ready
key_handling_state
key_handling_ready
signature_performed
verification_performed
signer_invoked
public_key_parsed
key_material_loaded
private_key_handling
key_generation_performed
hardware_key_used
trust_store_loaded
revocation_lookup_performed
handoff_performed
effect_performed
runtime_authority_granted
host_read_performed
host_write_performed
network_performed
mode
status
```

Expected values for an allowed first implementation result:

```
key_handling_profile=latticra-seal-key-handling/0.1
signing_operation_profile=latticra-seal-signing-operation/0.1
requested_signing_operation=metadata-only
requested_key_handling=metadata-only
key_handling_state=key-handling-metadata-only
key_handling_ready=1
signature_performed=0
verification_performed=0
signer_invoked=0
public_key_parsed=0
key_material_loaded=0
private_key_handling=0
key_generation_performed=0
hardware_key_used=0
trust_store_loaded=0
revocation_lookup_performed=0
runtime_authority_granted=0
mode=metadata-only
status=key-handling-metadata
```

Failure Behavior

Future key-handling handling must fail closed.

Required failure states:

```
null output -&gt; invalid
null signing operation -&gt; invalid
invalid signing operation -&gt; denied-signing-operation
signing_operation_ready=0 -&gt; denied-signing-operation
signing_operation_state not operation-metadata-only -&gt; denied-signing-operation
requested_signing_operation not metadata-only -&gt; denied-signing-operation
signer_invocation_ready=0 -&gt; denied-signer-invocation
signer_invocation_state not invocation-metadata-only -&gt; denied-signer-invocation
requested_signer_invocation not metadata-only -&gt; denied-signer-invocation
signer_handoff_ready=0 -&gt; denied-signer-handoff
signer_handoff_state not handoff-metadata-only -&gt; denied-signer-handoff
requested_signer_handoff not metadata-only -&gt; denied-signer-handoff
requested_signing_authorization not metadata-only -&gt; denied-signing-authorization
missing requested signature -&gt; denied-signature-algorithm
unknown requested signature -&gt; denied-signature-algorithm
missing requested key handling -&gt; denied-key-handling
unknown requested key handling -&gt; denied-key-handling
public-key parsing requested or observed -&gt; denied-key-material
key material loading requested or observed -&gt; denied-key-material
private-key handling requested or observed -&gt; denied-private-key
key generation requested or observed -&gt; denied-private-key
hardware-key use requested or observed -&gt; denied-private-key
trust-store loading requested or observed -&gt; denied-trust-store
revocation lookup requested or observed -&gt; denied-network-effect
signature already performed -&gt; denied-host-effect
verification already performed -&gt; denied-host-effect
signer already invoked -&gt; denied-host-effect
runtime authority already granted -&gt; denied-runtime-authority
handoff already performed -&gt; denied-host-effect
effect already performed -&gt; denied-host-effect
host read already performed -&gt; denied-host-effect
host write already performed -&gt; denied-host-effect
network already performed -&gt; denied-network-effect
```

Failures must not sign, verify signatures, invoke a signer, parse public keys, load key material, handle private keys, generate keys, use hardware keys, load trust stores, look up revocation status, read host files, write host files, contact networks, execute tools, execute shells, enforce capabilities, perform runtime handoff, persist policy, or grant runtime authority.

Promotion Rule

This contract permits and now has only this implementation slice:

```
key-handling metadata implementation
```

It does not permit cryptographic signing, signature verification, signer invocation behavior, public-key parsing, key material loading, private-key handling, key generation, hardware-key use, trust-store behavior, revocation lookup, runtime handoff execution, effect execution, capability enforcement, runtime authority, host behavior, network behavior, object sealing, or kernel behavior.

After key-handling metadata, its status/public-entry checkpoint, the key-material boundary contract, and key-material metadata implementation exist and are guarded, the next valid planning slice is bounded no-effect key parsing implementation that still must not add signing without separate implementation, key-handling, key-material, and guard contracts.

Validation

This contract is validated by:

```
sh scripts/test-latticra-seal-key-handling-contract.sh
```

docs/LATTICRA_SEAL_KEY_HANDLING_IMPLEMENTATION.md

Source title: Latticra Seal Key-Handling Implementation

Lines: 204 | Words: 605 | SHA-256: 31a6bf067e448e62184ecd9240f9b0e7323931068c6bb2f665cc9d9faba7eaae

Latticra Seal Key-Handling Implementation

Status: initial key-handling metadata implementation Scope: bounded C metadata surface for classifying Seal key-handling eligibility after ready signing operation metadata. This slice does not add public-key parsing, key material loading, private-key handling, key generation, hardware-key use, trust-store loading, revocation lookup, cryptographic signing, signature verification, signer invocation behavior, signer process execution, object sealing, runtime handoff execution, runtime authority, host reads, host writes, network behavior, shell execution, tool execution, capability enforcement, policy persistence, kernel behavior, Fedora approval claims, production readiness, or operating-system behavior.

Purpose

This document records the first Latticra Seal key-handling metadata implementation.

The implementation consumes ready signing operation metadata and classifies whether the request remains eligible for a future metadata-only key-handling path.

It is key-handling path classification only.

It does not parse public keys.

It does not load key material.

It does not handle private keys.

It does not sign.

Files

```
include/latticra/seal_key_handling.h
src/seal_key_handling.c
tests/seal_key_handling_invariants.c
scripts/test-latticra-seal-key-handling.sh
```

Required predecessors

This implementation depends on the key-handling boundary contract and the signing operation metadata surface:

```
docs/LATTICRA_SEAL_KEY_HANDLING_CONTRACT.md
docs/LATTICRA_SEAL_SIGNING_OPERATION_CONTRACT.md
docs/LATTICRA_SEAL_SIGNING_OPERATION_IMPLEMENTATION.md
docs/status/SEAL_SIGNING_OPERATION_STATUS.md
include/latticra/seal_signing_operation.h
src/seal_signing_operation.c
tests/seal_signing_operation_invariants.c
scripts/test-latticra-seal-key-handling-contract.sh
scripts/test-latticra-seal-signing-operation-contract.sh
scripts/test-latticra-seal-signing-operation.sh
scripts/test-latticra-seal-signing-operation-status.sh
```

Implemented surface

The key-handling metadata surface adds:

```
latticra_seal_key_handling_t
latticra_seal_key_handling_error_t
latticra_seal_key_handling_error_label
latticra_seal_key_handling_from_operation
latticra_seal_key_handling_is_metadata_only
latticra_seal_key_handling_render
```

The implementation:

```
accepts signing operation metadata
requires signing_operation_ready=1
requires signing_operation_state=operation-metadata-only
```

```
requires requested_signature=Ed25519-development
requires requested_signing_authorization=metadata-only
requires requested_signer_handoff=metadata-only
requires requested_signer_invocation=metadata-only
requires requested_signing_operation=metadata-only
accepts requested_key_handling=metadata-only
classifies the result as key_handling_state=key-handling-metadata-only
sets key_handling_ready=1 only for metadata-only allowed signing operation states
renders deterministic key-handling metadata
fails closed for invalid or denied predecessor metadata
```

Even when key_handling_ready=1, these fields remain zero:

```
signature_performed=0
verification_performed=0
signer_invoked=0
public_key_parsed=0
key_material_loaded=0
private_key_handling=0
key_generation_performed=0
hardware_key_used=0
trust_store_loaded=0
revocation_lookup_performed=0
handoff_performed=0
effect_performed=0
runtime_authority_granted=0
host_read_performed=0
host_write_performed=0
network_performed=0
```

Current metadata output

The successful metadata path renders:

```
key_handling_profile=latticra-seal-key-handling/0.1
signing_operation_profile=latticra-seal-signing-operation/0.1
signer_invocation_profile=latticra-seal-signer-invocation/0.1
signer_handoff_profile=latticra-seal-signer-handoff/0.1
signing_authorization_profile=latticra-seal-signing-authorization/0.1
signature_request_profile=latticra-seal-signature-request/0.1
requested_signature=Ed25519-development
requested_signing_authorization=metadata-only
requested_signer_handoff=metadata-only
requested_signer_invocation=metadata-only
requested_signing_operation=metadata-only
requested_key_handling=metadata-only
signing_authorization_state=authorized-metadata-only
signing_authorization_ready=1
signer_handoff_state=handoff-metadata-only
signer_handoff_ready=1
signer_invocation_state=invocation-metadata-only
signer_invocation_ready=1
signing_operation_state=operation-metadata-only
signing_operation_ready=1
key_handling_state=key-handling-metadata-only
key_handling_ready=1
public_key_parsed=0
key_material_loaded=0
hardware_key_used=0
mode=metadata-only
status=key-handling-metadata
```

Failure behavior

The implementation fails closed for:

```
null output
null signing operation
invalid signing operation
signing_operation_ready=0
signing_operation_state not operation-metadata-only
requested_signing_operation not metadata-only
signer_invocation_ready=0
signer_invocation_state not invocation-metadata-only
requested_signer_invocation not metadata-only
signer_handoff_ready=0
signer_handoff_state not handoff-metadata-only
requested_signer_handoff not metadata-only
signing_authorization_ready=0
```

```
signing_authorization_state not authorized-metadata-only
requested_signing_authorization not metadata-only
missing requested signature
unknown requested signature
missing requested key handling
unknown requested key handling
public-key parsing request
key material loading request
private-key handling request
key generation request
hardware-key use request
trust-store loading request
revocation lookup request
private-key handling already present
key generation already present
trust-store loading already present
revocation lookup already present
runtime authority already granted
signature already performed
verification already performed
signer already invoked
handoff already performed
effect already performed
host read already performed
host write already performed
network already performed
small render buffer
```

Failures do not sign, verify signatures, invoke a signer, parse public keys, load key material, handle private keys, generate keys, use hardware keys, load trust stores, look up revocation status, read host files, write host files, contact networks, execute tools, execute shells, enforce capabilities, perform runtime handoff, persist policy, or grant runtime authority.

Validation

Run:

```
sh scripts/test-latticra-seal-key-handling-contract.sh
sh scripts/test-latticra-seal-key-handling.sh
```

Expected output:

```
seal key-handling contract: ok
seal key-handling invariants: ok
```

Next valid slice

The next valid Latticra Seal planning slice is bounded no-effect key parsing implementation or another narrow status/index alignment follow-up that still must not add signing without separate key-material, signing, and guard contracts.

The key-handling metadata implementation is a guarded checkpoint. Future work must not add public-key parsing, key material loading, private-key handling, key generation, hardware-key use, trust-store behavior, revocation lookup, signing, verification, signer invocation behavior, host behavior, network behavior, runtime authority, capability enforcement, object sealing, or kernel behavior unless separately implemented and guarded.

docs/LATTICRA_SEAL_KEY_MATERIAL_CONTRACT.md

Source title: Latticra Seal Key-Material Boundary Contract

Lines: 351 | Words: 1054 | SHA-256: 56a21630778e30d50efb020938a81367f43a088c703b4945475b3f67452a5310

Latticra Seal Key-Material Boundary Contract

Status: Latticra Seal key-material boundary contract Scope: contract for a future metadata-only key-material surface after Seal key-handling metadata. This document does not implement public-key parsing, key material loading, private-key handling, key generation, hardware-key use, trust-store loading, revocation lookup, cryptographic signing, signature verification, signer invocation behavior, signer process execution, object sealing, runtime handoff execution, runtime authority, host reads, host writes, network behavior, shell execution, tool execution, capability enforcement, policy persistence, kernel behavior, Fedora approval claims, production readiness, or operating-system behavior.

Purpose

This document defines the first Latticra Seal key-material boundary after ready key-handling metadata.

The purpose of this layer is to decide whether a ready metadata-only key-handling record may be represented as eligible for a future metadata-only key-material request before any public-key parser, key material loader, private key, signer process, trust store, hardware key, runtime bridge, host authority, or signature generation exists.

The key-material surface is key-material path classification, not key material handling, not public-key parsing, not signing, not verification, and not trust-store behavior.

This document does not parse public keys.

This document does not load key material.

This document does not handle private keys.

Relationship to key handling

Latticra Seal key-handling metadata already records a no-effect eligibility checkpoint for the future key path:

```
docs/LATTICRA_SEAL_KEY_HANDLING_CONTRACT.md
docs/LATTICRA_SEAL_KEY_HANDLING_IMPLEMENTATION.md
docs/status/SEAL_KEY_HANDLING_STATUS.md
```

This key-material boundary contract starts from that checkpoint. It does not replace key-handling metadata, parse public keys, load key material, handle private keys, route to runtime behavior, invoke a signer, perform signing, verify signatures, load trust stores, persist policy, or grant runtime authority.

Required predecessors

This contract depends on:

```
docs/LATTICRA_SEAL_KEY_HANDLING_CONTRACT.md
docs/LATTICRA_SEAL_KEY_HANDLING_IMPLEMENTATION.md
docs/status/SEAL_KEY_HANDLING_STATUS.md
include/latticra/seal_key_handling.h
src/seal_key_handling.c
tests/seal_key_handling_invariants.c
scripts/test-latticra-seal-key-handling-contract.sh
scripts/test-latticra-seal-key-handling.sh
scripts/test-latticra-seal-key-handling-status.sh
```

The key-handling metadata surface remains the source of readiness evidence for this key-material surface.

Key-Material Boundary

Allowed in the next implementation slice:

```
accept key-handling metadata
require key_handling_ready=1
```

```
require key_handling_state=key-handling-metadata-only
require requested_signature=Ed25519-development
require requested_signing_authorization=metadata-only
require requested_signer_handoff=metadata-only
require requested_signer_invocation=metadata-only
require requested_signing_operation=metadata-only
require requested_key_handling=metadata-only
require signature_performed=0
require verification_performed=0
require signer_invoked=0
require public_key_parsed=0
require key_material_loaded=0
require private_key_handling=0
require key_generation_performed=0
require hardware_key_used=0
require trust_store_loaded=0
require revocation_lookup_performed=0
require handoff_performed=0
require effect_performed=0
require runtime_authority_granted=0
require host_read_performed=0
require host_write_performed=0
require network_performed=0
accept requested_key_material=metadata-only
classify metadata-only as key_material_state=key-material-metadata-only
produce deterministic key-material metadata
```

Forbidden in the next implementation slice:

```
public-key parsing
key material loading
private-key handling
key generation
hardware-key use
trust-store loading
revocation lookup
cryptographic signing
signature verification
signer process invocation
runtime handoff execution
runtime authority grants
host reads
host writes
network access
shell execution
tool execution
capability enforcement
policy persistence
object sealing
kernel interaction
```

Initial Key-Material Policy

Allowed key-handling state:

```
key_handling_state=key-handling-metadata-only
```

Allowed requested key-handling label:

```
metadata-only
```

Allowed requested key-material label:

```
metadata-only
```

These labels are metadata labels only. They do not mean public-key parsing, key material loading, private-key handling, key generation, hardware-key use, trust establishment, trust-store behavior, Ed25519 signing, Ed25519 verification, signer invocation, revocation lookup, runtime handoff, host behavior, network behavior, or capability enforcement exists in this path.

Planned key-material states:

```
key_material_state=key-material-metadata-only
key_material_state=denied-key-handling
key_material_state=denied-signing-operation
key_material_state=denied-signer-invocation
key_material_state=denied-signer-handoff
key_material_state=denied-signing-authorization
```

```
key_material_state=denied-signature-algorithm
key_material_state=denied-key-material
key_material_state=denied-private-key
key_material_state=denied-trust-store
key_material_state=denied-runtime-authority
key_material_state=denied-host-effect
key_material_state=denied-network-effect
```

The first implementation may set:

```
key_material_ready=1
```

only for ready metadata-only key-handling metadata, the allowed development signature label, the metadata-only signing operation label, the metadata-only key-handling label, and the metadata-only key-material label.

Even when key_material_ready=1, these must remain zero:

```
signature_performed=0
verification_performed=0
signer_invoked=0
public_key_parsed=0
key_material_loaded=0
private_key_handling=0
key_generation_performed=0
hardware_key_used=0
trust_store_loaded=0
revocation_lookup_performed=0
handoff_performed=0
effect_performed=0
runtime_authority_granted=0
host_read_performed=0
host_write_performed=0
network_performed=0
```

Planned Fields

A future key-material record should be bounded and deterministic.

Planned fields:

```
key_material_profile
key_handling_profile
signing_operation_profile
signer_invocation_profile
signer_handoff_profile
signing_authorization_profile
signature_request_profile
envelope_profile
report_profile
handoff_profile
decision_profile
gate_profile
receipt_profile
verify_profile
message_digest_algorithm
message_digest_hex
public_key_identity_label
requested_capability
requested_effect
requested_handoff
requested_report
requested_envelope
requested_signature
requested_signing_authorization
requested_signer_handoff
requested_signer_invocation
requested_signing_operation
requested_key_handling
requested_key_material
requested_scope
signing_authorization_state
signing_authorization_ready
signer_handoff_state
signer_handoff_ready
signer_invocation_state
signer_invocation_ready
signing_operation_state
signing_operation_ready
```

```
key_handling_state
key_handling_ready
key_material_state
key_material_ready
signature_performed
verification_performed
signer_invoked
public_key_parsed
key_material_loaded
private_key_handling
key_generation_performed
hardware_key_used
trust_store_loaded
revocation_lookup_performed
handoff_performed
effect_performed
runtime_authority_granted
host_read_performed
host_write_performed
network_performed
mode
status
```

Expected values for an allowed first implementation result:

```
key_material_profile=latticra-seal-key-material/0.1
key_handling_profile=latticra-seal-key-handling/0.1
signing_operation_profile=latticra-seal-signing-operation/0.1
requested_key_handling=metadata-only
requested_key_material=metadata-only
key_handling_state=key-handling-metadata-only
key_handling_ready=1
key_material_state=key-material-metadata-only
key_material_ready=1
signature_performed=0
verification_performed=0
signer_invoked=0
public_key_parsed=0
key_material_loaded=0
private_key_handling=0
key_generation_performed=0
hardware_key_used=0
trust_store_loaded=0
revocation_lookup_performed=0
runtime_authority_granted=0
mode=metadata-only
status=key-material-metadata
```

Failure Behavior

Future key-material handling must fail closed.

Required failure states:

```
null output -&gt; invalid
null key handling -&gt; invalid
invalid key handling -&gt; denied-key-handling
key_handling_ready=0 -&gt; denied-key-handling
key_handling_state not key-handling-metadata-only -&gt; denied-key-handling
requested_key_handling not metadata-only -&gt; denied-key-handling
signing_operation_ready=0 -&gt; denied-signing-operation
signing_operation_state not operation-metadata-only -&gt; denied-signing-operation
requested_signing_operation not metadata-only -&gt; denied-signing-operation
signer_invocation_ready=0 -&gt; denied-signer-invocation
signer_invocation_state not invocation-metadata-only -&gt; denied-signer-invocation
requested_signer_invocation not metadata-only -&gt; denied-signer-invocation
signer_handoff_ready=0 -&gt; denied-signer-handoff
signer_handoff_state not handoff-metadata-only -&gt; denied-signer-handoff
requested_signer_handoff not metadata-only -&gt; denied-signer-handoff
requested_signing_authorization not metadata-only -&gt; denied-signing-authorization
missing requested signature -&gt; denied-signature-algorithm
unknown requested signature -&gt; denied-signature-algorithm
missing requested key material -&gt; denied-key-material
unknown requested key material -&gt; denied-key-material
public-key parsing requested or observed -&gt; denied-key-material
key material loading requested or observed -&gt; denied-key-material
private-key handling requested or observed -&gt; denied-private-key
key generation requested or observed -&gt; denied-private-key
hardware-key use requested or observed -&gt; denied-private-key
trust-store loading requested or observed -&gt; denied-trust-store
```

```
revocation lookup requested or observed -&gt; denied-network-effect
signature already performed -&gt; denied-host-effect
verification already performed -&gt; denied-host-effect
signer already invoked -&gt; denied-host-effect
runtime authority already granted -&gt; denied-runtime-authority
handoff already performed -&gt; denied-host-effect
effect already performed -&gt; denied-host-effect
host read already performed -&gt; denied-host-effect
host write already performed -&gt; denied-host-effect
network already performed -&gt; denied-network-effect
```

Failures must not sign, verify signatures, invoke a signer, parse public keys, load key material, handle private keys, generate keys, use hardware keys, load trust stores, look up revocation status, read host files, write host files, contact networks, execute tools, execute shells, enforce capabilities, perform runtime handoff, persist policy, or grant runtime authority.

Promotion Rule

This contract permitted only the implementation slice:

```
key-material metadata implementation
```

That implementation slice now exists as:

```
docs/LATTICRA_SEAL_KEY_MATERIAL_IMPLEMENTATION.md
include/latticra/seal_key_material.h
src/seal_key_material.c
tests/seal_key_material_invariants.c
scripts/test-latticra-seal-key-material.sh
```

It does not permit public-key parsing, key material loading, private-key handling, key generation, hardware-key use, trust-store behavior, revocation lookup, cryptographic signing, signature verification, signer invocation behavior, runtime handoff execution, effect execution, capability enforcement, runtime authority, host behavior, network behavior, object sealing, or kernel behavior.

After key-material metadata, its status/public-entry checkpoint, and the public-key parsing boundary contract exist and are guarded, the next valid planning slice is bounded no-effect key parsing implementation that still must not add public-key parsing without separate implementation, key-material, public-key, and guard contracts.

Validation

This contract is validated by:

```
sh scripts/test-latticra-seal-key-material-contract.sh
```

docs/LATTICRA_SEAL_KEY_MATERIAL_IMPLEMENTATION.md

Source title: Latticra Seal Key-Material Implementation

Lines: 215 | Words: 627 | SHA-256: 7fa4af9e487dcfb97bafb6ce1627e1d53124d5cfe3706a6ec16e508fcc78573b

Latticra Seal Key-Material Implementation

Status: initial key-material metadata implementation Scope: bounded C metadata surface for classifying Seal key-material eligibility after ready key-handling metadata. This slice does not add public-key parsing, key material loading, private-key handling, key generation, hardware-key use, trust-store loading, revocation lookup, cryptographic signing, signature verification, signer invocation behavior, signer process execution, object sealing, runtime handoff execution, runtime authority, host reads, host writes, network behavior, shell execution, tool execution, capability enforcement, policy persistence, kernel behavior, Fedora approval claims, production readiness, or operating-system behavior.

Purpose

This document records the first Latticra Seal key-material metadata implementation.

The implementation consumes ready key-handling metadata and classifies whether the request remains eligible for a future metadata-only key-material path.

It is key-material path classification only.

It does not parse public keys.

It does not load key material.

It does not handle private keys.

It does not sign.

Files

```
include/latticra/seal_key_material.h
src/seal_key_material.c
tests/seal_key_material_invariants.c
scripts/test-latticra-seal-key-material.sh
```

Required predecessors

This implementation depends on the key-material boundary contract and the key-handling metadata surface:

```
docs/LATTICRA_SEAL_KEY_MATERIAL_CONTRACT.md
docs/LATTICRA_SEAL_KEY_HANDLING_CONTRACT.md
docs/LATTICRA_SEAL_KEY_HANDLING_IMPLEMENTATION.md
docs/status/SEAL_KEY_HANDLING_STATUS.md
include/latticra/seal_key_handling.h
src/seal_key_handling.c
tests/seal_key_handling_invariants.c
scripts/test-latticra-seal-key-material-contract.sh
scripts/test-latticra-seal-key-handling-contract.sh
scripts/test-latticra-seal-key-handling.sh
scripts/test-latticra-seal-key-handling-status.sh
```

Implemented surface

The key-material metadata surface adds:

```
latticra_seal_key_material_t
latticra_seal_key_material_error_t
latticra_seal_key_material_error_label
latticra_seal_key_material_from_key_handling
latticra_seal_key_material_is_metadata_only
latticra_seal_key_material_render
```

The implementation:

```
accepts key-handling metadata
requires key_handling_ready=1
requires key_handling_state=key-handling-metadata-only
requires requested_signature=Ed25519-development
requires requested_signing_authorization=metadata-only
requires requested_signer_handoff=metadata-only
requires requested_signer_invocation=metadata-only
requires requested_signing_operation=metadata-only
requires requested_key_handling=metadata-only
accepts requested_key_material=metadata-only
classifies the result as key_material_state=key-material-metadata-only
sets key_material_ready=1 only for metadata-only allowed key-handling states
renders deterministic key-material metadata
fails closed for invalid or denied predecessor metadata
```

Even when key_material_ready=1, these fields remain zero:

```
signature_performed=0
verification_performed=0
signer_invoked=0
public_key_parsed=0
key_material_loaded=0
private_key_handling=0
```

```
key_generation_performed=0
hardware_key_used=0
trust_store_loaded=0
revocation_lookup_performed=0
handoff_performed=0
effect_performed=0
runtime_authority_granted=0
host_read_performed=0
host_write_performed=0
network_performed=0
```

Current metadata output

The successful metadata path renders:

```
key_material_profile=latticra-seal-key-material/0.1
key_handling_profile=latticra-seal-key-handling/0.1
signing_operation_profile=latticra-seal-signing-operation/0.1
signer_invocation_profile=latticra-seal-signer-invocation/0.1
signer_handoff_profile=latticra-seal-signer-handoff/0.1
signing_authorization_profile=latticra-seal-signing-authorization/0.1
signature_request_profile=latticra-seal-signature-request/0.1
requested_signature=Ed25519-development
requested_signing_authorization=metadata-only
requested_signer_handoff=metadata-only
requested_signer_invocation=metadata-only
requested_signing_operation=metadata-only
requested_key_handling=metadata-only
requested_key_material=metadata-only
signing_authorization_state=authorized-metadata-only
signing_authorization_ready=1
signer_handoff_state=handoff-metadata-only
signer_handoff_ready=1
signer_invocation_state=invocation-metadata-only
signer_invocation_ready=1
signing_operation_state=operation-metadata-only
signing_operation_ready=1
key_handling_state=key-handling-metadata-only
key_handling_ready=1
key_material_state=key-material-metadata-only
key_material_ready=1
public_key_parsed=0
key_material_loaded=0
hardware_key_used=0
mode=metadata-only
status=key-material-metadata
```

Failure behavior

The implementation fails closed for:

```
null output
null key handling
invalid key handling
key_handling_ready=0
key_handling_state not key-handling-metadata-only
requested_key_handling not metadata-only
signing_operation_ready=0
signing_operation_state not operation-metadata-only
requested_signing_operation not metadata-only
signer_invocation_ready=0
signer_invocation_state not invocation-metadata-only
requested_signer_invocation not metadata-only
signer_handoff_ready=0
signer_handoff_state not handoff-metadata-only
requested_signer_handoff not metadata-only
signing_authorization_ready=0
signing_authorization_state not authorized-metadata-only
requested_signing_authorization not metadata-only
missing requested signature
unknown requested signature
missing requested key material
unknown requested key material
public-key parsing request
key material loading request
private-key handling request
key generation request
hardware-key use request
trust-store loading request
```

```
revocation lookup request
public-key parsing already present
key material loading already present
private-key handling already present
key generation already present
hardware-key use already present
trust-store loading already present
revocation lookup already present
runtime authority already granted
signature already performed
verification already performed
signer already invoked
handoff already performed
effect already performed
host read already performed
host write already performed
network already performed
small render buffer
```

Failures do not sign, verify signatures, invoke a signer, parse public keys, load key material, handle private keys, generate keys, use hardware keys, load trust stores, look up revocation status, read host files, write host files, contact networks, execute tools, execute shells, enforce capabilities, perform runtime handoff, persist policy, or grant runtime authority.

Validation

Run:

```
sh scripts/test-latticra-seal-key-material-contract.sh
sh scripts/test-latticra-seal-key-material.sh
```

Expected output:

```
seal key-material contract: ok
seal key-material invariants: ok
```

Next valid slice

The next valid Latticra Seal planning slice is bounded no-effect key parsing implementation or another narrow status/index alignment follow-up that still must not add public-key parsing without separate key-material, public-key, and guard contracts.

The key-material metadata implementation is a guarded checkpoint. Future work must not add public-key parsing, key material loading, private-key handling, key generation, hardware-key use, trust-store behavior, revocation lookup, signing, verification, signer invocation behavior, host behavior, network behavior, runtime authority, capability enforcement, object sealing, or kernel behavior unless separately implemented and guarded.

docs/LATTICRA_SEAL_LOCAL_CAPABILITY_REGISTRY_SCHEMA_CONTRACT.md

Source title: Latticra Seal Local Capability Registry Schema Contract

Lines: 270 | Words: 730 | SHA-256: b64cd85975486cdfee28c13644fc75c12fc4daa8d1ab70785fd2df8b54058fee

Latticra Seal Local Capability Registry Schema Contract

Status: contract for a future no-effect Latticra Seal local capability registry schema
Scope: contract-only planning for a future local capability registry schema after the operator receipt report surface/status checkpoint. This document does not implement a registry loader, read registry files, write registry files, create registry artifacts, execute tools, perform runtime behavior, grant runtime authority, enforce capabilities, perform effects, verify signatures, parse public keys, load key material, handle private keys, query trust stores, use networks, mutate host files, implement MCP behavior, control AI agents, claim malware prevention, claim ransomware prevention, or claim production security readiness.

Purpose

This contract defines the next Latticra Seal product slice: a future local capability registry schema.

The future schema should answer:

```
What local capability records may exist?
What fields must every capability record expose?
Which vocabulary values are allowed?
Which defaults keep every capability denied?
Which fields are descriptive only and cannot grant authority?
What evidence must exist before a future loader can be considered?
```

The answer must remain contract-only, local, no-effect, denied-by-default, and report-only.

Required Predecessors

A future implementation plan may only proceed after these predecessor surfaces remain present and guarded:

```
docs/latticra-seal/PRODUCT.md
docs/status/SEAL_PRODUCT_SPINE_STATUS.md
docs/LATTICRA_SEAL_OPERATOR_RECEIPT_REPORT_IMPLEMENTATION.md
docs/LATTICRA_SEAL_OPERATOR_RECEIPT_REPORT_SURFACE.md
docs/status/SEAL_OPERATOR_RECEIPT_REPORT_STATUS.md
docs/LATTICRA_SEAL_CAPABILITY_METADATA_REPORT_SURFACE.md
docs/status/SEAL_CAPABILITY_METADATA_REPORT_SURFACE_STATUS.md
docs/LATTICRA_SEAL_POLICY_DECISION_REPORT_SURFACE.md
docs/status/SEAL_POLICY_DECISION_REPORT_SURFACE_STATUS.md
docs/LATTICRA_SEAL_RUNTIME_DRY_RUN_REPORT_SURFACE.md
docs/status/SEAL_RUNTIME_DRY_RUN_REPORT_SURFACE_STATUS.md
```

Schema Profile

The future schema must use this profile:

```
registry_schema_profile=latticra-seal-local-capability-registry-schema/0.1
registry_scope=local-only
registry_mode=report-only
registry_status=contract-only
```

Registry Schema Fields

The future registry schema record must expose bounded metadata fields for:

```
registry_schema_profile=
registry_format_version=
registry_scope=
registry_mode=
registry_status=
registry_contract_present=
registry_schema_planning_only=
registry_loader_implemented=
registry_file_loading_supported=
registry_network_loading_supported=
registry_signature_verification_supported=
registry_trust_store_supported=
registry_entry_count_max=
registry_entry_id_max=
registry_namespace_max=
registry_description_max=
default_action_deny=
runtime_authority_granted=
effect_performed=
host_read_performed=
host_write_performed=
network_performed=
```

Capability Entry Fields

Every future capability entry must expose bounded metadata fields for:

```
capability_id=
capability_namespace=
```

```
capability_name=
capability_description=
capability_scope=
capability_effect_class=
capability_authority_class=
capability_default_decision=
capability_requires_guarded_allowlist=
capability_requires_policy_decision=
capability_requires_runtime_gate=
capability_requires_runtime_dry_run=
capability_requires_operator_review=
capability_requires_verification_receipt=
capability_requires_signed_request=
capability_grants_authority=
capability_executes_tool=
capability_reads_host=
capability_writes_host=
capability_uses_network=
capability_report_only=
capability_deprecated=
capability_blocked_reason=
```

Required Defaults

The future schema implementation, if added later, must default to:

```
registry_contract_present=1
registry_schema_planning_only=1
registry_loader_implemented=0
registry_file_loading_supported=0
registry_network_loading_supported=0
registry_signature_verification_supported=0
registry_trust_store_supported=0
default_action_deny=1
runtime_authority_granted=0
effect_performed=0
host_read_performed=0
host_write_performed=0
network_performed=0
capability_default_decision=deny
capability_requires_guarded_allowlist=1
capability_requires_policy_decision=1
capability_requires_runtime_gate=1
capability_requires_runtime_dry_run=1
capability_requires_operator_review=1
capability_requires_verification_receipt=1
capability_requires_signed_request=1
capability_grants_authority=0
capability_executes_tool=0
capability_reads_host=0
capability_writes_host=0
capability_uses_network=0
capability_report_only=1
```

Required Vocabulary

The future schema must restrict capability scopes to:

```
capability_scope=tool-boundary
capability_scope=request-boundary
capability_scope=policy-boundary
capability_scope=runtime-boundary
capability_scope=evidence-boundary
capability_scope=operator-review-boundary
```

The future schema must restrict effect classes to:

```
capability_effect_class=none
capability_effect_class=tool
capability_effect_class=host-read
capability_effect_class=host-write
capability_effect_class=network
capability_effect_class=runtime-authority
```

The future schema must restrict authority classes to:

```
capability_authority_class=none
capability_authority_class=descriptive-only
capability_authority_class=future-guarded
```

Any value other than none remains descriptive only until a separate implementation, verification, review, and authority contract exists.

Required Denial Rule

A future registry entry may describe a capability but must not authorize it.

Every future entry must preserve:

```
capability_grants_authority=0
capability_executes_tool=0
capability_reads_host=0
capability_writes_host=0
capability_uses_network=0
default_action_deny=1
runtime_authority_granted=0
effect_performed=0
```

Forbidden Behavior

This contract does not allow:

```
registry file loading
registry file writing
production capability registry loading
remote registry loading
trust-store lookup
signature verification
policy evaluation
policy enforcement
capability enforcement
runtime enforcement
tool execution
shell execution
AI-agent execution control
MCP protocol behavior
host reads
host writes
network behavior
runtime handoff execution
runtime authority grants
turning registry entries into execution grants
turning registry entries into effect grants
malware prevention claims
ransomware prevention claims
production security-product claims
```

Required Future Implementation Plan

A future implementation plan must specify:

```
exact header path
exact source path
exact test path
bounded struct sizes
enum labels
entry capacity
field copy behavior
default fixture entries
report shape
invalid schema handling
small-buffer behavior
null-input behavior
no-effect invariants
status/report-surface follow-up path
```

Promotion Rule

This contract does not authorize a registry loader.

The schema may be considered only as report-only metadata until a future implementation plan, implementation, report surface, status record, status-index alignment, public-entrypoint alignment, and negative-case evidence all remain merged and guarded.

Even after that sequence, a separate capability enforcement and runtime authority contract would be required before any registry entry could be used to authorize execution or effects.

Boundary

This is a contract-only planning slice.

It does not change implementation behavior, add runtime behavior, grant authority, or change public readiness.

Current Next Valid Slice

The local capability registry schema implementation plan is now represented by docs/LATTICRA_SEAL_LOCAL_CAPABILITY_REGISTRY_SCHEMA_IMPLEMENTATION_PLAN.md.

The local capability registry schema implementation is now represented by docs/LATTICRA_SEAL_LOCAL_CAPABILITY_REGISTRY_SCHEMA_IMPLEMENTATION.md.

The next valid Latticra Seal slice is a deterministic local capability registry schema report surface or a Panel-visible Seal dashboard planning checkpoint.

That future slice must preserve the no-effect posture and must not perform effects or grant authority.

docs/LATTICRA_SEAL_LOCAL_CAPABILITY_REGISTRY_SCHEMA_IMPLEMENTATION.md

Source title: Latticra Seal Local Capability Registry Schema Implementation

Lines: 199 | Words: 471 | SHA-256: 13e176fb205e3446c28456bda3de06ae286497d4f93a55642879540efb576673

Latticra Seal Local Capability Registry Schema Implementation

Status: no-effect implementation for the Latticra Seal local capability registry schema Scope: implementation record after the local capability registry schema contract and implementation plan. This implementation does not add a registry loader, read registry files, write registry files, create registry artifacts, execute tools, perform runtime behavior, grant runtime authority, enforce capabilities, perform effects, verify signatures, parse public keys, load key material, handle private keys, query trust stores, use networks, mutate host files, implement MCP behavior, control AI agents, claim malware prevention, claim ransomware prevention, or claim production security readiness.

Implemented Files

```
include/latticra/seal_local_capability_registry_schema.h
src/seal_local_capability_registry_schema.c
tests/seal_local_capability_registry_schema_invariants.c
scripts/test-latticra-seal-local-capability-registry-schema.sh
```

Implemented API

```
LATTICRA_SEAL_LOCAL_CAPABILITY_REGISTRY_PROFILE_MAX
LATTICRA_SEAL_LOCAL_CAPABILITY_REGISTRY_FORMAT_MAX
LATTICRA_SEAL_LOCAL_CAPABILITY_REGISTRY_SCOPE_MAX
LATTICRA_SEAL_LOCAL_CAPABILITY_REGISTRY_MODE_MAX
LATTICRA_SEAL_LOCAL_CAPABILITY_REGISTRY_STATUS_MAX
LATTICRA_SEAL_LOCAL_CAPABILITY_REGISTRY_ENTRY_MAX
LATTICRA_SEAL_LOCAL_CAPABILITY_REGISTRY_ENTRY_ID_MAX
LATTICRA_SEAL_LOCAL_CAPABILITY_REGISTRY_NAMESPACE_MAX
LATTICRA_SEAL_LOCAL_CAPABILITY_REGISTRY_NAME_MAX
LATTICRA_SEAL_LOCAL_CAPABILITY_REGISTRY_DESCRIPTION_MAX
LATTICRA_SEAL_LOCAL_CAPABILITY_REGISTRY_BLOCKED_REASON_MAX
LATTICRA_SEAL_LOCAL_CAPABILITY_REGISTRY_REPORT_MAX
latticra_seal_local_capability_registry_schema_error_t
latticra_seal_local_capability_registry_scope_t
latticra_seal_local_capability_registry_effect_class_t
latticra_seal_local_capability_registry_authority_class_t
latticra_seal_local_capability_registry_entry_t
latticra_seal_local_capability_registry_schema_t
latticra_seal_local_capability_registry_schema_error_label
latticra_seal_local_capability_registry_scope_label
latticra_seal_local_capability_registry_effect_class_label
latticra_seal_local_capability_registry_authority_class_label
latticra_seal_local_capability_registry_schema_init
latticra_seal_local_capability_registry_schema_add_entry
latticra_seal_local_capability_registry_schema_add_default_entry
latticra_seal_local_capability_registry_schema_validate
latticra_seal_local_capability_registry_schema_is_report_only
latticra_seal_local_capability_registry_schema_render
```

The API exposes no file-path input, registry-file reader, registry-file writer, network loader, trust-store loader, signature verifier, policy evaluator, runtime handoff function, or effect executor.

Initial Schema Output

The initialized schema preserves:

```
registry_schema_profile=latticra-seal-local-capability-registry-schema/0.1
registry_format_version=0.1
registry_scope=local-only
registry_mode=report-only
registry_status=contract-only
registry_contract_present=1
registry_schema_planning_only=1
registry_loader_implemented=0
registry_file_loading_supported=0
registry_network_loading_supported=0
registry_signature_verification_supported=0
registry_trust_store_supported=0
registry_entry_count=0
registry_entry_count_max=16
registry_entry_id_max=64
registry_namespace_max=64
registry_name_max=96
registry_description_max=256
registry_blocked_reason_max=160
default_action_deny=1
runtime_authority_granted=0
effect_performed=0
host_read_performed=0
host_write_performed=0
network_performed=0
error=ok
```

Default Fixture Entry

The default fixture entry emits:

```
capability_id=seal.local.registry.schema
capability_namespace=seal.local
capability_name=seal.local.registry.schema
capability_description=Describes local Seal capability schema metadata without loading or
granting capabilities.
capability_scope=operator-review-boundary
capability_effect_class=none
capability_authority_class=descriptive-only
```

```
capability_default_decision=deny
capability_requires_guarded_allowlist=1
capability_requires_policy_decision=1
capability_requires_runtime_gate=1
capability_requires_runtime_dry_run=1
capability_requires_operator_review=1
capability_requires_verification_receipt=1
capability_requires_signed_request=1
capability_grants_authority=0
capability_executes_tool=0
capability_reads_host=0
capability_writes_host=0
capability_uses_network=0
capability_report_only=1
capability_deprecated=0
capability_blocked_reason=registry-schema-is-descriptive-only
```

Report Shape

The renderer emits deterministic local metadata:

```
LATTICRA SEAL LOCAL CAPABILITY REGISTRY SCHEMA REPORT
registry_schema_profile=latticra-seal-local-capability-registry-schema/0.1
registry_format_version=0.1
registry_scope=local-only
registry_mode=report-only
registry_status=contract-only
registry_contract_present=1
registry_schema_planning_only=1
registry_loader_implemented=0
registry_file_loading_supported=0
registry_network_loading_supported=0
registry_signature_verification_supported=0
registry_trust_store_supported=0
registry_entry_count=1
registry_entry_count_max=16
default_action_deny=1
runtime_authority_granted=0
effect_performed=0
host_read_performed=0
host_write_performed=0
network_performed=0
capability_id=seal.local.registry.schema
capability_namespace=seal.local
capability_name=seal.local.registry.schema
capability_scope=operator-review-boundary
capability_effect_class=none
capability_authority_class=descriptive-only
capability_default_decision=deny
capability_grants_authority=0
capability_executes_tool=0
capability_reads_host=0
capability_writes_host=0
capability_uses_network=0
capability_report_only=1
capability_blocked_reason=registry-schema-is-descriptive-only
error=ok
```

Failure Behavior

The implementation fails closed for:

```
null output
null entry input
small render buffer
entry capacity overflow
invalid scope
invalid effect class
invalid authority class
allow default decision
entry authority grant
entry tool execution
entry host read
entry host write
entry network use
non-report-only entry
```

Invalid entries are not added to the schema. Invalid input preserves:

```
runtime_authority_granted=0
effect_performed=0
host_read_performed=0
host_write_performed=0
network_performed=0
```

Boundary

This is a no-effect local metadata implementation.

It does not authorize a registry loader, does not load a registry file, does not read a registry path, does not validate signatures, does not query a trust store, does not evaluate policy, does not enforce capabilities, and does not perform effects.

Current Next Valid Slice

The local capability registry schema implementation plan is represented by docs/LATTICRA_SEAL_LOCAL_CAPABILITY_REGISTRY_SCHEMA_IMPLEMENTATION_PLAN.md.

The next valid Latticra Seal slice is a deterministic local report surface for the local capability registry schema or a Panel-visible Seal dashboard planning checkpoint.

That future slice must preserve the no-effect posture and must not perform effects or grant authority.

docs/LATTICRA_SEAL_LOCAL_CAPABILITY_REGISTRY_SCHEMA_IMPLEMENTATION_PLAN.md

Source title: Latticra Seal Local Capability Registry Schema Implementation Plan

Lines: 375 | Words: 840 | SHA-256: 4a951c3c8ab4302a5e70f29ec0bc977d831fcbd6b2ce80e1e806fad8ce182fec

Latticra Seal Local Capability Registry Schema Implementation Plan

Status: implementation plan for a future no-effect Latticra Seal local capability registry schema Scope: implementation planning after the local capability registry schema contract. This document does not implement a registry loader, read registry files, write registry files, create registry artifacts, execute tools, perform runtime behavior, grant runtime authority, enforce capabilities, perform effects, verify signatures, parse public keys, load key material, handle private keys, query trust stores, use networks, mutate host files, implement MCP behavior, control AI agents, claim malware prevention, claim ransomware prevention, or claim production security readiness.

Purpose

This plan defines the exact future implementation shape for a no-effect local capability registry schema.

The future implementation should make capability records inspectable as bounded local metadata while preserving denial, non-execution, and zero runtime authority.

Required Contract

The implementation plan depends on:

```
docs/LATTICRA_SEAL_LOCAL_CAPABILITY_REGISTRY_SCHEMA_CONTRACT.md
scripts/test-latticra-seal-local-capability-registry-schema-contract.sh
```

The contract must remain merged and guarded before implementation code is added.

Planned Files

A future implementation slice may add:

```
include/latticra/seal_local_capability_registry_schema.h
src/seal_local_capability_registry_schema.c
tests/seal_local_capability_registry_schema_invariants.c
scripts/test-latticra-seal-local-capability-registry-schema.sh
docs/LATTICRA_SEAL_LOCAL_CAPABILITY_REGISTRY_SCHEMA_IMPLEMENTATION.md
```

A later report-surface slice may add:

```
tests/seal_local_capability_registry_schema_surface.c
scripts/latticra-seal-local-capability-registry-schema.sh
scripts/test-latticra-seal-local-capability-registry-schema-surface.sh
docs/LATTICRA_SEAL_LOCAL_CAPABILITY_REGISTRY_SCHEMA_SURFACE.md
docs/status/SEAL_LOCAL_CAPABILITY_REGISTRY_SCHEMA_STATUS.md
```

Header API Plan

The header should define:

```
LATTICRA_SEAL_LOCAL_CAPABILITY_REGISTRY_PROFILE_MAX
LATTICRA_SEAL_LOCAL_CAPABILITY_REGISTRY_FORMAT_MAX
LATTICRA_SEAL_LOCAL_CAPABILITY_REGISTRY_SCOPE_MAX
LATTICRA_SEAL_LOCAL_CAPABILITY_REGISTRY_MODE_MAX
LATTICRA_SEAL_LOCAL_CAPABILITY_REGISTRY_STATUS_MAX
LATTICRA_SEAL_LOCAL_CAPABILITY_REGISTRY_ENTRY_MAX
LATTICRA_SEAL_LOCAL_CAPABILITY_REGISTRY_ENTRY_ID_MAX
LATTICRA_SEAL_LOCAL_CAPABILITY_REGISTRY_NAMESPACE_MAX
LATTICRA_SEAL_LOCAL_CAPABILITY_REGISTRY_NAME_MAX
LATTICRA_SEAL_LOCAL_CAPABILITY_REGISTRY_DESCRIPTION_MAX
LATTICRA_SEAL_LOCAL_CAPABILITY_REGISTRY_BLOCKED_REASON_MAX
LATTICRA_SEAL_LOCAL_CAPABILITY_REGISTRY_REPORT_MAX
latticra_seal_local_capability_registry_schema_error_t
latticra_seal_local_capability_registry_scope_t
latticra_seal_local_capability_registry_effect_class_t
latticra_seal_local_capability_registry_authority_class_t
latticra_seal_local_capability_registry_entry_t
latticra_seal_local_capability_registry_schema_t
latticra_seal_local_capability_registry_schema_error_label
latticra_seal_local_capability_registry_schema_init
latticra_seal_local_capability_registry_schema_add_entry
latticra_seal_local_capability_registry_schema_add_default_entry
latticra_seal_local_capability_registry_schema_validate
latticra_seal_local_capability_registry_schema_is_report_only
latticra_seal_local_capability_registry_schema_render
```

The API must not include a path-loading function, registry-file reader, registry-file writer, network loader, trust-store loader, signature verifier, policy evaluator, runtime handoff function, or effect executor.

Capacity Plan

The future implementation should use bounded fixed storage:

```
registry_entry_count_max=16
registry_entry_id_max=64
registry_namespace_max=64
registry_name_max=96
registry_description_max=256
registry_blocked_reason_max=160
```

No dynamic allocation is required for the initial implementation.

Error Model

The error enum should include:

```
LATTICRA_SEAL_LOCAL_CAPABILITY_REGISTRY_SCHEMA_OK
LATTICRA_SEAL_LOCAL_CAPABILITY_REGISTRY_SCHEMA_INVALID_INPUT
LATTICRA_SEAL_LOCAL_CAPABILITY_REGISTRY_SCHEMA_INVALID_PROFILE
LATTICRA_SEAL_LOCAL_CAPABILITY_REGISTRY_SCHEMA_INVALID_SCOPE
LATTICRA_SEAL_LOCAL_CAPABILITY_REGISTRY_SCHEMA_INVALID_EFFECT_CLASS
LATTICRA_SEAL_LOCAL_CAPABILITY_REGISTRY_SCHEMA_INVALID_AUTHORITY_CLASS
LATTICRA_SEAL_LOCAL_CAPABILITY_REGISTRY_SCHEMA_INVALID_DEFAULT_DECISION
LATTICRA_SEAL_LOCAL_CAPABILITY_REGISTRY_SCHEMA_ENTRY_CAPACITY_EXCEEDED
LATTICRA_SEAL_LOCAL_CAPABILITY_REGISTRY_SCHEMA_ENTRY_WOULD_GRANT_AUTHORITY
LATTICRA_SEAL_LOCAL_CAPABILITY_REGISTRY_SCHEMA_ENTRY_WOULD_PERFORM_EFFECT
LATTICRA_SEAL_LOCAL_CAPABILITY_REGISTRY_SCHEMA_NON_REPORT_ONLY_ENTRY
LATTICRA_SEAL_LOCAL_CAPABILITY_REGISTRY_SCHEMA_BUFFER_TOO_SMALL
```

Registry Record Fields

The registry record should include:

```
registry_schema_profile
registry_format_version
registry_scope
registry_mode
registry_status
registry_contract_present
registry_schema_planning_only
registry_loader_implemented
registry_file_loading_supported
registry_network_loading_supported
registry_signature_verification_supported
registry_trust_store_supported
registry_entry_count
registry_entry_count_max
registry_entry_id_max
registry_namespace_max
registry_name_max
registry_description_max
registry_blocked_reason_max
default_action_deny
runtime_authority_granted
effect_performed
host_read_performed
host_write_performed
network_performed
last_error
```

Capability Entry Record Fields

Every entry should include:

```
capability_id
capability_namespace
capability_name
capability_description
capability_scope
capability_effect_class
capability_authority_class
capability_default_decision
capability_requires_guarded_allowlist
capability_requires_policy_decision
capability_requires_runtime_gate
capability_requires_runtime_dry_run
capability_requires_operator_review
capability_requires_verification_receipt
capability_requires_signed_request
capability_grants_authority
capability_executes_tool
capability_reads_host
capability_writes_host
capability_uses_network
capability_report_only
capability_deprecated
capability_blocked_reason
```

Initial Constants

The implementation should emit for an initialized schema:

```
registry_schema_profile=latticra-seal-local-capability-registry-schema/0.1
registry_format_version=0.1
registry_scope=local-only
registry_mode=report-only
registry_status=contract-only
registry_contract_present=1
registry_schema_planning_only=1
registry_loader_implemented=0
registry_file_loading_supported=0
registry_network_loading_supported=0
registry_signature_verification_supported=0
registry_trust_store_supported=0
registry_entry_count=0
registry_entry_count_max=16
registry_entry_id_max=64
registry_namespace_max=64
```

```
registry_name_max=96
registry_description_max=256
registry_blocked_reason_max=160
default_action_deny=1
runtime_authority_granted=0
effect_performed=0
host_read_performed=0
host_write_performed=0
network_performed=0
```

The default fixture entry should emit:

```
capability_id=seal.local.registry.schema
capability_namespace=seal.local
capability_name=seal.local.registry.schema
capability_description=Describes local Seal capability schema metadata without loading or
granting capabilities.
capability_scope=operator-review-boundary
capability_effect_class=none
capability_authority_class=descriptive-only
capability_default_decision=deny
capability_requires_guarded_allowlist=1
capability_requires_policy_decision=1
capability_requires_runtime_gate=1
capability_requires_runtime_dry_run=1
capability_requires_operator_review=1
capability_requires_verification_receipt=1
capability_requires_signed_request=1
capability_grants_authority=0
capability_executes_tool=0
capability_reads_host=0
capability_writes_host=0
capability_uses_network=0
capability_report_only=1
capability_deprecated=0
capability_blocked_reason=registry-schema-is-descriptive-only
```

Function Behavior

The builder should:

```
initialize a caller-provided registry record
add caller-provided static entries only
add one default fixture entry
validate bounded vocabulary values
validate deny-by-default entry posture
reject null registry output
reject null entry input
reject entry capacity overflow
reject malformed vocabulary values
reject unsupported default decisions
reject any capability entry that would grant authority
reject any capability entry that would perform an effect
reject any non-report-only capability entry
render deterministic metadata only
return BUFFER_TOO_SMALL for insufficient render buffers
```

The implementation must not expose a file-path input API.

Report Shape

The render function should produce:

```
LATTICRA SEAL LOCAL CAPABILITY REGISTRY SCHEMA REPORT
registry_schema_profile=latticra-seal-local-capability-registry-schema/0.1
registry_format_version=0.1
registry_scope=local-only
registry_mode=report-only
registry_status=contract-only
registry_contract_present=1
registry_schema_planning_only=1
registry_loader_implemented=0
registry_file_loading_supported=0
registry_network_loading_supported=0
registry_signature_verification_supported=0
registry_trust_store_supported=0
registry_entry_count=1
registry_entry_count_max=16
default_action_deny=1
```

```
runtime_authority_granted=0
effect_performed=0
host_read_performed=0
host_write_performed=0
network_performed=0
capability_id=seal.local.registry.schema
capability_namespace=seal.local
capability_name=seal.local.registry.schema
capability_scope=operator-review-boundary
capability_effect_class=none
capability_authority_class=descriptive-only
capability_default_decision=deny
capability_requires_guarded_allowlist=1
capability_requires_policy_decision=1
capability_requires_runtime_gate=1
capability_requires_runtime_dry_run=1
capability_requires_operator_review=1
capability_requires_verification_receipt=1
capability_requires_signed_request=1
capability_grants_authority=0
capability_executes_tool=0
capability_reads_host=0
capability_writes_host=0
capability_uses_network=0
capability_report_only=1
capability_deprecated=0
capability_blocked_reason=registry-schema-is-descriptive-only
error=ok
```

Test Plan

The invariant test should cover:

```
default schema initializes as report-only
default fixture entry remains denied
render output includes the report header
null output is rejected
null entry input is rejected
small render buffer is rejected
entry capacity overflow is rejected
invalid scope is rejected
invalid effect class is rejected
invalid authority class is rejected
allow default decision is rejected
entry authority grant is rejected
entry tool execution is rejected
entry host read is rejected
entry host write is rejected
entry network use is rejected
non-report-only entry is rejected
no-effect counters remain zero on invalid input
```

Forbidden Behavior

The implementation must not add:

```
registry loader
registry file loading
registry file writing
remote registry loading
trust-store lookup
signature verification
policy evaluation
policy enforcement
capability enforcement
runtime enforcement
tool execution
shell execution
AI-agent execution control
MCP protocol behavior
host reads
host writes
network behavior
runtime handoff execution
runtime authority grants
turning registry entries into execution grants
turning registry entries into effect grants
malware prevention claims
ransomware prevention claims
```

```
production security-product claims
```

Current Next Valid Slice

The local capability registry schema contract is represented by docs/LATTICRA_SEAL_LOCAL_CAPABILITY_REGISTRY_SCHEMA_CONTRACT.md.

The local capability registry schema implementation is now represented by docs/LATTICRA_SEAL_LOCAL_CAPABILITY_REGISTRY_SCHEMA_IMPLEMENTATION.md.

The next valid Latticra Seal slice is a deterministic local capability registry schema report surface or a Panel-visible Seal dashboard planning checkpoint.

That future slice must preserve the no-effect posture and must not perform effects or grant authority.

docs/LATTICRA_SEAL_MCP_ALIGNMENT_PLAN.md

Source title: Latticra Seal MCP Alignment Plan

Lines: 217 | Words: 678 | SHA-256: 090a951b4583ad8a782ba094be0f90d39fa751464cce8d11f57467cdccc6fb2f

Latticra Seal MCP Alignment Plan

Status: Latticra Seal MCP alignment planning document Scope: documentation-only alignment plan for model-context style tool invocation security after the Latticra Seal agentic automation security contract. This document does not implement runtime execution, runtime authority, effect execution, capability enforcement, cryptographic verification, verified receipts, public-key parsing, public-key trust stores, key generation, private-key storage, hardware key use, network trust lookup, revocation lookup, object sealing, host reads, host writes, kernel behavior, Fedora approval claims, production readiness, MCP protocol implementation, MCP server behavior, MCP client behavior, AI agent execution, model execution, tool execution, or operating-system behavior.

Purpose

This document records how Latticra Seal should align with model-context style automation security concerns while remaining evidence-bound and no-effect.

The purpose is not to implement MCP.

The purpose is to define a future-safe vocabulary and direction for protecting local tool invocation, automation, and AI-adjacent workflows through Seal metadata, policy, receipts, and runtime-boundary discipline.

Alignment thesis

Model-context style automation creates a new systems boundary:

```
model or assistant intent -&gt; tool request -&gt; parameter transfer -&gt; local action -&gt;
output return
 -&gt; possible downstream action
```

Latticra Seal should treat every boundary crossing as untrusted until measured, declared, constrained, and reported.

Seal mapping

The existing Seal chain maps naturally to agentic automation security:

```
Seal report -&gt; visibility surface
Seal measurement -&gt; identity and evidence posture
Seal manifest -&gt; declared tool identity and capability scope
Seal signature policy -&gt; rules for signed and unsigned objects
Seal signature metadata -&gt; signature presence and declared signature state
Seal verification policy -&gt; rules for accepting or rejecting trust material
Seal verification receipt -&gt; reportable verification result
```

```
Seal capability gate -&gt; denied-by-default authority boundary
Seal effect decision -&gt; explicit action decision
Seal runtime handoff -&gt; disabled runtime boundary
Seal status rollup -&gt; compact posture summary
Agentic automation security -&gt; tool invocation and context boundary planning
```

Planned MCP-adjacent fields

Future MCP-adjacent records should remain bounded and deterministic.

Planned fields:

```
mcp_alignment_profile
protocol_implementation_supported
server_behavior_supported
client_behavior_supported
tool_registry_present
tool_manifest_required
tool_manifest_signed_required
parameter_schema_required
parameter_schema_valid
request_identity_required
request_timestamp_required
request_expiration_required
nonce_required
context_hash_required
parameter_hash_required
message_signature_required
replay_protection_required
output_treated_as_untrusted
downstream_execution_allowed
operator_approval_required
receipt_required
runtime_authority_granted
mode
status
```

Initial values:

```
mcp_alignment_profile=latticra-seal-mcp-alignment/0.1
protocol_implementation_supported=0
server_behavior_supported=0
client_behavior_supported=0
tool_registry_present=0
tool_manifest_required=1
tool_manifest_signed_required=1
parameter_schema_required=1
parameter_schema_valid=0
request_identity_required=1
request_timestamp_required=1
request_expiration_required=1
nonce_required=1
context_hash_required=1
parameter_hash_required=1
message_signature_required=1
replay_protection_required=1
output_treated_as_untrusted=1
downstream_execution_allowed=0
operator_approval_required=1
receipt_required=1
runtime_authority_granted=0
mode=planning-only
status=mcp-alignment-planning-only
```

Trust boundary rules

Latticra Seal should preserve these rules for future implementation:

```
model output is not authority
tool output is not authority
retrieved context is not authority
unsigned manifests do not grant authority
unknown tools do not grant authority
parameters must not cross boundaries without validation
outputs must not become downstream inputs without policy
network access must remain denied unless explicitly granted
private key access must remain denied unless explicitly granted
runtime authority must remain zero until guarded implementation exists
```

Parameter validation direction

Future Seal records should be able to report:

```
parameter_schema_present
parameter_schema_valid
max_input_bytes_declared
input_size_within_limit
source_context_known
parameter_hash_present
parameter_forwarding_allowed
```

The initial default is:

```
parameter_forwarding_allowed=0
```

Freshness and replay direction

Future Seal records should be able to report:

```
request_timestamp_present
request_expiration_present
nonce_present
freshness_valid
replay_detected
```

The initial default is:

```
freshness_valid=0
replay_detected=0
```

Output filtering direction

Future Seal records should treat returned tool/model output as untrusted until explicitly classified.

Initial defaults:

```
output_treated_as_untrusted=1
downstream_execution_allowed=0
chain_continuation_requires_policy=1
```

Fedora/Linux composition direction

Latticra Seal should compose with Linux security instead of replacing it.

Future composition targets may include:

```
SELinux
systemd service boundaries
seccomp
read-only directories
temporary runtime directories
user namespaces
network namespace isolation
```

This plan does not implement any of these mechanisms.

Non-claims

This alignment plan must not be read as deployment, certification, endorsement, production hardening, or protocol implementation.

Required non-claims:

```
mcp_protocol_implemented=0
mcp_server_implemented=0
mcp_client_implemented=0
external_endorsement_claimed=0
NSA_endorsement_claimed=0
Fedora_approval_claimed=0
production_readiness_claimed=0
runtime_authority_granted=0
host_read_performed=0
host_write_performed=0
network_performed=0
```

Next valid slice

The next valid Latticra Seal slice is a report-only agentic automation security metadata implementation.

That future slice may add bounded C metadata and deterministic report rendering.

It must not implement MCP behavior, runtime behavior, host behavior, network behavior, AI agent execution, model execution, tool execution, capability enforcement, cryptographic verification, or authority grants.

docs/LATTICRA_SEAL_MEASUREMENT_CONTRACT.md

Source title: Latticra Seal Measurement Contract

Lines: 165 | Words: 470 | SHA-256: 37c47fd58140c92249362ed9482a8372e4d09a39e50605443fdd0ce980bffd54

Latticra Seal Measurement Contract

Status: Latticra Seal measurement contract Scope: contract for future read-only artifact measurement before measurement implementation, manifest generation, signing, encryption, key handling, runtime authority, host writes, network behavior, kernel behavior, Fedora approval claims, production readiness, or operating-system behavior.

Purpose

This document defines the next Latticra Seal layer: read-only measurement.

Measurement means computing deterministic digest metadata for explicitly supplied artifacts so Latticra can later bind reports, contracts, packages, and release evidence to stable identifiers.

This document does not implement measurement.

Required predecessors

This contract depends on:

```
docs/LATTICRA_SEAL_CONTRACT.md
docs/LATTICRA_SEAL_IMPLEMENTATION_PLAN.md
docs/LATTICRA_SEAL_REPORT_IMPLEMENTATION.md
include/latticra/seal_report.h
src/seal_report.c
scripts/test-latticra-seal-report.sh
```

The Seal report must remain the source of truth for the current no-effect posture until measurement code is implemented and guarded.

Measurement boundary

The first measurement implementation may only read an explicitly supplied regular file path from the caller.

Allowed future behavior:

```
open caller-supplied file for read-only access
read file bytes in bounded chunks
compute SHA-256 digest
record byte length
record measurement status
render deterministic report metadata
```

Forbidden first measurement behavior:

```
file writes
directory traversal by default
recursive hashing
network access
key generation
```

```
signing
encryption
manifest persistence
runtime authority grants
capability enforcement
kernel interaction
package installation
host configuration changes
```

Approved initial digest policy

The first official measurement digest is:

```
SHA-256
```

SHA-384 and SHA-512 may be planned later for wider digest profiles.

BLAKE3 may be planned later only for fast internal content addressing, not compliance claims.

No custom hash function may be introduced.

Planned API shape

The first measurement implementation should use bounded C records.

Proposed files:

```
include/latticra/seal_measurement.h
src/seal_measurement.c
tests/seal_measurement_invariants.c
scripts/test-latticra-seal-measurement.sh
docs/LATTICRA_SEAL_MEASUREMENT_IMPLEMENTATION.md
```

Proposed record fields:

```
measurement_profile
algorithm
artifact_label
artifact_size_bytes
digest_hex
read_performed
write_performed
network_performed
runtime_granted
status
error_label
```

Report integration

After implementation, the Seal report may advance:

```
measurement_supported=1
```

Only after the measurement implementation and invariant tests are present.

Until then, the report must keep:

```
measurement_supported=0
```

Failure behavior

The future measurement implementation must fail closed.

Required failure states:

```
null input -&gt; invalid
empty path -&gt; invalid
non-regular path -&gt; invalid
open failure -&gt; read unavailable
read failure -&gt; read failed
output buffer too small -&gt; bounded failure
unsupported algorithm -&gt; invalid
```

Failures must not create files, modify files, contact networks, grant runtime authority, or persist manifests.

Invariant requirements

The first measurement tests must verify:

```
known fixture produces expected SHA-256 digest
regular file read is recorded
write remains zero
network remains zero
runtime grant remains zero
null input fails
empty path fails
small report buffer fails closed
unsupported path fails without mutation
Seal report only changes measurement_supported after implementation exists
```

Promotion rule

This contract permits only the next implementation slice:

```
read-only SHA-256 measurement implementation
```

It does not permit signing, encryption, key handling, object sealing, capability enforcement, or runtime authority.

docs/LATTICRA_SEAL_MEASUREMENT_IMPLEMENTATION.md

Source title: Latticra Seal Measurement Implementation

Lines: 145 | Words: 406 | SHA-256: b35d6df900500faebea5ec1ce0341ab3ce5ae406ec9e83a4d33c353ea7367c09

Latticra Seal Measurement Implementation

Status: initial read-only SHA-256 measurement implementation Scope: bounded C measurement surface for caller-supplied regular files. This slice does not add signing, encryption, key handling, object sealing, capability enforcement, runtime authority, host writes, network behavior, kernel behavior, Fedora approval claims, production readiness, or operating-system behavior.

Purpose

This document records the first Latticra Seal measurement implementation.

The implementation adds read-only SHA-256 artifact measurement so Latticra can identify explicitly supplied artifacts with deterministic digest metadata.

Added files

```
include/latticra/seal_measurement.h
src/seal_measurement.c
tests/seal_measurement_invariants.c
scripts/test-latticra-seal-measurement.sh
```

This slice also advances the Seal report surface so it can truthfully state:

```
measurement_supported=1
```

API summary

The measurement surface adds:

```
latticra_seal_measurement_t
latticra_seal_measurement_error_t
latticra_seal_measurement_error_label
latticra_seal_measure_file
latticra_seal_measurement_is_read_only
latticra_seal_measurement_report
```

Measurement behavior

The implementation:

```
accepts a caller-supplied path
```

```
requires a regular file
opens the file in binary read-only mode
reads bytes in bounded chunks
computes SHA-256
records byte length
renders deterministic report metadata
```

The implementation does not recurse, scan directories, create manifests, sign data, encrypt data, write files, contact networks, or grant runtime authority.

Default report posture after this slice

The Seal report now states:

```
seal_profile=latticra-seal/0.1-report
report_only_supported=1
measurement_supported=1
signing_supported=0
capability_gate_supported=0
sealed_objects_supported=0
effect_performed=0
host_read_performed=0
host_write_performed=0
network_performed=0
runtime_granted=0
evidence_level=3
status=report-and-measurement
```

The report itself remains no-effect. Measurement reads only when the measurement API is explicitly called.

Measurement record posture

A successful measurement records:

```
measurement_profile=latticra-seal-measurement/0.1
algorithm=SHA-256
artifact_label=&lt;caller supplied path&gt;
artifact_size_bytes=&lt;read byte count&gt;
digest_hex=&lt;64 lowercase hex characters&gt;
read_performed=1
write_performed=0
network_performed=0
runtime_granted=0
error=ok
status=measured
```

Failure behavior

The implementation fails closed:

```
null output -&gt; LATTICRA_STATUS_NULL_ARGUMENT
null path -&gt; invalid-input
empty path -&gt; invalid-input
non-regular path -&gt; not-regular
open failure -&gt; open-failed
read failure -&gt; read-failed
small report buffer -&gt; LATTICRA_STATUS_BUFFER_TOO_SMALL
```

Failures do not write files, contact networks, persist manifests, or grant runtime authority.

Invariants

The invariant test verifies:

```
known fixture produces expected SHA-256 digest
regular file read is recorded
write remains zero
network remains zero
runtime grant remains zero
rendered measurement report contains required labels
null path fails closed
empty path fails closed
non-regular path fails closed
missing file fails closed
small report buffer fails closed
```

```
null report inputs fail closed
Seal report advertises measurement support only after implementation exists
```

Validation

Run:

```
sh scripts/test-latticra-seal-measurement.sh
sh scripts/test-latticra-seal-measurement-contract.sh
```

Next valid slice

The next valid Latticra Seal slice is a signed evidence-manifest contract.

That future slice must be contract-first and must not be added directly to this measurement implementation.

docs/LATTICRA_SEAL_OPERATOR_RECEIPT_REPORT_CONTRACT.md

Source title: Latticra Seal Operator Receipt Report Contract

Lines: 253 | Words: 702 | SHA-256: 8e355e23887cd8d41041d268ba5bd93607ef092ccef7a509452a415ee0e9bb66

Latticra Seal Operator Receipt Report Contract

Status: Latticra Seal operator receipt report contract Scope: contract-only planning for a future bundled local operator receipt report after the Seal product spine status checkpoint. This document does not implement a receipt report, write receipt files, create artifacts, execute tools, perform runtime behavior, grant runtime authority, enforce capabilities, perform effects, verify signatures, parse public keys, load key material, handle private keys, query trust stores, use networks, read host files beyond future caller-provided metadata, mutate host files, implement MCP behavior, control AI agents, claim malware prevention, claim ransomware prevention, or claim production security readiness.

Purpose

This contract defines the next Latticra Seal product slice: a future operator-visible receipt report that bundles the existing report-only Seal metadata chain into one local, inspectable decision artifact.

The future receipt report should answer:

```
What capability was requested?
Was the capability known only as a candidate?
What did policy decide?
Was freshness metadata present?
Was signed-request metadata present?
What would the runtime dry-run do?
Why is the request still denied?
Did anything execute?
Was runtime authority granted?
```

Required predecessors

The future implementation may only proceed after these predecessor surfaces remain present and guarded:

```
docs/latticra-seal/PRODUCT.md
docs/status/SEAL_PRODUCT_SPINE_STATUS.md
docs/LATTICRA_SEAL_CAPABILITY_METADATA_REPORT_SURFACE.md
docs/status/SEAL_CAPABILITY_METADATA_REPORT_SURFACE_STATUS.md
docs/LATTICRA_SEAL_POLICY_DECISION_REPORT_SURFACE.md
docs/status/SEAL_POLICY_DECISION_REPORT_SURFACE_STATUS.md
docs/status/SEAL_POLICY_DECISION_STATUS.md
docs/LATTICRA_SEAL_REQUEST_FRESHNESS_REPORT_SURFACE.md
docs/status/SEAL_REQUEST_FRESHNESS_STATUS.md
docs/LATTICRA_SEAL_SIGNED_REQUEST_IMPLEMENTATION.md
docs/status/SEAL_SIGNED_REQUEST_STATUS.md
```

```
docs/LATTICRA_SEAL_RUNTIME_DRY_RUN_REPORT_SURFACE.md
docs/status/SEAL_RUNTIME_DRY_RUN_REPORT_SURFACE_STATUS.md
```

Future implementation name

```
Latticra Seal operator receipt report
```

Future files

The future implementation should use a bounded C surface and deterministic shell guards:

```
include/latticra/seal_operator_receipt_report.h
src/seal_operator_receipt_report.c
tests/seal_operator_receipt_report_invariants.c
tests/seal_operator_receipt_report_surface.c
scripts/test-latticra-seal-operator-receipt-report.sh
scripts/latticra-seal-operator-receipt-report.sh
docs/LATTICRA_SEAL_OPERATOR_RECEIPT_REPORT_IMPLEMENTATION.md
docs/LATTICRA_SEAL_OPERATOR_RECEIPT_REPORT_SURFACE.md
docs/status/SEAL_OPERATOR_RECEIPT_REPORT_STATUS.md
```

Receipt profile

The future report must use this profile:

```
operator_receipt_profile=latticra-seal-operator-receipt-report/0.1
receipt_mode=report-only
receipt_status=denied-report-only
```

Required source bindings

The future receipt report must bind source metadata explicitly:

```
source_capability_metadata_present=1
source_policy_decision_present=1
source_request_freshness_present=1
source_signed_request_present=1
source_runtime_dry_run_present=1
source_denial_reason_present=1
```

If any required source metadata is absent, malformed, or not report-only, the receipt must fail closed:

```
receipt_complete=0
receipt_invalid=1
would_allow=0
would_deny=1
runtime_authority_granted=0
```

Required report fields

The future report must render deterministic fields for:

```
operator_receipt_profile=
receipt_mode=
receipt_status=
source_capability_metadata_present=
source_policy_decision_present=
source_request_freshness_present=
source_signed_request_present=
source_runtime_dry_run_present=
source_denial_reason_present=
capability_name=
capability_known=
capability_candidate=
policy_decision_state=
request_freshness_state=
signed_request_state=
runtime_dry_run_state=
blocked_reason=
default_action_deny=
would_allow=
would_deny=
would_require_operator_review=
would_execute_tool=
would_read_host=
would_write_host=
would_use_network=
```

```
would_grant_runtime_authority=
receipt_complete=
receipt_invalid=
report_only=
runtime_authority_granted=
effect_performed=
host_read_performed=
host_write_performed=
network_performed=
```

Required denied posture

The default operator receipt report must preserve:

```
default_action_deny=1
would_allow=0
would_deny=1
would_require_operator_review=1
would_execute_tool=0
would_read_host=0
would_write_host=0
would_use_network=0
would_grant_runtime_authority=0
report_only=1
runtime_authority_granted=0
effect_performed=0
host_read_performed=0
host_write_performed=0
network_performed=0
```

Failure behavior

The future implementation must fail closed when:

```
capability metadata is missing
policy decision metadata is missing
request freshness metadata is missing
signed request metadata is missing
runtime dry-run metadata is missing
any source metadata is not report-only
any source metadata would allow an effect
the output buffer is null
the output buffer is too small
```

Failure must produce no effects, no host reads, no host writes, no network behavior, no runtime handoff, no tool execution, and no runtime authority.

Non-goals

This contract does not allow:

```
runtime enforcement
capability enforcement
tool execution
AI-agent execution control
MCP protocol behavior
signature verification
signing
key parsing
key material loading
private-key handling
trust-store loading
revocation lookup
nonce storage
replay-cache mutation
host mutation
network behavior
kernel behavior
production security-product claims
malware prevention claims
ransomware prevention claims
```

Validation requirements

The future implementation guard must verify:

```
all required predecessor docs and status records exist
the receipt profile is stable
```

```
all source bindings are rendered
missing source metadata fails closed
non-report-only source metadata fails closed
would_execute_tool=0
would_read_host=0
would_write_host=0
would_use_network=0
runtime_authority_granted=0
small output buffer fails closed
```

Current guard

This contract is covered by:

```
sh scripts/test-latticra-seal-operator-receipt-report-contract.sh
```

Expected output:

```
latticra seal operator receipt report contract: ok
```

Current next valid slice

The no-effect operator receipt report implementation, report surface, and status record are now current follow-up checkpoints.

The operator receipt report surface/status checkpoint is now represented by docs/LATTICRA_SEAL_OPERATOR_RECEIPT_REPORT_SURFACE.md and docs/status/SEAL_OPERATOR_RECEIPT_REPORT_STATUS.md.

The local capability registry schema contract is now represented by docs/LATTICRA_SEAL_LOCAL_CAPABILITY_REGISTRY_SCHEMA_CONTRACT.md.

The local capability registry schema implementation plan is now represented by docs/LATTICRA_SEAL_LOCAL_CAPABILITY_REGISTRY_SCHEMA_IMPLEMENTATION_PLAN.md.

The local capability registry schema implementation is now represented by docs/LATTICRA_SEAL_LOCAL_CAPABILITY_REGISTRY_SCHEMA_IMPLEMENTATION.md.

The next valid Latticra Seal slice is a deterministic local capability registry schema report surface or a Panel-visible Seal dashboard planning checkpoint.

That future slice must preserve the no-effect posture and must not perform effects or grant authority.

docs/LATTICRA_SEAL_OPERATOR_RECEIPT_REPORT_IMPLEMENTATION.md

Source title: Latticra Seal Operator Receipt Report Implementation

Lines: 171 | Words: 476 | SHA-256: de08d317ece8d9f53f4125b29805af66ef062940ae0b96ac8f243e932b9d6553

Latticra Seal Operator Receipt Report Implementation

Status: no-effect Latticra Seal operator receipt report implementation Scope: bounded C metadata implementation for composing existing report-only Seal source records into one deterministic operator receipt. This implementation does not write receipt files, create persistent artifacts, execute tools, perform runtime behavior, grant runtime authority, enforce capabilities, perform effects, verify signatures, parse public keys, load key material, handle private keys, query trust stores, use networks, mutate host files, implement MCP behavior, control AI agents, claim malware prevention, claim ransomware prevention, or claim production security readiness.

Purpose

The operator receipt report makes the current Seal denial chain easier to inspect.

It combines these caller-provided in-memory records:

```
capability metadata
```

```
policy decision metadata
request freshness metadata
signed request metadata
runtime dry-run metadata
```

The result is still denied, report-only, and no-effect. It is an operator-facing evidence bundle, not an enforcement path.

Files

```
include/latticra/seal_operator_receipt_report.h
src/seal_operator_receipt_report.c
tests/seal_operator_receipt_report_invariants.c
scripts/test-latticra-seal-operator-receipt-report.sh
docs/LATTICRA_SEAL_OPERATOR_RECEIPT_REPORT_IMPLEMENTATION.md
```

Public API

The implementation adds:

```
LATTICRA_SEAL_OPERATOR_RECEIPT_PROFILE_MAX
LATTICRA_SEAL_OPERATOR_RECEIPT_STATE_MAX
LATTICRA_SEAL_OPERATOR_RECEIPT_REASON_MAX
LATTICRA_SEAL_OPERATOR_RECEIPT_CAPABILITY_MAX
LATTICRA_SEAL_OPERATOR_RECEIPT_REPORT_MAX
latticra_seal_operator_receipt_report_error_t
latticra_seal_operator_receipt_report_sources_t
latticra_seal_operator_receipt_report_t
latticra_seal_operator_receipt_report_error_label
latticra_seal_operator_receipt_report_from_sources
latticra_seal_operator_receipt_report_is_report_only
latticra_seal_operator_receipt_report_render
```

Error Model

```
LATTICRA_SEAL_OPERATOR_RECEIPT_REPORT_OK
LATTICRA_SEAL_OPERATOR_RECEIPT_REPORT_INVALID_INPUT
LATTICRA_SEAL_OPERATOR_RECEIPT_REPORT_MISSING_CAPABILITY_METADATA
LATTICRA_SEAL_OPERATOR_RECEIPT_REPORT_MISSING_POLICY_DECISION
LATTICRA_SEAL_OPERATOR_RECEIPT_REPORT_MISSING_REQUEST_FRESHNESS
LATTICRA_SEAL_OPERATOR_RECEIPT_REPORT_MISSING_SIGNED_REQUEST
LATTICRA_SEAL_OPERATOR_RECEIPT_REPORT_MISSING_RUNTIME_DRY_RUN
LATTICRA_SEAL_OPERATOR_RECEIPT_REPORT_NON_REPORT_ONLY_SOURCE
LATTICRA_SEAL_OPERATOR_RECEIPT_REPORT_SOURCE_WOULD_ALLOW_EFFECT
LATTICRA_SEAL_OPERATOR_RECEIPT_REPORT_BUFFER_TOO_SMALL
```

Invalid source metadata is represented as denied metadata inside the receipt record. A null output pointer is still a hard LATTICRA_STATUS_NULL_ARGUMENT API error. A too-small render buffer returns LATTICRA_STATUS_BUFFER_TOO_SMALL and clears the caller-provided buffer when possible.

Complete Denied Receipt

A complete report-only receipt renders:

```
LATTICRA SEAL OPERATOR RECEIPT REPORT
operator_receipt_profile=latticra-seal-operator-receipt-report/0.1
receipt_mode=report-only
receipt_status=denied-report-only
source_capability_metadata_present=1
source_policy_decision_present=1
source_request_freshness_present=1
source_signed_request_present=1
source_runtime_dry_run_present=1
source_denial_reason_present=1
capability_name=seal.capability.report
capability_known=1
capability_candidate=1
policy_decision_state=report-only
request_freshness_state=report-only
signed_request_state=report-only
runtime_dry_run_state=report-only
default_action_deny=1
would_allow=0
would_deny=1
would_require_operator_review=1
would_execute_tool=0
```

```
would_read_host=0
would_write_host=0
would_use_network=0
would_grant_runtime_authority=0
unknown_tool_denied=1
unsigned_request_denied=1
invalid_schema_denied=1
stale_request_denied=1
replayed_request_denied=1
invalid_signature_denied=1
blocked_reason=known-capability-candidate-still-denied
receipt_complete=1
receipt_invalid=0
report_only=1
runtime_authority_granted=0
effect_performed=0
host_read_performed=0
host_write_performed=0
network_performed=0
error=ok
```

Fail-Closed Behavior

Missing, malformed, non-report-only, or effect-allowing source metadata produces:

```
receipt_status=invalid-source-denied
receipt_complete=0
receipt_invalid=1
default_action_deny=1
would_allow=0
would_deny=1
would_execute_tool=0
would_read_host=0
would_write_host=0
would_use_network=0
would_grant_runtime_authority=0
runtime_authority_granted=0
effect_performed=0
host_read_performed=0
host_write_performed=0
network_performed=0
```

The implementation copies descriptive state only. It never copies authority, effect, host I/O, or network behavior from upstream sources.

Validation

Current guard:

```
sh scripts/test-latticra-seal-operator-receipt-report.sh
```

Expected output:

```
seal operator receipt report invariants: ok
latticra seal operator receipt report: ok
```

The guard compiles the new receipt implementation with the deterministic capability metadata fixture and verifies complete receipt rendering, missing source denial, non-report-only source denial, effect-allowing source denial, null handling, and small-buffer handling.

Current Next Valid Slice

The operator receipt report surface/status checkpoint is now represented by docs/LATTICRA_SEAL_OPERATOR_RECEIPT_REPORT_SURFACE.md and docs/status/SEAL_OPERATOR_RECEIPT_REPORT_STATUS.md.

The local capability registry schema contract is now represented by docs/LATTICRA_SEAL_LOCAL_CAPABILITY_REGISTRY_SCHEMA_CONTRACT.md.

The local capability registry schema implementation plan is now represented by docs/LATTICRA_SEAL_LOCAL_CAPABILITY_REGISTRY_SCHEMA_IMPLEMENTATION_PLAN.md.

The local capability registry schema implementation is now represented by docs/LATTICRA_SEAL_LOCAL_CAPABILITY_REGISTRY_SCHEMA_IMPLEMENTATION.md.

The next valid Latticra Seal slice is a deterministic local capability registry schema report surface or a Panel-visible Seal dashboard planning checkpoint.

That future slice must preserve the no-effect posture and must not perform effects or grant authority.

docs/LATTICRA_SEAL_OPERATOR_RECEIPT_REPORT_IMPLEMENTATION_PLAN.md

Source title: Latticra Seal Operator Receipt Report Implementation Plan

Lines: 390 | Words: 889 | SHA-256: f0e2b42a41718b81a28a1ee37f4250d50c5cb3a9b5e86429343ab905e762d75f

Latticra Seal Operator Receipt Report Implementation Plan

Status: implementation planning contract fulfilled by the no-effect Latticra Seal operator receipt report implementation Scope: implementation plan record after the Latticra Seal operator receipt report contract. This document does not itself write receipt files, create artifacts, execute tools, perform runtime behavior, grant runtime authority, enforce capabilities, perform effects, verify signatures, parse public keys, load key material, handle private keys, query trust stores, use networks, read host files beyond future caller-provided metadata, mutate host files, implement MCP behavior, control AI agents, claim malware prevention, claim ransomware prevention, or claim production security readiness.

Purpose

This plan defined the exact implementation shape for a no-effect Seal operator receipt report.

The implementation combines existing report-only Seal metadata into one deterministic operator-facing receipt record while preserving denial, non-execution, and zero runtime authority.

Required contract

The implementation plan depends on:

```
docs/LATTICRA_SEAL_OPERATOR_RECEIPT_REPORT_CONTRACT.md
scripts/test-latticra-seal-operator-receipt-report-contract.sh
```

The contract must remain merged and guarded before implementation code is added.

Implemented files

The implementation slice added:

```
include/latticra/seal_operator_receipt_report.h
src/seal_operator_receipt_report.c
tests/seal_operator_receipt_report_invariants.c
scripts/test-latticra-seal-operator-receipt-report.sh
docs/LATTICRA_SEAL_OPERATOR_RECEIPT_REPORT_IMPLEMENTATION.md
```

A later report-surface slice may add:

```
tests/seal_operator_receipt_report_surface.c
scripts/latticra-seal-operator-receipt-report.sh
scripts/test-latticra-seal-operator-receipt-report-surface.sh
docs/LATTICRA_SEAL_OPERATOR_RECEIPT_REPORT_SURFACE.md
docs/status/SEAL_OPERATOR_RECEIPT_REPORT_STATUS.md
```

Header API plan

The header defines:

```
LATTICRA_SEAL_OPERATOR_RECEIPT_PROFILE_MAX
LATTICRA_SEAL_OPERATOR_RECEIPT_STATE_MAX
LATTICRA_SEAL_OPERATOR_RECEIPT_REASON_MAX
LATTICRA_SEAL_OPERATOR_RECEIPT_CAPABILITY_MAX
LATTICRA_SEAL_OPERATOR_RECEIPT_REPORT_MAX
latticra_seal_operator_receipt_report_error_t
latticra_seal_operator_receipt_report_sources_t
latticra_seal_operator_receipt_report_t
latticra_seal_operator_receipt_report_error_label
latticra_seal_operator_receipt_report_from_sources
latticra_seal_operator_receipt_report_is_report_only
latticra_seal_operator_receipt_report_render
```

Error model

The error enum includes:

```
LATTICRA_SEAL_OPERATOR_RECEIPT_REPORT_OK
LATTICRA_SEAL_OPERATOR_RECEIPT_REPORT_INVALID_INPUT
LATTICRA_SEAL_OPERATOR_RECEIPT_REPORT_MISSING_CAPABILITY_METADATA
LATTICRA_SEAL_OPERATOR_RECEIPT_REPORT_MISSING_POLICY_DECISION
LATTICRA_SEAL_OPERATOR_RECEIPT_REPORT_MISSING_REQUEST_FRESHNESS
LATTICRA_SEAL_OPERATOR_RECEIPT_REPORT_MISSING_SIGNED_REQUEST
LATTICRA_SEAL_OPERATOR_RECEIPT_REPORT_MISSING_RUNTIME_DRY_RUN
LATTICRA_SEAL_OPERATOR_RECEIPT_REPORT_NON_REPORT_ONLY_SOURCE
LATTICRA_SEAL_OPERATOR_RECEIPT_REPORT_SOURCE_WOULD_ALLOW_EFFECT
LATTICRA_SEAL_OPERATOR_RECEIPT_REPORT_BUFFER_TOO_SMALL
```

Source binding record

The source binding record includes:

```
source_capability_metadata_present
source_policy_decision_present
source_request_freshness_present
source_signed_request_present
source_runtime_dry_run_present
source_denial_reason_present
source_capability_metadata_report_only
source_policy_decision_report_only
source_request_freshness_report_only
source_signed_request_report_only
source_runtime_dry_run_report_only
```

Receipt record fields

The receipt record includes:

```
operator_receipt_profile
receipt_mode
receipt_status
source_capability_metadata_present
source_policy_decision_present
source_request_freshness_present
source_signed_request_present
source_runtime_dry_run_present
source_denial_reason_present
capability_name
capability_known
capability_candidate
policy_decision_state
request_freshness_state
signed_request_state
runtime_dry_run_state
blocked_reason
default_action_deny
would_allow
would_deny
would_require_operator_review
would_execute_tool
would_read_host
would_write_host
would_use_network
would_grant_runtime_authority
receipt_complete
receipt_invalid
report_only
runtime_authority_granted
effect_performed
```

```
host_read_performed
host_write_performed
network_performed
error
```

Initial constants

The implementation emits for a complete denied receipt:

```
operator_receipt_profile=latticra-seal-operator-receipt-report/0.1
receipt_mode=report-only
receipt_status=denied-report-only
source_capability_metadata_present=1
source_policy_decision_present=1
source_request_freshness_present=1
source_signed_request_present=1
source_runtime_dry_run_present=1
source_denial_reason_present=1
capability_name=seal.capability.report
capability_known=1
capability_candidate=1
policy_decision_state=report-only
request_freshness_state=report-only
signed_request_state=report-only
runtime_dry_run_state=report-only
blocked_reason=known-capability-candidate-still-denied
default_action_deny=1
would_allow=0
would_deny=1
would_require_operator_review=1
would_execute_tool=0
would_read_host=0
would_write_host=0
would_use_network=0
would_grant_runtime_authority=0
receipt_complete=1
receipt_invalid=0
report_only=1
runtime_authority_granted=0
effect_performed=0
host_read_performed=0
host_write_performed=0
network_performed=0
```

The implementation emits for missing or invalid source metadata:

```
receipt_status=invalid-source-denied
receipt_complete=0
receipt_invalid=1
default_action_deny=1
would_allow=0
would_deny=1
would_execute_tool=0
would_read_host=0
would_write_host=0
would_use_network=0
would_grant_runtime_authority=0
runtime_authority_granted=0
effect_performed=0
host_read_performed=0
host_write_performed=0
network_performed=0
```

Function behavior

The builder:

```
accept report-only capability metadata input
accept report-only policy decision input
accept report-only request freshness input
accept report-only signed request input
accept report-only runtime dry-run input
reject null output
reject missing source metadata
reject non-report-only source metadata
reject source metadata that would allow an effect
copy descriptive capability and decision fields only
copy no authority from upstream inputs
render deterministic metadata only
```

Required report format

The report should begin with:

```
LATTICRA SEAL OPERATOR RECEIPT REPORT
```

It should render all fields as stable key=value lines.

Required report fields:

```
operator_receipt_profile=latticra-seal-operator-receipt-report/0.1
receipt_mode=report-only
receipt_status=denied-report-only
source_capability_metadata_present=1
source_policy_decision_present=1
source_request_freshness_present=1
source_signed_request_present=1
source_runtime_dry_run_present=1
source_denial_reason_present=1
capability_name=seal.capability.report
capability_known=1
capability_candidate=1
policy_decision_state=report-only
request_freshness_state=report-only
signed_request_state=report-only
runtime_dry_run_state=report-only
blocked_reason=known-capability-candidate-still-denied
default_action_deny=1
would_allow=0
would_deny=1
would_require_operator_review=1
would_execute_tool=0
would_read_host=0
would_write_host=0
would_use_network=0
would_grant_runtime_authority=0
receipt_complete=1
receipt_invalid=0
report_only=1
runtime_authority_granted=0
effect_performed=0
host_read_performed=0
host_write_performed=0
network_performed=0
```

Required invariant tests

The invariant test verifies:

```
valid report-only inputs produce a complete denied receipt
operator_receipt_profile is stable
receipt_mode remains report-only
receipt_status remains denied-report-only
all source present flags remain one for complete receipt
capability_name is copied descriptively
capability_known remains one
capability_candidate remains one
policy_decision_state remains report-only
request_freshness_state remains report-only
signed_request_state remains report-only
runtime_dry_run_state remains report-only
blocked_reason remains known-capability-candidate-still-denied
default_action_deny remains one
would_allow remains zero
would_deny remains one
would_require_operator_review remains one
would_execute_tool remains zero
would_read_host remains zero
would_write_host remains zero
would_use_network remains zero
would_grant_runtime_authority remains zero
receipt_complete remains one for complete denied receipt
receipt_invalid remains zero for complete denied receipt
missing source metadata fails closed
non-report-only source metadata fails closed
source metadata that would allow an effect fails closed
small report buffers fail closed
null inputs fail closed
```

Required build runner

The test runner compiles only local C sources and fixtures.

Runner:

```
sh scripts/test-latticra-seal-operator-receipt-report.sh
```

It compiles:

```
src/seal_operator_receipt_report.c
src/seal_capability_metadata.c
tests/seal_operator_receipt_report_invariants.c
```

Explicit non-goals

The implementation must not:

```
write receipt files
create persistent receipt artifacts
execute tools
execute shell commands
control AI agents
implement MCP behavior
read host files
write host files
use the network
evaluate external policies
load policy files
verify signatures
sign receipts
parse keys
load key material
handle private keys
query trust stores
query revocation sources
validate freshness against live time
mutate replay caches
grant authority
perform runtime handoff
perform effects
claim malware prevention
claim ransomware prevention
claim production readiness
```

The report may render only caller-provided in-memory metadata from existing local fixtures.

Operator receipt report implementation work is now represented by docs/LATTICRA_SEAL_OPERATOR_RECEIPT_REPORT_IMPLEMENTATION.md.

Operator receipt report surface/status work is now represented by docs/LATTICRA_SEAL_OPERATOR_RECEIPT_REPORT_SURFACE.md and docs/status/SEAL_OPERATOR_RECEIPT_REPORT_STATUS.md.

Current validation

This implementation plan is covered by:

```
sh scripts/test-latticra-seal-operator-receipt-report-implementation-plan.sh
```

Expected output:

```
latticra seal operator receipt report implementation plan: ok
```

Current next valid slice

The operator receipt report surface/status checkpoint is now represented by docs/LATTICRA_SEAL_OPERATOR_RECEIPT_REPORT_SURFACE.md and docs/status/SEAL_OPERATOR_RECEIPT_REPORT_STATUS.md.

The local capability registry schema contract is now represented by docs/LATTICRA_SEAL_LOCAL_CAPABILITY_REGISTRY_SCHEMA_CONTRACT.md.

The local capability registry schema implementation plan is now represented by docs/LATTICRA_SEAL_LOCAL_CAPABILITY_REGISTRY_SCHEMA_IMPLEMENTATION_PLAN.md.

The local capability registry schema implementation is now represented by docs/LATTICRA_SEAL_LOCAL_CAPABILITY_REGISTRY_SCHEMA_IMPLEMENTATION.md.

The next valid Latticra Seal slice is a deterministic local capability registry schema report surface or a Panel-visible Seal dashboard planning checkpoint.

That future slice must preserve the no-effect posture and must not perform effects or grant authority.

docs/LATTICRA_SEAL_OPERATOR_RECEIPT_REPORT_SURFACE.md

Source title: Latticra Seal Operator Receipt Report Surface

Lines: 118 | Words: 476 | SHA-256: dc97146b9c006f91c10c7d0eb416839e1ff2379ba813ace039c23199f5538a4a

Latticra Seal Operator Receipt Report Surface

Status: report surface for the Latticra Seal operator receipt report Scope: deterministic local report surface after the no-effect operator receipt report implementation. This document does not implement runtime behavior, runtime execution, runtime authority, effect execution, policy enforcement, capability enforcement, cryptographic verification, signature verification, freshness validation, replay detection, tool execution, AI agent execution, model execution, MCP protocol behavior, MCP server behavior, MCP client behavior, host reads, host writes, network behavior, operating-system behavior, production readiness, external endorsement, or authority grants.

Purpose

This document records the first operator-visible report surface for the Latticra Seal operator receipt report.

The report surface renders one deterministic denied receipt that binds capability metadata, policy decision metadata, request freshness metadata, signed request metadata, runtime dry-run metadata, and the denial reason into one local operator-facing report.

Added files

```
tests/seal_operator_receipt_report_surface.c
scripts/latticra-seal-operator-receipt-report.sh
```

Report runner

```
sh scripts/latticra-seal-operator-receipt-report.sh
```

Expected report posture

The report surface renders the current operator receipt posture for a known local fixture capability candidate, including:

```
LATTICRA SEAL OPERATOR RECEIPT REPORT
operator_receipt_profile=latticra-seal-operator-receipt-report/0.1
receipt_mode=report-only
receipt_status=denied-report-only
source_capability_metadata_present=1
source_policy_decision_present=1
source_request_freshness_present=1
source_signed_request_present=1
source_runtime_dry_run_present=1
source_denial_reason_present=1
capability_name=seal.capability.report
capability_known=1
capability_candidate=1
policy_decision_state=report-only
request_freshness_state=report-only
signed_request_state=report-only
```

```
runtime_dry_run_state=report-only
default_action_deny=1
would_allow=0
would_deny=1
would_require_operator_review=1
would_execute_tool=0
would_read_host=0
would_write_host=0
would_use_network=0
would_grant_runtime_authority=0
unknown_tool_denied=1
unsigned_request_denied=1
invalid_schema_denied=1
stale_request_denied=1
replayed_request_denied=1
invalid_signature_denied=1
blocked_reason=known-capability-candidate-still-denied
receipt_complete=1
receipt_invalid=0
report_only=1
runtime_authority_granted=0
effect_performed=0
host_read_performed=0
host_write_performed=0
network_performed=0
error=ok
```

Boundary

This report surface compiles and runs a local deterministic fixture only.

It does not execute tools, execute shell commands beyond compiling and running the local test fixture, read host files beyond the repository sources needed for local compilation, write host files beyond the temporary test binary/report path, use the network, evaluate external policies, load policy files, load production capability files, load production allowlist files, verify signatures, validate freshness against live time, mutate replay caches, grant authority, turn capability matches into execution grants, turn capability matches into effect grants, claim production readiness, claim AI-agent security, or claim MCP implementation.

Validation

Run:

```
sh scripts/test-latticra-seal-operator-receipt-report-surface.sh
```

Expected output:

```
latticra seal operator receipt report surface: ok
```

The underlying operator receipt report implementation remains covered by:

```
sh scripts/test-latticra-seal-operator-receipt-report.sh
```

Claim Boundary

This report surface does not justify the public claim that Latticra Seal is a production security product.

It makes the denied receipt posture easier to inspect before any future capability enforcement or runtime authority path is considered.

Next Valid Slice

The operator receipt report status alignment is now represented by docs/status/SEAL_OPERATOR_RECEIPT_REPORT_STATUS.md.

The local capability registry schema contract is now represented by docs/LATTICRA_SEAL_LOCAL_CAPABILITY_REGISTRY_SCHEMA_CONTRACT.md.

The local capability registry schema implementation plan is now represented by docs/LATTICRA_SEAL_LOCAL_CAPABILITY_REGISTRY_SCHEMA_IMPLEMENTATION_PLAN.md.

The local capability registry schema implementation is now represented by docs/LATTICRA_SEAL_LOCAL_CAPABILITY_REGISTRY_SCHEMA_IMPLEMENTATION.md.

The next valid Latticra Seal slice is a deterministic local capability registry schema report surface or a Panel-visible Seal dashboard planning checkpoint.

That future slice must preserve the no-effect posture and must not perform effects or grant authority.

docs/LATTICRA_SEAL_PARAMETER_SCHEMA_CONTRACT.md

Source title: Latticra Seal Parameter Schema Contract

Lines: 201 | Words: 584 | SHA-256: 5875e5a706fbbcf3e2ec430ae330f917e2d69218ad2b270f55364020d9d78b60

Latticra Seal Parameter Schema Contract

Status: Latticra Seal parameter schema contract Scope: contract for future parameter schema metadata after the report-only Seal agentic automation security report surface. This document does not implement schema parsing, schema validation, runtime execution, runtime authority, effect execution, capability enforcement, cryptographic verification, verified receipts, public-key parsing, public-key trust stores, key generation, private-key storage, hardware key use, network trust lookup, revocation lookup, object sealing, host reads, host writes, kernel behavior, Fedora approval claims, production readiness, MCP protocol implementation, MCP server behavior, MCP client behavior, AI agent execution, model execution, tool execution, shell execution, or operating-system behavior.

Purpose

This document defines the next Latticra Seal contract layer for declared parameter-schema metadata.

The purpose is to prepare a bounded report-only structure for describing tool-request parameters before any future validation or enforcement is considered.

This document does not implement parameter schema behavior.

Required predecessors

This contract depends on:

```
docs/LATTICRA_SEAL_AGENTIC_AUTOMATION_SECURITY_CONTRACT.md
docs/LATTICRA_SEAL_MCP_ALIGNMENT_PLAN.md
docs/LATTICRA_SEAL_AGENTIC_AUTOMATION_SECURITY_IMPLEMENTATION.md
docs/LATTICRA_SEAL_AGENTIC_AUTOMATION_SECURITY_REPORT_SURFACE.md
docs/status/SEAL_AGENTIC_AUTOMATION_SECURITY_STATUS.md
docs/status/SEAL_AGENTIC_AUTOMATION_SECURITY_INDEX_ALIGNMENT.md
docs/status/SEAL_AGENTIC_AUTOMATION_SECURITY_REPORT_SURFACE_STATUS.md
include/latticra/seal_agentic_automation_security.h
src/seal_agentic_automation_security.c
tests/seal_agentic_automation_security_invariants.c
tests/seal_agentic_automation_security_report_surface.c
scripts/test-latticra-seal-agentic-automation-security.sh
scripts/test-latticra-seal-agentic-automation-security-report-surface.sh
```

The existing agentic automation metadata surface remains report-only.

Parameter schema boundary

The parameter schema layer may describe whether parameter schema metadata is declared, present, bounded, and reportable.

The layer may not validate arbitrary schemas, parse untrusted schema languages, accept model output as authority, grant runtime authority, execute tools, execute shell commands, contact networks, read host files, write host files, or mutate system state.

Allowed in this contract slice:

```
parameter-schema vocabulary
schema-presence metadata planning
schema-id metadata planning
schema-version metadata planning
schema-hash metadata planning
max-input-size metadata planning
parameter-count metadata planning
required-parameter-count metadata planning
unknown-parameter policy planning
parameter-forwarding policy planning
report-only status planning
non-claims
static guard validation
```

Forbidden in this contract slice:

```
schema parsing
schema validation
schema language implementation
runtime execution
AI agent execution
model execution
tool execution
shell command execution
runtime authority grants
effect execution
host reads
host writes
network access
capability enforcement
cryptographic verification
verified receipt generation
public-key parsing
public-key trust store loading
private-key handling
key generation
signature generation
revocation lookup
object sealing
kernel interaction
MCP server implementation
MCP client implementation
```

Initial parameter schema policy

The initial policy is report-only and closed by default.

```
seal_parameter_schema_contract_present=1
parameter_schema_supported=0
parameter_schema_parsing_supported=0
parameter_schema_validation_supported=0
parameter_schema_present=0
parameter_schema_valid=0
schema_language_supported=0
schema_hash_present=0
max_input_bytes_declared=0
parameter_count_declared=0
required_parameter_count_declared=0
unknown_parameters_allowed=0
parameter_forwarding_allowed=0
runtime_authority_granted=0
host_read_performed=0
host_write_performed=0
network_performed=0
mode=contract-only
status=parameter-schema-contract-only
```

Planned metadata fields

Future parameter schema metadata should be bounded and deterministic.

Planned fields:

```
schema_profile
schema_id
schema_version
schema_language
```

```
schema_hash
schema_present
schema_parsing_supported
schema_validation_supported
schema_valid
max_input_bytes_declared
parameter_count_declared
required_parameter_count_declared
unknown_parameters_allowed
parameter_forwarding_allowed
input_size_within_limit
parameter_names_reported
runtime_authority_granted
mode
decision
reason
status
```

Initial values before schema implementation:

```
schema_profile=latticra-seal-parameter-schema/0.1
schema_id=unset
schema_version=unset
schema_language=unset
schema_hash=unset
schema_present=0
schema_parsing_supported=0
schema_validation_supported=0
schema_valid=0
max_input_bytes_declared=0
parameter_count_declared=0
required_parameter_count_declared=0
unknown_parameters_allowed=0
parameter_forwarding_allowed=0
input_size_within_limit=0
parameter_names_reported=0
runtime_authority_granted=0
mode=contract-only
decision=report-only
reason=parameter-schema-contract-only
status=parameter-schema-contract-only
```

Promotion rules

The next implementation after this contract may only add bounded C metadata fields and deterministic rendering.

It must not parse schema languages, validate untrusted schemas, execute tools, execute shell commands, call runtime components, read host files, write host files, contact networks, enforce capabilities, verify signatures, generate receipts, or grant authority.

Non-claims

This contract must not be read as implementation of parameter validation or MCP tool-security enforcement.

Required non-claim posture:

```
parameter_validation_implemented=0
schema_parser_implemented=0
schema_validator_implemented=0
mcp_tool_security_enforced=0
runtime_authority_granted=0
production_readiness_claimed=0
external_endorsement_claimed=0
```

Next valid slice

The next valid Latticra Seal slice is report-only parameter schema metadata.

That future slice may add a bounded metadata structure, deterministic rendering, invariant tests, and a test runner.

It must not change runtime behavior, host behavior, network behavior, MCP behavior, AI agent execution, model execution, tool execution, shell execution, capability enforcement, cryptographic verification, or authority grants.

docs/LATTICRA_SEAL_PARAMETER_SCHEMA_IMPLEMENTATION.md

Source title: Latticra Seal Parameter Schema Implementation

Lines: 133 | Words: 522 | SHA-256: f34e0499de9de01ec42c0eddfb64c7cebd312a7e9185ece64747b82643084aa6

Latticra Seal Parameter Schema Implementation

Status: initial report-only parameter schema metadata implementation Scope: bounded C metadata surface for parameter schema posture after the report-only Seal agentic automation security layer. This slice does not implement schema parsing, schema validation, runtime execution, runtime authority, effect execution, capability enforcement, cryptographic verification, verified receipts, public-key parsing, public-key trust stores, key generation, private-key storage, hardware key use, network trust lookup, revocation lookup, object sealing, host reads, host writes, kernel behavior, Fedora approval claims, production readiness, MCP protocol implementation, MCP server behavior, MCP client behavior, AI agent execution, model execution, tool execution, shell execution, or operating-system behavior.

Purpose

This document records the first Latticra Seal parameter schema metadata implementation.

The implementation accepts an existing report-only Seal agentic automation security metadata record and produces deterministic report-only parameter schema metadata.

Added files

```
include/latticra/seal_parameter_schema.h
src/seal_parameter_schema.c
tests/seal_parameter_schema_invariants.c
scripts/test-latticra-seal-parameter-schema.sh
```

API summary

The parameter schema metadata surface adds:

```
latticra_seal_parameter_schema_t
latticra_seal_parameter_schema_error_t
latticra_seal_parameter_schema_error_label
latticra_seal_parameter_schema_from_agentic
latticra_seal_parameter_schema_is_report_only
latticra_seal_parameter_schema_report
```

Metadata behavior

The implementation:

```
accepts a valid report-only Seal agentic automation security metadata record
sets schema_profile=latticra-seal-parameter-schema/0.1
sets schema_id=unset
sets schema_version=unset
sets schema_language=unset
sets schema_hash=unset
copies schema_present from agentic parameter schema metadata
sets schema_parsing_supported=0
sets schema_validation_supported=0
copies schema_valid from agentic parameter schema metadata
sets max_input_bytes_declared=0
sets parameter_count_declared=0
sets required_parameter_count_declared=0
sets unknown_parameters_allowed=0
sets parameter_forwarding_allowed=0
sets input_size_within_limit=0
sets parameter_names_reported=0
copies runtime_authority_granted from agentic metadata
copies host_read_performed from agentic metadata
copies host_write_performed from agentic metadata
```

```
copies network_performed from agentic metadata
sets mode=report-only
sets decision=report-only
sets reason=parameter-schema-metadata-only
renders deterministic parameter schema metadata
```

Boundary

This implementation does not parse schemas, validate schemas, implement a schema language, execute tools, execute shell commands, call runtime components, contact networks, read host files, write host files, verify signatures, generate receipts, enforce capabilities, or grant authority.

It is metadata only.

Failure behavior

The implementation fails closed:

```
null output -&gt; LATTICRA_STATUS_NULL_ARGUMENT
null agentic metadata input -&gt; invalid-input
invalid agentic metadata -&gt; invalid-agentic
non-report-only agentic metadata -&gt; invalid-agentic
small report buffer -&gt; LATTICRA_STATUS_BUFFER_TOO_SMALL
```

Failures do not parse schemas, validate schemas, contact networks, read host files, write host files, execute tools, enforce capabilities, or grant authority.

Invariants

The invariant test verifies:

```
valid report-only agentic metadata produces deterministic parameter schema metadata
schema_profile is stable
schema_id remains unset
schema_version remains unset
schema_language remains unset
schema_hash remains unset
schema_present remains zero
schema_parsing_supported remains zero
schema_validation_supported remains zero
schema_valid remains zero
max_input_bytes_declared remains zero
parameter_count_declared remains zero
required_parameter_count_declared remains zero
unknown_parameters_allowed remains zero
parameter_forwarding_allowed remains zero
input_size_within_limit remains zero
parameter_names_reported remains zero
runtime_authority_granted remains zero
host_read_performed remains zero
host_write_performed remains zero
network_performed remains zero
mode remains report-only
decision remains report-only
reason remains parameter-schema-metadata-only
small report buffer fails closed
null inputs fail closed
invalid agentic metadata fails closed
```

Validation

Run:

```
sh scripts/test-latticra-seal-parameter-schema-contract.sh
sh scripts/test-latticra-seal-parameter-schema.sh
```

Next valid slice

The next valid Latticra Seal slice is policy decision status/public-entry alignment.

That future slice must preserve the no-effect posture and must not implement real policy evaluation, policy enforcement, runtime execution, effect execution, capability enforcement, cryptographic verification, signature verification, freshness validation, replay detection, authority grants, host behavior, network behavior, MCP behavior, AI agent execution, model execution, tool execution, or shell execution.

docs/LATTICRA_SEAL_PARAMETER_SCHEMA_REPORT_SURFACE.md

Source title: Latticra Seal Parameter Schema Report Surface

Lines: 84 | Words: 353 | SHA-256: 81d1de3c8f4cf848d554b74c7a95d357d24e350e5ff18d14e3dc27defd618f62

Latticra Seal Parameter Schema Report Surface

Status: report surface for Latticra Seal parameter schema metadata Scope: no-effect report-surface fixture and shell runner for deterministic Seal parameter schema metadata. This slice does not implement schema parsing, schema validation, runtime execution, runtime authority, effect execution, capability enforcement, cryptographic verification, verified receipts, public-key parsing, public-key trust stores, key generation, private-key storage, hardware key use, network trust lookup, revocation lookup, object sealing, host reads, host writes, kernel behavior, Fedora approval claims, production readiness, MCP protocol implementation, MCP server behavior, MCP client behavior, AI agent execution, model execution, tool execution, shell execution, or operating-system behavior.

Purpose

This document records the first dedicated report surface for Latticra Seal parameter schema metadata.

The report surface exists so operators and contributors can render the current report-only parameter schema posture without adding schema parsing, validation, runtime behavior, or authority.

Added files

```
tests/seal_parameter_schema_report_surface.c
scripts/latticra-seal-parameter-schema-report.sh
scripts/test-latticra-seal-parameter-schema-report-surface.sh
```

Behavior

The report surface:

```
builds a report-only Seal agentic automation security fixture
constructs Seal parameter schema metadata from that fixture
renders the deterministic Seal parameter schema report
prints the report to stdout
```

The guard verifies report output fields including:

```
schema_profile=latticra-seal-parameter-schema/0.1
schema_id=unset
schema_version=unset
schema_language=unset
schema_hash=unset
schema_present=0
schema_parsing_supported=0
schema_validation_supported=0
schema_valid=0
max_input_bytes_declared=0
parameter_count_declared=0
required_parameter_count_declared=0
unknown_parameters_allowed=0
parameter_forwarding_allowed=0
input_size_within_limit=0
parameter_names_reported=0
runtime_authority_granted=0
host_read_performed=0
host_write_performed=0
network_performed=0
mode=report-only
decision=report-only
reason=parameter-schema-metadata-only
```

```
status=parameter-schema-metadata
```

Validation

Run:

```
sh scripts/test-latticra-seal-parameter-schema-report-surface.sh
```

The underlying metadata implementation remains covered by:

```
sh scripts/test-latticra-seal-parameter-schema.sh
```

Boundary

This report surface does not parse schemas, validate schemas, execute tools, execute shell commands on behalf of a model, contact networks, read host files, write host files, parse keys, verify signatures, create receipts, enforce capabilities, call runtime components, or grant runtime authority.

It compiles and runs a local deterministic fixture only.

Next valid slice

The next valid Latticra Seal slice is policy decision status/public-entry alignment.

That future slice must preserve the no-effect posture and must not implement real policy evaluation, policy enforcement, runtime execution, effect execution, capability enforcement, cryptographic verification, signature verification, freshness validation, replay detection, authority grants, host behavior, network behavior, MCP behavior, AI agent execution, model execution, tool execution, or shell execution.

docs/LATTICRA_SEAL_POLICY_DECISION_CONTRACT.md

Source title: Latticra Seal Policy Decision Contract

Lines: 272 | Words: 761 | SHA-256: 0c87b6fe72c513f4fb5c6bcfb1a46fa404396c3b85505070308e8676417ac4d6

Latticra Seal Policy Decision Contract

Status: Latticra Seal policy decision contract Scope: contract for future policy decision metadata after the report-only Seal signed request metadata layer. This document does not implement policy evaluation, allow/deny enforcement, runtime execution, runtime authority, effect execution, capability enforcement, cryptographic verification, signature verification, public-key parsing, trust-store loading, key generation, private-key storage, hardware key use, revocation lookup, network trust lookup, object sealing, host reads, host writes, kernel behavior, Fedora approval claims, production readiness, MCP protocol implementation, MCP server behavior, MCP client behavior, AI agent execution, model execution, tool execution, shell execution, or operating-system behavior.

Purpose

This document defines the next Latticra Seal contract layer for policy decision metadata.

The purpose is to prepare a bounded report-only structure for describing whether a future signed request would be treated as allowed, denied, unsupported, or review-required by a policy gate.

This document does not implement policy decision behavior.

Required predecessors

This contract depends on:

```
docs/LATTICRA_SEAL_AGENTIC_AUTOMATION_SECURITY_CONTRACT.md
docs/LATTICRA_SEAL_MCP_ALIGNMENT_PLAN.md
docs/LATTICRA_SEAL_PARAMETER_SCHEMA_CONTRACT.md
```

```
docs/LATTICRA_SEAL_PARAMETER_SCHEMA_IMPLEMENTATION.md
docs/LATTICRA_SEAL_REQUEST_FRESHNESS_CONTRACT.md
docs/LATTICRA_SEAL_REQUEST_FRESHNESS_IMPLEMENTATION.md
docs/LATTICRA_SEAL_SIGNED_REQUEST_CONTRACT.md
docs/LATTICRA_SEAL_SIGNED_REQUEST_IMPLEMENTATION.md
include/latticra/seal_signed_request.h
src/seal_signed_request.c
tests/seal_signed_request_invariants.c
scripts/test-latticra-seal-signed-request-contract.sh
scripts/test-latticra-seal-signed-request.sh
```

The existing signed request metadata surface remains report-only.

Policy decision boundary

The policy decision layer may describe policy-decision metadata, default-deny posture, deny reasons, and future promotion rules.

The layer may not evaluate real policy, enforce decisions, execute tools, execute shell commands, contact networks, read host files, write host files, verify signatures, validate freshness, detect replay, or mutate system state.

Allowed in this contract slice:

```
policy-decision vocabulary
policy-id metadata planning
policy-version metadata planning
decision-state planning
default-deny metadata planning
deny-reason metadata planning
unknown-tool denial planning
unsigned-request denial planning
invalid-schema denial planning
stale-request denial planning
replayed-request denial planning
signature-invalid denial planning
operator-review planning
report-only status planning
non-claims
static guard validation
```

Forbidden in this contract slice:

```
policy evaluation
policy enforcement
allow decision enforcement
deny decision enforcement
runtime execution
AI agent execution
model execution
tool execution
shell command execution
runtime authority grants
effect execution
host reads
host writes
network access
capability enforcement
cryptographic verification
signature verification
freshness validation
replay detection
public-key parsing
public-key trust store loading
private-key handling
key generation
signature generation
revocation lookup
object sealing
kernel interaction
MCP server implementation
MCP client implementation
```

Initial policy decision posture

The initial policy is report-only and default-deny.

```
seal_policy_decision_contract_present=1
```

```
policy_decision_supported=0
policy_evaluation_supported=0
policy_enforcement_supported=0
policy_id_present=0
policy_version_present=0
requested_action_present=0
requested_tool_present=0
signed_request_present=0
signature_valid=0
schema_valid=0
freshness_valid=0
replay_detected=0
default_decision=deny
decision_state=report-only
decision_allowed=0
decision_denied=1
operator_review_required=1
unknown_tool_denied=1
unsigned_request_denied=1
invalid_schema_denied=1
stale_request_denied=1
replayed_request_denied=1
invalid_signature_denied=1
runtime_authority_granted=0
host_read_performed=0
host_write_performed=0
network_performed=0
mode=contract-only
status=policy-decision-contract-only
```

Planned metadata fields

Future policy decision metadata should be bounded and deterministic.

Planned fields:

```
policy_decision_profile
policy_id
policy_version
requested_action
requested_tool
policy_decision_supported
policy_evaluation_supported
policy_enforcement_supported
policy_id_present
policy_version_present
requested_action_present
requested_tool_present
signed_request_present
signature_valid
schema_valid
freshness_valid
replay_detected
default_decision
decision_state
decision_allowed
decision_denied
operator_review_required
unknown_tool_denied
unsigned_request_denied
invalid_schema_denied
stale_request_denied
replayed_request_denied
invalid_signature_denied
runtime_authority_granted
mode
decision
reason
status
```

Initial values before policy decision implementation:

```
policy_decision_profile=latticra-seal-policy-decision/0.1
policy_id=unset
policy_version=unset
requested_action=unset
requested_tool=unset
policy_decision_supported=0
policy_evaluation_supported=0
policy_enforcement_supported=0
```

```
policy_id_present=0
policy_version_present=0
requested_action_present=0
requested_tool_present=0
signed_request_present=0
signature_valid=0
schema_valid=0
freshness_valid=0
replay_detected=0
default_decision=deny
decision_state=report-only
decision_allowed=0
decision_denied=1
operator_review_required=1
unknown_tool_denied=1
unsigned_request_denied=1
invalid_schema_denied=1
stale_request_denied=1
replayed_request_denied=1
invalid_signature_denied=1
runtime_authority_granted=0
mode=contract-only
decision=report-only
reason=policy-decision-contract-only
status=policy-decision-contract-only
```

Promotion rules

The next implementation after this contract may only add bounded C metadata fields and deterministic rendering.

It must not evaluate real policies, enforce allow or deny outcomes, execute tools, execute shell commands, call runtime components, read host files, write host files, contact networks, verify signatures, validate freshness, detect replay, enforce capabilities, generate receipts, or grant authority.

Claim gate

Latticra must not claim to secure AI agents from this contract alone.

A future claim that Latticra secures AI-agent tool execution boundaries requires, at minimum:

```
request identity metadata implemented
parameter schema metadata implemented
request freshness metadata implemented
signed request metadata implemented
policy decision metadata implemented
runtime enforcement gate implemented
negative tests for denied unknown tools
negative tests for denied unsigned manifests
negative tests for denied stale requests
negative tests for denied replayed requests
operator-visible evidence report implemented
```

Until those are implemented and validated, the accurate public claim remains:

```
Latticra Seal is building a report-only trust boundary for AI-era automation.
```

Non-claims

This contract must not be read as implementation of policy enforcement, tool security enforcement, cryptographic enforcement, or AI-agent security.

Required non-claim posture:

```
policy_evaluation_implemented=0
policy_enforcement_implemented=0
runtime_enforcement_implemented=0
signed_request_verification_implemented=0
freshness_validation_implemented=0
replay_detection_implemented=0
mcp_tool_security_enforced=0
ai_agent_security_claimed=0
runtime_authority_granted=0
```

```
production_readiness_claimed=0
external_endorsement_claimed=0
```

Next valid slice

The next valid Latticra Seal slice is report-only policy decision metadata.

That future slice may add a bounded metadata structure, deterministic rendering, invariant tests, and a test runner.

It must not change runtime behavior, host behavior, network behavior, MCP behavior, AI agent execution, model execution, tool execution, shell execution, capability enforcement, cryptographic verification, signature verification, freshness validation, replay detection, policy enforcement, or authority grants.

docs/LATTICRA_SEAL_POLICY_DECISION_IMPLEMENTATION.md

Source title: Latticra Seal Policy Decision Implementation

Lines: 159 | Words: 618 | SHA-256: b20dc9c0a9f83e3b7184b6aadedba6d066afb25dd2fc8ac9f84c786d8b9851b3

Latticra Seal Policy Decision Implementation

Status: initial report-only policy decision metadata implementation Scope: bounded C metadata surface for policy decision posture after the report-only Seal signed request layer. This slice does not implement policy evaluation, policy enforcement, runtime execution, runtime authority, effect execution, capability enforcement, cryptographic verification, signature verification, public-key parsing, trust-store loading, key generation, private-key storage, hardware key use, revocation lookup, network trust lookup, object sealing, host reads, host writes, kernel behavior, Fedora approval claims, production readiness, MCP protocol implementation, MCP server behavior, MCP client behavior, AI agent execution, model execution, tool execution, shell execution, or operating-system behavior.

Purpose

This document records the first Latticra Seal policy decision metadata implementation.

The implementation accepts an existing report-only Seal signed request metadata record and produces deterministic report-only policy decision metadata.

Added files

```
include/latticra/seal_policy_decision.h
src/seal_policy_decision.c
tests/seal_policy_decision_invariants.c
scripts/test-latticra-seal-policy-decision.sh
```

API summary

The policy decision metadata surface adds:

```
latticra_seal_policy_decision_t
latticra_seal_policy_decision_error_t
latticra_seal_policy_decision_error_label
latticra_seal_policy_decision_from_signed_request
latticra_seal_policy_decision_is_report_only
latticra_seal_policy_decision_report
```

Metadata behavior

The implementation:

```
accepts a valid report-only Seal signed request metadata record
sets policy_decision_profile=latticra-seal-policy-decision/0.1
sets policy_id=unset
sets policy_version=unset
sets requested_action=unset
```

```
sets requested_tool=unset
sets policy_decision_supported=0
sets policy_evaluation_supported=0
sets policy_enforcement_supported=0
sets policy_id_present=0
sets policy_version_present=0
sets requested_action_present=0
sets requested_tool_present=0
sets signed_request_present=0
sets signature_valid=0
sets schema_valid=0
sets freshness_valid=0
sets replay_detected=0
sets default_decision=deny
sets decision_state=report-only
sets decision_allowed=0
sets decision_denied=1
sets operator_review_required=1
sets unknown_tool_denied=1
sets unsigned_request_denied=1
sets invalid_schema_denied=1
sets stale_request_denied=1
sets replayed_request_denied=1
sets invalid_signature_denied=1
copies runtime_authority_granted from signed request metadata
copies host_read_performed from signed request metadata
copies host_write_performed from signed request metadata
copies network_performed from signed request metadata
sets mode=report-only
sets decision=report-only
sets reason=policy-decision-metadata-only
renders deterministic policy decision metadata
```

Boundary

This implementation does not evaluate policies, enforce policies, execute tools, execute shell commands, call runtime components, contact networks, read host files, write host files, verify signatures, validate freshness, detect replay, enforce capabilities, or grant authority.

It is metadata only.

Failure behavior

The implementation fails closed:

```
null output -&gt; LATTICRA_STATUS_NULL_ARGUMENT
null signed request metadata input -&gt; invalid-input
invalid signed request metadata -&gt; invalid-signed-request
non-report-only signed request metadata -&gt; invalid-signed-request
small report buffer -&gt; LATTICRA_STATUS_BUFFER_TOO_SMALL
```

Failures do not evaluate policy, contact networks, read host files, write host files, execute tools, enforce capabilities, or grant authority.

Invariants

The invariant test verifies:

```
valid report-only signed request metadata produces deterministic policy decision metadata
policy_decision_profile is stable
policy_id remains unset
policy_version remains unset
requested_action remains unset
requested_tool remains unset
policy_decision_supported remains zero
policy_evaluation_supported remains zero
policy_enforcement_supported remains zero
signed_request_present remains zero
signature_valid remains zero
schema_valid remains zero
freshness_valid remains zero
replay_detected remains zero
default_decision remains deny
decision_state remains report-only
decision_allowed remains zero
```

```
decision_denied remains one
operator_review_required remains one
unknown_tool_denied remains one
unsigned_request_denied remains one
invalid_schema_denied remains one
stale_request_denied remains one
replayed_request_denied remains one
invalid_signature_denied remains one
runtime_authority_granted remains zero
host_read_performed remains zero
host_write_performed remains zero
network_performed remains zero
mode remains report-only
decision remains report-only
reason remains policy-decision-metadata-only
small report buffer fails closed
null inputs fail closed
invalid signed request metadata fails closed
```

Validation

Run:

```
sh scripts/test-latticra-seal-policy-decision-contract.sh
sh scripts/test-latticra-seal-policy-decision.sh
```

Claim boundary

This implementation still does not justify the public claim that Latticra secures AI agents.

It moves the project closer by adding report-only default-deny policy decision metadata, but the stronger claim requires a runtime enforcement gate and negative tests for denied unknown, unsigned, stale, and replayed requests.

Next valid slice

The next valid Latticra Seal slice is defensive threat model validation refinement or another small guarded status alignment if drift appears.

That future slice must not implement runtime behavior, host behavior, network behavior, MCP behavior, AI agent execution, model execution, tool execution, shell execution, capability enforcement, cryptographic verification, signature verification, freshness validation, replay detection, policy enforcement, or authority grants unless a specific contract and validation path justify it.

docs/LATTICRA_SEAL_POLICY_DECISION_REPORT_SURFACE.md

Source title: Latticra Seal Policy Decision Report Surface

Lines: 96 | Words: 358 | SHA-256: e0e2049bb2cd5bc01ae4eb42d404449d02f2a965f1c75998dcff2c37c731cb19

Latticra Seal Policy Decision Report Surface

Status: report-only policy decision report surface Scope: deterministic local report surface for the existing Latticra Seal policy decision metadata layer. This document does not implement policy evaluation, policy enforcement, runtime execution, runtime authority, effect execution, capability enforcement, cryptographic verification, signature verification, public-key parsing, trust-store loading, key generation, private-key storage, hardware key use, revocation lookup, network trust lookup, object sealing, host reads, host writes, kernel behavior, Fedora approval claims, production readiness, MCP protocol implementation, MCP server behavior, MCP client behavior, AI agent execution, model execution, tool execution, shell execution, or operating-system behavior.

Purpose

This document records the first operator-visible report surface for Latticra Seal policy decision metadata.

The surface renders the existing default-deny, report-only policy decision posture using a deterministic local fixture.

Added files

```
tests/seal_policy_decision_report_surface.c
scripts/latticra-seal-policy-decision-report.sh
```

Report runner

```
sh scripts/latticra-seal-policy-decision-report.sh
```

Expected report posture

The report surface renders the current policy-decision posture, including:

```
LATTICRA SEAL POLICY DECISION
policy_decision_profile=latticra-seal-policy-decision/0.1
policy_decision_supported=0
policy_evaluation_supported=0
policy_enforcement_supported=0
default_decision=deny
decision_state=report-only
decision_allowed=0
decision_denied=1
operator_review_required=1
unknown_tool_denied=1
unsigned_request_denied=1
invalid_schema_denied=1
stale_request_denied=1
replayed_request_denied=1
invalid_signature_denied=1
runtime_authority_granted=0
host_read_performed=0
host_write_performed=0
network_performed=0
mode=report-only
decision=report-only
reason=policy-decision-metadata-only
status=policy-decision-metadata
```

Boundary

This report surface compiles and runs a local deterministic fixture only.

It does not evaluate policy, enforce policy, execute tools, execute shell commands, call runtime components, contact networks, read host files, write host files, verify signatures, validate freshness, detect replay, enforce capabilities, or grant authority.

It renders metadata only.

Validation

Run:

```
sh scripts/test-latticra-seal-policy-decision-report-surface.sh
```

Expected output:

```
latticra seal policy decision report surface: ok
```

The underlying policy decision implementation remains covered by:

```
sh scripts/test-latticra-seal-policy-decision-contract.sh
sh scripts/test-latticra-seal-policy-decision.sh
sh scripts/test-latticra-seal-policy-decision-status.sh
```

Claim boundary

This report surface does not justify the public claim that Latticra secures AI agents.

It makes the default-deny policy decision posture easier to inspect before any future runtime work is considered.

Next valid slice

The next valid Latticra Seal slice is policy-decision report status alignment or a no-effect dry-run planning contract for future runtime behavior.

That future slice must preserve the report-only posture until a specific contract, deterministic local fixture, no-effect dry-run report, guarded allowlist posture, and validation path justify any later runtime work.

docs/LATTICRA_SEAL_PUBLIC_KEY_PARSING_CONTRACT.md

Source title: Latticra Seal Public-Key Parsing Boundary Contract

Lines: 351 | Words: 1084 | SHA-256: c20e8faa22effe68624e0065779aea525855e76eb3e3e1a57cd9f78611046f18

Latticra Seal Public-Key Parsing Boundary Contract

Status: Latticra Seal public-key parsing boundary contract Scope: contract for a future metadata-only public-key parsing surface after Seal key-material metadata. This document does not implement public-key parsing, key material loading, private-key handling, key generation, hardware-key use, trust-store loading, revocation lookup, cryptographic signing, signature verification, signer invocation behavior, signer process execution, object sealing, runtime handoff execution, runtime authority, host reads, host writes, network behavior, shell execution, tool execution, capability enforcement, policy persistence, kernel behavior, Fedora approval claims, production readiness, or operating-system behavior.

Purpose

This document defines the first Latticra Seal public-key parsing boundary after ready key-material metadata.

The purpose of this layer is to decide whether a ready metadata-only key-material record may be represented as eligible for a future metadata-only public-key parsing request before any public-key parser, key material loader, private key, signer process, trust store, hardware key, runtime bridge, host authority, or signature generation exists.

The public-key parsing surface is public-key parsing path classification, not public-key parsing, not key material handling, not signing, not verification, and not trust-store behavior.

This document does not parse public keys.

This document does not load key material.

This document does not handle private keys.

Relationship to key material

Latticra Seal key-material metadata already records a no-effect eligibility checkpoint for the future key path:

```
docs/LATTICRA_SEAL_KEY_MATERIAL_CONTRACT.md
docs/LATTICRA_SEAL_KEY_MATERIAL_IMPLEMENTATION.md
docs/status/SEAL_KEY_MATERIAL_STATUS.md
```

This public-key parsing boundary contract starts from that checkpoint. It does not replace key-material metadata, parse public keys, load key material, handle private keys, route to runtime behavior, invoke a signer, perform signing, verify signatures, load trust stores, persist policy, or grant runtime authority.

Required predecessors

This contract depends on:

```
docs/LATTICRA_SEAL_KEY_MATERIAL_CONTRACT.md
docs/LATTICRA_SEAL_KEY_MATERIAL_IMPLEMENTATION.md
docs/status/SEAL_KEY_MATERIAL_STATUS.md
include/latticra/seal_key_material.h
src/seal_key_material.c
tests/seal_key_material_invariants.c
scripts/test-latticra-seal-key-material-contract.sh
scripts/test-latticra-seal-key-material.sh
scripts/test-latticra-seal-key-material-status.sh
```

The key-material metadata surface remains the source of readiness evidence for this public-key parsing surface.

Public-Key Parsing Boundary

Allowed in the next implementation slice:

```
accept key-material metadata
require key_material_ready=1
require key_material_state=key-material-metadata-only
require requested_signature=Ed25519-development
require requested_signing_authorization=metadata-only
require requested_signer_handoff=metadata-only
require requested_signer_invocation=metadata-only
require requested_signing_operation=metadata-only
require requested_key_handling=metadata-only
require requested_key_material=metadata-only
require signature_performed=0
require verification_performed=0
require signer_invoked=0
require public_key_parsed=0
require key_material_loaded=0
require private_key_handling=0
require key_generation_performed=0
require hardware_key_used=0
require trust_store_loaded=0
require revocation_lookup_performed=0
require handoff_performed=0
require effect_performed=0
require runtime_authority_granted=0
require host_read_performed=0
require host_write_performed=0
require network_performed=0
accept requested_public_key_parsing=metadata-only
classify metadata-only as public_key_parsing_state=public-key-parsing-metadata-only
produce deterministic public-key parsing metadata
```

Forbidden in the next implementation slice:

```
public-key parsing
key material loading
private-key handling
key generation
hardware-key use
trust-store loading
revocation lookup
cryptographic signing
signature verification
signer process invocation
runtime handoff execution
runtime authority grants
host reads
host writes
network access
shell execution
tool execution
capability enforcement
policy persistence
object sealing
kernel interaction
```

Initial Public-Key Parsing Policy

Allowed key-material state:

```
key_material_state=key-material-metadata-only
```

Allowed requested key-material label:

```
metadata-only
```

Allowed requested public-key parsing label:

```
metadata-only
```

These labels are metadata labels only. They do not mean public-key parsing, key material loading, private-key handling, key generation, hardware-key use, trust establishment, trust-store behavior, Ed25519 signing, Ed25519 verification, signer invocation, revocation lookup, runtime handoff, host behavior, network behavior, or capability enforcement exists in this path.

Planned public-key parsing states:

```
public_key_parsing_state=public-key-parsing-metadata-only
public_key_parsing_state=denied-key-material
public_key_parsing_state=denied-key-handling
public_key_parsing_state=denied-signing-operation
public_key_parsing_state=denied-signer-invocation
public_key_parsing_state=denied-signer-handoff
public_key_parsing_state=denied-signing-authorization
public_key_parsing_state=denied-signature-algorithm
public_key_parsing_state=denied-public-key-parsing
public_key_parsing_state=denied-private-key
public_key_parsing_state=denied-trust-store
public_key_parsing_state=denied-runtime-authority
public_key_parsing_state=denied-host-effect
public_key_parsing_state=denied-network-effect
```

The first implementation may set:

```
public_key_parsing_ready=1
```

only for ready metadata-only key-material metadata, the allowed development signature label, the metadata-only key-handling label, the metadata-only key-material label, and the metadata-only public-key parsing label.

Even when public_key_parsing_ready=1, these must remain zero:

```
signature_performed=0
verification_performed=0
signer_invoked=0
public_key_parsed=0
key_material_loaded=0
private_key_handling=0
key_generation_performed=0
hardware_key_used=0
trust_store_loaded=0
revocation_lookup_performed=0
handoff_performed=0
effect_performed=0
runtime_authority_granted=0
host_read_performed=0
host_write_performed=0
network_performed=0
```

Planned Fields

A future public-key parsing record should be bounded and deterministic.

Planned fields:

```
public_key_parsing_profile
key_material_profile
key_handling_profile
signing_operation_profile
signer_invocation_profile
signer_handoff_profile
signing_authorization_profile
signature_request_profile
envelope_profile
report_profile
handoff_profile
decision_profile
```

```
gate_profile
receipt_profile
verify_profile
message_digest_algorithm
message_digest_hex
public_key_identity_label
requested_capability
requested_effect
requested_handoff
requested_report
requested_envelope
requested_signature
requested_signing_authorization
requested_signer_handoff
requested_signer_invocation
requested_signing_operation
requested_key_handling
requested_key_material
requested_public_key_parsing
requested_scope
signing_authorization_state
signing_authorization_ready
signer_handoff_state
signer_handoff_ready
signer_invocation_state
signer_invocation_ready
signing_operation_state
signing_operation_ready
key_handling_state
key_handling_ready
key_material_state
key_material_ready
public_key_parsing_state
public_key_parsing_ready
signature_performed
verification_performed
signer_invoked
public_key_parsed
key_material_loaded
private_key_handling
key_generation_performed
hardware_key_used
trust_store_loaded
revocation_lookup_performed
handoff_performed
effect_performed
runtime_authority_granted
host_read_performed
host_write_performed
network_performed
mode
status
```

Expected values for an allowed first implementation result:

```
public_key_parsing_profile=latticra-seal-public-key-parsing/0.1
key_material_profile=latticra-seal-key-material/0.1
key_handling_profile=latticra-seal-key-handling/0.1
requested_key_handling=metadata-only
requested_key_material=metadata-only
requested_public_key_parsing=metadata-only
key_material_state=key-material-metadata-only
key_material_ready=1
public_key_parsing_state=public-key-parsing-metadata-only
public_key_parsing_ready=1
signature_performed=0
verification_performed=0
signer_invoked=0
public_key_parsed=0
key_material_loaded=0
private_key_handling=0
key_generation_performed=0
hardware_key_used=0
trust_store_loaded=0
revocation_lookup_performed=0
runtime_authority_granted=0
mode=metadata-only
status=public-key-parsing-metadata
```

Failure Behavior

Future public-key parsing metadata handling must fail closed.

Required failure states:

```
null output -&gt; invalid
null key material -&gt; invalid
invalid key material -&gt; denied-key-material
key_material_ready=0 -&gt; denied-key-material
key_material_state not key-material-metadata-only -&gt; denied-key-material
requested_key_material not metadata-only -&gt; denied-key-material
key_handling_ready=0 -&gt; denied-key-handling
key_handling_state not key-handling-metadata-only -&gt; denied-key-handling
requested_key_handling not metadata-only -&gt; denied-key-handling
signing_operation_ready=0 -&gt; denied-signing-operation
signing_operation_state not operation-metadata-only -&gt; denied-signing-operation
requested_signing_operation not metadata-only -&gt; denied-signing-operation
signer_invocation_ready=0 -&gt; denied-signer-invocation
signer_invocation_state not invocation-metadata-only -&gt; denied-signer-invocation
requested_signer_invocation not metadata-only -&gt; denied-signer-invocation
signer_handoff_ready=0 -&gt; denied-signer-handoff
signer_handoff_state not handoff-metadata-only -&gt; denied-signer-handoff
requested_signer_handoff not metadata-only -&gt; denied-signer-handoff
requested_signing_authorization not metadata-only -&gt; denied-signing-authorization
missing requested signature -&gt; denied-signature-algorithm
unknown requested signature -&gt; denied-signature-algorithm
missing requested public key parsing -&gt; denied-public-key-parsing
unknown requested public key parsing -&gt; denied-public-key-parsing
public-key parsing requested or observed -&gt; denied-public-key-parsing
key material loading requested or observed -&gt; denied-key-material
private-key handling requested or observed -&gt; denied-private-key
key generation requested or observed -&gt; denied-private-key
hardware-key use requested or observed -&gt; denied-private-key
trust-store loading requested or observed -&gt; denied-trust-store
revocation lookup requested or observed -&gt; denied-network-effect
signature already performed -&gt; denied-host-effect
verification already performed -&gt; denied-host-effect
signer already invoked -&gt; denied-host-effect
runtime authority already granted -&gt; denied-runtime-authority
handoff already performed -&gt; denied-host-effect
effect already performed -&gt; denied-host-effect
host read already performed -&gt; denied-host-effect
host write already performed -&gt; denied-host-effect
network already performed -&gt; denied-network-effect
```

Failures must not sign, verify signatures, invoke a signer, parse public keys, load key material, handle private keys, generate keys, use hardware keys, load trust stores, look up revocation status, read host files, write host files, contact networks, execute tools, execute shells, enforce capabilities, perform runtime handoff, persist policy, or grant runtime authority.

Promotion Rule

This contract permits only the next implementation slice:

```
public-key parsing metadata implementation
```

It does not permit public-key parsing, key material loading, private-key handling, key generation, hardware-key use, trust-store behavior, revocation lookup, cryptographic signing, signature verification, signer invocation behavior, runtime handoff execution, effect execution, capability enforcement, runtime authority, host behavior, network behavior, object sealing, or kernel behavior.

After public-key parsing metadata, status/public-entry alignment, and the future key parsing implementation contract exist and are guarded, the next valid planning slice is bounded no-effect key parsing implementation that still must not add public-key parsing without separate implementation, public-key, key-material, and guard contracts.

Validation

This contract is validated by:

```
sh scripts/test-latticra-seal-public-key-parsing-contract.sh
```

docs/LATTICRA_SEAL_PUBLIC_KEY_PARSING_IMPLEMENTATION.md

Source title: Latticra Seal Public-Key Parsing Implementation

Lines: 227 | Words: 665 | SHA-256: b95349925a81d8bb49f193f96bb143389d24c18fe9a906c32e9442f184a870f7

Latticra Seal Public-Key Parsing Implementation

Status: initial public-key parsing metadata implementation Scope: bounded C metadata surface for classifying Seal public-key parsing eligibility after ready key-material metadata. This slice does not add public-key parsing, key material loading, private-key handling, key generation, hardware-key use, trust-store loading, revocation lookup, cryptographic signing, signature verification, signer invocation behavior, signer process execution, object sealing, runtime handoff execution, runtime authority, host reads, host writes, network behavior, shell execution, tool execution, capability enforcement, policy persistence, kernel behavior, Fedora approval claims, production readiness, or operating-system behavior.

Purpose

This document records the first Latticra Seal public-key parsing metadata implementation.

The implementation consumes ready key-material metadata and classifies whether the request remains eligible for a future metadata-only public-key parsing path.

It is public-key parsing path classification only.

It does not parse public keys.

It does not load key material.

It does not handle private keys.

It does not sign.

It does not verify signatures.

Files

```
include/latticra/seal_public_key_parsing.h
src/seal_public_key_parsing.c
tests/seal_public_key_parsing_invariants.c
scripts/test-latticra-seal-public-key-parsing.sh
```

Required predecessors

This implementation depends on the public-key parsing boundary contract and the key-material metadata surface:

```
docs/LATTICRA_SEAL_PUBLIC_KEY_PARSING_CONTRACT.md
docs/LATTICRA_SEAL_KEY_MATERIAL_CONTRACT.md
docs/LATTICRA_SEAL_KEY_MATERIAL_IMPLEMENTATION.md
docs/status/SEAL_KEY_MATERIAL_STATUS.md
include/latticra/seal_key_material.h
src/seal_key_material.c
tests/seal_key_material_invariants.c
scripts/test-latticra-seal-public-key-parsing-contract.sh
scripts/test-latticra-seal-key-material-contract.sh
scripts/test-latticra-seal-key-material.sh
scripts/test-latticra-seal-key-material-status.sh
```

Implemented surface

The public-key parsing metadata surface adds:

```
latticra_seal_public_key_parsing_t
latticra_seal_public_key_parsing_error_t
latticra_seal_public_key_parsing_error_label
```

```
latticra_seal_public_key_parsing_from_key_material
latticra_seal_public_key_parsing_is_metadata_only
latticra_seal_public_key_parsing_render
```

The implementation:

```
accepts key-material metadata
requires key_material_ready=1
requires key_material_state=key-material-metadata-only
requires requested_signature=Ed25519-development
requires requested_signing_authorization=metadata-only
requires requested_signer_handoff=metadata-only
requires requested_signer_invocation=metadata-only
requires requested_signing_operation=metadata-only
requires requested_key_handling=metadata-only
requires requested_key_material=metadata-only
accepts requested_public_key_parsing=metadata-only
classifies the result as public_key_parsing_state=public-key-parsing-metadata-only
sets public_key_parsing_ready=1 only for metadata-only allowed key-material states
renders deterministic public-key parsing metadata
fails closed for invalid or denied predecessor metadata
```

Even when public_key_parsing_ready=1, these fields remain zero:

```
signature_performed=0
verification_performed=0
signer_invoked=0
public_key_parsed=0
key_material_loaded=0
private_key_handling=0
key_generation_performed=0
hardware_key_used=0
trust_store_loaded=0
revocation_lookup_performed=0
handoff_performed=0
effect_performed=0
runtime_authority_granted=0
host_read_performed=0
host_write_performed=0
network_performed=0
```

Current metadata output

The successful metadata path renders:

```
public_key_parsing_profile=latticra-seal-public-key-parsing/0.1
key_material_profile=latticra-seal-key-material/0.1
key_handling_profile=latticra-seal-key-handling/0.1
signing_operation_profile=latticra-seal-signing-operation/0.1
signer_invocation_profile=latticra-seal-signer-invocation/0.1
signer_handoff_profile=latticra-seal-signer-handoff/0.1
signing_authorization_profile=latticra-seal-signing-authorization/0.1
signature_request_profile=latticra-seal-signature-request/0.1
requested_signature=Ed25519-development
requested_signing_authorization=metadata-only
requested_signer_handoff=metadata-only
requested_signer_invocation=metadata-only
requested_signing_operation=metadata-only
requested_key_handling=metadata-only
requested_key_material=metadata-only
requested_public_key_parsing=metadata-only
signing_authorization_state=authorized-metadata-only
signing_authorization_ready=1
signer_handoff_state=handoff-metadata-only
signer_handoff_ready=1
signer_invocation_state=invocation-metadata-only
signer_invocation_ready=1
signing_operation_state=operation-metadata-only
signing_operation_ready=1
key_handling_state=key-handling-metadata-only
key_handling_ready=1
key_material_state=key-material-metadata-only
key_material_ready=1
public_key_parsing_state=public-key-parsing-metadata-only
public_key_parsing_ready=1
public_key_parsed=0
key_material_loaded=0
hardware_key_used=0
mode=metadata-only
status=public-key-parsing-metadata
```

Failure behavior

The implementation fails closed for:

```
null output
null key material
invalid key material
key_material_ready=0
key_material_state not key-material-metadata-only
requested_key_material not metadata-only
key_handling_ready=0
key_handling_state not key-handling-metadata-only
requested_key_handling not metadata-only
signing_operation_ready=0
signing_operation_state not operation-metadata-only
requested_signing_operation not metadata-only
signer_invocation_ready=0
signer_invocation_state not invocation-metadata-only
requested_signer_invocation not metadata-only
signer_handoff_ready=0
signer_handoff_state not handoff-metadata-only
requested_signer_handoff not metadata-only
signing_authorization_ready=0
signing_authorization_state not authorized-metadata-only
requested_signing_authorization not metadata-only
missing requested signature
unknown requested signature
missing requested public-key parsing
unknown requested public-key parsing
public-key parsing request
key material loading request
private-key handling request
key generation request
hardware-key use request
trust-store loading request
revocation lookup request
public-key parsing already present
key material loading already present
private-key handling already present
key generation already present
hardware-key use already present
trust-store loading already present
revocation lookup already present
runtime authority already granted
signature already performed
verification already performed
signer already invoked
handoff already performed
effect already performed
host read already performed
host write already performed
network already performed
small render buffer
```

Failures do not sign, verify signatures, invoke a signer, parse public keys, load key material, handle private keys, generate keys, use hardware keys, load trust stores, look up revocation status, read host files, write host files, contact networks, execute tools, execute shells, enforce capabilities, perform runtime handoff, persist policy, or grant runtime authority.

Validation

Run:

```
sh scripts/test-latticra-seal-public-key-parsing-contract.sh
sh scripts/test-latticra-seal-public-key-parsing.sh
sh scripts/test-latticra-seal-public-key-parsing-status.sh
```

Expected output:

```
seal public-key parsing contract: ok
seal public-key parsing invariants: ok
seal public-key parsing status: ok
```

Next valid slice

The next valid Latticra Seal planning slice is bounded no-effect key parsing implementation or another narrow status/index alignment follow-up that still must not add public-key parsing without separate public-key parsing, key-material, and guard contracts.

The public-key parsing metadata implementation is a guarded checkpoint. Future work must not add public-key parsing, key material loading, private-key handling, key generation, hardware-key use, trust-store behavior, revocation lookup, signing, verification, signer invocation behavior, host behavior, network behavior, runtime authority, capability enforcement, object sealing, or kernel behavior unless separately implemented and guarded.

docs/LATTICRA_SEAL_REPLAYED_REQUEST_CASE_CONTRACT.md

Source title: Latticra Seal Replayed Request Case Contract

Lines: 104 | Words: 296 | SHA-256: 80abf44265255a25a761e1705d0217e11cd4049eeba45b0796e2b30b445331d7

Latticra Seal Replayed Request Case Contract

Status: Latticra Seal replayed request case contract Scope: case-specific contract after the stale request case fixture. This document does not implement runtime behavior, policy behavior, tool behavior, host behavior, network behavior, cryptographic behavior, replay detection, or authority grants.

Purpose

This document defines the fourth case-specific test contract for the Seal runtime gate path.

The case is a replayed request. The expected posture is that the gate remains report-only, blocked by default, and grants no authority.

This document does not implement the case behavior.

Required predecessors

```
docs/LATTICRA_SEAL_RUNTIME_GATE_TEST_PLAN.md
docs/LATTICRA_SEAL_STALE_REQUEST_CASE_CONTRACT.md
docs/LATTICRA_SEAL_STALE_REQUEST_CASE_IMPLEMENTATION.md
docs/LATTICRA_SEAL_RUNTIME_GATE_IMPLEMENTATION.md
include/latticra/seal_runtime_gate.h
src/seal_runtime_gate.c
tests/seal_runtime_gate_invariants.c
tests/seal_stale_request_case.c
scripts/test-latticra-seal-runtime-gate-test-plan.sh
scripts/test-latticra-seal-stale-request-case-contract.sh
scripts/test-latticra-seal-stale-request-case.sh
```

Case definition

```
case_profile=latticra-seal-replayed-request-case/0.1
case_name=replayed-request
case_contract_present=1
replayed_request_case_contract_present=1
input_replay_detected=1
input_nonce_reused=1
input_request_seen_before=1
expected_gate_state=report-only
expected_default_blocked=1
expected_replayed_request_blocked=1
expected_runtime_authority_granted=0
expected_effect_performed=0
expected_host_read_performed=0
expected_host_write_performed=0
expected_network_performed=0
case_behavior_implemented=0
```

Future test requirements

A future implementation must add a deterministic test fixture showing that a replayed request case remains blocked and does not perform effects.

Planned future file names:

```
tests/seal_replayed_request_case.c
scripts/test-latticra-seal-replayed-request-case.sh
```

Expected future output:

```
seal replayed request case: ok
```

Boundary

This contract is documentation-only.

It does not add case execution, runtime behavior, host behavior, network behavior, MCP behavior, AI agent behavior, model behavior, tool behavior, shell behavior, policy behavior, cryptographic behavior, replay detection, or authority grants.

Claim gate

This contract alone does not justify the public claim that Latticra secures AI agents.

The accurate public claim remains:

```
Latticra Seal is building a report-only trust boundary for AI-era automation.
```

A stronger claim requires implemented and validated gate behavior plus case tests for unknown, unsigned, stale, and replayed requests.

Non-claims

```
replayed_request_case_implemented=0
runtime_gate_case_tests_implemented=0
runtime_behavior_implemented=0
policy_behavior_implemented=0
tool_behavior_implemented=0
host_behavior_implemented=0
network_behavior_implemented=0
replay_detection_implemented=0
authority_granted=0
production_readiness_claimed=0
external_endorsement_claimed=0
```

Next valid slice

The next valid Latticra Seal slice is the replayed request case test fixture.

docs/LATTICRA_SEAL_REPLAYED_REQUEST_CASE_IMPLEMENTATION.md

Source title: Latticra Seal Replayed Request Case Implementation

Lines: 51 | Words: 161 | SHA-256: 623d64cedf16507c035cb819ed8d0e27488a46d69a5734db85bff2a4be5471db

Latticra Seal Replayed Request Case Implementation

Status: initial replayed request case fixture Scope: local deterministic case fixture after the replayed request case contract.

Purpose

This record documents the replayed-request case fixture for the Seal runtime gate metadata path.

The fixture keeps the gate in report-only state and verifies that no authority, host operation, network operation, or effect is reported.

Added files

```
tests/seal_replayed_request_case.c
scripts/test-latticra-seal-replayed-request-case.sh
```

Validation

Run:

```
sh scripts/test-latticra-seal-replayed-request-case.sh
```

Expected output:

```
seal replayed request case: ok
```

Boundary

This slice is a local deterministic fixture only.

It does not add runtime behavior, tool behavior, host behavior, network behavior, effect behavior, or authority grants.

Claim boundary

This fixture does not by itself justify a stronger public claim.

The accurate public claim remains:

```
Latticra Seal is building a report-only trust boundary for AI-era automation.
```

Next valid slice

The next valid slice is status/index alignment for the completed core blocked-request case set.

docs/LATTICRA_SEAL_REPORT_ENVELOPE_CONTRACT.md

Source title: Latticra Seal Report Envelope Contract

Lines: 199 | Words: 575 | SHA-256: 86b0bc6901bbfecaca799aad272d23d92828f642f69ad512d3c09cc648cf5c66

Latticra Seal Report Envelope Contract

Status: Latticra Seal report envelope contract Scope: contract for a future sealed report envelope surface after ready runtime handoff report metadata. This document does not implement runtime handoff execution, runtime authority, host reads, host writes, network behavior, shell execution, tool execution, capability enforcement, policy persistence, signing, key generation, private-key storage, trust-store loading, revocation lookup, object sealing, kernel behavior, Fedora approval claims, production readiness, or operating-system behavior.

Purpose

This document defines the first Latticra Seal report envelope boundary that may consume ready metadata-only runtime handoff report metadata.

The purpose of this layer is to decide whether a previously ready metadata-only report may be wrapped into a deterministic envelope record before any future signing or runtime bridge exists.

The envelope surface is envelope classification, not signing and not runtime handoff.

Required predecessors

This contract depends on:

```
docs/LATTICRA_SEAL_RUNTIME_HANDOFF_REPORT_CONTRACT.md
docs/LATTICRA_SEAL_RUNTIME_HANDOFF_REPORT_IMPLEMENTATION.md
```

```
include/latticra/seal_runtime_handoff_report.h
src/seal_runtime_handoff_report.c
tests/seal_runtime_handoff_report_invariants.c
scripts/test-latticra-seal-runtime-handoff-report.sh
```

The runtime handoff report metadata surface remains the source of report-readiness evidence for this envelope surface.

Envelope boundary

Allowed in the next implementation slice:

```
accept runtime handoff report metadata
require report_ready=1
require report_state=ready-report-only or report_state=ready-evaluate-only
require handoff_performed=0
require runtime_authority_granted=0
require effect_performed=0
require host_read_performed=0
require host_write_performed=0
require network_performed=0
accept requested envelope metadata
classify report-only as envelope_state=sealed-report-only
classify evaluate-only as envelope_state=sealed-evaluate-only
produce deterministic sealed report envelope metadata
```

Forbidden in the next implementation slice:

```
cryptographic signing
private-key handling
key generation
trust-store loading
revocation lookup
runtime handoff execution
runtime authority grants
host reads
host writes
network access
shell execution
tool execution
capability enforcement
policy persistence
object sealing
kernel interaction
```

Initial envelope policy

Allowed input report states:

```
report_state=ready-report-only
report_state=ready-evaluate-only
```

Allowed requested envelope labels:

```
report-only
evaluate-only
```

Planned envelope states:

```
envelope_state=sealed-report-only
envelope_state=sealed-evaluate-only
envelope_state=denied-report
envelope_state=denied-envelope
envelope_state=denied-runtime-authority
envelope_state=denied-host-effect
envelope_state=denied-network-effect
```

The first implementation may set:

```
envelope_ready=1
```

only for metadata-only report/evaluate envelopes.

Even when envelope_ready=1, these must remain zero:

```
signature_performed=0
handoff_performed=0
effect_performed=0
runtime_authority_granted=0
host_read_performed=0
```

```
host_write_performed=0
network_performed=0
```

Planned fields

A future sealed report envelope record should be bounded and deterministic.

Planned fields:

```
envelope_profile
report_profile
handoff_profile
decision_profile
gate_profile
receipt_profile
verify_profile
message_digest_algorithm
message_digest_hex
public_key_identity_label
requested_capability
requested_effect
requested_handoff
requested_report
requested_envelope
requested_scope
report_state
report_ready
envelope_state
envelope_ready
signature_performed
handoff_performed
effect_performed
runtime_authority_granted
host_read_performed
host_write_performed
network_performed
status
```

Failure behavior

Future report envelope handling must fail closed.

Required failure states:

```
null output -&gt; invalid
null runtime handoff report -&gt; invalid
invalid runtime handoff report -&gt; denied-report
report_ready=0 -&gt; denied-report
report_state not ready-report-only or ready-evaluate-only -&gt; denied-report
missing requested envelope -&gt; denied-envelope
unknown requested envelope -&gt; denied-envelope
requested envelope mismatch -&gt; denied-envelope
runtime authority already granted -&gt; denied-runtime-authority
signature already performed -&gt; denied-host-effect
handoff already performed -&gt; denied-host-effect
effect already performed -&gt; denied-host-effect
host read already performed -&gt; denied-host-effect
host write already performed -&gt; denied-host-effect
network already performed -&gt; denied-network-effect
```

Failures must not sign, handle private keys, read host files, write host files, contact networks, execute tools, execute shells, enforce capabilities, perform handoff, persist policy, or grant runtime authority.

Promotion rule

This contract permits only the next implementation slice:

```
sealed report envelope metadata implementation
```

It does not permit cryptographic signing, private-key handling, key generation, trust-store behavior, revocation lookup, runtime handoff execution, effect execution, capability enforcement, runtime authority, host behavior, network behavior, object sealing, or kernel behavior.

After sealed report envelope metadata exists and is guarded, the next valid planning slice is a signature request contract that still performs no signing.

Validation

This contract is validated by:

```
sh scripts/test-latticra-seal-report-envelope-contract.sh
```

docs/LATTICRA_SEAL_REPORT_ENVELOPE_IMPLEMENTATION.md

Source title: Latticra Seal Report Envelope Implementation

Lines: 152 | Words: 555 | SHA-256: 41dc9cce35cc716c5e1c306ecae2769915f9fb1e15484c011650240bfb681dd0

Latticra Seal Report Envelope Implementation

Status: initial sealed report envelope metadata implementation Scope: bounded C metadata surface for classifying ready metadata-only runtime handoff report output into deterministic sealed report envelope readiness. This does not implement cryptographic signing, signature verification, key generation, private-key handling, trust-store loading, revocation lookup, object sealing, runtime handoff execution, runtime authority, host reads, host writes, network behavior, shell execution, tool execution, capability enforcement, policy persistence, kernel interaction, Fedora approval claims, production readiness, or operating-system behavior.

Purpose

This document records the first Latticra Seal report envelope metadata implementation.

The implementation consumes runtime handoff report metadata and classifies whether the requested metadata-only envelope remains ready as report-only or evaluate-only.

The envelope surface is envelope classification, not signing and not runtime handoff.

Added files

```
include/latticra/seal_report_envelope.h
src/seal_report_envelope.c
tests/seal_report_envelope_invariants.c
scripts/test-latticra-seal-report-envelope.sh
```

Required predecessor

This implementation depends on the runtime handoff report metadata surface:

```
docs/LATTICRA_SEAL_REPORT_ENVELOPE_CONTRACT.md
docs/LATTICRA_SEAL_RUNTIME_HANDOFF_REPORT_CONTRACT.md
docs/LATTICRA_SEAL_RUNTIME_HANDOFF_REPORT_IMPLEMENTATION.md
include/latticra/seal_runtime_handoff_report.h
src/seal_runtime_handoff_report.c
tests/seal_runtime_handoff_report_invariants.c
scripts/test-latticra-seal-runtime-handoff-report.sh
```

API summary

The report envelope metadata surface adds:

```
latticra_seal_report_envelope_t
latticra_seal_report_envelope_error_t
latticra_seal_report_envelope_error_label
latticra_seal_report_envelope_from_report
latticra_seal_report_envelope_is_metadata_only
latticra_seal_report_envelope_render
```

Envelope behavior

The implementation:

```
accepts runtime handoff report metadata
```

```
requires report_ready=1
requires report_state=ready-report-only or report_state=ready-evaluate-only
requires runtime_authority_granted=0
requires handoff_performed=0
requires effect_performed=0
requires host_read_performed=0
requires host_write_performed=0
requires network_performed=0
accepts requested envelope metadata
classifies report-only as envelope_state=sealed-report-only
classifies evaluate-only as envelope_state=sealed-evaluate-only
sets envelope_ready=1 only for metadata-only report/evaluate envelope surfaces
renders deterministic sealed report envelope metadata
```

Effect and runtime boundary

Even when envelope_ready=1, these fields remain zero:

```
signature_performed=0
handoff_performed=0
effect_performed=0
runtime_authority_granted=0
host_read_performed=0
host_write_performed=0
network_performed=0
```

This implementation does not sign records, verify signatures, handle private keys, load trust stores, look up revocation status, perform runtime handoff, read host files, write host files, contact networks, execute tools, execute shells, enforce capabilities, persist policy, seal objects, or interact with the kernel.

Failure behavior

The implementation fails closed:

```
null output -&gt; LATTICRA_STATUS_NULL_ARGUMENT
null runtime handoff report -&gt; invalid-input
invalid runtime handoff report -&gt; invalid-report
report_ready=0 -&gt; denied-report
report_state not ready-report-only or ready-evaluate-only -&gt; denied-report
missing requested envelope -&gt; missing-requested-envelope
unknown requested envelope -&gt; denied-unknown-envelope
requested envelope mismatch -&gt; denied-envelope
runtime authority already granted -&gt; denied-runtime-authority
handoff already performed -&gt; denied-host-effect
effect already performed -&gt; denied-host-effect
host read already performed -&gt; denied-host-effect
host write already performed -&gt; denied-host-effect
network already performed -&gt; denied-network-effect
small report buffer -&gt; LATTICRA_STATUS_BUFFER_TOO_SMALL
```

Failures do not sign, perform handoff, perform effects, read host files, write host files, contact networks, or grant runtime authority.

Invariants

The invariant test verifies:

```
ready report-only metadata produces sealed-report-only envelope metadata
ready evaluate-only metadata produces sealed-evaluate-only envelope metadata
envelope_ready is one only for metadata-only envelope states
signature_performed remains zero
handoff_performed remains zero
effect_performed remains zero
runtime_authority_granted remains zero
host_read_performed remains zero
host_write_performed remains zero
network_performed remains zero
small render buffer fails closed
null inputs fail closed
invalid report metadata fails closed
missing, unknown, and mismatched requested envelope labels fail closed
```

Validation

Run:

```
sh scripts/test-latticra-seal-report-envelope-contract.sh
sh scripts/test-latticra-seal-report-envelope.sh
```

Expected output:

```
seal report envelope contract: ok
seal report envelope invariants: ok
```

Next valid slice

The next valid Latticra Seal planning slice is a signature request contract that still performs no signing.

That future slice must remain contract-first and must not add private-key handling, signing, trust-store behavior, revocation lookup, host behavior, network behavior, runtime authority, capability enforcement, object sealing, or kernel behavior unless separately contracted, implemented, and guarded.

docs/LATTICRA_SEAL_REPORT_IMPLEMENTATION.md

Source title: Latticra Seal Report Implementation

Lines: 114 | Words: 351 | SHA-256: e02dbe30a3bf142dfde467b7f369f08f0c0d221fcec7fae24dab7c485c154fe7

Latticra Seal Report Implementation

Status: Seal report implementation with read-only measurement awareness Scope: bounded C report surface for Latticra Seal status labels. This surface now reports that read-only measurement support exists. It does not add signing, object sealing, key handling, runtime authority, host writes, network behavior, kernel behavior, Fedora approval claims, production readiness, or operating-system behavior.

Purpose

This document records the Latticra Seal report implementation.

The implementation adds a deterministic report surface that makes the current Seal posture visible without granting authority.

Added files

```
include/latticra/seal_report.h
src/seal_report.c
tests/seal_report_invariants.c
scripts/test-latticra-seal-report.sh
```

API summary

The report surface adds:

```
latticra_seal_report_t
latticra_seal_report_default
latticra_seal_report_is_no_effect
latticra_seal_report_render
```

The report uses fixed-size fields, no dynamic allocation, and bounded rendering through snprintf.

Default report posture

The default report now states:

```
seal_profile=latticra-seal/0.1-report
contract_present=1
implementation_plan_present=1
report_only_supported=1
measurement_supported=1
signing_supported=0
capability_gate_supported=0
sealed_objects_supported=0
```

```
effect_performed=0
host_read_performed=0
host_write_performed=0
network_performed=0
runtime_granted=0
evidence_level=3
status=report-and-measurement
```

Effect boundary

The report itself performs no host read, no host write, no network behavior, no runtime grant, and no object mutation.

Read-only measurement is represented by the separate measurement surface.

The helper latticra_seal_report_is_no_effect reports true only when all effect fields remain zero.

Failure behavior

The renderer fails closed:

```
null report -&gt; LATTICRA_STATUS_NULL_ARGUMENT
null buffer -&gt; LATTICRA_STATUS_NULL_ARGUMENT
small buffer -&gt; LATTICRA_STATUS_BUFFER_TOO_SMALL
```

When the buffer is too small and has nonzero capacity, the renderer clears the first byte.

Invariants

The invariant test verifies:

```
default report is report-only plus measurement-aware
contract and plan are visible
measurement support is visible
signing remains unsupported
capability gate remains unsupported
sealed objects remain unsupported
no host read is performed by the report
no host write is performed by the report
no network behavior is performed
no runtime grant is performed
rendered report contains required labels
small render buffer fails closed
null inputs fail closed
```

Validation

Run:

```
sh scripts/test-latticra-seal-report.sh
```

The measurement implementation is validated by:

```
sh scripts/test-latticra-seal-measurement.sh
```

Next valid slice

The next valid Latticra Seal slice after read-only measurement is a signed evidence-manifest contract.

That future slice must be contract-first and must not be added directly to the measurement implementation.

docs/LATTICRA_SEAL_REQUEST_FRESHNESS_CONTRACT.md

Source title: Latticra Seal Request Freshness Contract

Lines: 252 | Words: 766 | SHA-256: c0afe8e60e34fda3be6a4aed0c126e09a1fdadf90e913078cbd2b44c00978cfe

Latticra Seal Request Freshness Contract

Status: Latticra Seal request freshness contract Scope: contract for future request freshness and replay metadata after the report-only Seal parameter schema report surface. This document does not implement timestamp parsing, clock trust, nonce storage, replay-cache storage, context hashing, parameter hashing, signature verification, runtime execution, runtime authority, effect execution, capability enforcement, cryptographic verification, verified receipts, public-key parsing, public-key trust stores, key generation, private-key storage, hardware key use, network trust lookup, revocation lookup, object sealing, host reads, host writes, kernel behavior, Fedora approval claims, production readiness, MCP protocol implementation, MCP server behavior, MCP client behavior, AI agent execution, model execution, tool execution, shell execution, or operating-system behavior.

Purpose

This document defines the next Latticra Seal contract layer for request freshness and replay metadata.

The purpose is to prepare a bounded report-only structure for describing whether a future tool request is time-scoped, nonce-scoped, context-bound, and parameter-bound before any execution or enforcement is considered.

This document does not implement request freshness behavior.

Required predecessors

This contract depends on:

```
docs/LATTICRA_SEAL_AGENTIC_AUTOMATION_SECURITY_CONTRACT.md
docs/LATTICRA_SEAL_MCP_ALIGNMENT_PLAN.md
docs/LATTICRA_SEAL_AGENTIC_AUTOMATION_SECURITY_IMPLEMENTATION.md
docs/LATTICRA_SEAL_AGENTIC_AUTOMATION_SECURITY_REPORT_SURFACE.md
docs/LATTICRA_SEAL_PARAMETER_SCHEMA_CONTRACT.md
docs/LATTICRA_SEAL_PARAMETER_SCHEMA_IMPLEMENTATION.md
docs/LATTICRA_SEAL_PARAMETER_SCHEMA_REPORT_SURFACE.md
docs/status/SEAL_AGENTIC_AUTOMATION_SECURITY_STATUS.md
docs/status/SEAL_AGENTIC_AUTOMATION_SECURITY_INDEX_ALIGNMENT.md
docs/status/SEAL_AGENTIC_AUTOMATION_SECURITY_REPORT_SURFACE_STATUS.md
include/latticra/seal_parameter_schema.h
src/seal_parameter_schema.c
tests/seal_parameter_schema_invariants.c
tests/seal_parameter_schema_report_surface.c
scripts/test-latticra-seal-parameter-schema-contract.sh
scripts/test-latticra-seal-parameter-schema.sh
scripts/test-latticra-seal-parameter-schema-report-surface.sh
```

The existing parameter schema metadata surface remains report-only.

Request freshness boundary

The request freshness layer may describe whether freshness metadata is declared, present, bounded, and reportable.

The layer may not parse trusted time, maintain a nonce cache, compare real clocks, validate signatures, authorize a request, execute tools, execute shell commands, contact networks, read host files, write host files, or mutate system state.

Allowed in this contract slice:

```
request-freshness vocabulary
request-id metadata planning
caller-id metadata planning
tool-id metadata planning
request timestamp metadata planning
request expiration metadata planning
nonce metadata planning
context hash metadata planning
parameter hash metadata planning
```

```
freshness status planning
replay status planning
report-only status planning
non-claims
static guard validation
```

Forbidden in this contract slice:

```
timestamp parsing
trusted clock behavior
nonce storage
replay-cache storage
context hashing
parameter hashing
freshness validation
replay detection
signature verification
runtime execution
AI agent execution
model execution
tool execution
shell command execution
runtime authority grants
effect execution
host reads
host writes
network access
capability enforcement
cryptographic verification
verified receipt generation
public-key parsing
public-key trust store loading
private-key handling
key generation
signature generation
revocation lookup
object sealing
kernel interaction
MCP server implementation
MCP client implementation
```

Initial request freshness policy

The initial policy is report-only and closed by default.

```
seal_request_freshness_contract_present=1
request_freshness_supported=0
request_freshness_validation_supported=0
replay_protection_supported=0
request_id_present=0
caller_id_present=0
tool_id_present=0
request_timestamp_present=0
request_expiration_present=0
nonce_present=0
context_hash_present=0
parameter_hash_present=0
freshness_valid=0
replay_detected=0
runtime_authority_granted=0
host_read_performed=0
host_write_performed=0
network_performed=0
mode=contract-only
status=request-freshness-contract-only
```

Planned metadata fields

Future request freshness metadata should be bounded and deterministic.

Planned fields:

```
freshness_profile
request_id
caller_id
tool_id
request_timestamp
request_expiration
nonce
```

```
context_hash
parameter_hash
request_freshness_supported
request_freshness_validation_supported
replay_protection_supported
request_id_present
caller_id_present
tool_id_present
request_timestamp_present
request_expiration_present
nonce_present
context_hash_present
parameter_hash_present
freshness_valid
replay_detected
runtime_authority_granted
mode
decision
reason
status
```

Initial values before freshness implementation:

```
freshness_profile=latticra-seal-request-freshness/0.1
request_id=unset
caller_id=unset
tool_id=unset
request_timestamp=unset
request_expiration=unset
nonce=unset
context_hash=unset
parameter_hash=unset
request_freshness_supported=0
request_freshness_validation_supported=0
replay_protection_supported=0
request_id_present=0
caller_id_present=0
tool_id_present=0
request_timestamp_present=0
request_expiration_present=0
nonce_present=0
context_hash_present=0
parameter_hash_present=0
freshness_valid=0
replay_detected=0
runtime_authority_granted=0
mode=contract-only
decision=report-only
reason=request-freshness-contract-only
status=request-freshness-contract-only
```

Promotion rules

The next implementation after this contract may only add bounded C metadata fields and deterministic rendering.

It must not parse trusted time, maintain a nonce cache, compare live clocks, compute hashes, validate freshness, detect replay, execute tools, execute shell commands, call runtime components, read host files, write host files, contact networks, enforce capabilities, verify signatures, generate receipts, or grant authority.

Claim gate

Latticra must not claim to secure AI agents from this contract alone.

A future claim that Latticra secures AI agents requires, at minimum:

```
request identity metadata implemented
parameter schema metadata implemented
request freshness metadata implemented
signed request metadata implemented
policy decision metadata implemented
runtime enforcement gate implemented
negative tests for denied unknown tools
negative tests for denied unsigned manifests
negative tests for denied stale requests
negative tests for denied replayed requests
```

```
operator-visible evidence report implemented
```

Until those are implemented and validated, the accurate public claim remains:

```
Latticra Seal is building a report-only trust boundary for AI-era automation.
```

Non-claims

This contract must not be read as implementation of freshness validation, replay protection, signed request verification, tool security enforcement, or AI-agent security.

Required non-claim posture:

```
freshness_validation_implemented=0
replay_protection_implemented=0
signed_request_verification_implemented=0
mcp_tool_security_enforced=0
ai_agent_security_claimed=0
runtime_authority_granted=0
production_readiness_claimed=0
external_endorsement_claimed=0
```

Next valid slice

The next valid Latticra Seal slice is report-only request freshness metadata.

That future slice may add a bounded metadata structure, deterministic rendering, invariant tests, and a test runner.

It must not change runtime behavior, host behavior, network behavior, MCP behavior, AI agent execution, model execution, tool execution, shell execution, capability enforcement, cryptographic verification, freshness validation, replay detection, or authority grants.

docs/LATTICRA_SEAL_REQUEST_FRESHNESS_IMPLEMENTATION.md

Source title: Latticra Seal Request Freshness Implementation

Lines: 151 | Words: 634 | SHA-256: c982a798ba430cf4cc907b84ac26adbdd17d76bc1ca3d0dd37f86c5c8b9a2aeb

Latticra Seal Request Freshness Implementation

Status: initial report-only request freshness metadata implementation Scope: bounded C metadata surface for request freshness and replay posture after the report-only Seal parameter schema layer. This slice does not implement timestamp parsing, trusted clock behavior, nonce storage, replay-cache storage, context hashing, parameter hashing, freshness validation, replay detection, signature verification, runtime execution, runtime authority, effect execution, capability enforcement, cryptographic verification, verified receipts, public-key parsing, public-key trust stores, key generation, private-key storage, hardware key use, network trust lookup, revocation lookup, object sealing, host reads, host writes, kernel behavior, Fedora approval claims, production readiness, MCP protocol implementation, MCP server behavior, MCP client behavior, AI agent execution, model execution, tool execution, shell execution, or operating-system behavior.

Purpose

This document records the first Latticra Seal request freshness metadata implementation.

The implementation accepts an existing report-only Seal parameter schema metadata record and produces deterministic report-only request freshness metadata.

Added files

```
include/latticra/seal_request_freshness.h
src/seal_request_freshness.c
tests/seal_request_freshness_invariants.c
scripts/test-latticra-seal-request-freshness.sh
```

API summary

The request freshness metadata surface adds:

```
latticra_seal_request_freshness_t
latticra_seal_request_freshness_error_t
latticra_seal_request_freshness_error_label
latticra_seal_request_freshness_from_schema
latticra_seal_request_freshness_is_report_only
latticra_seal_request_freshness_report
```

Metadata behavior

The implementation:

```
accepts a valid report-only Seal parameter schema metadata record
sets freshness_profile=latticra-seal-request-freshness/0.1
sets request_id=unset
sets caller_id=unset
sets tool_id=unset
sets request_timestamp=unset
sets request_expiration=unset
sets nonce=unset
sets context_hash=unset
sets parameter_hash=unset
sets request_freshness_supported=0
sets request_freshness_validation_supported=0
sets replay_protection_supported=0
sets request_id_present=0
sets caller_id_present=0
sets tool_id_present=0
sets request_timestamp_present=0
sets request_expiration_present=0
sets nonce_present=0
sets context_hash_present=0
sets parameter_hash_present=0
sets freshness_valid=0
sets replay_detected=0
copies runtime_authority_granted from parameter schema metadata
copies host_read_performed from parameter schema metadata
copies host_write_performed from parameter schema metadata
copies network_performed from parameter schema metadata
sets mode=report-only
sets decision=report-only
sets reason=request-freshness-metadata-only
renders deterministic request freshness metadata
```

Boundary

This implementation does not parse timestamps, compare clocks, store nonces, maintain a replay cache, compute hashes, validate freshness, detect replay, verify signatures, parse keys, create receipts, execute tools, execute shell commands, call runtime components, contact networks, read host files, write host files, enforce capabilities, or grant authority.

It is metadata only.

Failure behavior

The implementation fails closed:

```
null output -&gt; LATTICRA_STATUS_NULL_ARGUMENT
null parameter schema metadata input -&gt; invalid-input
invalid parameter schema metadata -&gt; invalid-schema
non-report-only parameter schema metadata -&gt; invalid-schema
small report buffer -&gt; LATTICRA_STATUS_BUFFER_TOO_SMALL
```

Failures do not parse time, read clocks, store nonces, contact networks, read host files, write host files, execute tools, enforce capabilities, or grant authority.

Invariants

The invariant test verifies:

```
valid report-only parameter schema metadata produces deterministic request freshness metadata
```

```
freshness_profile is stable
request_id remains unset
caller_id remains unset
tool_id remains unset
request_timestamp remains unset
request_expiration remains unset
nonce remains unset
context_hash remains unset
parameter_hash remains unset
request_freshness_supported remains zero
request_freshness_validation_supported remains zero
replay_protection_supported remains zero
request_id_present remains zero
caller_id_present remains zero
tool_id_present remains zero
request_timestamp_present remains zero
request_expiration_present remains zero
nonce_present remains zero
context_hash_present remains zero
parameter_hash_present remains zero
freshness_valid remains zero
replay_detected remains zero
runtime_authority_granted remains zero
host_read_performed remains zero
host_write_performed remains zero
network_performed remains zero
mode remains report-only
decision remains report-only
reason remains request-freshness-metadata-only
small report buffer fails closed
null inputs fail closed
invalid parameter schema metadata fails closed
```

Validation

Run:

```
sh scripts/test-latticra-seal-request-freshness-contract.sh
sh scripts/test-latticra-seal-request-freshness.sh
```

Claim boundary

This implementation still does not justify the public claim that Latticra secures AI agents.

It moves the project closer by adding report-only metadata for freshness and replay posture, but the stronger claim requires signed request metadata, policy decision metadata, a runtime enforcement gate, and negative tests for denied unknown, unsigned, stale, and replayed requests.

Next valid slice

The next valid Latticra Seal slice is policy decision status/public-entry alignment.

That future slice must preserve the no-effect posture and must not implement real policy evaluation, policy enforcement, runtime execution, effect execution, capability enforcement, cryptographic verification, signature verification, freshness validation, replay detection, authority grants, host behavior, network behavior, MCP behavior, AI agent execution, model execution, tool execution, or shell execution.

docs/LATTICRA_SEAL_REQUEST_FRESHNESS_REPORT_SURFACE.md

Source title: Latticra Seal Request Freshness Report Surface

Lines: 96 | Words: 437 | SHA-256: dca04e745b1816d58659b19be08aaf23c354189d1cbaabaa9e8de5f8553c1c6d

Latticra Seal Request Freshness Report Surface

Status: report surface for Latticra Seal request freshness metadata Scope: no-effect report-surface fixture and shell runner for deterministic Seal request freshness metadata. This slice does not implement timestamp parsing, trusted clock behavior, nonce storage, replay-cache storage, context hashing, parameter hashing, freshness validation, replay detection, signature verification, runtime execution, runtime authority, effect execution, capability enforcement, cryptographic verification, verified receipts, public-key parsing, public-key trust stores, key generation, private-key storage, hardware key use, network trust lookup, revocation lookup, object sealing, host reads, host writes, kernel behavior, Fedora approval claims, production readiness, MCP protocol implementation, MCP server behavior, MCP client behavior, AI agent execution, model execution, tool execution, shell execution, or operating-system behavior.

Purpose

This document records the first dedicated report surface for Latticra Seal request freshness metadata.

The report surface exists so operators and contributors can render the current report-only request freshness posture without adding timestamp validation, replay detection, runtime behavior, or authority.

Added files

```
tests/seal_request_freshness_report_surface.c
scripts/latticra-seal-request-freshness-report.sh
scripts/test-latticra-seal-request-freshness-report-surface.sh
```

Behavior

The report surface:

```
builds a report-only Seal parameter schema fixture
constructs Seal request freshness metadata from that fixture
renders the deterministic Seal request freshness report
prints the report to stdout
```

The guard verifies report output fields including:

```
freshness_profile=latticra-seal-request-freshness/0.1
request_id=unset
caller_id=unset
tool_id=unset
request_timestamp=unset
request_expiration=unset
nonce=unset
context_hash=unset
parameter_hash=unset
request_freshness_supported=0
request_freshness_validation_supported=0
replay_protection_supported=0
request_id_present=0
caller_id_present=0
tool_id_present=0
request_timestamp_present=0
request_expiration_present=0
nonce_present=0
context_hash_present=0
parameter_hash_present=0
freshness_valid=0
replay_detected=0
runtime_authority_granted=0
host_read_performed=0
host_write_performed=0
network_performed=0
mode=report-only
decision=report-only
reason=request-freshness-metadata-only
status=request-freshness-metadata
```

Validation

Run:

```
sh scripts/test-latticra-seal-request-freshness-report-surface.sh
```

The underlying metadata implementation remains covered by:

```
sh scripts/test-latticra-seal-request-freshness.sh
```

Boundary

This report surface does not parse timestamps, read trusted clocks, store nonces, maintain a replay cache, compute hashes, validate freshness, detect replay, verify signatures, execute tools, execute shell commands on behalf of a model, contact networks, read host files, write host files, parse keys, create receipts, enforce capabilities, call runtime components, or grant runtime authority.

It compiles and runs a local deterministic fixture only.

Claim boundary

This report surface still does not justify the public claim that Latticra secures AI agents.

It makes the freshness/replay metadata visible, but the stronger claim requires signed request metadata, policy decision metadata, a runtime enforcement gate, and negative tests for denied unknown, unsigned, stale, and replayed requests.

Next valid slice

The next valid Latticra Seal slice is policy decision status/public-entry alignment.

That future slice must preserve the no-effect posture and must not implement real policy evaluation, policy enforcement, runtime execution, effect execution, capability enforcement, cryptographic verification, signature verification, freshness validation, replay detection, authority grants, host behavior, network behavior, MCP behavior, AI agent execution, model execution, tool execution, or shell execution.

docs/LATTICRA_SEAL_RUNTIME_DRY_RUN_CONTRACT.md

Source title: Latticra Seal Runtime Dry-Run Contract

Lines: 177 | Words: 555 | SHA-256: 0c3e1544c5e46be80db4b02d0156ab87b9bacf9472dea79a6c8aa988362ff617

Latticra Seal Runtime Dry-Run Contract

Status: planning contract for a future Latticra Seal runtime dry-run surface Scope: contract-only planning for a future no-effect dry-run layer after the report-only policy decision and runtime gate evidence path. This document does not implement runtime behavior, runtime execution, runtime authority, effect execution, policy enforcement, capability enforcement, cryptographic verification, signature verification, freshness validation, replay detection, tool execution, AI agent execution, model execution, MCP protocol behavior, MCP server behavior, MCP client behavior, host reads, host writes, network behavior, operating-system behavior, production readiness, external endorsement, or authority grants.

Purpose

This contract defines the next safe Latticra Seal step before any runtime enforcement work can be considered.

The future dry-run surface should answer one question:

```
If this request reached the Seal runtime boundary, what would the boundary report, deny, and
```

```
refuse to do?
```

The answer must remain no-effect, deterministic, local, and report-only.

Required prerequisites

A future implementation may begin only after these existing layers remain present and guarded:

```
seal_agentic_automation_metadata_present=1
seal_parameter_schema_metadata_present=1
seal_request_freshness_metadata_present=1
seal_signed_request_metadata_present=1
seal_policy_decision_metadata_present=1
seal_policy_decision_report_surface_present=1
seal_runtime_gate_metadata_present=1
seal_core_blocked_case_set_complete=1
```

Future record shape

A future dry-run record should expose bounded metadata fields similar to:

```
runtime_dry_run_profile=latticra-seal-runtime-dry-run/0.1
input_policy_decision_present
input_runtime_gate_present
dry_run_supported
dry_run_performed
request_class
policy_decision_state
runtime_gate_state
default_action
would_allow
would_deny
would_require_operator_review
would_execute_tool
would_read_host
would_write_host
would_use_network
would_grant_runtime_authority
blocked_reason
report_only
mode
status
```

Initial required defaults

The initial implementation, if added later, must default to:

```
dry_run_supported=1
dry_run_performed=1
default_action=deny
would_allow=0
would_deny=1
would_require_operator_review=1
would_execute_tool=0
would_read_host=0
would_write_host=0
would_use_network=0
would_grant_runtime_authority=0
report_only=1
mode=report-only
status=runtime-dry-run-metadata
```

Required denied cases

The dry-run surface must preserve the existing core blocked-request vocabulary:

```
unknown_tool_denied=1
unsigned_request_denied=1
invalid_schema_denied=1
stale_request_denied=1
replayed_request_denied=1
invalid_signature_denied=1
```

Forbidden behavior

The dry-run layer must not:

```
evaluate real policy files
enforce policy
execute tools
execute shell commands
call a runtime executor
read host files
write host files
perform network operations
verify signatures
validate freshness against live time
perform replay-cache mutation
generate keys
load private keys
load trust stores
query revocation services
grant runtime authority
claim production readiness
claim AI-agent security
claim MCP implementation
```

Required report surface

A future implementation must include a deterministic report renderer and a local fixture runner.

Required future files:

```
include/latticra/seal_runtime_dry_run.h
src/seal_runtime_dry_run.c
tests/seal_runtime_dry_run_invariants.c
tests/seal_runtime_dry_run_report_surface.c
scripts/test-latticra-seal-runtime-dry-run.sh
scripts/latticra-seal-runtime-dry-run-report.sh
docs/LATTICRA_SEAL_RUNTIME_DRY_RUN_IMPLEMENTATION.md
```

Required tests

A future implementation must prove:

```
valid report-only policy decision input produces denied dry-run metadata
valid report-only runtime gate input remains report-only
unknown tool remains denied
unsigned request remains denied
invalid schema remains denied
stale request remains denied
replayed request remains denied
invalid signature remains denied
no runtime authority is granted
no host read is performed
no host write is performed
no network action is performed
no tool execution is performed
report rendering is deterministic
small buffers fail closed
null inputs fail closed
invalid upstream metadata fails closed
```

Promotion rule

This contract does not authorize runtime enforcement.

Runtime enforcement may be considered only after a dry-run implementation, dry-run report surface, status record, status-index alignment, and negative-case evidence all remain merged and guarded.

Boundary

This is a contract-only planning slice.

It does not change implementation behavior, add runtime behavior, grant authority, or change public readiness.

Current next valid slice

The next valid slice is a no-effect runtime dry-run implementation plan.

That future slice must still avoid implementation behavior and must specify exact structs, fields, APIs, report format, fixtures, tests, and failure behavior before any C code is added.

docs/LATTICRA_SEAL_RUNTIME_DRY_RUN_IMPLEMENTATION.md

Source title: Latticra Seal Runtime Dry-Run Implementation

Lines: 156 | Words: 561 | SHA-256: 3085cb5bd4948f6ec7d585568eb1378096faadc62f0dc19d426abb1ec17ec53f

Latticra Seal Runtime Dry-Run Implementation

Status: initial no-effect runtime dry-run metadata implementation Scope: bounded C metadata surface for Latticra Seal runtime dry-run posture after the policy decision report surface and runtime gate metadata path. This implementation does not add runtime behavior, runtime execution, runtime authority, effect execution, policy enforcement, capability enforcement, cryptographic verification, signature verification, freshness validation, replay detection, tool execution, AI agent execution, model execution, MCP protocol behavior, MCP server behavior, MCP client behavior, host reads, host writes, network behavior, operating-system behavior, production readiness, external endorsement, or authority grants.

Purpose

This document records the first Latticra Seal runtime dry-run metadata implementation.

The implementation accepts report-only policy decision metadata and report-only runtime gate metadata, then renders deterministic metadata describing what the boundary would deny without doing it.

Added files

```
include/latticra/seal_runtime_dry_run.h
src/seal_runtime_dry_run.c
tests/seal_runtime_dry_run_invariants.c
scripts/test-latticra-seal-runtime-dry-run.sh
```

API summary

The dry-run metadata surface adds:

```
latticra_seal_runtime_dry_run_t
latticra_seal_runtime_dry_run_error_t
latticra_seal_runtime_dry_run_error_label
latticra_seal_runtime_dry_run_from_policy_and_gate
latticra_seal_runtime_dry_run_is_report_only
latticra_seal_runtime_dry_run_report
```

Metadata behavior

The implementation:

```
accepts report-only policy decision metadata
accepts report-only runtime gate metadata
sets runtime_dry_run_profile=latticra-seal-runtime-dry-run/0.1
sets request_class=core-blocked-request
sets policy_decision_state=report-only
sets runtime_gate_state=report-only
sets blocked_reason=default-deny-dry-run
sets status=runtime-dry-run-metadata
sets dry_run_supported=1
sets dry_run_performed=1
sets input_policy_decision_present=1
sets input_runtime_gate_present=1
sets policy_decision_report_only=1
```

```
sets runtime_gate_report_only=1
sets default_action_deny=1
sets would_allow=0
sets would_deny=1
sets would_require_operator_review=1
sets would_execute_tool=0
sets would_read_host=0
sets would_write_host=0
sets would_use_network=0
sets would_grant_runtime_authority=0
sets unknown_tool_denied=1
sets unsigned_request_denied=1
sets invalid_schema_denied=1
sets stale_request_denied=1
sets replayed_request_denied=1
sets invalid_signature_denied=1
sets report_only=1
sets mode=report-only
renders deterministic runtime dry-run metadata
```

Failure behavior

The implementation fails closed:

```
null output -&gt; LATTICRA_STATUS_NULL_ARGUMENT
null policy decision input -&gt; invalid-input
null runtime gate input -&gt; invalid-input
invalid policy decision metadata -&gt; invalid-policy-decision
invalid runtime gate metadata -&gt; invalid-runtime-gate
small report buffer -&gt; LATTICRA_STATUS_BUFFER_TOO_SMALL
```

Failures do not evaluate policies, contact networks, read host files, write host files, execute tools, enforce capabilities, or grant authority.

Invariants

The invariant test verifies:

```
valid report-only inputs produce dry-run metadata
runtime_dry_run_profile is stable
request_class remains core-blocked-request
policy_decision_state remains report-only
runtime_gate_state remains report-only
blocked_reason remains default-deny-dry-run
dry_run_supported remains one
dry_run_performed remains one
input policy decision remains present
input runtime gate remains present
policy decision remains report-only
runtime gate remains report-only
default action remains deny
would_allow remains zero
would_deny remains one
would_require_operator_review remains one
would_execute_tool remains zero
would_read_host remains zero
would_write_host remains zero
would_use_network remains zero
would_grant_runtime_authority remains zero
all core denied case flags remain one
report_only remains one
mode remains report-only
status remains runtime-dry-run-metadata
report rendering is deterministic
small report buffers fail closed
null inputs fail closed
invalid upstream metadata fails closed
```

Validation

Run:

```
sh scripts/test-latticra-seal-runtime-dry-run-contract.sh
sh scripts/test-latticra-seal-runtime-dry-run-implementation-plan.sh
sh scripts/test-latticra-seal-runtime-dry-run.sh
```

Expected new output:

```
seal runtime dry-run invariants: ok
```

Boundary

This implementation is metadata-only.

It does not execute tools, execute shell commands, read host files, write host files, use the network, evaluate external policies, load policy files, verify signatures, validate freshness against live time, mutate replay caches, grant authority, claim production readiness, claim AI-agent security, or claim MCP implementation.

Claim boundary

This implementation does not justify the public claim that Latticra secures AI agents.

It moves the project closer by adding a no-effect dry-run layer that can describe what would be denied before any runtime enforcement path is considered.

Next valid slice

The next valid Latticra Seal slice is a runtime dry-run report surface or runtime dry-run status alignment.

That future slice must preserve the no-effect posture and must not perform effects or grant authority.

docs/LATTICRA_SEAL_RUNTIME_DRY_RUN_IMPLEMENTATION_PLAN.md

Source title: Latticra Seal Runtime Dry-Run Implementation Plan

Lines: 275 | Words: 653 | SHA-256: 46ac30c12df022848b6046dafe6bb928cdb9baa60f4e34be4f087b9b60410b69

Latticra Seal Runtime Dry-Run Implementation Plan

Status: implementation planning contract for a future no-effect Latticra Seal runtime dry-run surface Scope: implementation plan only after the Latticra Seal runtime dry-run contract. This document does not implement runtime behavior, runtime execution, runtime authority, effect execution, policy enforcement, capability enforcement, cryptographic verification, signature verification, freshness validation, replay detection, tool execution, AI agent execution, model execution, MCP protocol behavior, MCP server behavior, MCP client behavior, host reads, host writes, network behavior, operating-system behavior, production readiness, external endorsement, or authority grants.

Purpose

This plan defines the exact future implementation shape for a no-effect Seal runtime dry-run layer.

The future implementation should render what the Seal boundary would deny without executing tools, contacting networks, touching host state, or granting authority.

Required contract

The implementation plan depends on:

```
docs/LATTICRA_SEAL_RUNTIME_DRY_RUN_CONTRACT.md
scripts/test-latticra-seal-runtime-dry-run-contract.sh
```

The contract must remain merged and guarded before implementation code is added.

Future files

The future implementation slice should add:

```
include/latticra/seal_runtime_dry_run.h
src/seal_runtime_dry_run.c
```

```
tests/seal_runtime_dry_run_invariants.c
scripts/test-latticra-seal-runtime-dry-run.sh
docs/LATTICRA_SEAL_RUNTIME_DRY_RUN_IMPLEMENTATION.md
```

A later report-surface slice may add:

```
tests/seal_runtime_dry_run_report_surface.c
scripts/latticra-seal-runtime-dry-run-report.sh
scripts/test-latticra-seal-runtime-dry-run-report-surface.sh
```

Header API plan

The future header should define:

```
LATTICRA_SEAL_RUNTIME_DRY_RUN_PROFILE_MAX
LATTICRA_SEAL_RUNTIME_DRY_RUN_STATE_MAX
LATTICRA_SEAL_RUNTIME_DRY_RUN_REASON_MAX
LATTICRA_SEAL_RUNTIME_DRY_RUN_REPORT_MAX
latticra_seal_runtime_dry_run_error_t
latticra_seal_runtime_dry_run_t
latticra_seal_runtime_dry_run_error_label
latticra_seal_runtime_dry_run_from_policy_and_gate
latticra_seal_runtime_dry_run_is_report_only
latticra_seal_runtime_dry_run_report
```

Error model

The future error enum should include:

```
LATTICRA_SEAL_RUNTIME_DRY_RUN_OK
LATTICRA_SEAL_RUNTIME_DRY_RUN_INVALID_INPUT
LATTICRA_SEAL_RUNTIME_DRY_RUN_INVALID_POLICY_DECISION
LATTICRA_SEAL_RUNTIME_DRY_RUN_INVALID_RUNTIME_GATE
```

Record fields

The future record should include:

```
runtime_dry_run_profile
request_class
policy_decision_state
runtime_gate_state
blocked_reason
status
dry_run_supported
dry_run_performed
input_policy_decision_present
input_runtime_gate_present
policy_decision_report_only
runtime_gate_report_only
default_action_deny
would_allow
would_deny
would_require_operator_review
would_execute_tool
would_read_host
would_write_host
would_use_network
would_grant_runtime_authority
unknown_tool_denied
unsigned_request_denied
invalid_schema_denied
stale_request_denied
replayed_request_denied
invalid_signature_denied
report_only
mode
error
```

Initial constants

The initial future implementation should emit:

```
runtime_dry_run_profile=latticra-seal-runtime-dry-run/0.1
request_class=core-blocked-request
policy_decision_state=report-only
runtime_gate_state=report-only
blocked_reason=default-deny-dry-run
status=runtime-dry-run-metadata
```

```
dry_run_supported=1
dry_run_performed=1
input_policy_decision_present=1
input_runtime_gate_present=1
policy_decision_report_only=1
runtime_gate_report_only=1
default_action_deny=1
would_allow=0
would_deny=1
would_require_operator_review=1
would_execute_tool=0
would_read_host=0
would_write_host=0
would_use_network=0
would_grant_runtime_authority=0
unknown_tool_denied=1
unsigned_request_denied=1
invalid_schema_denied=1
stale_request_denied=1
replayed_request_denied=1
invalid_signature_denied=1
report_only=1
mode=report-only
```

Function behavior

The future builder should:

```
accept a report-only Seal policy decision metadata input
accept a report-only Seal runtime gate metadata input
reject null output
return invalid-input for null upstream inputs
return invalid-policy-decision for non-report-only policy decision metadata
return invalid-runtime-gate for non-report-only runtime gate metadata
copy no authority from upstream inputs
render deterministic metadata only
```

Required report format

The report should begin with:

```
LATTICRA SEAL RUNTIME DRY RUN
```

It should render all fields as stable key=value lines.

Required report fields:

```
runtime_dry_run_profile=latticra-seal-runtime-dry-run/0.1
request_class=core-blocked-request
policy_decision_state=report-only
runtime_gate_state=report-only
blocked_reason=default-deny-dry-run
would_allow=0
would_deny=1
would_require_operator_review=1
would_execute_tool=0
would_read_host=0
would_write_host=0
would_use_network=0
would_grant_runtime_authority=0
report_only=1
mode=report-only
status=runtime-dry-run-metadata
```

Required invariant tests

The future invariant test should verify:

```
valid report-only inputs produce dry-run metadata
runtime_dry_run_profile is stable
request_class is core-blocked-request
policy_decision_state remains report-only
runtime_gate_state remains report-only
blocked_reason is default-deny-dry-run
dry_run_supported remains one
dry_run_performed remains one
would_allow remains zero
would_deny remains one
would_require_operator_review remains one
```

```
would_execute_tool remains zero
would_read_host remains zero
would_write_host remains zero
would_use_network remains zero
would_grant_runtime_authority remains zero
all core denied case flags remain one
report_only remains one
mode remains report-only
status remains runtime-dry-run-metadata
small report buffers fail closed
null inputs fail closed
invalid upstream metadata fails closed
```

Required build runner

The future test runner should compile only local C sources and fixtures.

Planned runner:

```
sh scripts/test-latticra-seal-runtime-dry-run.sh
```

It should compile:

```
src/seal_runtime_dry_run.c
src/seal_runtime_gate.c
src/seal_policy_decision.c
src/seal_signed_request.c
src/seal_request_freshness.c
src/seal_parameter_schema.c
src/seal_agentic_automation_security.c
src/seal_status_rollup.c
tests/seal_runtime_dry_run_invariants.c
```

Explicit non-goals

The future implementation must not:

```
execute tools
execute shell commands
read host files
write host files
use the network
evaluate external policies
load policy files
verify signatures
validate freshness against live time
mutate replay caches
grant authority
claim production readiness
claim AI-agent security
claim MCP implementation
```

Promotion rule

No runtime enforcement work may begin from this plan alone.

A future C implementation must first be merged with tests, a report surface, status record, and negative-case evidence while preserving the report-only boundary.

Current next valid slice

The next valid Latticra Seal slice is the no-effect runtime dry-run implementation.

That future slice must implement only deterministic metadata, local fixtures, fail-closed behavior, and report rendering. It must not perform effects or grant authority.

docs/LATTICRA_SEAL_RUNTIME_DRY_RUN_REPORT_SURFACE.md

Source title: Latticra Seal Runtime Dry-Run Report Surface

Lines: 98 | Words: 341 | SHA-256: be92f42763a7cc4d930e8e1da8f80ddc7bde29deaa994881e0c82eaf1184aaf4

Latticra Seal Runtime Dry-Run Report Surface

Status: report surface for the Latticra Seal runtime dry-run metadata layer Scope: deterministic local report surface after the no-effect runtime dry-run metadata implementation. This document does not implement runtime behavior, runtime execution, runtime authority, effect execution, policy enforcement, capability enforcement, cryptographic verification, signature verification, freshness validation, replay detection, tool execution, AI agent execution, model execution, MCP protocol behavior, MCP server behavior, MCP client behavior, host reads, host writes, network behavior, operating-system behavior, production readiness, external endorsement, or authority grants.

Purpose

This document records the first operator-visible report surface for Latticra Seal runtime dry-run metadata.

The report surface renders what the dry-run layer would deny without executing tools, touching host state, using the network, or granting authority.

Added files

```
tests/seal_runtime_dry_run_report_surface.c
scripts/latticra-seal-runtime-dry-run-report.sh
```

Report runner

```
sh scripts/latticra-seal-runtime-dry-run-report.sh
```

Expected report posture

The report surface renders the current dry-run posture, including:

```
LATTICRA SEAL RUNTIME DRY RUN
runtime_dry_run_profile=latticra-seal-runtime-dry-run/0.1
request_class=core-blocked-request
policy_decision_state=report-only
runtime_gate_state=report-only
blocked_reason=default-deny-dry-run
dry_run_supported=1
dry_run_performed=1
input_policy_decision_present=1
input_runtime_gate_present=1
policy_decision_report_only=1
runtime_gate_report_only=1
default_action_deny=1
would_allow=0
would_deny=1
would_require_operator_review=1
would_execute_tool=0
would_read_host=0
would_write_host=0
would_use_network=0
would_grant_runtime_authority=0
unknown_tool_denied=1
unsigned_request_denied=1
invalid_schema_denied=1
stale_request_denied=1
replayed_request_denied=1
invalid_signature_denied=1
report_only=1
mode=report-only
status=runtime-dry-run-metadata
```

Boundary

This report surface compiles and runs a local deterministic fixture only.

It does not execute tools, execute shell commands, read host files, write host files, use the network, evaluate external policies, load policy files, verify signatures, validate freshness against live time, mutate replay caches, grant authority, claim production readiness, claim AI-agent security, or claim MCP implementation.

Validation

Run:

```
sh scripts/test-latticra-seal-runtime-dry-run-report-surface.sh
```

Expected output:

```
latticra seal runtime dry-run report surface: ok
```

The underlying runtime dry-run implementation remains covered by:

```
sh scripts/test-latticra-seal-runtime-dry-run.sh
```

Claim boundary

This report surface does not justify the public claim that Latticra secures AI agents.

It makes the dry-run denial posture easier to inspect before any future runtime enforcement path is considered.

Next valid slice

The next valid Latticra Seal slice is runtime dry-run report status alignment.

That future slice must preserve the no-effect posture and must not perform effects or grant authority.

docs/LATTICRA_SEAL_RUNTIME_ENFORCEMENT_GATE_CONTRACT.md

Source title: Latticra Seal Runtime Enforcement Gate Contract

Lines: 299 | Words: 870 | SHA-256: 85d94ab9403c56ccfc65adc99875510cf465ec6099cae836e0da006fc765c7a2

Latticra Seal Runtime Enforcement Gate Contract

Status: Latticra Seal runtime enforcement gate contract Scope: contract for future runtime enforcement-gate metadata after the report-only Seal policy decision metadata layer. This document does not implement runtime enforcement, allow/deny enforcement, runtime execution, runtime authority, effect execution, tool execution, shell execution, capability enforcement, cryptographic verification, signature verification, public-key parsing, trust-store loading, freshness validation, replay detection, network trust lookup, revocation lookup, object sealing, host reads, host writes, kernel behavior, Fedora approval claims, production readiness, MCP protocol implementation, MCP server behavior, MCP client behavior, AI agent execution, model execution, or operating-system behavior.

Purpose

This document defines the Latticra Seal runtime enforcement gate contract.

The purpose is to prepare a bounded, evidence-bound gate layer that will eventually consume policy-decision metadata and report whether a requested action would remain blocked, require operator review, or be eligible for future runtime handoff.

This document does not implement runtime enforcement behavior.

Required predecessors

This contract depends on:

```
docs/LATTICRA_SEAL_AGENTIC_AUTOMATION_SECURITY_CONTRACT.md
docs/LATTICRA_SEAL_MCP_ALIGNMENT_PLAN.md
docs/LATTICRA_SEAL_PARAMETER_SCHEMA_CONTRACT.md
docs/LATTICRA_SEAL_PARAMETER_SCHEMA_IMPLEMENTATION.md
docs/LATTICRA_SEAL_REQUEST_FRESHNESS_CONTRACT.md
```

```
docs/LATTICRA_SEAL_REQUEST_FRESHNESS_IMPLEMENTATION.md
docs/LATTICRA_SEAL_SIGNED_REQUEST_CONTRACT.md
docs/LATTICRA_SEAL_SIGNED_REQUEST_IMPLEMENTATION.md
docs/LATTICRA_SEAL_POLICY_DECISION_CONTRACT.md
docs/LATTICRA_SEAL_POLICY_DECISION_IMPLEMENTATION.md
include/latticra/seal_policy_decision.h
src/seal_policy_decision.c
tests/seal_policy_decision_invariants.c
scripts/test-latticra-seal-policy-decision-contract.sh
scripts/test-latticra-seal-policy-decision.sh
```

The existing policy decision metadata surface remains report-only and default-deny.

Runtime enforcement gate boundary

The runtime enforcement gate layer may describe future enforcement-gate metadata, blocked-state metadata, operator-review metadata, and eligibility metadata.

The layer may not enforce allow or deny outcomes, execute tools, execute shell commands, call runtime components, contact networks, read host files, write host files, verify signatures, validate freshness, detect replay, or mutate system state.

Allowed in this contract slice:

```
runtime-enforcement-gate vocabulary
gate-id metadata planning
gate-version metadata planning
gate-state metadata planning
policy-decision input planning
default-blocked posture planning
operator-review-required planning
unknown-tool blocked planning
unsigned-request blocked planning
invalid-schema blocked planning
stale-request blocked planning
replayed-request blocked planning
invalid-signature blocked planning
runtime-handoff eligibility planning
negative-test planning
report-only status planning
non-claims
static guard validation
```

Forbidden in this contract slice:

```
runtime enforcement
allow enforcement
deny enforcement
runtime execution
AI agent execution
model execution
tool execution
shell command execution
runtime authority grants
effect execution
host reads
host writes
network access
capability enforcement
cryptographic verification
signature verification
freshness validation
replay detection
policy evaluation
policy enforcement
public-key parsing
public-key trust store loading
private-key handling
key generation
signature generation
revocation lookup
object sealing
kernel interaction
MCP server implementation
MCP client implementation
```

Initial runtime enforcement gate posture

The initial policy is report-only, blocked, and deny-by-default.

```
seal_runtime_enforcement_gate_contract_present=1
runtime_enforcement_gate_supported=0
runtime_enforcement_supported=0
runtime_enforcement_active=0
policy_decision_input_supported=0
policy_decision_consumed=0
gate_id_present=0
gate_version_present=0
gate_state=report-only
runtime_handoff_eligible=0
runtime_handoff_performed=0
allow_enforcement_supported=0
deny_enforcement_supported=0
allow_enforcement_performed=0
deny_enforcement_performed=0
effect_performed=0
default_blocked=1
operator_review_required=1
unknown_tool_blocked=1
unsigned_request_blocked=1
invalid_schema_blocked=1
stale_request_blocked=1
replayed_request_blocked=1
invalid_signature_blocked=1
runtime_authority_granted=0
host_read_performed=0
host_write_performed=0
network_performed=0
mode=contract-only
status=runtime-enforcement-gate-contract-only
```

Planned metadata fields

Future runtime enforcement gate metadata should be bounded and deterministic.

Planned fields:

```
runtime_enforcement_gate_profile
gate_id
gate_version
gate_state
runtime_enforcement_gate_supported
runtime_enforcement_supported
runtime_enforcement_active
policy_decision_input_supported
policy_decision_consumed
gate_id_present
gate_version_present
runtime_handoff_eligible
runtime_handoff_performed
allow_enforcement_supported
deny_enforcement_supported
allow_enforcement_performed
deny_enforcement_performed
effect_performed
default_blocked
operator_review_required
unknown_tool_blocked
unsigned_request_blocked
invalid_schema_blocked
stale_request_blocked
replayed_request_blocked
invalid_signature_blocked
runtime_authority_granted
host_read_performed
host_write_performed
network_performed
mode
decision
reason
status
```

Initial values before runtime enforcement implementation:

```
runtime_enforcement_gate_profile=latticra-seal-runtime-enforcement-gate/0.1
```

```
gate_id=unset
gate_version=unset
gate_state=report-only
runtime_enforcement_gate_supported=0
runtime_enforcement_supported=0
runtime_enforcement_active=0
policy_decision_input_supported=0
policy_decision_consumed=0
gate_id_present=0
gate_version_present=0
runtime_handoff_eligible=0
runtime_handoff_performed=0
allow_enforcement_supported=0
deny_enforcement_supported=0
allow_enforcement_performed=0
deny_enforcement_performed=0
effect_performed=0
default_blocked=1
operator_review_required=1
unknown_tool_blocked=1
unsigned_request_blocked=1
invalid_schema_blocked=1
stale_request_blocked=1
replayed_request_blocked=1
invalid_signature_blocked=1
runtime_authority_granted=0
host_read_performed=0
host_write_performed=0
network_performed=0
mode=contract-only
decision=report-only
reason=runtime-enforcement-gate-contract-only
status=runtime-enforcement-gate-contract-only
```

Negative-test requirements before enforcement claims

Before any future claim that Latticra secures AI-agent tool execution boundaries, the repository must include negative tests showing that the enforcement path denies or blocks:

```
unknown tools
unsigned requests
invalid schemas
stale requests
replayed requests
invalid signatures
requests without operator approval when approval is required
requests attempting host reads without declared authority
requests attempting host writes without declared authority
requests attempting network access without declared authority
```

Those tests must remain separate from this contract slice.

Promotion rules

The next implementation after this contract may only add bounded C metadata fields and deterministic rendering.

It must not evaluate real policies, enforce allow or deny outcomes, execute tools, execute shell commands, call runtime components, read host files, write host files, contact networks, verify signatures, validate freshness, detect replay, enforce capabilities, generate receipts, or grant authority.

Claim gate

Latticra must not claim to secure AI agents from this contract alone.

A future claim that Latticra secures AI-agent tool execution boundaries requires, at minimum:

```
request identity metadata implemented
parameter schema metadata implemented
request freshness metadata implemented
signed request metadata implemented
policy decision metadata implemented
runtime enforcement gate implemented
```

```
negative tests for denied unknown tools
negative tests for denied unsigned manifests
negative tests for denied stale requests
negative tests for denied replayed requests
operator-visible evidence report implemented
```

Until those are implemented and validated, the accurate public claim remains:

```
Latticra Seal is building a report-only trust boundary for AI-era automation.
```

Non-claims

This contract must not be read as implementation of runtime enforcement, tool security enforcement, cryptographic enforcement, or AI-agent security.

Required non-claim posture:

```
runtime_enforcement_implemented=0
policy_enforcement_implemented=0
allow_enforcement_implemented=0
deny_enforcement_implemented=0
signed_request_verification_implemented=0
freshness_validation_implemented=0
replay_detection_implemented=0
mcp_tool_security_enforced=0
ai_agent_security_claimed=0
runtime_authority_granted=0
production_readiness_claimed=0
external_endorsement_claimed=0
```

Next valid slice

The next valid Latticra Seal slice is report-only runtime enforcement gate metadata.

That future slice may add a bounded metadata structure, deterministic rendering, invariant tests, and a test runner.

It must not change runtime behavior, host behavior, network behavior, MCP behavior, AI agent execution, model execution, tool execution, shell execution, capability enforcement, cryptographic verification, signature verification, freshness validation, replay detection, policy enforcement, runtime enforcement, or authority grants.

docs/LATTICRA_SEAL_RUNTIME_GATE_IMPLEMENTATION.md

Source title: Latticra Seal Runtime Gate Implementation

Lines: 157 | Words: 618 | SHA-256: 6b5288f23624b8dea0e5501a79d9f9c4ff386f75397d7c9d444dd7d4395ff33c

Latticra Seal Runtime Gate Implementation

Status: initial report-only runtime gate metadata implementation Scope: bounded C metadata surface for runtime gate posture after the report-only Seal policy decision layer. This slice does not implement runtime enforcement, allow/deny enforcement, runtime execution, runtime authority, effect execution, tool execution, shell execution, capability enforcement, cryptographic verification, signature verification, public-key parsing, trust-store loading, freshness validation, replay detection, network trust lookup, revocation lookup, object sealing, host reads, host writes, kernel behavior, Fedora approval claims, production readiness, MCP protocol implementation, MCP server behavior, MCP client behavior, AI agent execution, model execution, or operating-system behavior.

Purpose

This document records the first Latticra Seal runtime gate metadata implementation.

The implementation accepts an existing report-only Seal policy decision metadata record and produces deterministic report-only runtime gate metadata.

Added files

```
include/latticra/seal_runtime_gate.h
src/seal_runtime_gate.c
tests/seal_runtime_gate_invariants.c
scripts/test-latticra-seal-runtime-gate.sh
```

API summary

The runtime gate metadata surface adds:

```
latticra_seal_runtime_gate_t
latticra_seal_runtime_gate_error_t
latticra_seal_runtime_gate_error_label
latticra_seal_runtime_gate_from_policy_decision
latticra_seal_runtime_gate_is_report_only
latticra_seal_runtime_gate_report
```

Metadata behavior

The implementation:

```
accepts a valid report-only Seal policy decision metadata record
sets runtime_enforcement_gate_profile=latticra-seal-runtime-enforcement-gate/0.1
sets gate_id=unset
sets gate_version=unset
sets gate_state=report-only
sets runtime_enforcement_gate_supported=0
sets runtime_enforcement_supported=0
sets runtime_enforcement_active=0
sets policy_decision_input_supported=0
sets policy_decision_consumed=0
sets gate_id_present=0
sets gate_version_present=0
sets runtime_handoff_eligible=0
sets runtime_handoff_performed=0
sets allow_enforcement_supported=0
sets deny_enforcement_supported=0
sets allow_enforcement_performed=0
sets deny_enforcement_performed=0
sets effect_performed=0
sets default_blocked=1
sets operator_review_required=1
sets unknown_tool_blocked=1
sets unsigned_request_blocked=1
sets invalid_schema_blocked=1
sets stale_request_blocked=1
sets replayed_request_blocked=1
sets invalid_signature_blocked=1
copies runtime_authority_granted from policy decision metadata
copies host_read_performed from policy decision metadata
copies host_write_performed from policy decision metadata
copies network_performed from policy decision metadata
sets mode=report-only
sets decision=report-only
sets reason=runtime-gate-metadata-only
renders deterministic runtime gate metadata
```

Boundary

This implementation does not enforce allow outcomes, enforce deny outcomes, execute tools, execute shell commands, call runtime components, contact networks, read host files, write host files, verify signatures, validate freshness, detect replay, enforce capabilities, perform effects, or grant authority.

It is metadata only.

Failure behavior

The implementation fails closed:

```
null output -&gt; LATTICRA_STATUS_NULL_ARGUMENT
null policy decision metadata input -&gt; invalid-input
invalid policy decision metadata -&gt; invalid-policy-decision
non-report-only policy decision metadata -&gt; invalid-policy-decision
small report buffer -&gt; LATTICRA_STATUS_BUFFER_TOO_SMALL
```

Failures do not evaluate policy, contact networks, read host files, write host files, execute tools, enforce capabilities, or grant authority.

Invariants

The invariant test verifies:

```
valid report-only policy decision metadata produces deterministic runtime gate metadata
runtime_enforcement_gate_profile is stable
gate_id remains unset
gate_version remains unset
gate_state remains report-only
runtime_enforcement_gate_supported remains zero
runtime_enforcement_supported remains zero
runtime_enforcement_active remains zero
policy_decision_input_supported remains zero
policy_decision_consumed remains zero
runtime_handoff_eligible remains zero
runtime_handoff_performed remains zero
allow_enforcement_supported remains zero
deny_enforcement_supported remains zero
allow_enforcement_performed remains zero
deny_enforcement_performed remains zero
effect_performed remains zero
default_blocked remains one
operator_review_required remains one
unknown_tool_blocked remains one
unsigned_request_blocked remains one
invalid_schema_blocked remains one
stale_request_blocked remains one
replayed_request_blocked remains one
invalid_signature_blocked remains one
runtime_authority_granted remains zero
host_read_performed remains zero
host_write_performed remains zero
network_performed remains zero
mode remains report-only
decision remains report-only
reason remains runtime-gate-metadata-only
small report buffer fails closed
null inputs fail closed
invalid policy decision metadata fails closed
```

Validation

Run:

```
sh scripts/test-latticra-seal-runtime-gate-contract.sh
sh scripts/test-latticra-seal-runtime-gate.sh
```

Claim boundary

This implementation still does not justify the public claim that Latticra secures AI agents.

It moves the project closer by adding report-only runtime gate metadata, but the stronger claim requires negative tests for denied unknown, unsigned, stale, and replayed requests plus a guarded enforcement path that actually blocks effects.

Next valid slice

The next valid Latticra Seal slice is negative-test planning for blocked request classes or a runtime gate report surface.

That future slice must not implement runtime behavior, host behavior, network behavior, MCP behavior, AI agent execution, model execution, tool execution, shell execution, capability enforcement, cryptographic verification, signature verification, freshness validation, replay detection, policy enforcement, runtime enforcement, or authority grants unless a specific contract and validation path justify it.

docs/LATTICRA_SEAL_RUNTIME_GATE_TEST_PLAN.md

Source title: Latticra Seal Runtime Gate Test Plan

Lines: 96 | Words: 270 | SHA-256: 7d93235faa55403b8b4a2084addc707d1423d48eb30a78c9450f8575e9ad6435

Latticra Seal Runtime Gate Test Plan

Status: runtime gate test planning record Scope: planning document after the report-only Seal runtime gate metadata layer. This document does not implement runtime behavior, policy behavior, tool behavior, host behavior, network behavior, cryptographic behavior, or authority grants.

Purpose

This document names the future test cases required before the Seal runtime gate can move beyond report-only metadata.

The current runtime gate remains metadata-only and blocked by default.

Required predecessors

```
docs/LATTICRA_SEAL_RUNTIME_ENFORCEMENT_GATE_CONTRACT.md
docs/LATTICRA_SEAL_RUNTIME_GATE_IMPLEMENTATION.md
include/latticra/seal_runtime_gate.h
src/seal_runtime_gate.c
tests/seal_runtime_gate_invariants.c
scripts/test-latticra-seal-runtime-gate-contract.sh
scripts/test-latticra-seal-runtime-gate.sh
```

Planned case coverage

Future tests should cover these request classes:

```
unknown_tool_case_planned=1
unsigned_request_case_planned=1
invalid_schema_case_planned=1
stale_request_case_planned=1
replayed_request_case_planned=1
invalid_signature_case_planned=1
missing_operator_approval_case_planned=1
host_read_without_authority_case_planned=1
host_write_without_authority_case_planned=1
network_without_authority_case_planned=1
```

Planned sequence

```
1. unknown tool case
2. unsigned request case
3. invalid schema case
4. stale request case
5. replayed request case
6. invalid signature case
7. missing operator approval case
8. host read authority case
9. host write authority case
10. network authority case
```

Expected future posture

All planned cases should keep these values until a later implementation contract changes them:

```
expected_runtime_authority_granted=0
expected_effect_performed=0
expected_host_read_performed=0
expected_host_write_performed=0
expected_network_performed=0
```

Claim gate

This plan alone does not justify the public claim that Latticra secures AI agents.

The accurate public claim remains:

```
Latticra Seal is building a report-only trust boundary for AI-era automation.
```

A stronger claim requires implemented and validated gate behavior plus case tests for unknown, unsigned, stale, and replayed requests.

Non-claims

```
runtime_gate_case_tests_implemented=0
runtime_behavior_implemented=0
policy_behavior_implemented=0
tool_behavior_implemented=0
host_behavior_implemented=0
network_behavior_implemented=0
authority_granted=0
production_readiness_claimed=0
external_endorsement_claimed=0
```

Next valid slice

The next valid Latticra Seal slice is the first case-specific contract, beginning with the unknown tool case.

docs/LATTICRA_SEAL_RUNTIME_HANDOFF_CONTRACT.md

Source title: Latticra Seal Runtime Handoff Contract

Lines: 219 | Words: 633 | SHA-256: a04c6f94cd6f94ad9282815d311dca1158189355627d76071e1d8bed5143e5c9

Latticra Seal Runtime Handoff Contract

Status: Latticra Seal runtime handoff contract Scope: contract for future runtime handoff metadata after effect decision metadata. This document does not implement runtime execution, runtime authority, effect execution, capability enforcement, cryptographic verification, verified receipts, public-key parsing, public-key trust stores, key generation, private-key storage, hardware key use, network trust lookup, revocation lookup, object sealing, host reads, host writes, kernel behavior, Fedora approval claims, production readiness, or operating-system behavior.

Purpose

This document defines the Latticra Seal runtime handoff layer.

The purpose of this layer is to decide how a future effect decision may be represented at the runtime boundary before any runtime component is allowed to act on it.

This document does not implement runtime handoff behavior.

Required predecessors

This contract depends on:

```
docs/LATTICRA_SEAL_CONTRACT.md
docs/LATTICRA_SEAL_MEASUREMENT_IMPLEMENTATION.md
docs/LATTICRA_SEAL_SIGNED_MANIFEST_IMPLEMENTATION.md
docs/LATTICRA_SEAL_SIGNATURE_POLICY_IMPLEMENTATION.md
docs/LATTICRA_SEAL_SIGNATURE_IMPLEMENTATION.md
docs/LATTICRA_SEAL_VERIFICATION_POLICY_IMPLEMENTATION.md
docs/LATTICRA_SEAL_VERIFICATION_RECEIPT_IMPLEMENTATION.md
docs/LATTICRA_SEAL_CAPABILITY_GATE_IMPLEMENTATION.md
docs/LATTICRA_SEAL_EFFECT_DECISION_CONTRACT.md
docs/LATTICRA_SEAL_EFFECT_DECISION_IMPLEMENTATION.md
include/latticra/seal_measurement.h
include/latticra/seal_manifest.h
include/latticra/seal_signature_policy.h
include/latticra/seal_signature.h
include/latticra/seal_verification_policy.h
include/latticra/seal_verification_receipt.h
include/latticra/seal_capability_gate.h
```

```
include/latticra/seal_effect_decision.h
src/seal_measurement.c
src/seal_manifest.c
src/seal_signature_policy.c
src/seal_signature.c
src/seal_verification_policy.c
src/seal_verification_receipt.c
src/seal_capability_gate.c
src/seal_effect_decision.c
scripts/test-latticra-seal-measurement.sh
scripts/test-latticra-seal-manifest.sh
scripts/test-latticra-seal-signature-policy.sh
scripts/test-latticra-seal-signature.sh
scripts/test-latticra-seal-verification-policy.sh
scripts/test-latticra-seal-verification-receipt.sh
scripts/test-latticra-seal-capability-gate.sh
scripts/test-latticra-seal-effect-decision-contract.sh
scripts/test-latticra-seal-effect-decision.sh
```

The effect decision metadata surface remains denied metadata until runtime handoff metadata exists and is guarded.

Handoff boundary

No effect decision becomes runtime behavior.

No denied decision may produce an active runtime handoff.

No runtime handoff may perform host reads, host writes, network access, kernel interaction, or authority grants until a later runtime-boundary implementation explicitly permits and guards those behaviors.

Allowed in this contract slice:

```
runtime handoff vocabulary
handoff-state labels
decision metadata planning
runtime-boundary label planning
no-runtime posture planning
failure-state planning
promotion rules
non-claims
static guard validation
```

Forbidden in this contract slice:

```
runtime execution
runtime authority grants
effect execution
host reads
host writes
network access
capability enforcement
cryptographic verification
verified receipt generation
public-key parsing
public-key trust store loading
private-key handling
key generation
signature generation
revocation lookup
object sealing
kernel interaction
```

Initial handoff policy

The initial runtime handoff policy is denied by default.

```
denied decision metadata may be inspected
effect_allowed=0 must deny handoff activation
effect_performed=0 must remain zero
runtime_authority_granted=0 must remain zero
handoff_active must remain zero
runtime_effect_performed must remain zero
unknown boundary target must deny
unknown runtime request must deny
```

The first implementation after this contract may only add metadata fields and denied-state handling. It must not perform runtime behavior.

Planned handoff states

Future records should use explicit labels:

```
handoff_state=unsupported
handoff_state=denied-decision
handoff_state=denied-runtime-boundary
handoff_state=denied-policy
handoff_state=inactive-metadata
handoff_state=active-runtime-gated
```

For the next implementation, the expected state is:

```
handoff_state=denied-decision
```

Planned handoff fields

A future runtime handoff record should be bounded and deterministic.

Planned fields:

```
handoff_profile
decision_profile
gate_profile
requested_capability
requested_effect
requested_scope
decision_state
effect_allowed
effect_performed
runtime_boundary_state
runtime_request_label
handoff_active
runtime_effect_performed
host_read_performed
host_write_performed
network_performed
runtime_authority_granted
status
```

Initial values before real runtime behavior:

```
effect_allowed=0
effect_performed=0
runtime_boundary_state=disabled
handoff_active=0
runtime_effect_performed=0
host_read_performed=0
host_write_performed=0
network_performed=0
runtime_authority_granted=0
handoff_state=denied-decision
status=runtime-handoff-contract-only
```

Failure behavior

Future runtime handoff handling must fail closed.

Required failure states:

```
null effect decision metadata -&gt; invalid
invalid effect decision metadata -&gt; invalid
missing requested capability -&gt; denied
missing requested effect -&gt; denied
unknown runtime boundary -&gt; denied
unknown runtime request -&gt; denied
effect_allowed=0 -&gt; denied-decision
runtime boundary disabled -&gt; denied-runtime-boundary
runtime authority request -&gt; rejected
```

Failures must not parse keys, create keys, persist secrets, contact networks, query revocation status, verify records, sign records, read host files, write host files, enforce capabilities, execute effects, call runtime components, or grant runtime

authority.

Promotion rule

This contract permits only the next implementation slice:

```
runtime handoff metadata implementation
```

It does not permit runtime execution, effect execution, capability enforcement, runtime authority, cryptographic verification, verified receipt generation, key handling, trust-store behavior, revocation lookup, object sealing, network behavior, host reads, host writes, or kernel behavior.

After runtime handoff metadata exists and is guarded, the next valid planning slice is a Seal status rollup contract.

Validation

This contract is validated by:

```
sh scripts/test-latticra-seal-runtime-handoff-contract.sh
```

docs/LATTICRA_SEAL_RUNTIME_HANDOFF_EVALUATION_CONTRACT.md

Source title: Latticra Seal Runtime Handoff Evaluation Contract

Lines: 185 | Words: 540 | SHA-256: ba70e27573e74afccc4303d5698f1c14d4c6b9ce5f9b7e78f3bde08f186ea215

Latticra Seal Runtime Handoff Evaluation Contract

Status: Latticra Seal runtime handoff evaluation contract Scope: contract for a future runtime handoff evaluation step after verified effect decision metadata. This document does not implement runtime handoff, runtime authority, host reads, host writes, network behavior, shell execution, tool execution, capability enforcement, policy persistence, signing, key generation, private-key storage, trust-store loading, revocation lookup, object sealing, kernel behavior, Fedora approval claims, production readiness, or operating-system behavior.

Purpose

This document defines the first Latticra Seal runtime handoff evaluation boundary that may consume an allowed metadata-only verified effect decision.

The purpose of this layer is to decide whether a previously allowed metadata-only effect decision is eligible to be described as a runtime handoff candidate before any future runtime bridge exists.

The evaluation is handoff classification, not runtime handoff.

Required predecessors

This contract depends on:

```
docs/LATTICRA_SEAL_VERIFIED_EFFECT_DECISION_CONTRACT.md
docs/LATTICRA_SEAL_VERIFIED_EFFECT_DECISION_IMPLEMENTATION.md
include/latticra/seal_verified_effect_decision.h
src/seal_verified_effect_decision.c
tests/seal_verified_effect_decision_invariants.c
scripts/test-latticra-seal-verified-effect-decision.sh
```

The verified effect decision metadata surface remains the source of effect-decision evidence for this runtime handoff evaluation.

Evaluation boundary

Allowed in the next implementation slice:

```
accept verified effect decision metadata
require effect_allowed=1
require decision_state=allowed-report-only
require decision_state=allowed-evaluate-only
require runtime_authority_granted=0
require effect_performed=0
require host_read_performed=0
require host_write_performed=0
require network_performed=0
accept requested handoff metadata
classify report-only as handoff_state=eligible-report-only
classify evaluate-only as handoff_state=eligible-evaluate-only
produce deterministic runtime handoff evaluation metadata
```

Forbidden in the next implementation slice:

```
runtime handoff execution
runtime authority grants
host reads
host writes
network access
shell execution
tool execution
capability enforcement
policy persistence
trust-store loading
revocation lookup
key generation
private-key handling
object sealing
kernel interaction
```

Initial handoff policy

Allowed input decision states:

```
decision_state=allowed-report-only
decision_state=allowed-evaluate-only
```

Allowed requested handoff labels:

```
report-only
evaluate-only
```

Planned handoff states:

```
handoff_state=eligible-report-only
handoff_state=eligible-evaluate-only
handoff_state=denied-decision
handoff_state=denied-effect
handoff_state=denied-runtime-authority
handoff_state=denied-host-effect
handoff_state=denied-network-effect
```

The first implementation may set:

```
handoff_eligible=1
```

only for metadata-only report/evaluate decisions.

Even when handoff_eligible=1, these must remain zero:

```
handoff_performed=0
effect_performed=0
runtime_authority_granted=0
host_read_performed=0
host_write_performed=0
network_performed=0
```

Planned fields

A future runtime handoff evaluation record should be bounded and deterministic.

Planned fields:

```
handoff_profile
decision_profile
gate_profile
receipt_profile
requested_capability
```

```
requested_effect
requested_handoff
requested_scope
decision_state
effect_allowed
handoff_state
handoff_eligible
handoff_performed
effect_performed
runtime_authority_granted
host_read_performed
host_write_performed
network_performed
status
```

Failure behavior

Future runtime handoff evaluation handling must fail closed.

Required failure states:

```
null output -&gt; invalid
null verified effect decision -&gt; invalid
invalid verified effect decision -&gt; denied-decision
effect_allowed=0 -&gt; denied-effect
decision_state not allowed-report-only or allowed-evaluate-only -&gt; denied-decision
missing requested handoff -&gt; denied-effect
unknown requested handoff -&gt; denied-effect
runtime authority already granted -&gt; denied-runtime-authority
effect already performed -&gt; denied-host-effect
host read already performed -&gt; denied-host-effect
host write already performed -&gt; denied-host-effect
network already performed -&gt; denied-network-effect
```

Failures must not read host files, write host files, contact networks, execute tools, execute shells, enforce capabilities, perform handoff, persist policy, or grant runtime authority.

Promotion rule

This contract permits only the next implementation slice:

```
runtime handoff evaluation metadata implementation
```

It does not permit runtime handoff execution, effect execution, capability enforcement, runtime authority, host behavior, network behavior, trust-store behavior, revocation lookup, key handling, object sealing, or kernel behavior.

After runtime handoff evaluation metadata exists and is guarded, the next valid planning slice is a runtime handoff report surface that still performs no runtime handoff.

Validation

This contract is validated by:

```
sh scripts/test-latticra-seal-runtime-handoff-evaluation-contract.sh
```

docs/LATTICRA_SEAL_RUNTIME_HANDOFF_EVALUATION_IMPLEMENTATION.md

Source title: Latticra Seal Runtime Handoff Evaluation Implementation

Lines: 151 | Words: 521 | SHA-256: 753ce70761f0d23c84cb65e836856ee9fe0d317b1d6bab9ce86b711065db5519

Latticra Seal Runtime Handoff Evaluation Implementation

Status: initial runtime handoff evaluation metadata implementation Scope: bounded C metadata surface for classifying allowed metadata-only verified effect decision output into deterministic runtime handoff eligibility. This does not implement runtime handoff execution, runtime authority, host reads, host writes, network behavior, shell execution, tool execution, capability enforcement, policy persistence, trust-store loading, revocation lookup, key generation, private-key handling, object sealing, kernel interaction, Fedora approval claims, production readiness, or operating-system behavior.

Purpose

This document records the first Latticra Seal runtime handoff evaluation metadata implementation.

The implementation consumes verified effect decision metadata and classifies whether the requested metadata-only runtime handoff remains eligible as report-only or evaluate-only.

When the verified effect decision carries crypto graduation metadata, the evaluation copies that evidence forward and requires it to remain passed, standard-aligned, and authority-neutral.

The evaluation is handoff classification, not runtime handoff.

Added files

```
include/latticra/seal_runtime_handoff_evaluation.h
src/seal_runtime_handoff_evaluation.c
tests/seal_runtime_handoff_evaluation_invariants.c
scripts/test-latticra-seal-runtime-handoff-evaluation.sh
```

Required predecessor

This implementation depends on the verified effect decision metadata surface:

```
include/latticra/seal_verified_effect_decision.h
src/seal_verified_effect_decision.c
tests/seal_verified_effect_decision_invariants.c
scripts/test-latticra-seal-verified-effect-decision.sh
docs/LATTICRA_SEAL_VERIFIED_EFFECT_DECISION_IMPLEMENTATION.md
```

API summary

The runtime handoff evaluation metadata surface adds:

```
latticra_seal_runtime_handoff_evaluation_t
latticra_seal_runtime_handoff_evaluation_error_t
latticra_seal_runtime_handoff_evaluation_error_label
latticra_seal_runtime_handoff_evaluation_from_decision
latticra_seal_runtime_handoff_evaluation_is_metadata_only
latticra_seal_runtime_handoff_evaluation_report
```

Evaluation behavior

The implementation:

```
accepts verified effect decision metadata
copies crypto graduation gate metadata when present
requires crypto_graduation_gate_passed=1 when crypto_graduation_gate_present=1
requires standard_expectations_met=1 when crypto_graduation_gate_present=1
requires local_verify_graduated=1 when crypto_graduation_gate_present=1
requires receipt_promotion_graduated=1 when crypto_graduation_gate_present=1
requires authority_promotion_allowed=0 when crypto_graduation_gate_present=1
requires effect_allowed=1
requires decision_state=allowed-report-only or decision_state=allowed-evaluate-only
requires runtime_authority_granted=0
requires effect_performed=0
requires host_read_performed=0
requires host_write_performed=0
requires network_performed=0
accepts requested handoff metadata
classifies report-only as handoff_state=eligible-report-only
```

```
classifies evaluate-only as handoff_state=eligible-evaluate-only
sets handoff_eligible=1 only for metadata-only report/evaluate handoff evaluations
renders deterministic runtime handoff evaluation metadata
```

Crypto-bound handoff evaluation metadata records:

```
crypto_graduation_profile=latticra-seal-crypto-graduation-gate/0.1
assurance_baseline_profile=latticra-cryptographic-assurance-key-management/0.1
crypto_graduation_gate_state=graduated-authority-neutral
crypto_graduation_gate_present=1
crypto_graduation_gate_passed=1
standard_expectations_met=1
local_verify_graduated=1
receipt_promotion_graduated=1
authority_promotion_allowed=0
handoff_state=eligible-report-only
handoff_eligible=1
handoff_performed=0
runtime_authority_granted=0
```

Effect and runtime boundary

Even when handoff_eligible=1, these fields remain zero:

```
handoff_performed=0
effect_performed=0
runtime_authority_granted=0
host_read_performed=0
host_write_performed=0
network_performed=0
```

This implementation does not perform runtime handoff, read host files, write host files, contact networks, execute tools, execute shells, enforce capabilities, persist policy, load trust stores, look up revocation status, generate keys, handle private keys, seal objects, or interact with the kernel.

Failure behavior

The implementation fails closed:

```
null output -&gt; LATTICRA_STATUS_NULL_ARGUMENT
null verified effect decision -&gt; invalid-input
invalid verified effect decision -&gt; invalid-decision
failed crypto graduation gate evidence -&gt; denied-crypto-graduation-gate
authority-bearing crypto graduation evidence -&gt; denied-crypto-graduation-gate
effect_allowed=0 -&gt; denied-effect
decision_state not allowed-report-only or allowed-evaluate-only -&gt; denied-decision
missing requested handoff -&gt; missing-requested-handoff
unknown requested handoff -&gt; denied-unknown-handoff
runtime authority already granted -&gt; denied-runtime-authority
effect already performed -&gt; denied-host-effect
host read already performed -&gt; denied-host-effect
host write already performed -&gt; denied-host-effect
network already performed -&gt; denied-network-effect
small report buffer -&gt; LATTICRA_STATUS_BUFFER_TOO_SMALL
```

Failures do not perform handoff, perform effects, read host files, write host files, contact networks, or grant runtime authority.

Validation

Run locally:

```
sh scripts/test-latticra-seal-runtime-handoff-evaluation.sh
```

Expected output:

```
seal runtime handoff evaluation invariants: ok
```

Next valid slice

The next valid Latticra Seal planning slice is a runtime handoff report surface from eligible crypto-graduation-gated metadata-only runtime handoff evaluation.

That next slice should remain contract-first and should not perform runtime handoff unless separately implemented and guarded.

docs/LATTICRA_SEAL_RUNTIME_HANDOFF_IMPLEMENTATION.md

Source title: Latticra Seal Runtime Handoff Implementation

Lines: 134 | Words: 511 | SHA-256: f2d664fbb79e3fe22ba2c9c9dd29d9a7ff2235472fc605a0b78dae75b95662f8

Latticra Seal Runtime Handoff Implementation

Status: initial runtime handoff metadata implementation Scope: bounded C metadata surface for runtime handoff posture after effect decision metadata. This slice does not implement runtime execution, runtime authority, effect execution, capability enforcement, cryptographic verification, verified receipts, public-key parsing, public-key trust stores, key generation, private-key storage, hardware key use, network trust lookup, revocation lookup, object sealing, host reads, host writes, kernel behavior, Fedora approval claims, production readiness, or operating-system behavior.

Purpose

This document records the first Latticra Seal runtime handoff metadata implementation.

The implementation accepts an existing effect decision metadata record and produces deterministic runtime handoff metadata. It does not activate a runtime boundary and does not perform effects.

Added files

```
include/latticra/seal_runtime_handoff.h
src/seal_runtime_handoff.c
tests/seal_runtime_handoff_invariants.c
scripts/test-latticra-seal-runtime-handoff.sh
```

API summary

The runtime handoff metadata surface adds:

```
latticra_seal_runtime_handoff_t
latticra_seal_runtime_handoff_error_t
latticra_seal_runtime_handoff_error_label
latticra_seal_runtime_handoff_from_decision
latticra_seal_runtime_handoff_is_inactive_metadata
latticra_seal_runtime_handoff_report
```

Handoff behavior

The implementation:

```
accepts a valid effect decision metadata record
copies decision profile metadata
copies gate profile metadata
copies requested capability metadata
copies requested effect metadata
copies requested scope metadata
copies decision_state
copies effect_allowed
copies effect_performed
sets runtime_boundary_state=disabled
records runtime request label metadata, defaulting to no-runtime-request
sets handoff_active=0
sets runtime_effect_performed=0
sets host_read_performed=0
sets host_write_performed=0
sets network_performed=0
sets runtime_authority_granted=0
sets handoff_state=denied-decision
renders deterministic runtime handoff metadata
```

Boundary

This implementation does not verify signatures, parse public keys, create keys, store keys, contact networks, query revocation status, persist handoff decisions, enforce capabilities, perform host reads, perform host writes, execute network behavior, call runtime components, or grant runtime authority.

It is metadata only.

Failure behavior

The implementation fails closed:

```
null runtime handoff output -&gt; LATTICRA_STATUS_NULL_ARGUMENT
null effect decision metadata input -&gt; invalid-input
invalid effect decision metadata -&gt; invalid-decision
missing requested capability -&gt; missing-requested-capability
missing requested effect -&gt; missing-requested-effect
small report buffer -&gt; LATTICRA_STATUS_BUFFER_TOO_SMALL
```

Failures do not parse keys, create keys, persist secrets, contact networks, verify records, sign records, read host files, write host files, enforce capabilities, perform effects, call runtime components, or grant runtime authority.

Invariants

The invariant test verifies:

```
valid effect decision metadata produces deterministic runtime handoff metadata
decision profile is copied
gate profile is copied
requested capability is copied
requested effect is copied
requested scope is copied
decision_state is copied
effect_allowed remains zero
effect_performed remains zero
runtime_boundary_state remains disabled
runtime request label is recorded
missing runtime request label defaults to no-runtime-request
handoff_active remains zero
runtime_effect_performed remains zero
host_read_performed remains zero
host_write_performed remains zero
network_performed remains zero
runtime_authority_granted remains zero
handoff_state remains denied-decision
small report buffer fails closed
null inputs fail closed
invalid effect decision metadata fails closed
missing requested capability fails closed
missing requested effect fails closed
```

Validation

Run:

```
sh scripts/test-latticra-seal-runtime-handoff-contract.sh
sh scripts/test-latticra-seal-runtime-handoff.sh
sh scripts/test-latticra-seal-runtime-handoff-status.sh
```

Expected output:

```
seal runtime handoff contract: ok
seal runtime handoff invariants: ok
seal runtime handoff status: ok
```

Next valid slice

The next valid Latticra Seal slice is status rollup status/public-entry alignment.

That future slice must not add runtime execution, effect execution, capability enforcement, runtime authority, cryptographic verification, signing, host behavior, network behavior, or object sealing unless separately implemented and guarded.

docs/LATTICRA_SEAL_RUNTIME_HANDOFF_REPORT_CONTRACT.md

Source title: Latticra Seal Runtime Handoff Report Contract

Lines: 194 | Words: 558 | SHA-256: d2382fbe48a5225e9454aaefe44728467c87772fc1c9e1602ecc83475f9aab7b

Latticra Seal Runtime Handoff Report Contract

Status: Latticra Seal runtime handoff report contract Scope: contract for a future report surface after runtime handoff evaluation metadata. This document does not implement runtime handoff execution, runtime authority, host reads, host writes, network behavior, shell execution, tool execution, capability enforcement, policy persistence, signing, key generation, private-key storage, trust-store loading, revocation lookup, object sealing, kernel behavior, Fedora approval claims, production readiness, or operating-system behavior.

Purpose

This document defines the first Latticra Seal runtime handoff report boundary that may consume an eligible metadata-only runtime handoff evaluation.

The purpose of this layer is to decide whether a previously eligible metadata-only runtime handoff evaluation may be surfaced as a deterministic report record before any future runtime bridge exists.

The report surface is report classification, not runtime handoff.

Required predecessors

This contract depends on:

```
docs/LATTICRA_SEAL_RUNTIME_HANDOFF_EVALUATION_CONTRACT.md
docs/LATTICRA_SEAL_RUNTIME_HANDOFF_EVALUATION_IMPLEMENTATION.md
include/latticra/seal_runtime_handoff_evaluation.h
src/seal_runtime_handoff_evaluation.c
tests/seal_runtime_handoff_evaluation_invariants.c
scripts/test-latticra-seal-runtime-handoff-evaluation.sh
```

The runtime handoff evaluation metadata surface remains the source of eligibility evidence for this report surface.

Report boundary

Allowed in the next implementation slice:

```
accept runtime handoff evaluation metadata
require handoff_eligible=1
require handoff_state=eligible-report-only or handoff_state=eligible-evaluate-only
require handoff_performed=0
require runtime_authority_granted=0
require effect_performed=0
require host_read_performed=0
require host_write_performed=0
require network_performed=0
accept requested report metadata
classify report-only as report_state=ready-report-only
classify evaluate-only as report_state=ready-evaluate-only
produce deterministic runtime handoff report metadata
```

Forbidden in the next implementation slice:

```
runtime handoff execution
runtime authority grants
host reads
host writes
network access
shell execution
tool execution
capability enforcement
policy persistence
trust-store loading
```

```
revocation lookup
key generation
private-key handling
object sealing
kernel interaction
```

Initial report policy

Allowed input handoff states:

```
handoff_state=eligible-report-only
handoff_state=eligible-evaluate-only
```

Allowed requested report labels:

```
report-only
evaluate-only
```

Planned report states:

```
report_state=ready-report-only
report_state=ready-evaluate-only
report_state=denied-evaluation
report_state=denied-handoff
report_state=denied-report
report_state=denied-runtime-authority
report_state=denied-host-effect
report_state=denied-network-effect
```

The first implementation may set:

```
report_ready=1
```

only for metadata-only report/evaluate handoff reports.

Even when report_ready=1, these must remain zero:

```
handoff_performed=0
effect_performed=0
runtime_authority_granted=0
host_read_performed=0
host_write_performed=0
network_performed=0
```

Planned fields

A future runtime handoff report record should be bounded and deterministic.

Planned fields:

```
report_profile
handoff_profile
decision_profile
gate_profile
receipt_profile
verify_profile
message_digest_algorithm
message_digest_hex
public_key_identity_label
requested_capability
requested_effect
requested_handoff
requested_report
requested_scope
handoff_state
handoff_eligible
report_state
report_ready
handoff_performed
effect_performed
runtime_authority_granted
host_read_performed
host_write_performed
network_performed
status
```

Failure behavior

Future runtime handoff report handling must fail closed.

Required failure states:

```
null output -&gt; invalid
null runtime handoff evaluation -&gt; invalid
invalid runtime handoff evaluation -&gt; denied-evaluation
handoff_eligible=0 -&gt; denied-handoff
handoff_state not eligible-report-only or eligible-evaluate-only -&gt; denied-handoff
missing requested report -&gt; denied-report
unknown requested report -&gt; denied-report
requested report mismatch -&gt; denied-report
runtime authority already granted -&gt; denied-runtime-authority
handoff already performed -&gt; denied-host-effect
effect already performed -&gt; denied-host-effect
host read already performed -&gt; denied-host-effect
host write already performed -&gt; denied-host-effect
network already performed -&gt; denied-network-effect
```

Failures must not read host files, write host files, contact networks, execute tools, execute shells, enforce capabilities, perform handoff, persist policy, or grant runtime authority.

Promotion rule

This contract permits only the next implementation slice:

```
runtime handoff report metadata implementation
```

It does not permit runtime handoff execution, effect execution, capability enforcement, runtime authority, host behavior, network behavior, trust-store behavior, revocation lookup, key handling, object sealing, or kernel behavior.

After runtime handoff report metadata exists and is guarded, the next valid planning slice is a sealed report envelope contract that still performs no runtime handoff.

Validation

This contract is validated by:

```
sh scripts/test-latticra-seal-runtime-handoff-report-contract.sh
```

docs/LATTICRA_SEAL_RUNTIME_HANDOFF_REPORT_IMPLEMENTATION.md

Source title: Latticra Seal Runtime Handoff Report Implementation

Lines: 126 | Words: 448 | SHA-256: 64a2f54700d560614c4ad5a56042a393e7cb07be664635915ed37f7458a29e92

Latticra Seal Runtime Handoff Report Implementation

Status: initial runtime handoff report metadata implementation Scope: bounded C metadata surface for classifying eligible metadata-only runtime handoff evaluation output into deterministic report readiness. This does not implement runtime handoff execution, runtime authority, host reads, host writes, network behavior, shell execution, tool execution, capability enforcement, policy persistence, trust-store loading, revocation lookup, key generation, private-key handling, object sealing, kernel interaction, Fedora approval claims, production readiness, or operating-system behavior.

Purpose

This document records the first Latticra Seal runtime handoff report metadata implementation.

The implementation consumes runtime handoff evaluation metadata and classifies whether the requested metadata-only report remains ready as report-only or evaluate-only.

The report surface is report classification, not runtime handoff.

Added files

```
include/latticra/seal_runtime_handoff_report.h
src/seal_runtime_handoff_report.c
tests/seal_runtime_handoff_report_invariants.c
scripts/test-latticra-seal-runtime-handoff-report.sh
```

Required predecessor

This implementation depends on the runtime handoff evaluation metadata surface:

```
include/latticra/seal_runtime_handoff_evaluation.h
src/seal_runtime_handoff_evaluation.c
tests/seal_runtime_handoff_evaluation_invariants.c
scripts/test-latticra-seal-runtime-handoff-evaluation.sh
docs/LATTICRA_SEAL_RUNTIME_HANDOFF_EVALUATION_IMPLEMENTATION.md
```

API summary

The runtime handoff report metadata surface adds:

```
latticra_seal_runtime_handoff_report_t
latticra_seal_runtime_handoff_report_error_t
latticra_seal_runtime_handoff_report_error_label
latticra_seal_runtime_handoff_report_from_evaluation
latticra_seal_runtime_handoff_report_is_metadata_only
latticra_seal_runtime_handoff_report_render
```

Report behavior

The implementation:

```
accepts runtime handoff evaluation metadata
requires handoff_eligible=1
requires handoff_state=eligible-report-only or handoff_state=eligible-evaluate-only
requires runtime_authority_granted=0
requires handoff_performed=0
requires effect_performed=0
requires host_read_performed=0
requires host_write_performed=0
requires network_performed=0
accepts requested report metadata
classifies report-only as report_state=ready-report-only
classifies evaluate-only as report_state=ready-evaluate-only
sets report_ready=1 only for metadata-only report/evaluate report surfaces
renders deterministic runtime handoff report metadata
```

Effect and runtime boundary

Even when report_ready=1, these fields remain zero:

```
handoff_performed=0
effect_performed=0
runtime_authority_granted=0
host_read_performed=0
host_write_performed=0
network_performed=0
```

This implementation does not perform runtime handoff, read host files, write host files, contact networks, execute tools, execute shells, enforce capabilities, persist policy, load trust stores, look up revocation status, generate keys, handle private keys, seal objects, or interact with the kernel.

Failure behavior

The implementation fails closed:

```
null output -&gt; LATTICRA_STATUS_NULL_ARGUMENT
null runtime handoff evaluation -&gt; invalid-input
invalid runtime handoff evaluation -&gt; invalid-evaluation
handoff_eligible=0 -&gt; denied-handoff
handoff_state not eligible-report-only or eligible-evaluate-only -&gt; denied-handoff
missing requested report -&gt; missing-requested-report
unknown requested report -&gt; denied-unknown-report
requested report mismatch -&gt; denied-report
runtime authority already granted -&gt; denied-runtime-authority
```

```
handoff already performed -&gt; denied-host-effect
effect already performed -&gt; denied-host-effect
host read already performed -&gt; denied-host-effect
host write already performed -&gt; denied-host-effect
network already performed -&gt; denied-network-effect
small report buffer -&gt; LATTICRA_STATUS_BUFFER_TOO_SMALL
```

Failures do not perform handoff, perform effects, read host files, write host files, contact networks, or grant runtime authority.

Validation

Run locally:

```
sh scripts/test-latticra-seal-runtime-handoff-report.sh
```

Expected output:

```
seal runtime handoff report invariants: ok
```

Next valid slice

The next valid Latticra Seal planning slice is a sealed report envelope contract from ready metadata-only runtime handoff report metadata.

That next slice should remain contract-first and should not perform runtime handoff unless separately implemented and guarded.

docs/LATTICRA_SEAL_SIGNATURE_IMPLEMENTATION.md

Source title: Latticra Seal Signature Implementation

Lines: 118 | Words: 415 | SHA-256: c3d214c5d71c3f224f01bc5f3c012f543bbc1024624221dc1bcc38f18e9ced74

Latticra Seal Signature Implementation

Status: initial signature metadata envelope implementation Scope: bounded C metadata surface for caller-supplied signature envelope metadata. This slice does not implement cryptographic signing, signature verification, key generation, private-key storage, hardware key use, network trust lookup, object sealing, capability enforcement, runtime authority, host writes, kernel behavior, Fedora approval claims, production readiness, or operating-system behavior.

Purpose

This document records the first Latticra Seal signature metadata envelope implementation.

The implementation records caller-supplied development-lane signature metadata for an existing unsigned evidence manifest. It does not create, verify, or interpret cryptographic signatures.

Added files

```
include/latticra/seal_signature.h
src/seal_signature.c
tests/seal_signature_invariants.c
scripts/test-latticra-seal-signature.sh
```

API summary

The signature metadata surface adds:

```
latticra_seal_signature_t
latticra_seal_signature_error_t
latticra_seal_signature_error_label
latticra_seal_signature_from_manifest
latticra_seal_signature_is_metadata_only
latticra_seal_signature_report
```

Signature metadata behavior

The implementation:

```
accepts a valid unsigned manifest record
copies manifest profile
copies manifest kind
copies artifact digest algorithm
copies artifact digest hex
copies caller-supplied signer identity label
accepts only the Ed25519-development algorithm label
records caller-supplied signature byte length
sets signature_state=metadata-only
sets signature_supported=1
sets verification_supported=0
sets private_key_handling=0
sets network_lookup_allowed=0
sets runtime_authority_granted=0
renders deterministic signature metadata
```

Boundary

This implementation does not generate signatures, verify signatures, handle private keys, contact networks, persist signature files, seal objects, enforce capabilities, write host files, or grant runtime authority.

It is metadata only.

Failure behavior

The implementation fails closed:

```
null signature output -&gt; LATTICRA_STATUS_NULL_ARGUMENT
null manifest input -&gt; invalid-input
invalid manifest -&gt; invalid-manifest
missing artifact digest -&gt; missing-digest
missing signer label -&gt; missing-signer
unsupported algorithm label -&gt; unsupported-algorithm
zero signature byte length -&gt; missing-signature-metadata
small report buffer -&gt; LATTICRA_STATUS_BUFFER_TOO_SMALL
```

Failures do not generate keys, store keys, contact networks, sign records, verify records, write host files, or grant runtime authority.

Invariants

The invariant test verifies:

```
valid manifest plus caller-supplied signature metadata produces deterministic signature metadata
manifest profile is copied
manifest kind is copied
artifact digest algorithm is copied
artifact digest hex is copied
signer identity label is copied
signature algorithm label is copied
signature byte length is recorded
signature_supported is one
verification_supported remains zero
private_key_handling remains zero
network_lookup_allowed remains zero
runtime_authority_granted remains zero
small report buffer fails closed
null inputs fail closed
invalid manifest fails closed
missing digest fails closed
missing signer fails closed
unsupported algorithm fails closed
missing signature metadata fails closed
```

Validation

Run:

```
sh scripts/test-latticra-seal-signature.sh
```

Next valid slice

The next valid Latticra Seal slice is a verification policy contract.

That future slice must be contract-first and must not be added directly to this signature metadata implementation.

docs/LATTICRA_SEAL_SIGNATURE_IMPLEMENTATION_CONTRACT.md

Source title: Latticra Seal Signature Implementation Contract

Lines: 182 | Words: 562 | SHA-256: 2eff566676f9b4dc54433a4e4bd5ae841fda76c68907c06da9212f63e2491ff8

Latticra Seal Signature Implementation Contract

Status: Latticra Seal signature implementation contract Scope: contract for future development-only signature implementation after signature policy metadata. This document does not implement signing, verification, key generation, private-key storage, hardware key use, post-quantum signatures, network trust lookup, object sealing, capability enforcement, runtime authority, host writes, kernel behavior, Fedora approval claims, production readiness, or operating-system behavior.

Purpose

This document defines the first allowed implementation boundary for Latticra Seal signatures.

The purpose of the future implementation is to support deterministic development-lane signing metadata for already-built unsigned evidence manifests, without granting runtime authority or introducing production trust claims.

This document does not implement signatures.

Required predecessors

This contract depends on:

```
docs/LATTICRA_SEAL_CONTRACT.md
docs/LATTICRA_SEAL_SIGNED_MANIFEST_CONTRACT.md
docs/LATTICRA_SEAL_SIGNED_MANIFEST_IMPLEMENTATION.md
docs/LATTICRA_SEAL_SIGNATURE_POLICY_CONTRACT.md
docs/LATTICRA_SEAL_SIGNATURE_POLICY_IMPLEMENTATION.md
include/latticra/seal_manifest.h
include/latticra/seal_signature_policy.h
src/seal_manifest.c
src/seal_signature_policy.c
scripts/test-latticra-seal-manifest.sh
scripts/test-latticra-seal-signature-policy.sh
```

The signature policy metadata surface remains the source of truth until a signature implementation is merged and guarded.

First signature implementation boundary

The first signature implementation may only support a development-lane signature envelope.

Allowed future behavior:

```
accept a valid manifest record
accept a caller-supplied public identity label
accept caller-supplied signature bytes as metadata
record signature algorithm label
record signature byte length
record signature state
render deterministic signature report metadata
keep private-key handling disabled
keep network lookup disabled
keep runtime authority disabled
```

Forbidden first implementation behavior:

```
private-key generation
private-key storage
secret handling
hardware token handling
network trust lookup
certificate authority behavior
post-quantum signature implementation
object sealing
capability enforcement
runtime authority grants
host writes
package installation
host configuration changes
```

Algorithm scope

The first implementation may use only a label for:

```
Ed25519-development
```

The first implementation must not implement Ed25519 math, ML-DSA, SLH-DSA, or any custom signature primitive.

Real signing and verification require a later implementation contract.

Planned signature envelope shape

The first implementation should define a bounded metadata envelope.

Planned fields:

```
signature_profile
manifest_profile
manifest_kind
artifact_digest_algorithm
artifact_digest_hex
signer_identity_label
signature_algorithm
signature_state
signature_byte_length
signature_supported
verification_supported
private_key_handling
network_lookup_allowed
runtime_authority_granted
status
```

Initial metadata values:

```
signature_algorithm=Ed25519-development
signature_state=metadata-only
signature_supported=1
verification_supported=0
private_key_handling=0
network_lookup_allowed=0
runtime_authority_granted=0
status=signature-metadata
```

Planned files

The future implementation should use bounded C surfaces consistent with the rest of Latticra Seal.

```
include/latticra/seal_signature.h
src/seal_signature.c
tests/seal_signature_invariants.c
scripts/test-latticra-seal-signature.sh
docs/LATTICRA_SEAL_SIGNATURE_IMPLEMENTATION.md
```

Failure behavior

The future signature metadata implementation must fail closed.

Required failure states:

```
null output -&gt; invalid
null manifest -&gt; invalid
invalid manifest -&gt; invalid
missing artifact digest -&gt; invalid
missing signer label -&gt; invalid
missing signature bytes -&gt; invalid
unsupported algorithm label -&gt; unsupported
output buffer too small -&gt; bounded failure
```

Failures must not create keys, store keys, contact networks, write host files, seal objects, enforce capabilities, verify signatures, or grant runtime authority.

Invariant requirements

The first signature metadata tests must verify:

```
valid manifest plus caller-supplied signature metadata produces deterministic signature metadata
manifest profile is copied
manifest kind is copied
artifact digest algorithm is copied
artifact digest hex is copied
signer identity label is copied
signature algorithm is recorded
signature byte length is recorded
verification_supported remains zero
private_key_handling remains zero
network_lookup_allowed remains zero
runtime_authority_granted remains zero
small report buffer fails closed
null inputs fail closed
invalid manifest fails closed
unsupported algorithm label fails closed
```

Promotion rule

This contract permits only the next implementation slice:

```
signature metadata envelope implementation
```

It does not permit real signature generation, signature verification, key generation, private-key storage, object sealing, capability enforcement, network trust lookup, host writes, or runtime authority.

docs/LATTICRA_SEAL_SIGNATURE_POLICY_CONTRACT.md

Source title: Latticra Seal Signature Policy Contract

Lines: 168 | Words: 439 | SHA-256: ffaa49989805ee2b92eaf9f69ae9f750a44a6fd259b3b488925783a4a1b36da2

Latticra Seal Signature Policy Contract

Status: Latticra Seal signature policy contract Scope: policy for future signature behavior after unsigned evidence-manifest metadata. This document does not implement signing, verification, key generation, private-key storage, hardware key use, post-quantum signatures, network trust, object sealing, capability enforcement, runtime authority, host writes, kernel behavior, Fedora approval claims, production readiness, or operating-system behavior.

Purpose

This document defines the Latticra Seal signature policy layer.

The purpose of this layer is to decide how future signatures may be represented, requested, validated, and promoted before any signature implementation exists.

This document does not implement signatures.

Required predecessors

This contract depends on:

```
docs/LATTICRA_SEAL_CONTRACT.md
docs/LATTICRA_SEAL_MEASUREMENT_IMPLEMENTATION.md
docs/LATTICRA_SEAL_SIGNED_MANIFEST_CONTRACT.md
docs/LATTICRA_SEAL_SIGNED_MANIFEST_IMPLEMENTATION.md
include/latticra/seal_measurement.h
include/latticra/seal_manifest.h
src/seal_measurement.c
src/seal_manifest.c
scripts/test-latticra-seal-measurement.sh
scripts/test-latticra-seal-manifest.sh
```

The manifest metadata surface remains unsigned until a later implementation explicitly adds signature support.

Policy boundary

Allowed in this policy slice:

```
signature vocabulary
algorithm planning
signature-state labels
public-key metadata planning
verification-state planning
failure-state planning
promotion rules
non-claims
static guard validation
```

Forbidden in this policy slice:

```
signature generation
signature verification
key generation
private-key storage
secret handling
network trust lookup
certificate authority behavior
hardware token behavior
runtime authority grants
host writes
object sealing
capability enforcement
```

Initial algorithm policy

Initial planned signature families:

```
Ed25519 for local development and fast signatures
ML-DSA for future post-quantum signature support
SLH-DSA for conservative offline/root signature support
```

The first implementation after this contract may only add metadata fields and unsupported-state handling. It must not add the algorithms themselves.

No custom signature primitive may be introduced.

Planned signature states

Future records should use explicit labels:

```
signature_state=unsupported
signature_state=unsigned
signature_state=requested
signature_state=signed
signature_state=verified
signature_state=invalid
signature_state=unsupported-algorithm
```

For the next implementation, the expected state is:

```
signature_state=unsupported
```

Planned policy fields

A future signature policy record should be bounded and deterministic.

Planned fields:

```
policy_profile
manifest_profile
manifest_kind
planned_signature_algorithm
post_quantum_algorithm_planned
conservative_root_algorithm_planned
signature_supported
verification_supported
public_key_metadata_supported
private_key_handling
network_lookup_allowed
runtime_authority_granted
status
```

Initial values before implementation:

```
signature_supported=0
verification_supported=0
public_key_metadata_supported=0
private_key_handling=0
network_lookup_allowed=0
runtime_authority_granted=0
status=signature-policy-only
```

Failure behavior

Future signature policy handling must fail closed.

Required failure states:

```
null manifest -&gt; invalid
missing manifest digest -&gt; invalid
signature requested before support -&gt; unsupported
unknown algorithm -&gt; unsupported-algorithm
private-key input -&gt; rejected
network lookup request -&gt; rejected
runtime authority request -&gt; rejected
```

Failures must not create keys, persist secrets, contact networks, sign records, verify records, or grant runtime authority.

Promotion rule

This contract permits only the next implementation slice:

```
signature policy metadata implementation
```

It does not permit signature generation, verification, key handling, object sealing, capability enforcement, network behavior, host writes, or runtime authority.

Validation

This contract is validated by:

```
sh scripts/test-latticra-seal-signature-policy-contract.sh
```

docs/LATTICRA_SEAL_SIGNATURE_POLICY_IMPLEMENTATION.md

Source title: Latticra Seal Signature Policy Implementation

Lines: 104 | Words: 316 | SHA-256: 732663d17308cfa912f073431c147c3be600d33d87c95128f578982d681bc1b8

Latticra Seal Signature Policy Implementation

Status: initial signature policy metadata implementation Scope: bounded C metadata surface for Latticra Seal signature policy posture. This slice does not add signing, verification, key handling, network trust lookup, object sealing, capability enforcement, runtime authority, host writes, kernel behavior, Fedora approval claims, production readiness, or operating-system behavior.

Purpose

This document records the first Latticra Seal signature policy metadata implementation.

The implementation consumes unsigned manifest metadata and reports the planned signature posture while keeping all operational signature capability disabled.

Added files

```
include/latticra/seal_signature_policy.h
src/seal_signature_policy.c
tests/seal_signature_policy_invariants.c
scripts/test-latticra-seal-signature-policy.sh
```

API summary

The policy surface adds:

```
latticra_seal_signature_policy_t
latticra_seal_signature_policy_error_t
latticra_seal_signature_policy_error_label
latticra_seal_signature_policy_from_manifest
latticra_seal_signature_policy_is_metadata_only
latticra_seal_signature_policy_report
```

Policy behavior

The implementation:

```
accepts a valid unsigned manifest record
copies manifest profile
copies manifest kind
records planned Ed25519 metadata
records planned ML-DSA metadata
records planned SLH-DSA metadata
sets signature_state=unsupported
sets signature_supported=0
sets verification_supported=0
sets public_key_metadata_supported=0
sets private_key_handling=0
sets network_lookup_allowed=0
sets runtime_authority_granted=0
renders deterministic policy metadata
```

Boundary

This implementation does not sign data, verify records, generate keys, store keys, contact networks, use hardware tokens, seal objects, enforce capabilities, write host files, or grant runtime authority.

It is metadata only.

Failure behavior

The implementation fails closed:

```
null policy output -&gt; LATTICRA_STATUS_NULL_ARGUMENT
null manifest input -&gt; invalid-input
invalid manifest -&gt; invalid-manifest
small report buffer -&gt; LATTICRA_STATUS_BUFFER_TOO_SMALL
```

Invariants

The invariant test verifies:

```
valid manifest produces deterministic policy metadata
manifest profile is copied
manifest kind is copied
signature_state remains unsupported
signature_supported remains zero
verification_supported remains zero
public_key_metadata_supported remains zero
private_key_handling remains zero
network_lookup_allowed remains zero
runtime_authority_granted remains zero
```

```
small report buffer fails closed
null inputs fail closed
invalid manifest fails closed
```

Validation

Run:

```
sh scripts/test-latticra-seal-signature-policy.sh
```

Next valid slice

The next valid Latticra Seal slice is a signature implementation contract.

That future slice must be contract-first and must not be added directly to this signature policy metadata implementation.

docs/LATTICRA_SEAL_SIGNATURE_REQUEST_CONTRACT.md

Source title: Latticra Seal Signature Request Contract

Lines: 224 | Words: 682 | SHA-256: 61c8d28054fed8ec0caaae5d281d0b332c5d6be1da7b3bb8ce0297635b25a5e2

Latticra Seal Signature Request Contract

Status: Latticra Seal signature request contract Scope: contract for a future metadata-only signature request surface after sealed report-envelope metadata. This document does not implement signing, signature verification, key generation, private-key handling, trust-store loading, revocation lookup, object sealing, runtime handoff execution, runtime authority, host reads, host writes, network behavior, shell execution, tool execution, capability enforcement, policy persistence, kernel behavior, Fedora approval claims, production readiness, or operating-system behavior.

Purpose

This document defines the first Latticra Seal signature-request boundary for sealed report-envelope metadata.

The purpose of this layer is to decide whether a ready metadata-only report envelope may be marked as eligible for a future signing request before any signing implementation, key authority, trust store, or runtime bridge exists.

The signature-request surface is request classification, not signing and not verification.

This document does not implement signing.

Relationship to existing signature metadata

Latticra Seal already has a manifest-chain signature metadata envelope:

```
docs/LATTICRA_SEAL_SIGNATURE_IMPLEMENTATION_CONTRACT.md
docs/LATTICRA_SEAL_SIGNATURE_IMPLEMENTATION.md
include/latticra/seal_signature.h
src/seal_signature.c
tests/seal_signature_invariants.c
scripts/test-latticra-seal-signature.sh
```

That earlier surface records caller-supplied signature metadata for unsigned evidence manifests.

This contract is a separate envelope-chain planning layer. It starts from ready sealed report-envelope metadata and does not consume private keys, produce signatures, verify signatures, trust signatures, or grant authority.

Required predecessors

This contract depends on:

```
docs/LATTICRA_SEAL_REPORT_ENVELOPE_CONTRACT.md
docs/LATTICRA_SEAL_REPORT_ENVELOPE_IMPLEMENTATION.md
include/latticra/seal_report_envelope.h
src/seal_report_envelope.c
tests/seal_report_envelope_invariants.c
scripts/test-latticra-seal-report-envelope.sh
```

The report-envelope metadata surface remains the source of envelope-readiness evidence for this signature-request surface.

Signature request boundary

Allowed in the next implementation slice:

```
accept sealed report-envelope metadata
require envelope_ready=1
require envelope_state=sealed-report-only or envelope_state=sealed-evaluate-only
require signature_performed=0
require handoff_performed=0
require effect_performed=0
require runtime_authority_granted=0
require host_read_performed=0
require host_write_performed=0
require network_performed=0
accept requested signature metadata
classify Ed25519-development as signature_request_state=requested-metadata-only
produce deterministic signature request metadata
```

Forbidden in the next implementation slice:

```
cryptographic signing
signature verification
private-key handling
key generation
trust-store loading
revocation lookup
runtime handoff execution
runtime authority grants
host reads
host writes
network access
shell execution
tool execution
capability enforcement
policy persistence
object sealing
kernel interaction
```

Initial request policy

Allowed input envelope states:

```
envelope_state=sealed-report-only
envelope_state=sealed-evaluate-only
```

Allowed requested signature labels:

```
Ed25519-development
```

This label is a metadata request label only. It does not mean Ed25519 signing, Ed25519 verification, key generation, private-key handling, or trust establishment exists in this path.

Planned signature request states:

```
signature_request_state=requested-metadata-only
signature_request_state=denied-envelope
signature_request_state=denied-signature-request
signature_request_state=denied-runtime-authority
signature_request_state=denied-host-effect
signature_request_state=denied-network-effect
```

The first implementation may set:

```
signature_request_ready=1
```

only for ready metadata-only sealed report/evaluate envelopes and an allowed metadata-only signature request label.

Even when signature_request_ready=1, these must remain zero:

```
signature_performed=0
verification_performed=0
private_key_handling=0
handoff_performed=0
effect_performed=0
runtime_authority_granted=0
host_read_performed=0
host_write_performed=0
network_performed=0
```

Planned fields

A future signature request record should be bounded and deterministic.

Planned fields:

```
signature_request_profile
envelope_profile
report_profile
handoff_profile
decision_profile
gate_profile
receipt_profile
verify_profile
message_digest_algorithm
message_digest_hex
public_key_identity_label
requested_capability
requested_effect
requested_handoff
requested_report
requested_envelope
requested_signature
requested_scope
envelope_state
envelope_ready
signature_request_state
signature_request_ready
signature_performed
verification_performed
private_key_handling
handoff_performed
effect_performed
runtime_authority_granted
host_read_performed
host_write_performed
network_performed
status
```

Failure behavior

Future signature-request handling must fail closed.

Required failure states:

```
null output -&gt; invalid
null report envelope -&gt; invalid
invalid report envelope -&gt; denied-envelope
envelope_ready=0 -&gt; denied-envelope
envelope_state not sealed-report-only or sealed-evaluate-only -&gt; denied-envelope
missing requested signature -&gt; denied-signature-request
unknown requested signature -&gt; denied-signature-request
signature already performed -&gt; denied-host-effect
runtime authority already granted -&gt; denied-runtime-authority
handoff already performed -&gt; denied-host-effect
effect already performed -&gt; denied-host-effect
host read already performed -&gt; denied-host-effect
host write already performed -&gt; denied-host-effect
network already performed -&gt; denied-network-effect
```

Failures must not sign, verify signatures, handle private keys, read host files, write host files, contact networks, execute tools, execute shells, enforce capabilities, perform handoff, persist policy, or grant runtime authority.

Promotion rule

This contract permits only the next implementation slice:

```
signature request metadata implementation
```

It does not permit cryptographic signing, signature verification, private-key handling, key generation, trust-store behavior, revocation lookup, runtime handoff execution, effect execution, capability enforcement, runtime authority, host behavior, network behavior, object sealing, or kernel behavior.

After signature request metadata and its status/public-entry checkpoint exist, the next valid planning slice is a signing authorization contract that still must not add signing without a separate implementation contract.

Validation

This contract is validated by:

```
sh scripts/test-latticra-seal-signature-request-contract.sh
```

docs/LATTICRA_SEAL_SIGNATURE_REQUEST_IMPLEMENTATION.md

Source title: Latticra Seal Signature Request Implementation

Lines: 156 | Words: 576 | SHA-256: 13f480a1bd7ae957511e2bb1ccfb0ee32626b3871d54a63b69f18b970be26b53

Latticra Seal Signature Request Implementation

Status: initial signature request metadata implementation Scope: bounded C metadata surface for classifying ready sealed report-envelope metadata into deterministic signature-request readiness. This does not implement cryptographic signing, signature verification, key generation, private-key handling, trust-store loading, revocation lookup, object sealing, runtime handoff execution, runtime authority, host reads, host writes, network behavior, shell execution, tool execution, capability enforcement, policy persistence, kernel behavior, Fedora approval claims, production readiness, or operating-system behavior.

Purpose

This document records the first Latticra Seal signature request metadata implementation.

The implementation consumes sealed report-envelope metadata and classifies whether the requested metadata-only signature request remains eligible for a future signing path.

The signature-request surface is request classification, not signing and not verification.

Added files

```
include/latticra/seal_signature_request.h
src/seal_signature_request.c
tests/seal_signature_request_invariants.c
scripts/test-latticra-seal-signature-request.sh
```

Required predecessor

This implementation depends on the signature request contract and the report-envelope metadata surface:

```
docs/LATTICRA_SEAL_SIGNATURE_REQUEST_CONTRACT.md
docs/LATTICRA_SEAL_REPORT_ENVELOPE_CONTRACT.md
docs/LATTICRA_SEAL_REPORT_ENVELOPE_IMPLEMENTATION.md
include/latticra/seal_report_envelope.h
src/seal_report_envelope.c
tests/seal_report_envelope_invariants.c
scripts/test-latticra-seal-report-envelope.sh
```

API summary

The signature request metadata surface adds:

```
latticra_seal_signature_request_t
latticra_seal_signature_request_error_t
latticra_seal_signature_request_error_label
latticra_seal_signature_request_from_envelope
latticra_seal_signature_request_is_metadata_only
latticra_seal_signature_request_render
```

Request behavior

The implementation:

```
accepts sealed report-envelope metadata
requires envelope_ready=1
requires envelope_state=sealed-report-only or envelope_state=sealed-evaluate-only
requires signature_performed=0
requires handoff_performed=0
requires effect_performed=0
requires runtime_authority_granted=0
requires host_read_performed=0
requires host_write_performed=0
requires network_performed=0
accepts requested signature metadata
classifies Ed25519-development as signature_request_state=requested-metadata-only
sets signature_request_ready=1 only for metadata-only sealed report/evaluate envelope surfaces
renders deterministic signature request metadata
```

Effect and runtime boundary

Even when signature_request_ready=1, these fields remain zero:

```
signature_performed=0
verification_performed=0
private_key_handling=0
handoff_performed=0
effect_performed=0
runtime_authority_granted=0
host_read_performed=0
host_write_performed=0
network_performed=0
```

This implementation does not sign records, verify signatures, handle private keys, load trust stores, look up revocation status, perform runtime handoff, read host files, write host files, contact networks, execute tools, execute shells, enforce capabilities, persist policy, seal objects, or interact with the kernel.

Failure behavior

The implementation fails closed:

```
null output -&gt; LATTICRA_STATUS_NULL_ARGUMENT
null report envelope -&gt; invalid-input
invalid report envelope -&gt; invalid-envelope
envelope_ready=0 -&gt; denied-envelope
envelope_state not sealed-report-only or sealed-evaluate-only -&gt; denied-envelope
missing requested signature -&gt; missing-requested-signature
unknown requested signature -&gt; denied-unknown-signature
signature already performed -&gt; denied-host-effect
runtime authority already granted -&gt; denied-runtime-authority
handoff already performed -&gt; denied-host-effect
effect already performed -&gt; denied-host-effect
host read already performed -&gt; denied-host-effect
host write already performed -&gt; denied-host-effect
network already performed -&gt; denied-network-effect
small report buffer -&gt; LATTICRA_STATUS_BUFFER_TOO_SMALL
```

Failures do not sign, verify, handle private keys, perform handoff, perform effects, read host files, write host files, contact networks, or grant runtime authority.

Invariants

The invariant test verifies:

```
ready sealed-report-only envelope metadata produces requested-metadata-only signature request
metadata
ready sealed-evaluate-only envelope metadata produces requested-metadata-only signature request
metadata
signature_request_ready is one only for metadata-only allowed request states
signature_performed remains zero
verification_performed remains zero
private_key_handling remains zero
handoff_performed remains zero
effect_performed remains zero
runtime_authority_granted remains zero
host_read_performed remains zero
host_write_performed remains zero
network_performed remains zero
small render buffer fails closed
null inputs fail closed
invalid envelope metadata fails closed
missing and unknown requested signature labels fail closed
```

Validation

Run:

```
sh scripts/test-latticra-seal-signature-request-contract.sh
sh scripts/test-latticra-seal-signature-request.sh
```

Expected output:

```
seal signature request contract: ok
seal signature request invariants: ok
```

Next valid slice

The next valid Latticra Seal slice is bounded no-effect key parsing implementation or another narrow status/index alignment follow-up that still must not add signing without separate implementation, key-handling, key-material, and guard contracts.

That future slice must not add private-key handling, signing, verification, trust-store behavior, revocation lookup, host behavior, network behavior, runtime authority, capability enforcement, object sealing, or kernel behavior unless separately contracted, implemented, and guarded.

docs/LATTICRA_SEAL_SIGNED_MANIFEST_CONTRACT.md

Source title: Latticra Seal Signed Manifest Contract

Lines: 184 | Words: 558 | SHA-256: e92380ac336bacbb84da4f7e024ff1baddf3a49690ee4eb5556d277c0ec09155

Latticra Seal Signed Manifest Contract

Status: Latticra Seal signed evidence-manifest contract Scope: contract for future signed evidence manifests after read-only measurement. This document does not implement signing, key generation, private-key storage, signature verification, Ed25519, ML-DSA, SLH-DSA, encryption, object sealing, capability enforcement, runtime authority, host writes, network behavior, kernel behavior, Fedora approval claims, production readiness, or operating-system behavior.

Purpose

This document defines the next Latticra Seal layer: signed evidence manifests.

A signed evidence manifest is a future bounded record that binds measured artifacts, contract identifiers, evidence levels, and signature metadata into an auditable structure.

This document does not implement signed manifests.

Required predecessors

This contract depends on:

```
docs/LATTICRA_SEAL_CONTRACT.md
docs/LATTICRA_SEAL_IMPLEMENTATION_PLAN.md
docs/LATTICRA_SEAL_REPORT_IMPLEMENTATION.md
docs/LATTICRA_SEAL_MEASUREMENT_CONTRACT.md
docs/LATTICRA_SEAL_MEASUREMENT_IMPLEMENTATION.md
include/latticra/seal_report.h
include/latticra/seal_measurement.h
src/seal_report.c
src/seal_measurement.c
scripts/test-latticra-seal-report.sh
scripts/test-latticra-seal-measurement.sh
```

The measurement surface remains the source of truth for artifact digests until signed manifests are implemented and guarded.

Signed manifest boundary

The first signed-manifest implementation may only build deterministic manifest metadata from already-measured artifact records.

Allowed future behavior:

```
accept a bounded measurement record
copy artifact label
copy digest algorithm
copy digest hex
copy artifact size
copy contract identifier metadata
copy evidence level
render deterministic manifest text
record signature posture as unsupported until signing exists
```

Forbidden first signed-manifest behavior:

```
private key generation
private key storage
signature generation
signature verification
network access
encryption
object sealing
capability enforcement
runtime authority grants
host writes
manifest persistence by default
package installation
host configuration changes
```

Planned primitive policy

Initial signature algorithm planning is:

```
Ed25519 for local development and fast signatures
ML-DSA for future post-quantum signatures
SLH-DSA for future conservative offline/root signatures
```

This contract does not implement any of those algorithms.

No custom signature primitive may be introduced.

Planned manifest shape

The first manifest record should be bounded and deterministic.

Planned fields:

```
manifest_version
manifest_kind
manifest_profile
artifact_label
artifact_size_bytes
artifact_digest_algorithm
artifact_digest_hex
measurement_profile
contract_id
contract_digest_algorithm
contract_digest_hex
```

```
evidence_level
signature_algorithm_planned
signature_supported
verification_supported
private_key_handling
runtime_authority_granted
status
```

Initial values before signing support:

```
signature_supported=0
verification_supported=0
private_key_handling=0
runtime_authority_granted=0
status=unsigned-manifest
```

Planned files

The future implementation should use bounded C surfaces consistent with the rest of Latticra Seal.

```
include/latticra/seal_manifest.h
src/seal_manifest.c
tests/seal_manifest_invariants.c
scripts/test-latticra-seal-manifest.sh
docs/LATTICRA_SEAL_SIGNED_MANIFEST_IMPLEMENTATION.md
```

Report integration

After a manifest metadata implementation exists, the Seal report may add a manifest-support field in a later report refinement.

Signing support must remain false until a separate signing contract and implementation exist.

Failure behavior

The future manifest implementation must fail closed.

Required failure states:

```
null manifest output -&gt; invalid
null measurement input -&gt; invalid
invalid measurement status -&gt; invalid
missing digest -&gt; invalid
unsupported digest algorithm -&gt; invalid
output buffer too small -&gt; bounded failure
signature requested before signing support -&gt; unsupported
```

Failures must not create files, modify files, contact networks, generate keys, sign records, verify signatures, or grant runtime authority.

Invariant requirements

The first manifest tests must verify:

```
valid measurement produces deterministic unsigned manifest metadata
artifact label is copied
artifact size is copied
SHA-256 digest is copied
measurement profile is copied
signature_supported remains zero
verification_supported remains zero
private_key_handling remains zero
runtime_authority_granted remains zero
small report buffer fails closed
null inputs fail closed
unsupported signing request remains unsupported
```

Promotion rule

This contract permits only the next implementation slice:

```
unsigned evidence-manifest metadata implementation
```

It does not permit signing implementation, verification implementation, key handling, object sealing, capability enforcement, network behavior, host writes, or runtime authority.

docs/LATTICRA_SEAL_SIGNED_MANIFEST_IMPLEMENTATION.md

Source title: Latticra Seal Signed Manifest Implementation

Lines: 128 | Words: 365 | SHA-256: 3c91a1047d32314df5399ab5ac3d8aa02352f3ee273bc3de356ff5a7d17cdd55

Latticra Seal Signed Manifest Implementation

Status: initial unsigned evidence-manifest metadata implementation Scope: bounded C manifest metadata surface after read-only measurement. This slice does not add signing, verification, key handling, object sealing, capability enforcement, runtime authority, host writes, network behavior, kernel behavior, Fedora approval claims, production readiness, or operating-system behavior.

Purpose

This document records the first Latticra Seal manifest implementation.

The implementation builds deterministic unsigned evidence-manifest metadata from a valid read-only measurement record.

Added files

```
include/latticra/seal_manifest.h
src/seal_manifest.c
tests/seal_manifest_invariants.c
scripts/test-latticra-seal-manifest.sh
```

API summary

The manifest surface adds:

```
latticra_seal_manifest_t
latticra_seal_manifest_error_t
latticra_seal_manifest_error_label
latticra_seal_manifest_from_measurement
latticra_seal_manifest_is_unsigned_metadata
latticra_seal_manifest_report
```

Manifest behavior

The implementation:

```
accepts a valid measurement record
copies artifact label
copies artifact size
copies digest algorithm
copies digest hex
copies measurement profile
copies contract id metadata
renders deterministic manifest text
keeps signature support at zero
keeps verification support at zero
keeps private-key handling at zero
keeps runtime authority at zero
```

Default manifest posture

A successful unsigned manifest records:

```
manifest_profile=latticra-seal-manifest/0.1
manifest_kind=unsigned-evidence-manifest
artifact_label=&lt;measurement artifact label&gt;
artifact_size_bytes=&lt;measurement byte count&gt;
artifact_digest_algorithm=SHA-256
artifact_digest_hex=&lt;measurement digest&gt;
measurement_profile=&lt;measurement profile&gt;
```

```
contract_id=&lt;caller supplied contract id&gt;
contract_digest_algorithm=not-computed
evidence_level=4
planned_signature_algorithm=Ed25519-planned
signature_supported=0
verification_supported=0
private_key_handling=0
runtime_authority_granted=0
status=unsigned-manifest
```

Boundary

This implementation does not sign data, verify signatures, generate keys, store keys, write manifests, persist manifests, contact networks, or grant runtime authority.

It is metadata only.

Failure behavior

The implementation fails closed:

```
null manifest output -&gt; LATTICRA_STATUS_NULL_ARGUMENT
null measurement input -&gt; invalid-input
invalid measurement -&gt; invalid-measurement
missing digest -&gt; missing-digest
small report buffer -&gt; LATTICRA_STATUS_BUFFER_TOO_SMALL
```

Failures do not write files, contact networks, create keys, sign records, verify records, or grant runtime authority.

Invariants

The invariant test verifies:

```
valid measurement produces deterministic unsigned manifest metadata
artifact label is copied
artifact size is copied
SHA-256 digest is copied
measurement profile is copied
signature_supported remains zero
verification_supported remains zero
private_key_handling remains zero
runtime_authority_granted remains zero
small report buffer fails closed
null inputs fail closed
invalid measurement fails closed
missing digest fails closed
```

Validation

Run:

```
sh scripts/test-latticra-seal-manifest.sh
```

Next valid slice

The next valid Latticra Seal slice is a signature policy contract.

That future slice must be contract-first and must not be added directly to this manifest metadata implementation.

docs/LATTICRA_SEAL_SIGNED_REQUEST_CONTRACT.md

Source title: Latticra Seal Signed Request Contract

Lines: 249 | Words: 746 | SHA-256: aff3839945e953fe4e642251aceda50c24703ba4e6c0f55429d62581cc2391c4

Latticra Seal Signed Request Contract

Status: Latticra Seal signed request contract Scope: contract for future signed request metadata after the report-only Seal request freshness report surface. This document does not implement signature generation, signature verification, public-key parsing, trust-store loading, key generation, private-key storage, hardware key use, signed request enforcement, runtime execution, runtime authority, effect execution, capability enforcement, cryptographic verification, verified receipts, network trust lookup, revocation lookup, object sealing, host reads, host writes, kernel behavior, Fedora approval claims, production readiness, MCP protocol implementation, MCP server behavior, MCP client behavior, AI agent execution, model execution, tool execution, shell execution, or operating-system behavior.

Purpose

This document defines the next Latticra Seal contract layer for signed request metadata.

The purpose is to prepare a bounded report-only structure for describing whether a future tool request carries declared signature metadata and whether the signed material is expected to bind identity, context, parameters, freshness, and policy intent.

This document does not implement signed request behavior.

Required predecessors

This contract depends on:

```
docs/LATTICRA_SEAL_AGENTIC_AUTOMATION_SECURITY_CONTRACT.md
docs/LATTICRA_SEAL_MCP_ALIGNMENT_PLAN.md
docs/LATTICRA_SEAL_PARAMETER_SCHEMA_CONTRACT.md
docs/LATTICRA_SEAL_PARAMETER_SCHEMA_IMPLEMENTATION.md
docs/LATTICRA_SEAL_PARAMETER_SCHEMA_REPORT_SURFACE.md
docs/LATTICRA_SEAL_REQUEST_FRESHNESS_CONTRACT.md
docs/LATTICRA_SEAL_REQUEST_FRESHNESS_IMPLEMENTATION.md
docs/LATTICRA_SEAL_REQUEST_FRESHNESS_REPORT_SURFACE.md
include/latticra/seal_request_freshness.h
src/seal_request_freshness.c
tests/seal_request_freshness_invariants.c
tests/seal_request_freshness_report_surface.c
scripts/test-latticra-seal-request-freshness-contract.sh
scripts/test-latticra-seal-request-freshness.sh
scripts/test-latticra-seal-request-freshness-report-surface.sh
```

The existing request freshness metadata surface remains report-only.

Signed request boundary

The signed request layer may describe signature metadata fields, expected binding fields, and report-only verification posture.

The layer may not generate signatures, verify signatures, parse keys, load trust stores, contact networks, check revocation, authorize a request, execute tools, execute shell commands, read host files, write host files, or mutate system state.

Allowed in this contract slice:

```
signed-request vocabulary
signature-presence metadata planning
signature-algorithm metadata planning
signing-key-id metadata planning
signature-hash metadata planning
signed-request-id planning
identity-binding metadata planning
context-binding metadata planning
parameter-binding metadata planning
freshness-binding metadata planning
policy-binding metadata planning
verification-status planning
report-only status planning
non-claims
```

```
static guard validation
```

Forbidden in this contract slice:

```
signature generation
signature verification
public-key parsing
public-key trust store loading
private-key handling
key generation
hardware key use
revocation lookup
network trust lookup
signed request enforcement
runtime execution
AI agent execution
model execution
tool execution
shell command execution
runtime authority grants
effect execution
host reads
host writes
network access
capability enforcement
cryptographic verification
verified receipt generation
object sealing
kernel interaction
MCP server implementation
MCP client implementation
```

Initial signed request policy

The initial policy is report-only and closed by default.

```
seal_signed_request_contract_present=1
signed_request_supported=0
signature_generation_supported=0
signature_verification_supported=0
signature_present=0
signature_valid=0
signature_algorithm_declared=0
signing_key_id_present=0
signature_hash_present=0
signed_request_id_present=0
identity_binding_declared=0
context_binding_declared=0
parameter_binding_declared=0
freshness_binding_declared=0
policy_binding_declared=0
trust_store_supported=0
revocation_lookup_supported=0
runtime_authority_granted=0
host_read_performed=0
host_write_performed=0
network_performed=0
mode=contract-only
status=signed-request-contract-only
```

Planned metadata fields

Future signed request metadata should be bounded and deterministic.

Planned fields:

```
signed_request_profile
signed_request_id
signature_algorithm
signing_key_id
signature_hash
signed_request_supported
signature_generation_supported
signature_verification_supported
signature_present
signature_valid
signature_algorithm_declared
signing_key_id_present
signature_hash_present
```

```
signed_request_id_present
identity_binding_declared
context_binding_declared
parameter_binding_declared
freshness_binding_declared
policy_binding_declared
trust_store_supported
revocation_lookup_supported
runtime_authority_granted
mode
decision
reason
status
```

Initial values before signed request implementation:

```
signed_request_profile=latticra-seal-signed-request/0.1
signed_request_id=unset
signature_algorithm=unset
signing_key_id=unset
signature_hash=unset
signed_request_supported=0
signature_generation_supported=0
signature_verification_supported=0
signature_present=0
signature_valid=0
signature_algorithm_declared=0
signing_key_id_present=0
signature_hash_present=0
signed_request_id_present=0
identity_binding_declared=0
context_binding_declared=0
parameter_binding_declared=0
freshness_binding_declared=0
policy_binding_declared=0
trust_store_supported=0
revocation_lookup_supported=0
runtime_authority_granted=0
mode=contract-only
decision=report-only
reason=signed-request-contract-only
status=signed-request-contract-only
```

Promotion rules

The next implementation after this contract may only add bounded C metadata fields and deterministic rendering.

It must not generate signatures, verify signatures, parse keys, load trust stores, perform revocation lookup, contact networks, execute tools, execute shell commands, call runtime components, read host files, write host files, enforce capabilities, generate receipts, or grant authority.

Claim gate

Latticra must not claim to secure AI agents from this contract alone.

A future claim that Latticra secures AI-agent tool execution boundaries requires, at minimum:

```
request identity metadata implemented
parameter schema metadata implemented
request freshness metadata implemented
signed request metadata implemented
policy decision metadata implemented
runtime enforcement gate implemented
negative tests for denied unknown tools
negative tests for denied unsigned manifests
negative tests for denied stale requests
negative tests for denied replayed requests
operator-visible evidence report implemented
```

Until those are implemented and validated, the accurate public claim remains:

```
Latticra Seal is building a report-only trust boundary for AI-era automation.
```

Non-claims

This contract must not be read as implementation of signed request verification, tool security enforcement, cryptographic enforcement, or AI-agent security.

Required non-claim posture:

```
signed_request_verification_implemented=0
signature_generation_implemented=0
signature_verification_implemented=0
trust_store_implemented=0
revocation_lookup_implemented=0
mcp_tool_security_enforced=0
ai_agent_security_claimed=0
runtime_authority_granted=0
production_readiness_claimed=0
external_endorsement_claimed=0
```

Next valid slice

The next valid Latticra Seal slice is report-only signed request metadata.

That future slice may add a bounded metadata structure, deterministic rendering, invariant tests, and a test runner.

It must not change runtime behavior, host behavior, network behavior, MCP behavior, AI agent execution, model execution, tool execution, shell execution, capability enforcement, cryptographic verification, signature verification, revocation lookup, or authority grants.

docs/LATTICRA_SEAL_SIGNED_REQUEST_IMPLEMENTATION.md

Source title: Latticra Seal Signed Request Implementation

Lines: 149 | Words: 602 | SHA-256: 96413c51d042688d6ee587385eda42b713f187642a5944ccfa52ef100b8dd826

Latticra Seal Signed Request Implementation

Status: initial report-only signed request metadata implementation Scope: bounded C metadata surface for signed request posture after the report-only Seal request freshness layer. This slice does not implement signature generation, signature verification, public-key parsing, trust-store loading, key generation, private-key storage, hardware key use, revocation lookup, network trust lookup, signed request enforcement, runtime execution, runtime authority, effect execution, capability enforcement, cryptographic verification, verified receipts, object sealing, host reads, host writes, kernel behavior, Fedora approval claims, production readiness, MCP protocol implementation, MCP server behavior, MCP client behavior, AI agent execution, model execution, tool execution, shell execution, or operating-system behavior.

Purpose

This document records the first Latticra Seal signed request metadata implementation.

The implementation accepts an existing report-only Seal request freshness metadata record and produces deterministic report-only signed request metadata.

Added files

```
include/latticra/seal_signed_request.h
src/seal_signed_request.c
tests/seal_signed_request_invariants.c
scripts/test-latticra-seal-signed-request.sh
```

API summary

The signed request metadata surface adds:

```
latticra_seal_signed_request_t
latticra_seal_signed_request_error_t
latticra_seal_signed_request_error_label
latticra_seal_signed_request_from_freshness
latticra_seal_signed_request_is_report_only
latticra_seal_signed_request_report
```

Metadata behavior

The implementation:

```
accepts a valid report-only Seal request freshness metadata record
sets signed_request_profile=latticra-seal-signed-request/0.1
sets signed_request_id=unset
sets signature_algorithm=unset
sets signing_key_id=unset
sets signature_hash=unset
sets signed_request_supported=0
sets signature_generation_supported=0
sets signature_verification_supported=0
sets signature_present=0
sets signature_valid=0
sets signature_algorithm_declared=0
sets signing_key_id_present=0
sets signature_hash_present=0
sets signed_request_id_present=0
sets identity_binding_declared=0
sets context_binding_declared=0
sets parameter_binding_declared=0
sets freshness_binding_declared=0
sets policy_binding_declared=0
sets trust_store_supported=0
sets revocation_lookup_supported=0
copies runtime_authority_granted from request freshness metadata
copies host_read_performed from request freshness metadata
copies host_write_performed from request freshness metadata
copies network_performed from request freshness metadata
sets mode=report-only
sets decision=report-only
sets reason=signed-request-metadata-only
renders deterministic signed request metadata
```

Boundary

This implementation does not generate signatures, verify signatures, parse keys, load trust stores, perform revocation lookup, contact networks, create receipts, execute tools, execute shell commands, call runtime components, read host files, write host files, enforce capabilities, or grant authority.

It is metadata only.

Failure behavior

The implementation fails closed:

```
null output -&gt; LATTICRA_STATUS_NULL_ARGUMENT
null request freshness metadata input -&gt; invalid-input
invalid request freshness metadata -&gt; invalid-freshness
non-report-only request freshness metadata -&gt; invalid-freshness
small report buffer -&gt; LATTICRA_STATUS_BUFFER_TOO_SMALL
```

Failures do not generate signatures, verify signatures, parse keys, contact networks, read host files, write host files, execute tools, enforce capabilities, or grant authority.

Invariants

The invariant test verifies:

```
valid report-only request freshness metadata produces deterministic signed request metadata
signed_request_profile is stable
signed_request_id remains unset
signature_algorithm remains unset
signing_key_id remains unset
signature_hash remains unset
signed_request_supported remains zero
signature_generation_supported remains zero
```

```
signature_verification_supported remains zero
signature_present remains zero
signature_valid remains zero
signature_algorithm_declared remains zero
signing_key_id_present remains zero
signature_hash_present remains zero
signed_request_id_present remains zero
identity_binding_declared remains zero
context_binding_declared remains zero
parameter_binding_declared remains zero
freshness_binding_declared remains zero
policy_binding_declared remains zero
trust_store_supported remains zero
revocation_lookup_supported remains zero
runtime_authority_granted remains zero
host_read_performed remains zero
host_write_performed remains zero
network_performed remains zero
mode remains report-only
decision remains report-only
reason remains signed-request-metadata-only
small report buffer fails closed
null inputs fail closed
invalid request freshness metadata fails closed
```

Validation

Run:

```
sh scripts/test-latticra-seal-signed-request-contract.sh
sh scripts/test-latticra-seal-signed-request.sh
```

Claim boundary

This implementation still does not justify the public claim that Latticra secures AI agents.

It moves the project closer by adding report-only metadata for signed request posture, but the stronger claim requires policy decision metadata, a runtime enforcement gate, and negative tests for denied unknown, unsigned, stale, and replayed requests.

Next valid slice

The next valid Latticra Seal slice is policy decision status/public-entry alignment.

That future slice must preserve the no-effect posture and must not implement real policy evaluation, policy enforcement, runtime execution, effect execution, capability enforcement, cryptographic verification, signature verification, freshness validation, replay detection, authority grants, host behavior, network behavior, MCP behavior, AI agent execution, model execution, tool execution, or shell execution.

docs/LATTICRA_SEAL_SIGNER_HANDOFF_CONTRACT.md

Source title: Latticra Seal Signer Handoff Contract

Lines: 286 | Words: 916 | SHA-256: 123f208695e7f3886071e69951e53d338ef51a6c0c332e99d702b1ec2b19d049

Latticra Seal Signer Handoff Contract

Status: Latticra Seal signer handoff contract Scope: contract for a future metadata-only signer handoff surface after Seal signing authorization metadata. This document does not implement signing, signature verification, signer invocation, key generation, private-key handling, trust-store loading, revocation lookup, object sealing, runtime handoff execution, runtime authority, host reads, host writes, network behavior, shell execution, tool execution, capability enforcement, policy persistence, kernel behavior, Fedora approval claims, production readiness, or operating-system behavior.

Purpose

This document defines the first Latticra Seal signer handoff boundary after ready signing authorization metadata.

The purpose of this layer is to decide whether a ready metadata-only signing authorization may be represented as eligible for a future signer handoff before any signer, private key, trust store, runtime bridge, host authority, or signature generation exists.

The signer handoff surface is signer-path classification, not signing, not verification, not signer invocation, and not runtime handoff.

This document does not implement signing.

Relationship to runtime handoff

Latticra Seal already has runtime handoff planning and metadata surfaces for effect and runtime-boundary posture:

```
docs/LATTICRA_SEAL_RUNTIME_HANDOFF_CONTRACT.md
docs/LATTICRA_SEAL_RUNTIME_HANDOFF_IMPLEMENTATION.md
docs/LATTICRA_SEAL_RUNTIME_HANDOFF_EVALUATION_CONTRACT.md
docs/LATTICRA_SEAL_RUNTIME_HANDOFF_EVALUATION_IMPLEMENTATION.md
```

Those surfaces describe runtime-boundary posture for effect decisions.

This signer handoff contract is separate. It starts from signing authorization metadata and describes only a future signer-path handoff record. It does not route to runtime behavior, invoke a signer, perform signing, handle private keys, verify signatures, persist policy, or grant runtime authority.

Required predecessors

This contract depends on:

```
docs/LATTICRA_SEAL_SIGNING_AUTHORIZATION_CONTRACT.md
docs/LATTICRA_SEAL_SIGNING_AUTHORIZATION_IMPLEMENTATION.md
docs/status/SEAL_SIGNING_AUTHORIZATION_STATUS.md
include/latticra/seal_signing_authorization.h
src/seal_signing_authorization.c
tests/seal_signing_authorization_invariants.c
scripts/test-latticra-seal-signing-authorization-contract.sh
scripts/test-latticra-seal-signing-authorization.sh
scripts/test-latticra-seal-signing-authorization-status.sh
```

The signing authorization metadata surface remains the source of readiness evidence for this signer handoff surface.

Signer handoff boundary

Allowed in the next implementation slice:

```
accept signing authorization metadata
require signing_authorization_ready=1
require signing_authorization_state=authorized-metadata-only
require requested_signature=Ed25519-development
require requested_signing_authorization=metadata-only
require signature_performed=0
require verification_performed=0
require private_key_handling=0
require key_generation_performed=0
require trust_store_loaded=0
require revocation_lookup_performed=0
require handoff_performed=0
require effect_performed=0
require runtime_authority_granted=0
require host_read_performed=0
require host_write_performed=0
require network_performed=0
accept requested signer handoff metadata
classify metadata-only as signer_handoff_state=handoff-metadata-only
produce deterministic signer handoff metadata
```

Forbidden in the next implementation slice:

```
cryptographic signing
signature verification
signer process invocation
private-key handling
